I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to deny the permit because the Draft Supplemental Environmental Impact Statement does not accurately represent the true greenhouse gas emission profile of the project. I have the following specific concerns:

The SEIS should be using the 20-year GWP of methane NOT the 100 year GWP. This is because of methane's potency in the short term. Given the IPCC dire warning that we must change our energy fuel ⇒ (Check here to continue comments on the other side).

In addition a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required, and consultation with the Puyallup Tribe and other neighbors of the proje must be done.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Fracked Methane AKA natural gas has & does contribute to poor health. I got asthma In my late twenties while living in Tacoma. I've been told my work and residence are big contributors. Looking into this asthma rates have skyrocketed since the industrial revolution In the proximity of work or living quarters.
Please for the quality of health of the people, plants, animals and Mother Earth, Please say No to Tacoma LNG.

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

The Puget Sound Clean Air Agency should go back to the drawing board. The draft SEIS does not account for the full climate impacts of fracked gas. The analysis is incredibly flawed and unacceptable, and we need the Air Agency to do better before they decide on the air permit for the facility.

Puyallup Rights and Justice

1. The proposed project is a direct affront to the Puyallup Tribe, putting their treaty rights and community at risk
first and worst.
2. Treaty rights have more authority than the right of any other governing body or agency. The Medicine Creek
Treaty is the supreme law of the land and has been violated throughout the process for this facility.
3. I stand with the Puyallup in opposition to the LNG facility. The Puget Sound Clean Air Agency and all
agencies involved in permitting this facility still need to consult with the Puyallup Tribe.

Climate Impacts of Gas

1. Although fracked gas produces less carbon emissions than coal when burned, the production, processing, storage, transmission, and distribution of fracked gas leaks into the atmosphere immense amounts of methane, which is a much more destructive pollutant for our climate than carbon dioxide. When accounting for methane leaks, fracked gas has climate impacts that rival those of coal.
2. LNG does not arrive in Washington carbon neutral. When methane is leaked directly into the atmosphere, it is 87 times more powerful at trapping heat than carbon dioxide when its impact is averaged over a 20-year period.
3. PSE's LNG facility, is precedent setting on how we deal with gas in Washington state. Analysis should assume a 3 percent overall leakage rate of methane. This modest standard reflects the global average leak rate, and is conservative in light of high average leak rates in the West and the additional losses that occur within distribution systems or at end-use facilities.
4. An overall 3 percent leakage rate should be applied unless PSE can provide clear evidence that the leakage rate associated with its proposed LNG project is, in fact, below this 3 percent standard. The burden of proof for adopting a project-specific standard should be on the project proponent, because the gas industry is the keeper of all crucial information about leakage rates.

Environmental Justice

1481-4 5. Regulatory Framework
1481-4 12. LCA Inputs and Assumptions - Global Warming Potential Value
1481-4 21. LCA Inputs and Assumptions - Additional Air Pollutants
1481-4 3. Outside of SEIS Scope
1481-5 14. LCA Inputs and Assumptions - Leakage/Slippage

1. At public information meetings in 2017, the Air Agency shared that the facility would release ammonia,
arsenic, cadmium, hydrogen sulfide, and sulfur dioxide. LNG facilities have been shown to threaten human
health by significantly degrading air quality and contributing to health-harming pollution. The proposed
emissions units in this facility include an enclosed ground flare and vaporizer unit that would emit volatile
organic compounds (VOCs). VOCs include a chemical complex that has been linked to birth defects, shown to
cause cancer, and negatively affect the nervous system.
2. The communities being most impacted by the dangers of LNG, from the extraction site to the end location
are most often low income, communities of color; and most often indigenous communities as seen here in
Tacoma with the Puyallup Tribe and in B.C. the numerous First Nations suffering the consequences of
fracking.
Facility has 40-year plan, despite dire climate crisis
1. The IPCC reports that we need to change our fuel mix immediately in the next 12 years, or face dire consequences. The best available science on methane emissions must be used here if we are serious about combating climate change. This project would exacerbate the crisis we are in, locking Washington into gas infrastructure we do not need. Moreover, there is the potential that the facility itself will be impacted by rising sea levels due to climate change at the Port of Tacoma.

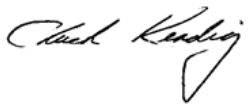
Subject: TOTE MARITIME ALASKA LNG PROJECT

Good afternoon,

I am writing as the head of logistics at Honda, longtime partners with TOTE Maritime. We have followed with great anticipation TOTE's conversion to LNG as it aligns very closely with our corporate initiative to leave the world better than we find it today (our "Blue Skies for Our Children" initiative).

I lead the teams responsible for shipping automobiles from factories around the world to our dealerships in the U.S. As you can imagine this activity creates a significant carbon / GHG footprint, which we are striving to reduce. We do this by collaborating with likeminded Ocean Carriers, Railroads and Trucking Partners who are proactively seeking to reduce the carbon footprint and GHG emissions related to their trade.



I was concerned to hear of delays in TOTE Maritime's conversion plan when I last inquired. It seems as though the environmental review has taken on a life of its own and has gone on far too long already. I have seen this happen in other regions to the detriment of the Port's competitiveness and ability to serve the growing demand of shippers (like Honda) for clean air alternatives. Further delay puts the port of Tacoma (in my opinion) at a competitive dis-advantage while continuing to un-necessarily pollute our environment. As I understand them, the benefits of this conversion are quite clear:

- Nearly 14% reduction in GHG
- The practical elimination of particulate emissions
- 100% reduction in SOX
- 90% reduction in Nitrogen Oxides

We can all be proud of these outcomes. As a company concerned with the environment we leave our children and grandchildren, I felt it important to express my concern regarding the delays and urge you to move swiftly forward with the approvals necessary to enable TOTE's LNG conversion plan.

Sincerely,

AMERICAN HONDA MOTOR CO., INC.

Date: Thursday, November 15, 2018 10:45:21 PM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

Hello sweet fellow beings of Earth,
I am so terrified as I watch the collapse of our biome and the 6th mass extinction of recorded life on this planet that I fear will be our last. I am so terrified for me, my loved ones, and you and your loved ones. And every other creature and plant here. We are so vulnerable to our atmospheric conditions. These terrible fires and the deadly heat waves to come are directly related to the increased solar insolation of our planet caused by the increase in the green house gases in our atmosphere. We are going to asphixiate. You, me, every child, every elderly person. Rich, poor. We will all starve in this inhabitable planet. The suffering will be endless until it takes us all. You cannot do this. Do not pass this. The bribes are not worth the suffering. Please look into activism in your voting base that stems from the urgent need to save humanity. Please. Please don't kill me for your families money.

Subject: Puget Sound Energy's (PSE) liquefied Natural Gas (LNG) Facility
Date: Monday, November 19, 2018 10:02:22 AM

Hello,

I wish to express my support for Puget Sound Energy's (PSE) liquefied natural gas (LNG) facility. Based on draft SEIS issued by the Puget Sound Clean Air Agency (PSCAA) on October 8, 2018, I encourage the agency to issue the necessary permits for the project to proceed.

We all need to be good stewards of environment and make responsible decisions at local, state and federal levels. All the information reviewed thus far regarding this project gives me confidence that proceeding with the project is the responsible thing to do for the community and overall environment. LNG is a cleaner fuel than Diesel so PSCAA needs to act appropriately and support PSE in making this project a success.

Sincerely,
Khaled,

Carole: Thank you. Marilyn Kimmerling?

Marilyn: Good afternoon. My name is Marilyn Kimmerling. When I heard that the Puget Sound Clean Air Agency was going to insist on a new supplemental environmental impact study, I was so thrilled.

[02:06:00] And we waited and we waited, until the results were available. And then, I looked at them. Tisk, tisk, tisk. So, I'm disappointed, as are a lot of other people. I'm going to keep this as brief as I can. I understand that the purview of the Puget Sound Clean Air Agency is on comments on the air quality. But first, I have to say the Puyallup – well, this whole plan is illegal. It's illegal because the Puyallup Nation, which is a sovereign nation, was never consulted in the process. It violates their treaty rights. And it ignored them. As their treaty rights were established in the 1854 Medicine Creek Treaty, which is still a working document.

So, it's illegal. Now, let's go on to air quality. First of all, the data that PSCAA used in this study is outdated. They used a 2007 study.

[02:07:00] Why not the 2016 study? Why 100 year study instead of a 20 year study, when we know that the issues on climate change have become an emergency, and we really only have 12 years to get it together? My previous lifetime, I was a mental health counselor. And even at that point, some of the children that I worked with actually said to me will I get a chance to grow up because they were concerned about climate change. When you look into the eyes of a child that has that kind of concern and fear, you have to take it seriously. Earlier this month, in October, earlier this month, there was a big trash and metal and battery fire right in the Port of Tacoma.

I was walking my dog in the woods many miles away at Point Defiance Park, and we could not breathe.

[02:08:02] Also, they said that the Titanic was unsinkable. It was perfectly safe. There can't be an accident here with a 3,000 degree fire that would ensue. But we all know that the unthinkable does occur, and accidents do happen. We have to take a look at health impacts, due to reduced air quality, too.

Carole: Could you try to wrap it up in a few seconds?

Marilyn: Yeah. Benzene causes brain cancer. There are parts of that study

1184-1 5. Regulatory Framework
1184-2 12. LCA Inputs and Assumptions - Global Warming Potential Value

that were not done, looking at particulate matter. Tacoma already has a worse health outcome as determined by the Health Department because of our history of heavy industrial businesses. And now, we're going to bring another one in. We deserve better. We are not a sacrifice zone.

[02:09:00] You must order a more complete supplemental environmental study, and you must delay until you have that study and people have a chance to have full comment. Thank you.

Dear Puget Sound Clean Air Agency,

As a resident of Tacoma, I am appalled that the SEIS did not include diesel emissions from trucks moving water & sand to and from fracking wells to and from fracking wells, both in B.C. & in the U.S. There is no guarantee that all fracked gas will be piped in from British Columbia. The SEIS further assumes that PSE will have additional maritime customers, with No factual basis. You cannot put assumptions into a "Fact" based statement hoping that they will become true sometime in the foreseeable future. This is not a wishlist. I wish for clean air and a future for my grandchildrens grandchildren. Please take the time & energy to address these issues

Please include this in the final supplemental environmental impact statement.

0468-2 3. Outside of SEIS Scope
0468-2 22. General Opposition

Dear Puget Sound Clean Air Agency,

As a member of 350 Tacoma, I recognize that we have already exceeded the "Safe" air quality. We are in a climate crisis, with the UN IPCC statement of August 8, 2018 explicitly stating that we have less than 12 years to mitigate this, or face dire consequences. My concern is that we as citizens & residents of Tacoma & the Salish Sea, are being ignored while the monied interests of PSE, continues to ignore the facts of the fracked gas cycle & the SEIS has not sufficiently addressed the total air emissions from this process. I ask that PSCAA hire a firm that is independent of the consultation of the original, defective FEIS, to present all of the facts, with the best available science. I further ask that PSCAA ultimately deny an air quality permit to this project. It is not needed.

Please include this in the final supplemental environmental impact statement.

0469-2 22. General Opposition
0469-2 5. Regulatory Framework

Dear Puget Sound Clean Air Agency,

I am a retired attorney who has, in the pursuit of researching this particular LNG project, developed an intimate & rewarding relationship with members of the Puyallup Tribe of Indians. As such, my value system rejects outright the greenhouse gas emissions which extremely adversely contribute to climate crisis, and have historically violated the fishing rights & living conditions of their raped homeland. My concern is that the monied & shortsighted interests of PSE will continue to deteriorate & destroy the already contaminated Port of Tacoma & greater Salish Sea. My ask is that PSCAA prepare an additional SEIS, reflecting the best science available, & then provide an additional comment period, based on facts & not theoretical scenarios. Hopefully an accurate SEIS will prove that the LNG project is untenable to sustaining our environment, both for our tribal neighbors, but for future generations of all human & animal life.

Please include this in the final supplemental environmental impact statement.

Re: Public Comment for PSE LNG Draft SEIS

After attending both sessions of the oral public comment hearing at the Rialto Theater on October 30, 2018, I feel the need to expand upon my opposition to the draft SEIS in particular and the LNG refinery in general.

You heard early in the afternoon the unequivocal opposition by Annette Bryan, a Puyallup Tribal council member, who represented the Puyallup Tribe as a whole. You heard her state quite clearly that PSE never meaningfully consulted the tribe, much less invited representatives to the table as a peer government and a sovereign entity prior to the original EIS.

You heard multiple testifiers from the scientific community raise multiple questions and statements in opposition to the draft SEIS presented for comment. Those statements made clear that the draft SEIS was incomplete and inconsistent at best. It was based on outdated science (albeit within the current state regulations), and assumed facts not in evidence (i.e., nonexistent shipping customers and a sole source of the fracked methane gas from British Columbia).

It drew upon erroneous calculations, and it depended upon spoon fed data supplied by Puget Sound Energy, and not a neutral third party with no interest in securing an air emissions permit. PSCAA had stated at the onset of its SEIS that it was going to examine both upstream and downstream emissions (or "womb to tomb"). It has also stated that it was going to entertain comments pertaining only to the SEIS and its obligation to examine the air quality in its analysis of whether the SEIS sufficiently addressed this issue.

As was made clear by the consistent testimony of people who studied the SEIS most thoroughly (given that it was often convoluted and incomplete in its analysis), no such assurances were made using the best available science for methane emissions. Further, "facts" were presented using presumed "customers" of liquid natural gas, and not the single current contracted customer, TOTE. PSE itself has presented power point presentations reflecting that the "peak" energy needs of its customer base has actually DECREASED (latest data 2017). I personally attended a meeting in Bellevue where that was explicitly graphed on a power point slide.

The community of faith further questioned the social impact of climate change which is being rapidly accelerated by the continued dependence on fossil fuel extraction, as did

representatives of the Missing and Murdered Indigenous Women coalition. They provided solid statistics on that sordid and tragic element of the fracking sites. We pretend that it doesn't affect us, as we have no fracking sites within Washington State, and yet the SEIS itself reflects that all of the methane gas provided to PSE would be piped down from its fracking sources in British Columbia (in itself a false and misleading statement regarding the source(s) of all of the methane gas).

The medical and healthcare community gave testimony regarding the medical implications of climate change, specifically conditions such as asthma and diseases including multiple types of cancer directly related to CO^2 and methane, which is 86 times deadlier as a heat trapping gas in a 20-year period of time. This testimony, as well as the testimony of the above referenced parties, repeatedly cited the Intergovernmental Panel on Climate Change (IPCC), which unequivocally stated that this planet has (less than) 12 years to mitigate the rapid increase of the climate worldwide or face dire consequences as a species.

First hand anecdotal testimony was given about experiencing both the effects of the massive forest fires from British Columbia for the second year in a row, as well as the acrid smoke arising from the spontaneous combustion of lithium batteries in a scrap metal dump in the tideflats in mid-September 2018. This smoke didn't just rise over the Port of Tacoma, but as air does, it spread out throughout the city.

That smoke also directly impacted the people being detained within the ICE detention center on the tideflats, where they are housed on land which is EPA designated Superfund landfill.

It is directly germane to an air quality issue, which PSCAA is bound by its authority to be limited to in the scope of its decision. It must therefore, be included when there are human beings who have no remedy but to shelter in place in the event of a major gas leak or catastrophic natural disaster or manmade "accident." These are not made up assumptions. These are real humans, in real time, who will be the first to be adversely affected as they have no evacuation available to them in a worst-case scenario.

In contrast, and I acknowledge bias on my part, the only opposition I heard to denying this air quality permit based on the incomplete and inaccurate SEIS was made by industry representatives, specifically PSE and TOTE, and by labor union representatives. The PSE and TOTE voices I understand, although I disagree with their assessments. In fact, no heavy oil bunkering occurs by TOTE within the Port of Tacoma, as the two ships plug in to electricity.

The labor voices also gave misleading information, specifically that this LNG refinery and export terminal would provide long-term employment at "family" wage jobs. This is simply untrue. When construction is completed (and it is 90% complete absent the air

0760-4 cont'd 13. LCA Inputs and Assumptions - Natural Gas Source
0760-5 12. LCA Inputs and Assumptions - Global Warming Potential Value
0760-6 3. Outside of SEIS Scope
0760-7 3. Outside of SEIS Scope

0760-7 cont'd 3. Outside of SEIS Scope

permit), it will provide at most 17 full time jobs. This is not an exaggeration. The jobs have been in the construction process, not the maintenance of the plant. For a tank which will be filled with 8 million gallons of frozen methane gas, it is incomprehensible that there will be so few jobs to ensure that that gas does not leak, expand or explode, but those are the facts as presented by PSE itself.

The SEIS must be amended to include both the most recent science available, as well as the real customers and need, and not theoretical facts not in evidence. It cannot be formulated using charts, power points, and narrative provided by the company which would be most benefitted by a positive assessment.

In the two weeks since I first started this letter, California has been inundated with wildfires fires of unprecedented scope and intensity. It is November. There is no more "fire season". Firefighters themselves are saying this. It is now a year-round situation with no relief in the foreseeable future. Fire eats up air. It is incontrovertible that climate warming has been a primary factor in this phenomenon, and also irrefutable that this will not be reversed unless and until we, as the human force responsible for climate warming, begin to address it from a viewpoint other than the potential for profit. Money does not buy air. To ignore that fact is to ensure that we will die from lack of air.

Sincerely,

Carol M Kindt

Carol M. Kindt
350 Tacoma

[04:00:00]

Steve: Carol Kindt?

Carol: Good evening. My name is Carol Kindt. Thank you for the opportunity to let us all speak tonight. I'm going to take my moment to let us all be silent tonight. To listen to the voices of the ancestors who lived here long before we ever thought about being here. To listen to the voices of the unborn children, of these young women who may not have those children because of climate change. To listen to the voices of the orcas who are almost extinct who also breathe air. Take the moment and listen.

[04:01:00]

[04:02:00] Thank you.

Steve: So, before I call up the next speaker, the next group after that, I'll give you a heads up, it's David Phillips, Suzanne Greenburg, Valerie Peaphon, Jessica Zimmerle, and Reverend Jan Ruud. So, Nanette Reetz?

Nanette: Good evening. Thank you for taking our comments this evening.

[04:03:00] My name is Nanette Reetz, and I'm a member of Advocates for Cleaner Tacoma. We are a part of a coalition of 28 environmental, health, social justice groups who oppose this project. I would like to read off the coalition members that have signed on in just this last week. This coalition is growing.

They include Advocates for a Cleaner Tacoma, 350 Tacoma, Washington Physicians for Social Responsibility, Climate Scientist, Redefine Tacoma, Native Daily Network, Vashon Climate Action Group, Climate Action Bainbridge, Protectors of the Salish Sea, Mozisca Talks, Missing and Murdered Indigenous Women and Girls' Collaborative, Civic Actions for the Salish Sea, Stop Fracked Gas PDX, Direct Action Tacoma, 350 East Side, Sierra Club Washington Chapter, 350 Seattle, Oregon Physicians for Social Responsibility, Earth Ministries, and Washington's Interfaith Power and Light, The Conversation, Legal Rights of the Salish Sea, Cascadia Wildlands, Rogue Climate, Stand Up Earth, Plant for the Planet Seattle, Green Peace USA, Climate Action Coalition, Mosquito Fleet, and the Northwest Detention Center Resistance.

[04:04:28] This coalition, as I said, is growing. And we would like to state that we, incorporate by reference, the comments of the Puyallup Tribe. Please do the right thing. Thank you.

Draft SEIS – open for public comment through November 21, 2018

Sent from Mail for Windows 10
It is completely ironic to me as an individual, and as a member of 350 Tacoma, a grassroots group committed to combatting the adverse affects of rapid global warming, that Puget Sound Energy's own website stated that its gas sources for the Tacoma LNG facility would be from multiple locations. It was only after the draft SEIS was released that Puget Sound Energy changed their own narrative to claim that the only source of its fracked gas for the Tacoma LNG facility would be from British Columbia. PSE has a history of changing the "facts" and its own narrative to meet the requirements of any agency granting a permit. When they don't get one through a streamlined and unexamined process, they continue to build anyway, assured that in the end they will be issued whatever permit they need to put this dangerous and unnecessary refinery online.

Their misleading claims, especially to the public, are a red flag. They are duplicitous in their business practices. Their own data reflects that the need for "natural" gas to meet "peak" periods of use has actually decreased in the last 10 years. They can no longer use that claim to rationalize the need for the LNG facility. Now PSCAA assists them in misleading the public by including phantom maritime customers which do not, in fact, exist as of the date of the release of the draft SEIS. Do not issue a permit based on assumptions.

We, as inhabitants of this planet, have less than 12 years to radically mitigate the harm already experienced on our planet by global warming. Do not let a "bridge fuel" dependent on fracked methane accelerate this dire scenario. LNG is a bridge to nowhere. It will be a bridge to certain death, far worse than coal in a 20-year cycle. We don't even have 20 years. We are in crisis now. Please, as the agency tasked with protecting the air we breathe, deny the permit.

Date: Thursday, November 15, 2018 9:41:48 AM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

After analyzing the SEIS presented by PSCAA, it is obvious that this needs to be redone, using the best available science and the real customers PSE has lined up, in real time. Last night I heard a PSE representative tell the West End Neighborhood Council in Tacoma tell the audience that the LNG stored in Tacoma would also be used for vehicle (trucks) fuel. That proposal was never included in either the original EIS, which he said was an FEIS, approved by the City of Tacoma as lead CEPA agency, or in the SEIS, as requested by PSCAA. What other lies are they going to tell the public while this process is being reviewed?

Sincerely,

Carol Kindt

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

The SEIS prepared for PSCAA must be revised to reflect not only the best available science, the real sources of fracked methane gas that will be piped into the LNG facility in Tacoma (because PSE lies about it only being piped from British Columbia), and real customers, not made-up, theoretical customers. Most recently (Wednesday, November 14, 2018) a PSE spokesperson told the West End Neighborhood Council that the LNG would be used for vehicle transportation (i.e., trucks that now run on diesel fuel). This was the first time I heard that particular lie. That statement was not included in either the original EIS approved by the Tacoma City Council, nor in this SEIS. The lies continue to suit the needs of PSE. This is totally unacceptable.

Sincerely,

Carol Kindt

Subject: Puget Sound Energy's LNG facility
Date: Tuesday, November 20, 2018 4:59:50 PM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

By now, you're probably sick of reading all of the thousands of comments in opposition to the PSE LNG facility and the defective SEIS on the air quality from the origin of the fracking site(s) in British Columbia and other places, to the delivery site in Tacoma, Washington. If you will just pay attention to the science which has been offered (not by the consulting firm but by independent sources), the fact that theoretical and not real customers were included in the SEIS for the distribution of the liquid natural gas, the fact that PSE as recently as last week at a West End Neighborhood Council meeting in Tacoma stated that the LNG would also be used as a fuel for diesel trucks in the tideflats (which fact has never, ever been discussed either in the original FEIS nor in the SEIS requested by PSCAA, or any number of other issues not addressed in the SEIS, you must come to the conclusion that another, new SEIS needs to be researched and written by an independent consulting firm which has not previously been used to promote this project.

Sincerely,

Carol Kindt

Subject: I"m against the Tacoma LNG Project
Date: Tuesday, October 23, 2018 7:45:28 AM

Dear Responsible Official,

I'm a geologist and I've been either studying or working on climate change since 1989. We've known about this problem for 30 years. We've also known the solution, all along.

We've done almost nothing to solve the problem, and we've squandered the buffer of time we had for a gradual transition away from fossil fuels.

Now, we have little choice. We've tied our own hands. The choice has to be this: no new fossil fuel infrastructure. No new fossil fuel development, no new fossil fuel anything.

Fossil fuels have a direct, negative impact on public health, and air pollution from fossil fuels cause the premature deaths of tens of thousands of Americans every year. Thousands more suffer from asthma and other illnesses from air pollution.

The health care bill for these illnesses is borne by the public, not the fossil fuel companies, nor the utilities that put fossil fuel projects in place. It is an enormous public subsidy for fossil fuel use, and it should be tallied in the actual costs of fossil fuel. When you consider the damage caused by dirty energy sources, they are economically untenable.

Fracked natural gas also emits methane, which packs a mean punch in terms of heat-retention in the atmosphere. We simply can't afford to commit to a whole new fossil fuel project. The time to unequivocally move away from these polluting fuels is right now.

Please say no to this LNG project, and focus instead on addressing climate change, protecting public health, and steering Washington toward clean and sustainable energy.

Specifically, the “no-action alternative” should be revised to include a clean energy alternative in which PSE provides electricity not with a different source of fracked gas, but with renewable energy and energy efficiency. That is exactly the direction in which we need to go - we no longer have time to waste.

Thank you for your consideration.

Sincerely,
Karin Kirk

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Dear fellow Breathing Human Beings & fellow Neighbors of the Pacific NW,

I urge you to go outside and take a big deep breath ... and as you do ...please appreciate the fact that you still Can!

2 Reasons WHY to NOT Support the LNG Proposal:

1st Emotional:

"Tacoma" comes from the [Native American] name..., Tacopid, meaning "She who gives us the waters."
....I add: Tacoma is NOT the 'One who gives GAS'... JDK 11/14/18

1st reference from: walkingtacoma.blogspot.com/2005/07/meaning-of-tacoma.html

... as referenced from:
nativeamericannetroots.net/diary/1465

Tacoma: the Salish-speaking Indians in the area referred to it as Shubahlup which means “the sheltered place.”
American settlers later named it Tacoma which is supposedly from Takohoma which has been reported to mean “frozen waters,” or “nourishing breast,” or “near to heaven” which may refer to the nearby Mt. Rainier.

2nd Logical Reason below:

I understand you will act with your heart & mind, supported by research, to evaluate and vote in a way that is right for our current fellow citizens the world over. Towards this end, question all that you know about our current Climate situation. We are far worse off than most individuals know or realize. As recently reported internationally, OUR (CURRENT & FUTURE GENERATIONS IF YOU CARE AT ALL) ... EARTH's Carbon numbers in the atmosphere have been under estimated and accounted for ... to the extent that we must ACT now to focus exclusively on truly GREEN non-Carbon Emission Energy producing options in the next 2 to 5 years. What this means is DON'T Trust the "Natural Gas" drilling & distribution Companies' message that Gas from the Earth will reduce overall Carbon Footprint,

1516-1 22. General Opposition

It will not. It is mis represented as NATURAL.
It's marketing 101. They the companies have been wrong before and they are wrong here. THE life-Cycle of Extraction, formulation, Distribution & use are all CARBON Releasing steps. The overall FOOTPRINT or GAS PRINT or LIFE PRINT is DEADLY for us now ... and FOR our CHILDREN'S CHILDREN or
FOR our NIECES & NEPHEWS Children's Children!

Stop, Go Out side, Breath IN, Care, Act & Vote to RE-DIRECT to Truly NON-Carbon Emitting sources to GREEN Power our Future. Please GO Buy Stock in SOLAR or WIND or WAVE or just help someone get a GREEN JOB! Don't be distracted by the SHORT TERM FALSE HOPE - GO forward for a GREEN WIN!

"Make Tacoma the Green to Seattle's Blue!" ... JDK 11/14/18

Subject: Tacoma LNG
Date: Thursday, November 1, 2018 9:25:06 AM

It makes me fearful for the future of humanity to think that a project that replaced bunker fuel (an environmental nightmare) with LNG would obtain opposition.

Boats don't move because of wishes or dreams. Idealism won't beam cargo to Alaska.

Nothing is perfect. Solar panels have heavy metals.

LNG is the cleanest fuel for large tankers.

People can't just say no. They need a cleaner alternatives. Saying no won't cause a cleaner future, it will return us to a dirtier past.

There is no question that burning LNG is better for the environment than burning bunker fuel. To imply that that question has not been resolved is a lie and manipulates well-intentioned stupid people. It is evil.

Subject: TOTE Marine LNG facility - Public Comment
Date: Wednesday, November 21, 2018 6:17:24 PM

Thank you for the opportunity to voice my opinion of SUPPORT for TOTE's desire to convert to LNG and the needed approval for the LNG storage facility.

My name is David Knutzen and I am the CEO of Northwest Marine Technology (NMT). Prior to working for NMT, I was a biologist with the Washington Department of Fish and Wildlife and have since been a member of various management committees. NMT is a small fish tagging business located in northern Puget Sound. NMT has been instrumental in the application of marking and tagging salmon in order to collect data to aid management in making sound scientific decisions. Having the applicable data is key to increasing ones confidence in the management process.

Puget Sound and the beautiful Pacific Northwest are in trouble. From critically low salmon populations to starving orcas I see it daily in my work and personal live. We are at a critical time where serious small and large scale change is necessary if we want to get ahead of this pending environmental crisis. People throughout Puget Sound are working to lower our environmental footprint in our daily lives. Businesses are encouraged to do the same. While things like converting to LED lighting, limiting our driving, or enhancing our recycling programs is very important it is equally important to recognize and encourage industries that can make bold steps in adopting greener practices. The shipping industry in Tacoma is at this step. Having traditionally diesel powered ships crossing Puget Sound convert to LNG is a significant milestone. Taking a bold step to reduce our emissions is a step for a greener future.

I work for a company that knows the power of data. Solid data that can demonstrate why it is important to make a specific decision. The emission reduction data for the diesel to LNG conversion is staggering. 100% reduction in sulfur emissions, nitric oxide and nitrogen dioxide emission reduction of 90% and carbon dioxide by 20% are something that needs to be supported. It is going to take generations to clean up our environment. TOTE converting to LNG is the type of change that is needed today and one that the Puget Sound Clean Air Authority and City of Tacoma should be proud to have done on their watch.

I would hope that PSCAA and the City of Tacoma reward TOTE for improving our air quality.

Thank you for time.

Dave Knutzen

Subject: Tacoma LNG SEIS Project Comment
Date: Tuesday, October 23, 2018 8:22:41 PM

Dear Responsible Official,

As an environmentally aware citizen and Tacoma resident, I am deeply concerned about the LNG tank proposed to be sited at the Port of Tacoma.

The project is touted as a way to meet stricter clean energy standards. However, most of the rhetoric supporting this view is centered on the environmental impact of the fuel as it is burned, and not on its impact during extraction, delivery, etc.

I applaud your decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct this more rigorous analysis. Thank you.

Bearing in mind that your agency's stated goals, per your website, include a priority on climate change and GHG from the transportation sector. In light of this emphasis, I urge you to revise the analysis to account for the following:

1. Methane should be counted as 86 times more potent than CO2 based on the current IPCC analysis (AR5 rather than AR4) considering a 20 year timeframe (rather than the 100-year).

2. Revise the analysis of the impacts of fracking in British Columbia based on recent research(1) demonstrating that methane escapement has been dramatically under-estimated.

3. Revise the “no-action alternative” to include a clean energy alternative in which PSE provides electricity not with a different source of fracked gas, but with renewable energy and energy efficiency.

4. Revise the “no-action alternative” to include the assumption that Tote Maritime will achieve a 50% GHG reduction, in line with the International Maritime Agency’s established goals. This reduction might alternatively be achieved by a combination of fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion or many other alternatives besides fracked LNG.(2) For clean local emissions requirements, Tote Marine can achieve virtually all of the localized lower-particulate and lower SOx and NOx benefits claimed for LNG propulsion by opting for low-sulfur marine gas oil over heavy fuel oil, and installing selective catalytic reducers and diesel particulate filters.(3)

5. This more accurate analysis will show that the project has a significant and unmitigated impact on the global climate, which
should be seen as a sufficient basis for denial of the Notice of Construction application.

Thank you for your time and consideration of these comments.

Puget Sound Clean Air Agency
ATTN: Public Comment on DSEIS, PSE LNG Project
1904 Third Avenue, Suite 105
Seattle, WA 98101

RE: PSE LNG Project

To whom it may concern:

I wish to express my support for Puget Sound Energy's (PSE) liquefied natural gas (LNG) facility. Maxum Petroleum is a marine diesel fuel and lubricant provider. Locally, we have terminals on the water, barges, vessels and trucks that we use to distribute our products to tugs, vessels and ships throughout Puget Sound. Additionally, we have operations on the Columbia River, San Francisco/Oakland and LA/ Long Beach, which provide the same mode of distribution to the maritime community. Several of our clients are and have begun to transition their vessels propulsion system to operate on LNG due to the environmental and regulatory pressures outlined in this letter. The facility at Puget LNG is an important supply source for these vessels to receive the services they require to operate. This specifically includes my concurrence with the conclusion about the environmental benefit of replacing transportation bunker fuel with clean burning LNG contained in the October 8, 2018 Draft SEIS issued by the Puget Sound Clean Air Agency (PSCAA) and my support for the agency in issuing the necessary permit(s) for the project to proceed.

The Washington Department of Ecology's State Environmental Policy Act (SEPA) regulations recognize that air quality is a part of the environment. It's hard to ignore the significant environmental and air quality benefits of replacing bunker fuel currently used by the maritime industry with LNG fuel. Switching from bunker to LNG reduces greenhouse gas emissions by nearly 15%, sulfur dioxide (SOx) emissions by over 99% percent, and nitrogen oxide (NOx) emissions by nearly 85% while eliminating visible particulate matter (PM) produced by ships by more than 85%. It is these particulate emissions that are extremely harmful to the lung health of anyone breathing them in.

It is also important to note that LNG powered ships will substantially exceed the North American Emission Control Area requirements established by the International Marine Organization's (IMO). The IMO regulations have required a reduction in the bunker fuel sulfur content from 3.5 percent to 0.5 percent. Both US EPA and the US Coast Guard are enforcing these fuel regulations, which have been estimated by EPA to reduce mortality by as much as 30,000 people per year. TOTE has made the commitment to use LNG fuel, which provides substantially greater benefits than even the IMO regulations mandate. Maxum Petroleum has assisted its clients that have already moved from bunker fuel to Ultra Low Sulfur diesel fuel over the last decade. In each case, the clients have placed their environmental stewardship programs at the forefront of their company's core values and have

remained not only competitive but also safe and efficient operators. These shipping lines as well as several others that call in Puget Sound are incorporating LNG propulsion systems into their new build programs. The future primary source of fuel for bunkering vessel is LNG.

Another important environmental advantage of LNG as fuel is that in the unlikely event of a spill, LNG turns into vapor and dissipates with no lasting effects on water or marine life.

The LNG facility will also generate important economic benefits for all South Sound residents. In addition to helping local employers like TOTE remain competitive, it will create at least 250 construction jobs and over 300 indirect jobs due to the construction. After the construction, the economic activity from the project will create another 125 permanent jobs.

The draft SEIS, prepared by Ecology and Environment, Inc. and released by PSCAA on October 8, 2018, stated "When evaluating direct, upstream, and end use GHG emissions, replacing a diesel propulsion engine with a pure LNG propulsion engine results in reduced life-cycle GHG emissions."

Since the draft SEIS independently prepared for and published by PSCAA has confirmed the environmental benefits and overall reduction in GHG emissions from use of LNG as a replacement for diesel, I fully support PSCAA promptly finalizing its October 8, 2018 draft SEIS and granting the necessary permit(s) so the LNG facility can be completed as soon as possible.

Sincerely,

Dan Kovacich
Vice President, Marine Division

Subject: Tacoma LNG SEIS
Date: Wednesday, November 21, 2018 5:58:11 PM

Puget Sound Clean Air,

Dear Puget Sound Clean Air Agency,
There is no fossil fuel extraction that does not emit carbon, which is a long term pollutant, along with the production and transportation of, or for, fossil fuel energy, which creates immediate air and land pollution. Liquefied Natural Gas is a fossil fuel, based on its production and input. Neither private nor public ventures need to produce any more energy that is not devoid of all air, water and land pollution because our world is overburdened already with toxins, including carbon and its lethal byproducts. The IPCC has said our viewable future time for clean air at all, is decade limited.

Beyond the moral choice to not add more carbon to our environment, there is the opportunity now that the PSCAA commissioners have, to right the wrong of PSE building on land, which is first and foremost, traditional tribal land. Even more egregiously, PSE has already built this plant, without all the permits required, thus disallowing the process for either the Tribe to object before the project got started and for the rest of Tacoma, whose air is further threatened, to know what is happening.

Puget Sound Clean Air Agency Permit rules page:
https://www.pscleanair.org/177/Construction-Permits

“A permit is required of any new or modified air pollution source prior to construction or making modifications (including equipment, process, or design changes) that affect the level of air contaminants emitted. This permit is obtained through the Notice of Construction program.”

PSE has built this plant, off the “profits” of their ratepayers (who have no choice), without proper construction permits, on toxic landfill which is on traditional Puyallup waters (which tribe did NOT give permission to do so), about to start up a process which is not only extremely dangerous (explosive potential next to explosive tanker cars and carrying volatile gas up the Puget Sound exposing thousands to death and destruction) but also extremely toxic, requiring fracked gas to be pumped in across our State (from BC, where there was a leak in their pipelines recently), increasing this infrastructure with its potential for failure.

As your website says, about half of the State lives in the Puget Sound region, giving you ultimate responsibility for the breathable air for millions of people (including all the non-human species).
"Every day we work to protect public health, improve neighborhood air quality, and reduce our region’s contribution to climate change."
We are thankful that you are here for us and our State and ask that you reject this permit and all further petitions from PSE, and any other entity involved, to continue with this plant.

Sincerely,
Anne Kroeker and Richard Leeds

Subject: Tacoma LNG SEIS
Date: Wednesday, November 21, 2018 4:51:14 PM

Puget Sound Clean Air,

Thank you for providing the opportunity to review and comment on the PSE Tacoma LNG SEIS.

I am a Tacoma resident concerned about climate change and our contributions to global warming. Part of what makes Tacoma so special is its story of moving from a legacy of pollution to a community that can take pride in its industry and environment.

After reading the SEIS, it appears to use old information, and it's missing data. The SEIS should be using the latest IPCC numbers when determining the global warming potential of greenhouse gases. It should also use the 20-year numbers instead of the 100-year, since this plant will only be operational for 40, and we'll see big impacts from the very beginning. When the 20-year GWP from the 2013 IPCC report is used, it shows that emissions from the LNG facility are actually 30-31% worse than the No Action alternative.

The SEIS is also missing really important information, like the carbon content of the gas to be used. This data is needed for a complete study, and until it's there, this SEIS is incomplete.

How will PSCAA ensure that the methane gas comes from BC? The SEIS should also analyze the very likely scenario in which PSE will have to get its methane gas from the Unites States network.

Finally, the SEIS doesn't include smaller sources of emissions, like those from tearing the plant down. These smaller sources of emissions could add up to a big impact, and should be included in the analysis.

Because of these conclusions, I am opposed to the PSE Tacoma LNG project. Please update the SEIS, reissue it when it is complete and credible, and then re-open the comment period.

Subject: Puget Sound Energy's LNG facility
Date: Friday, November 16, 2018 8:49:29 AM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

PSE's LNG project increases our greenhouse gas emissions and fuels climate change - which means more wildfires and smoke for our region. The resulting air pollution makes us sick and leads to higher rates of asthma attacks, heart problems and cancer in our communities. We have very little time left to deal with climate change-12 years according to a UN Report. We need to be working on turning Initiative 1631 into law.

Sincerely,

Jim Krueger

Subject: LNG - Opposition
Date: Monday, November 5, 2018 10:30:53 AM

To Whom It May Concern -

I am writing to express my opposition to the construction of the LNG facility on the Tacoma Tideflats. I believe the city/Port is being short-sighted not only in allowing PSE to begin construction before all the approvals were obtained or the Tribe on whose lands this is being built was consulted, but in apparently assuming that since construction began, we should continue with it. Given the IPCC findings, we need to think long-term about something that will cause cumulative harm to our environment - and particularly to our air quality. We need to look at the delivery of natural gas as a system and make our environmental impact decisions based on what this proposal does from point of origin to ultimate destination (the ships). As to jobs, has anyone considered the number of jobs we could create to find alternatives? Think of the statement this city could make to the nation and in concert with all the Ports up and down the Pacific when we say 'no' to this and that we will only support environmentally sound activities. Given our strategic location, I am sure this will provoke shipping companies to really begin working on/investing in sustainable solutions.

Further, I am concerned that if this is approved, the next step will be that PSE will request this become part of a bigger distribution facility and the additional environmental issues that would arise.

The citizens spoke to you about the Methanol plant and they are speaking to you again about the LNG plant. Please listen and respond accordingly, as it is YOUR decision that will make the difference. Our existence matters more than economics right now.

Subject: LNG Facility Construction Tacoma
Date: Monday, November 19, 2018 12:28:53 PM

To Whom It May Concern,

I am very much opposed to the construction/completion of the LNG facility located in the Tideflats of Tacoma. Given the surrounding environment and geography, an accident could be catastrophic. This is not a permanent nor temporary solution to any atmospheric problems that exist as leakage of natural gas (methane) will have a much larger detrimental effect on the environment. The natural gas will be obtained by fracking and fracking is one of the most ecologically damaging systems used.

We need to look for long term solutions now. There's no time to waste with implementing solutions that fix one problem but create multiple larger problems. Approval for this project must be denied.

Sincerely,
James Kuhlman

Subject: Puget Sound Energy LNG Project
Date: Tuesday, November 13, 2018 12:16:45 AM

Puget Sound Clean Air Agency,

Dear PPSCAA

First of all, fracked gas is an environmental nightmare poisoning water resources, and destroying lives and livelihoods of people affected by the externalized cost of this pollution. The activity is also being linked to triggering earthquakes. Fracking is has also been exempt from the Clean Water Act, and there is little or no oversight to the pollution it causes. The process should be entirely illegal.

Second, the consensus on the need to eliminate fossil fuel use can not be denied. Any attempt to contribute to the sale and distribution of fossil fuel is a grave threat to humanity. The only appropriate use of this fuel is to facilitate a transition off of these fuels. Facilitating the transport of fuel merely for corporate profit is a massive crime and unacceptable.

Thirdly the transportation and storage of these fuels also pose a specific threat to the communities that the are routed through, stored , and processed.

For these reasons plans for the LNG plant need to be rejected

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

First of all, I want to thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma.

Scientists make clear that we cannot, and must not, allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.

Here are some of the issues as I understand them:

- The SEIS is not using the best available science for the Global Warming Potential (GWP) of methane. It uses the 100-year GWP of methane and not the 20-year value which is much more relevant given the urgency in addressing the climate crisis. The appropriate 20-year GWP value to use is 96.
- This facility is projected to have a 40 year lifespan, so why does the report project out to 100 years, which is 90 years beyond the time we need to have taken decisive action?

-1) What is the maximum earthquake magnitude (also modeled depth & epicenter distance) along the Tacoma Fault & Cascadia megathrust the LNG facility could withstand in the OBE and SSE scenarios? Alternatively what is the %g horizontal ground acceleration the LNG facility could withstand during a seismic event?
2) What is the maximum tsunami run-up height the LNG facility is capable of withstanding?

Thanks again for initiating this crucially important review of this facility and I hope that you will take best available science into consideration when revising this draft SEIS.

0477-3 10. LCA Calculations

Dear Puget Sound Clean Air Agency,

I am a Tacoma resident and the parent of an eleven-year-old daughter. I have read the UN climate commission's recent report, which predicts with a high degree of certainty devastating climate impacts by 2040 if the world does not immediately shift to non-greenhouse gas emitting energy sources. Allowing PSE to lock in 50 years of burning fracked gas - much of which leaks during drilling and transport and is itself a potent GHG - threatens the future of my daughter and children everywhere. I have read the SEIS, and even to this non-scientist, it is obviously flawed, with numerous field indicating missing data, ~~error~~ making errors by transposing feet^3 + meters^3 and using outdated + disproven climate data. The SEIS is too severely flawed to allow the LNG refinery to be permitted. I ask you to disallow the permit of construction.

Please include this in the final supplemental environmental impact statement.

Name:	Phone:

Robert

Steve: Thank you. Next up, Tiffany MacBain.

[06:29:00] William Kupinse.

William: I had something very neat typed up, when I came here, and I've rewritten it many times, most recently, in my head, in response to some of the comments that I heard. So, we'll see how this goes. My name is William Kupinse, and I'm a Tacoma resident apparent and professor of English at the University of Puget Sound where I teach courses on environmental writing and the literature of environmental justice. I'm here because I stand with the Puyallup Nation in opposing the LNG refinery, and I incorporate their comments by reference into my own here.

[06:30:05] I'm here because I stand with those communities in Canada and the US where their water would be threatened by the fracked gas PSE wants to pipe to Tacoma. And I stand with the men and women, at the Northwest Detention Center, who would be breathing in the pollution from this fossil fuel refinery, with no way to escape. I've heard a number of the people who are speaking in favor of the LNG plant, the fracked gas refinery. And a kind of common thread I've noticed is I stand for science. And I stand for science, too. And I think it's important for us to understand what exactly is in that report.

There's science, and I work with scientists. I, in my own research, come across science.

[06:31:00] And it works this way. It works through a process of peer review where, anonymously, things are sent out. Studies are written up as papers. They're sent out to outside reviewers who then weigh in. And that determines whether something gets published. And other people have a chance to weigh in on that. Now, the fact that the science that was used in that report was questioned by the actual scientists who are here let's me know that there may be a problem with that. There's also a disclosure of financial interest. And there's also a sense that there's a progressive increase in knowledge.

A study from 2016 is going to, on the whole, if it's going through that peer review process, be more reliable, be more closer to producing truthful information, than one that is from 2007. So, you've got science, and then, you've got the interpretation of science. And there, it becomes much, much messier. And you have to think about what scientific studies are most relevant.

[06:32:00] And that is not always a completely obvious thing. Are we picking the scientific studies that, in fact, speak to the issues that we're looking for? And even more generally, how is the data being used, whether it's in a scientific study or whether it's in the SEIS itself, the draft SEIS? Where is that data coming from? Because I know that self-reported data is notoriously unreliable. If you ask people to self-report how often they floss their teeth, you're going to get a much higher level than you will if you were actually to sit there and watch whether people floss at night.

Self-reported data is even less reliable, when the entity reporting the data has a financial interest in that data. So, if you're the people who are up there running a fracking well, and you're like, yeah, look how low our numbers are, it's like, gee, I'd be surprised if they weren't.

[06:33:00] So, science, the interpretation science. I support science, and I support the responsible interpretation of science. And I do not see the responsible interpretation of science in that SEIS. I ask you to reject it. Thank you very much.

To: Public Comment
Subject: LNG facility
Date: Sunday, October 21, 2018 4:52:43 PM

Dear Puget Sound Clean Air Agency:

I am strongly opposed to any further development of the liquefied natural gas facility in Tacoma. Most of natural gas is fracked, resulting in release of methane a very powerful greenhouse gas. The time is overdue to invest strongly in renewable energies such as solar, wind, geothermal, etc. in Tacoma and Pierce County, not in natural gas. The recent ICC Report clearly outlines that climate change is occurring much faster than any of us imagined and our planet needs a rapid transition to renewable energy, and away from fossil fuels, now. This is an existential threat, a moral issue, and one we particularly needed to meet for the sake of our young people now alive, future generations, and the natural world.

Thank you for the opportunity for me to share my views.

Sincerely,

David Lambert
Pierce County resident

Subject: Tacoma LNG SEIS Project Comment
Date: Thursday, October 25, 2018 4:25:28 PM

Dear Responsible Official,

Fracking gas has proven itself to be more harmful than helpful and that was well before we knew how severe all the effects of fracking would be.
.
To bring an eight million gallon liquified natural gas project to a beautiful treasured area is incomprehensible.

The time for fossil fuels is over. Forward looking countries are moving to replaceable clean energy. The only reason we are not is almighty buck.

Climate change is real. We can see for ourselves what's happening. Does it matter what percentage is nature and what is caused by man? We must move with urgency and resolve away from resources so harmful to our environment such as methane.

Please look to the future. Our health of our planet and the life on it depends on the decisions made today. We can only implore you to do the right thing. And the right thing is a full, complete, honest and fair environmental study be conducted before one step further is taken on this project.

Sincerely,

I support the findings in the DSEIS. I and my family live overlooking the tide flats and observe the plume of exhaust from many of the ships coming and going out of the Port of Tacoma. Any step we can take to transition from bunker fuel to a cleaner alternative is a positive step. After living in oil/gas producing areas for many years and seeing the flaring off of gas, I feel that this resource needs to be recovered. We are producing the nat gas anyways, many times as a byproduct of oil production, better to us it in a productive manner than to flare it off.
Having had to address an abandoned tank of bunker fuel in a previous career, almost anything is cleaner and more effective than this form of hydrocarbon.
I do take exception to the fact that the DSEIS only sees the benefit of western Canada (British Columbia) gas. After vacationing in North Dakota, if only a small portion of the currently flared off gas as captured and put to work, the overall greenhouse gas levels would be a net reduction.

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

There are many sound scientific reasons to oppose permitting this Tacoma LNG system. On those alone it is a hazardous plan. The immorality of violating Puyallup Treaty rights is the essential center of the objection that I wish to state. How is it possible that the dominant culture of this nation still puts exploitation before all else? Is there still no respect for sovereignty of a nation within the larger nation? As my long gone grandma would admonish me when my moral compass was in doubt " you should be ashamed."

[04:51:08] So, next up is Kathy Lawhon.

Kathy: My name is Kathy Lawhon. I live on the Hilltop. So, I'm in the blast zone. The gentleman, some of what he said might be true, if you ignore fracking. But let's not ignore fracking because that would be incredibly selfish, would it not? Fracking is the literal rape of Mother Earth. It is a violent, disgusting, destructive, horrible thing that is done to this earth increasingly everywhere where they have these fields of shale.

[04:52:00] It's just unbelievable. They drill down to the shale, and then, they drill this way, and they drill that way, and they drill this way. And they put so much sand and water. It's so much fresh water that we can't afford. And then, they reuse some of it, if they can get enough contaminants out of it. And then, it gets so contaminated that their ponds run over. So, they inject it into the earth. And if it gets close to a fault, that's where the earthquakes come in. But it's low birth weights, it's cancer. It's the literal rape of the earth. And I don't know anything that's more Trumpian, frankly, than allowing a corporation that claims that they're local, and they are not.

They claim they are safe, and it is not, and we know it. It can't be safe sitting on fault lines in the line of lahars, in the line of tsunamis. We had a 2.9, as somebody pointed out, in Fircrest yesterday or the day before.

[04:53:03] It is insane. It is so destructive. It is so selfish, if we sit here, and we believe the lies of Puget Sound Energy. There is nothing more Trumpian than what they're doing to this town. They stole our politics. They've lied to us constantly. They spend millions on a lying PR campaign. And it's all to kill the earth. And it's all to have their way with Tacoma. And we're not having it. We are not having it. Thank you.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

• The SEIS draft analysis is incredibly flawed and unacceptable. It does not account for the full climate impacts of fracked gas.

• Methane is significantly more potent in the near-term, yet the SEIS analysis only looks at the long term impact. Methane is a significantly more potent greenhouse gas than carbon dioxide, especially in the short term.

• The 2018 report found that 85 percent of active wells are directly venting methane daily, and that those leakages have been historically underreported.

• The same report found that methane emissions in BC are 2.5 times higher than reported.

• No guarantee that all of the fracked gas would come from BC - The draft claims that all of the natural gas will be coming to the facility from British Columbia.

Subject: Puget Sound Energy air permit
Date: Wednesday, November 21, 2018 2:32:41 PM

To Whom It May Concern,

I am writing in support of Puget Sound Energy and their LNG facility in Tacoma. This is a step in the right direction for the environment as well as the maritime industry.

I work for Foss Maritime and we provide tugs and barges for transportation and ship assist services in the Puget Sound area as well as along the USWC and globally. We see the trend toward LNG and applaud it. The environmental benefits in reduction of SOx, particulate matter, nitrogen oxides and greenhouse gasses are irrefutable.

The Puget Sound is an amazing natural resource and we must do our best to maintain the environment while also supporting the local industries and communities that depend on them.

Please issue the permit without delay.

Best Regards,
Leiv Lea

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

As you know, Puget Sound Energy is trying to build a liquefied "natural" gas processing/ storage/fueling facility in the Tideflats area of Tacoma.

My family and I are strongly opposed to this project: It is sited on Puyallup Tribal lands and is being built without their consent; and--more alarming--its inevitable negative impact on the environment is especially concerning at this time of ever-increasing, alarming climate changes.

1977-1 23. General Support

From: Lisa Lefeber
To: Public Comment
Subject: Port of Everett Support
Date: Tuesday, October 30, 2018 1:32:17 AM

Similar to the Ports of Seattle and Tacoma, Everett wishes to express its support for Puget Sound Energy's liquefied natural gas facility.

The Puget Sound Clean Air Agency SEIS dated October 8 concluded the environmental advantage of replacing transportation diesel fuel with clean burning LNG. We support the agency's issuance of the necessary permit(s) for the project to proceed.

Subject: Puget Sound Energy's LNG facility
Date: Thursday, November 15, 2018 11:09:10 AM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

Fracking in an already earthquake-prone area is a recipe for disaster. If you look at the recent earthquake activity in Oklahoma, putting the Puget Sound at risk for the same is a rash decision that should result in significant liability for PSE should the same occur.

Sincerely,

Mindy Leffler
mindy_lef@hotmail.com

Carole: Thank you. So, the next group is Victoria Leistman, Rachel Hogan, Lester Pogue, Kelly O'Hanley, and Charles Barnhart. So, Victoria Leistman is first.

[02:34:00]

Victoria: Hi, Air Agency staff. Good to see you. My name is Victoria Leistman, and I'm an organizer with Sierra Club. I wanted to share a brief personal note today. Two weekends ago, I was at a cabin with a group of friends, and we decided to watch a movie. After finding nothing appealing in the comedies on Netflix, we moved to dramas and picked something we all thought sounded interesting. It wasn't until we hit play that I registered what we chose. Wind River. I'd heard of the film mostly from activists in the Missing and Murdered Indigenous Women's Movement. The movie takes place on the Wind River Indian Reservation.

It follows the story of an 18-year-old indigenous woman who is raped multiple times before running barefoot 6 miles in the snow to her death. The men who raped her were living in a man camp working at a nearby drilling rig.

[02:35:00] There aren't words for how this has stuck with me. I've cried. I've felt sick, mostly because it visualized for me a story that I know is tired and true and, unfortunately, not isolated. Mostly because I know my grief and disgust pales in comparison for people who have lived this experience. When you consider the upstream impacts of fracked gas, I know that you're examining methane impacts and the science as you 100% should. But I also want you to think about how implicated the fossil fuel industry is in the rape and pillage not only of the earth but of human beings.

From the point of extraction to the end use, fracked gas violates human rights. It is a heartbreaking, enraging environmental injustice.

[02:36:00] I wanted to turn in the first batch of thousands of comments that Sierra Club has been collecting and will continue to receive throughout the comment period. We stand with the Puyallup Tribe in opposition to this facility. There are hundreds of people here today, people who have no financial interest and no motivation other than to give you basic facts and to share with you what's written on their hearts. Please do not accept this poorly composed draft and think of Wind River and all of the individuals and communities impacted throughout the lifecycle of gas, as you make your decision. Thank you.

To whom it may concern,

The current version of the draft SEIS does not contain all the information we, the public, need to fully assess the accuracy of this study and the predicted impact of the LNG facility. There are at least 10 places in the study that have “placeholder” values instead of actual data. We request that the PSCAA complete the draft SEIS, re-issue it, and then reset the public comment period so that we may better formulate our questions about this project.

Thank you,
Hannah Lemke

[06:36:00]

Steve: Thank you. Kathryn?

Kathryn: I'm sorry. I missed the heads up.

Steve: You're Kathryn?

Catherine: Yes. My name is Kathryn Lewandowsky. And I'm from Arlington, Washington. I am the fourth generation granddaughter from an Italian, English, Irish, and Scotsman trespassers who immigrated here. They came in a mob. And they invaded this country. And 59 years ago, I was born here in Tacoma. And I grew up here. And I raised my children here. And, honestly, I always felt really bad about that because we were known as the aroma of Tacoma, which other people have mentioned. And other people told me it was just a dirty, little town.

[06:37:00] And that's kind of how I always felt that that's the town I came from. In recent years though, Tacoma made such huge advances in cleaning up. And I was so proud of what they had done. It's been amazing, the differences, especially after getting rid of Asarco. So, and I also, I'm sorry, I did want to say that I truly apologize to the people of the Puyallup Tribe. And I recognize that their authority in that they have been the caretakers of this land, and they deserve to have a say in this.

So, I did want to say that. I just want you guys to remember that the decisions you make in a board room, when you're looking at numbers, those are going to be affecting our children, my family who still lives here, our children, our grandchildren. And I urge you please not to look at the numbers.

[06:38:00] And when people say that there's only this option and that option and no other option, I really think that that's very short sighted of you. And you really need to have more faith in the ingenuity that our children are intelligent enough that we're going to figure out how to fix this. But it's obvious, to me and to most everybody, that fracking is not good. It's not good to our earth. And so, I encourage you not to approve this. Thank you.

Subject: Puget Sound Energy LNG Project
Date: Monday, October 29, 2018 6:59:16 AM

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

First of all, I want to thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. With our climate in grave peril, as emphatically stated in the latest IPCC report, your review of the greenhouse gas impacts of the natural gas used in this project couldn't be more important. Those scientists make clear that we cannot, and must not, allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.

The IPCC report states that "rapid and far-reaching" transitions are required for energy, industry, cities, transport and land use if we are to avoid the catastrophic outcomes of exceeding 1.5C degrees of global warming. This limit does not leave space for new fossil fuel infrastructure. On the contrary, we should begin decommissioning natural gas and other fossil fuel facilities.

We must prioritize ecosystem restoration to stabilize Earth's carbon and water cycles, and invest fully in renewable energy. And we need to make these changes now, not tomorrow.

Thanks again for initiating this crucially important review of this facility and I hope that you will take best available science into consideration when revising this draft SEIS.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Stop. Do not built gas facility in tacoma

1139-1 23. General Support

[00:50:00]

Carole: Thank you. Frank Leyritz?

Frank: Thank you very much for the opportunity to speak. As a lifelong resident of the Puget Sound area, I'm supporting PSE's LNG facility, at the Port of Tacoma. In my opinion, this facility will benefit all of us. 1) It will provide PSE's residential and commercial customers with natural gas reserves to ensure an adequate natural gas supply, in the event of a major emergency.

This is significant due to the recent natural gas pipeline explosion in British Columbia and the resulting pipeline shut down, which impacted the northwest region in mid-October. Utilizing local media, PSE asked customers to temporarily reduce hot water usage and lower furnace temperatures to conserve natural gas.

[00:51:05] If this rupture would have occurred in very cold weather like January or February, it would have been a major impact to our personal comfort and may have required businesses with high natural gas usage to reduce their usage or possibly suspend operations. 2) The Tacoma facility provides local transportation companies like TOTE Maritimes, Alaska cargo vessels, with a significant cleaner fuel alternative. We will have the cleanest shipping fleet on the west coast. LNG reduces the risk of cargo ships, diesel, or bunker fuel spillage in both Commencement Bay and in Puget Sound, particularly during refueling operations.

We wish for clean air and water here in the Pacific Northwest.

[00:52:02] Mr. Kendall mentioned four environmental factors that I also support. The use of LNG is forecasted to increase. The Tacoma facility will meet the needs of new LNG customers for powering buses, trucks, and hopefully, cruise ships, in the future. I see this as a chicken and egg, which comes first, issue. If there's an LNG facility, it will increase the refueling opportunities for new LNG customers. LNG is not a new technology. The LNG industry has had an exceptional safety record for over the past 50 years. PSE safely operated the LNG facility over in Gig Harbor for nearly 14.

[00:53:00] The design for the Tacoma facility has been well vetted by environmental permitting and specialists. Thank you very much.

Puget Sound Clean Air Agency,

As a long-time resident of Washington State, I carefully watch what is going on in our area to determine what is best for my family, neighbors, and community. I feel very strongly about keeping our waterways and shorelines clean and safe, our air healthy, and our public services properly funded. It is from this perspective that I express my support for the Puget Sound Clean Air Agency (PSCAA) to finalize the draft SEIS it presented on October 8, 2018 and to issue the permit(s) that Puget Sound Energy (PSE) has requested for its liquefied natural gas (LNG) facility at the Port of Tacoma.

We all pay our fair share of taxes, and an important benefit of the LNG project is that it will generate millions of dollars in tax revenue for local schools and other state and local government services. I appreciate and value seeing projects that will lead to increased tax revenues to help our local schools and public safety departments.

The LNG facility will improve our marine environment by providing a cleaner fuel alternative for vessels owned by TOTE Maritime and berthed at the Port of Tacoma. LNG reduces the risk of fuel spills over water thereby preventing damage our waterways. It will also help reduce greenhouse gas emissions and virtually eliminate visible particulate emissions produced by ships. This is a very favorable outcome for the citizens of Tacoma and the entire South Sound region, namely better air quality with accompanying reduction in health risks.

Another thing is also clear: this will be good for our local economy. I strongly support the region's efforts to create a healthy business climate for local companies who choose to do business in Tacoma. Tacoma is a working industrial marine port-based community, and both TOTE and PSE are respected, long-time area businesses here. We all benefit from both the family wage jobs they provide within the Port, and the fact that both are committed to using the best available environmental technology to remain competitive in the world economy is a boon to our entire community.

The draft SEIS, prepared by Ecology and Environment, Inc. and released by PSCAA on October 8, 2018, stated "When evaluating direct, upstream, and end use GHG emissions, replacing a diesel propulsion engine with a pure LNG propulsion engine results in reduced life-cycle GHG emissions."

I am confident in the conclusion of the draft SEIS that the project will result in a decrease in GHGs. I look forward to publication of a Final SEIS that confirms the draft's conclusions about LNG fuel benefits. I urge you to move forward and approve the PSCAA permit(s) for Tacoma LNG. This project will provide great benefits to the citizens of Tacoma, Pierce County, and Washington State for years to come.

Bill VanZanten

Corporate Office: 2380 Grandview Road, Ferndale WA 98248 Phone: (360) 366-3303 Fax: (360) 366-3304

Puget Sound Clean Air Agency,

I wish to express my support for Puget Sound Energy's (PSE) liquefied natural gas (LNG) facility. This specifically includes my concurrence with the conclusion about the environmental benefit of replacing transportation diesel fuel with clean burning LNG contained in the October 8, 2018 Draft SEIS issued by the Puget Sound Clean Air Agency (PSCAA) and my support for the agency in issuing the necessary permit(s) for the project to proceed.

The Washington Department of Ecology's State Environmental Policy Act (SEPA) regulations recognize that air quality is a part of the environment. It's hard to ignore the significant environmental and air quality benefits of replacing diesel or bunker fuel currently used by the maritime industry with LNG fuel. Switching from diesel to LNG reduces greenhouse gas emissions by nearly 15%, sulfur dioxide (SOx) emissions by over 99% percent, and nitrogen oxide (NOx) emissions by nearly 85% while eliminating visible particulate matter (PM) produced by ships by more than 85%. It is these particulate emissions that are extremely harmful to the lung health of anyone breathing them in.

It is also important to note that LNG powered ships will substantially exceed the North American Emission Control Area requirements established by the International Marine Organization's (IMO). The IMO regulations have required a reduction in the fuel sulfur content from 3.5 percent to 0.5 percent. Both US EPA and the Coast Guard are enforcing these fuel regulations which have been estimated by EPA to reduce mortality by as much as 30,000 people per year. TOTE has made the commitment to use LNG fuel, which provides substantially greater benefits than even the IMO regulations mandate.

Another important environmental advantage of LNG as fuel is that in the unlikely event of a spill, LNG turns into vapor and dissipates with no lasting effects on water or marine life.

The LNG facility will also generate important economic benefits for all South Sound residents. In addition to helping local employers like TOTE remain competitive, it will create at least 250 construction jobs and over 300 indirect jobs due to the construction. After the construction, the economic activity from the project will create another 125 permanent jobs.

The draft SEIS, prepared by Ecology and Environment, Inc. and released by PSCAA on October 8, 2018, stated "When evaluating direct, upstream, and end use GHG emissions, replacing a diesel propulsion engine with a pure LNG propulsion engine results in reduced life-cycle GHG emissions."

Since the draft SEIS independently prepared for and published by PSCAA has confirmed the environmental benefits and overall reduction in GHG emissions from use of LNG as a replacement for diesel, I fully support PSCAA promptly finalizing its October 8, 2018 draft SEIS and granting the necessary permit(s) so the LNG facility can be completed as soon as possible.

Thanks for the opportunity to express opinions in this matter.

Sincerely,

Bill VanZanten
CEO/Owner

Subject: Comment for PSE's LNG Hearing at Puget Sound Clean Air Agency
Date: Thursday, November 1, 2018 2:17:20 PM

I'm glad that the Agency works everyday to PROTECT public health, IMPROVE neighborhood air quality, and ***REDUCE our region's contribution to climate change***.

In part, because the Department of Ecology for Washington State has some *pretty* impressive GHG emission reduction goals, including to:

- Reduce overall GHG emissions to 1990 levels by 2020 – **that's *ONLY 2 years away***.
- Then to reduce overall GHG emissions to *25 percent below* 1990 levels by 2035.
- And, finally to reduce emissions to *50 percent below* 1990 levels by 2050.

How are we going to meet these goals if we continue to build fossil fuel infrastructure INSTEAD of transitioning to renewable energy? ***We're not.***

The Draft (SEIS) states that it focuses *exclusively* on the lifecycle of GHG emissions. And, that the approval of PSE's LNG Facility is DEPENDANT on British Columbia being the SOLE source of its natural gas supply. How can British Columbia be considered better than anything else when a pipeline exploded near Prince George, British Columbia earlier this month? It released UNTOLD amounts of methane and other Green House Gases into the air.

Please DENY the final Order of Approval for PSE's LNG Facility in Tacoma. To *truly* reduce GHG emissions we need *our* energy companies to transition *entirely* off of fossil fuels. There is no other way for Washington State to meet its GHG emission reduction targets.

Thank you.

Jane Lindley
Climate Action Bainbridge member

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Please revisit the environmental impact statement. It is pretty obviously biased. Tacoma does not need a huge polluting gas plant. It makes no sense to invest in fossil fuel infrastructure when we all know we need to leave it in the ground or face a world we won't recognize. The climate situation is very bad and, fairy tales aside, we must respond.

Subject: Tacoma LNG SEIS Project Comment
Date: Tuesday, November 6, 2018 6:51:08 PM

Dear Responsible Official,

I presume the fracked LNG is being piped from wells in British Columbia, which is extremely dangerous, considering that another subduction earthquake could rip through the area at any time, not to mention earthquakes from other faults. Plus there is the risk of a Mt. Rainier eruption and subsequent lahars flowing down rivers emptying into Tacoma Harbor.

But most importantly, we must phase out fossil fuel production and exports because of the greenhouse gases they produce, resulting in runaway global warming and eventual catastrophic loss of life worldwide.

Puget Sound Energy and Tote Marine seem to imagine that a clean energy future can be arrived at by digging the fossil fuel hole deeper. This proposed LNG project is another step toward climate chaos at a moment when the IPCC has given us a clear warning that we must urgently move away from fossil fuels.

Fracked gas is not a lesser evil. Scientists' understanding of methane's impact on the climate continues to evolve, and at every step along the way we learn that fracking allows more methane escapement than we had previously observed and that the impact of methane on the climate, particularly in the short term, is even more serious than had been previously understood.

I applaud your decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct this more rigorous analysis. Thank you.

I urge you to revise the analysis to account for the following:

1. Methane should be counted as 86 times more potent than CO2 based on the current IPCC analysis (AR5 rather than AR4) considering a 20 year timeframe (rather than the 100-year).

2. Revise the analysis of the impacts of fracking in British Columbia based on recent research(1) demonstrating that methane escapement has been dramatically under-estimated.

3. Revise the "no-action alternative" to include a clean energy alternative in which PSE provides electricity not with a different source of fracked gas, but with renewable energy and energy efficiency.

4. Revise the "no-action alternative" to include the assumption that Tote Marine will achieve a 50% GHG reduction, in line with the International Maritime Agency's established goals. This reduction might alternatively be achieved by a combination of fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion or many other alternatives besides fracked LNG.(2) For clean local emissions requirements, Tote Marine can achieve virtually all of the localized lower-particulate and lower SOx and NOx benefits claimed for LNG propulsion by opting for low-sulfur marine gas oil over heavy fuel oil, and installing selective catalytic reducers and diesel particulate filters.(3)

5. This more accurate analysis will show that the project has a significant and unmitigated impact on the global climate, which
should be seen as a sufficient basis for denial of the Notice of Construction application.

Thank you for your time and consideration of these comments.

Oc t. 21, 2018

Dear committee member,

I live on the Key Peninsula, which is 17 miles from the Port of Tacoma as the crow flies. I have three basic concerns about the development of the LNG project there. First: the chemicals that will be released into the air as a result of the LNG process will be harmful to the people living in Tacoma. Second: The danger of explosions to the nearby people and businesses is horrific. Third: The fact that this will be a bunkering facility implies that fracked LNG will be sold for export. We must not develop new markets for fracked fossil fuels, but rather conserve and change to new technologies.

I see that our ship of state, with the corporate controlled federal government at the helm, is not leading the way to a sustainable future. With the unsustainable options looming before us, we must paddle our way as best we can to turn our behemoth country away from fossil fuels and toward a future for our children and grandchildren.

Thank you for your attention to this.

Lynn Lloyd

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

If we're creating new infrastructure for energy creation, it needs to be coming from renewables and it needs to be coming yesterday. Twelve years is not a lot of time to get our proverbial ducks in a row when it comes to climate change. I urge you to do the right thing for the environment and public health. Say no to the LNG Refinery.

Subject: Puget Sound Energy's LNG facility
Date: Thursday, November 15, 2018 10:10:13 AM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

As an environmental educator, it is crystal clear that we need to burn less fossil fuels, not more, regardless of the type. Fracked gas destroys and pollutes our water table, releases enormous amounts of methane, and is a major factor in climate change. We must stop stealing the future from our children.

Sincerely,

Dan Lombardo

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Please disapprove this gas project. We cannot afford the impact on our atmosphere. Pumping more co2 in the air must stop now. People are burning alive from forest fires caused by global warming. Doughts are everywhere. Our NW climate is suffering with record low rainfall and record high temperature s.

Subject: Tacoma LNG Plant
Date: Wednesday, November 21, 2018 1:47:27 PM

I am opposed to building the proposed LNG Facility in Tacoma, or anywhere in the Puget Sound. The great challenge of our lives is addressing climate change. Any increase in emissions in our area is a step backwards in that fight.

There is no need for LNG. PSE claims that the fuel will be used to meet high demand for natural gas, but it would be preferable for customers to reduce their usage or identify alternative, cleaner fuel options (e.g., solar). Every home using natural gas for heat also has electricity, and electric heating may be used as a supplement should any shortage of gas occur.

TOTE Marine is also identified as a potential user of LNG, but there are better options for marine fuels as well. The Washington State Ferries are moving to electric power as a cleaner alternative to current fuels. That means that electric power for large ships will be available in our area, and there will be local expertise for installing and maintaining equipment. In addition, TOTE recently pushed back (by some years) the date by which it expects to convert over to LNG-powered ships, and this rollback raises the question of whether they aren't exploring options other than LNG.

In addition, given the location of the Northwest Detention Center (close by on the Tideflats and housing more than 1500 detainees), the emissions associated with this facility become of particular concern.

Given recent reports about the imminent impacts of warming and climate change, it would be irresponsible to approve any increase in emissions in the Puget Sound region unless there is a compelling need. There is no compelling need for LNG

I urge you to deny the air quality permit.

Subject: Stop LNG plant
Date: Tuesday, November 20, 2018 11:59:51 AM

I'm shocked you would even think of going ahead with this project.
Don't waste taxpayer money on technology that will be shut down before it is completed.
Use our taxes and future taxes on cheaper, clean energy

Global warming is real and we have to invest in solar, wind, tidal sources.

This LNG plant will only worsen global warming

Thank you Susan Lord

Steve: Thank you. Shirley Low?

[05:43:00]

Shirley: Hi. Thank you for being here this evening and providing this opportunity for me to comment. I'm Shirley Low and a resident of Tacoma for 25 years. I'm here to give comment as a stakeholder. A stakeholder in the air that we breathe, in the waters that flow in our community, in the land on which we walk. I'm also a stakeholder, the same as my fellow community members, who deserve a seat at the table equal to the seat Puget Sound Energy and other corporations enjoy.

The executive summary of the draft SEIS states that it informs the public and decision makers of the proposed actions' potential impacts related to the emissions of greenhouse gas emissions. However, the draft SEIS does not take into account the full lifecycle of the GHG emissions for LNG.

[05:44:02] It does not use the latest available science, excuse me, the best available science in its analysis and conclusion. It uses old 2007 IPCC data, instead of using 2016 data. That makes a big difference in the outcome of how this report has concluded. There are also several other areas where the draft is incomplete or based on inappropriate or flawed assumptions. The draft, for instance, assumes all of the fracked gas for this project will be sourced from British Columbia. It is unrealistic to deem that is the only source for the next 25 or 50 years. And that's really what this is looking at.

To use a football analogy, there's no forward movement on an incomplete pass.

[05:45:00] The ball is returned to a starting point. Likewise, the draft SEIS and the LNG project should not move forward. The draft SEIS should be returned to its starting point using the best available science and reissue a complete draft, without flawed assumptions and then, another public comment period. I have several other points that I will submit in detail in writing. So, I will wrap up and just say sometimes, interim steps to a so-called better solution changes the packaging, while the basic ingredients remain the same. LNG is a fossil fuel with GHG emissions dressed in a green wrapper. It is not a step in the right direction. Thank you very much.

Subject: Tacoma LNG SEIS
Date: Wednesday, November 21, 2018 11:11:20 PM

Puget Sound Clean Air,

Thank you for providing the opportunity to review and comment on the PSE Tacoma LNG SEIS.

I am a Tacoma resident concerned about climate change and our contributions to global warming. Part of what makes Tacoma so special is its story of moving from a legacy of pollution to a community that can take pride in its industry and environment.

After reading the SEIS, it appears to use old information, and it's missing data. The SEIS should be using the latest IPCC numbers when determining the global warming potential of greenhouse gases. It should also use the 20-year numbers instead of the 100-year, since this plant will only be operational for 40, and we'll see big impacts from the very beginning. When the 20-year GWP from the 2013 IPCC report is used, it shows that emissions from the LNG facility are actually 30-31% worse than the No Action alternative.

The SEIS is also missing really important information, like the carbon content of the gas to be used. This data is needed for a complete study, and until it's there, this SEIS is incomplete.

How will PSCAA ensure that the methane gas comes from BC? The SEIS should also analyze the very likely scenario in which PSE will have to get its methane gas from the Unites States network.

Finally, the SEIS doesn't include smaller sources of emissions, like those from tearing the plant down. These smaller sources of emissions could add up to a big impact, and should be included in the analysis.

Because of these conclusions, I am opposed to the PSE Tacoma LNG project. Please update the SEIS, reissue it when it is complete and credible, and then re-open the comment period.

Subject: Comment on PSE LNG facility in Tacoma
Date: Wednesday, November 21, 2018 11:19:11 AM

1 - Methane leaks create health and environmental risks that are too high. Several recent articles in newspapers and magazines report that methane leaks happen, e.g., Washington Post reported on the 112 day long leak at the Aliso Canyon facility that released about 5 billion feet of methane into the air, making it the second largest leak on record, equivalent to the annual exhaust emissions from about 600,000 cars.

Methane also leaks during the production, delivery, and use of natural gas. There are reports that methane leaks exceed the projected 4% and in places go up to 11% and more. Those in the industry know that methane is up to 25 times more potent than CO2 as a greenhouse gas, even though it dissipates more quickly than CO2. We cannot trust PSE when they say that their pipeline leaks only 1%.

An independent evaluation of the methane leakage needs to be done on the PSE pipeline. PSE was also responsible for the pipeline that exploded in Seattle several years ago, indicating that PSE's maintenance of the pipeline is inadequate.

Because of these leaks, the LNG facility along with the procurement of methane from Canada may negate much of the greenhouse gas benefits we think we're getting when we use natural gas instead of other fuels.

2 - Going after another non-renewable energy source keeps money and effort from going toward the development of renewable energy sources such as wind and solar. PSE has to know that the production of fracked gas creates more air pollution than burning the gas saves. It doesn't matter that the fracking is done in British Columbia – we all breath the same air and have to deal with the side-effects. Using fracked gas is an example of PSE going after a short-term goal rather than investing in long term renewable resources.

3 – The south Puget Sound region is fighting an exponential increase of airline toxins, particularly those of jet fuel from the expansion of Sea-Tac operations. Studies are published every few weeks that toxins released from the burning of jet fuel are harmful to residents. There is strong opposition to the Sea-Tac operations and the negative effect on the public, and the addition of the pollution from the LNG plant adds to that pollution. It does not matter that Sea-Tac is in King County and the LNG plant is in Pierce County. Residents in the area breath the same air and are exposed to the same air pollution. It would be unfortunate for PSE to change only when there are law suits or legislation requiring change. The legacy of PSE will be the same as that of other companies that look at only immediate gains and do not take into account the long-term health effects of their actions. PSE will then become associated with tobacco companies (increasing lung cancer rates), asbestos companies (increasing mesothelioma), and Monsanto (with agent orange creating far reaching environmental and human health problems).

Subject: Please deny the permit for the Tacoma fracked gas plant
Date: Monday, November 12, 2018 8:19:03 PM

Hello Puget Sound Clean Air Agency,
I'm writing today to ask that you do not grant the required permits to complete construction on the liquified natural gas plant on Puyallup land. For one thing, the current version of the draft SEIS does not contain all the information we, the public, need to fully assess the accuracy of this study and the predicted impact of the LNG facility. There are at least 10 places in the study that have “placeholder” values instead of actual data. We request that the PSCAA complete the draft SEIS, re-issue it, and then reset the public comment period so that we may better formulate our questions about this project.
It is vital that this process is carried out with all of the required information for the public and the PSCAA to make the most informed decisions, and if the company has not done it's due diligence to have the information required to submit a completed report, than they should not be granted the permit they want.
All the best,
Johanna Lundahl

Subject: Please deny the permit to finish building the liquified natural gas plant in Tacoma
Date: Monday, November 12, 2018 8:11:39 PM

I write today to respectfully ask that the LNG plant in Tacoma not be allowed to complete construction on the grounds that the data used in the report to calculate methane's impact on global warming was out of date. According to the recent IPCC report on climate change, Methane has a much higher impact on global warming than previously thought, and that makes the environmental impact of this plant, much greater. If you use the most recent 2016 data on the global warming potential of methane, you must acknowledge that methane is 32 times more potent than carbon dioxide, and that makes the use of it dirtier than the dirtiest fossil fuels. Please use accurate data in your reporting, and acknowledge it's true meaning.
Sincerely,
Johanna Lundahl

Remarks – Puget Sound Clean Energy Agency Hearing, Oct. 30, 2018

Hello. I am a resident of Tacoma, and my professional training is in textual analysis. I have reviewed your Supplemental Impact Statement and found your packaging of the data and your conclusions to be seriously misleading. I ask that you revisit the report to account for the full climate impacts of housing a greenhouse-gas producing LNG facility within a mile of a city center, residential areas, and one of the largest immigrant detention centers in the U.S.

You report that replacing "other fuels with LNG" at the Port of Tacoma would result over time in "greater...overall reductions in [greenhouse gas] emissions," but you do not take into account the full impacts of fracked gas on the climate and the residents of the communities directly and indirectly impacted by the devastating practices of extraction and export of methane gas. Many of these impacts are well documented: "fracking" has become synonymous with cancer, earthquakes, and pipeline ruptures. Others are less well known but horribly real, like the connection between pipeline construction and violence against indigenous women and girls.

Your report allows for the fact that the operation of an LNG facility would cause emissions: construction, operational, and downstream, and so many subcategories of emission that you include a glossary of abbreviations for them. Yet you claim that replacing "other fuels with LNG" would result over time in "greater...overall reductions in [greenhouse gas] emissions." Tell me: what of the transport, cooling, warehousing, and transfer of LNG? With paragraphs of contextual information and pages of tables and graphs, your report obscures the fact that you do not consider the near-term effects of methane in our air, or the high rates of leakage in U.S. and Canadian gas systems. Just last week the B.C. pipeline on which you base your outcomes *burst*, causing a national gas shortage.

0446-1 3. Outside of SEIS Scope
0446-2 13. LCA Inputs and Assumptions - Natural Gas Source
0446-3 14. LCA Inputs and Assumptions - Leakage/Slippage

I ask you to consider what will happen to our air, not in some distant, imagined future in which all ships, trucks, and cars are fueled by fracked gas—a future that your report envisions but that is not consistent with *the fossil-fuel-free* future that our lives depend on. I ask you to think about five years from now or twenty years from now, when the LNG facility in Tacoma has been churning out methane, which turns into CO2, poisoning the air that we and our children breathe and exacerbating climate change.

Most of us are here because we love Tacoma. The Puyallup people have been here, as they say, for time immemorial. They are not leaving. We are not leaving. Do you know who needs to leave? PSE and their ill-conceived, greed-driven, fundamentally unsafe LNG facility. Your report must engage with real science on this issue and refuse to obfuscate the results.

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Fracked gas is not the energy of the future. Why put all this time, energy, and money into something that is going to be obsolete in the near future. Spend your money on renewables, not fossil fuels!

Carole: Thank you. Lloyd Madden?

Lloyd: Hi. First off, thanks a lot for listening. I know you guys have an incredibly difficult decision ahead of you. So, my goal is simply to provide a perspective that will enable you to make a better decision. I come to you as a citizen. I don't have the power that you have. You will be making a decision. You have been granted that power. And I have something in front of me that talks about the walk the talk, be good and wise towards the resources given to you, defend the future, prevent reduced risks. So, very important things for the entire world that are entrusted to you. I'm going to try to remember some of this. So, big decision. Change is hard. Change is very hard.

You've heard a lot of information back and forth. And my head is swimming.

[02:55:00] My talk is very different now, based on all of the information. So, what you're actually going to do, I think there's a lot of momentum towards approving this. Things are being built. There's probably a lot of money going towards saying this is a good idea. You've also heard a lot of people very passionately saying, hey, we're nervous about this. So, this potentially represents a big change. Do you guys have it in you to make the decision to not approve this? Does this, all of a sudden, mean that this port is no longer competitive? Potentially. Is the science wrong? Potentially. What are the alternatives we're dealing with?

Lisa made a very good point up there of saying it's a step in the right direction. The question is is the step big enough? How much time do we actually have? We don't know that. So, let's look at the alternatives. What if the science that a lot of people are saying here is wrong, and we have more time?

[02:56:00] Well, then, we're going to clean things up a little sooner than we needed to. But what if it's right, and you have to make the decision? So, what if you make the decision to go forward with this, and the science is right, and it's a big problem? So, I'll leave you on the note of people are willing to incur the pain of saying this is not a big enough step. I'm making all kinds of changes. Other people are making changes. The power of an idea that's time is right is very impressive. You make this stand, the world will notice, and you will be rewarded for that. Thanks a lot.

Subject: LNG Plant in Tacoma
Date: Tuesday, October 30, 2018 6:07:51 PM

I would like to add my comment and my opinion for consideration during the up coming public information period. Iam not a member of any political action committee, Iam a pierce county resident and concerned about climate change.

After researching LNG plants and the need to reduce green house gasses I have come to the opinion that the construction of the LNG plant should proceed. The amount of co2 released by commercial cargo ships makes them the 6th largest emitter of this green house gas in the world. Shipping companies want to convert to LNG but they must be able to refuel. The future of the Port of Tacoma which is a regional asset must be considered. Although natural gas is a fossil fuel it is far less polluting than the bunker oil now used, If the port authority and the Tacoma council do not build this facility the future of the port as a viable working port is in doubt as as is the revenue and jobs the port creates.

I don’t have a T shirt with a slogan but I appreciate the opportunity to be heard, thank you

I am a PSE customer in Olympia and Vashon. (2 accts.)

I oppose the LNG terminal. I worked on LNG permitting ~~for~~ related to a terminal in southern Calif. in the late 1970s. It was ultimately not permitted. A few years ago I threw away all my files and information on the topic because I was confident no one would be so foolhardy as to propose another LNG terminal in the current economic and environmental climate. Certainly not in a location prone to earthquakes and significant sea rise.

The LNG terminal should not be permitted. Its impact

on the air and resultant increased temperatures would be devastating to Western Washington and beyond.

The terminal operations pose a grave risk to workers and the community, and the consequences of explosion and leaks need to be part of the Clean Air Agency's decision making & analysis. As does the air impacts from fracking to ship.

PSE has already demonstrated its bad faith by beginning construction without the required permitting and without resolving its dispute with the tribe. There is no reason to believe they will adhere to any protective regulations.

Although this is likely not anything the Clean Air Agency can consider, I am outraged that I as a ratepayer have to pay for a foreign corporation's (PSE's) project to enrich its investors and partners at the expense of my health, safety, and environment. As well as the realestate value of my home on Vashon.

2062-1 12. LCA Inputs and Assumptions - Global Warming Potential Value

Dear Port of Kalama, and Cowlitz County,

Dear Puget Sound Clean Air Agency,

I am extremely concerned about how fracking gas can increase climate change.

When methane is leaked directly into the atmosphere, it is 36 times more powerful at trapping heat than carbon dioxide when its impact is averaged over a 100-year period.

Over a 20-year period, methane's heat-trapping impact is 87 times more powerful than that of carbon dioxide.

Climate change is not being debated here. We accept that Washington state is already impacted by climate change.

Considering the above information regarding methane, please reject both the Tacoma LNG facility and Methanol refinery proposals.

Please include this impact in the Final Supplemental Environmental Impact Statement.

2064-1 3. Outside of SEIS Scope

Dear Port of Kalama, and Cowlitz County,
Dear Puget Sound Clean Air Agency,

I am concerned about the health and safety impacts of fracking which includes, but is not limited to the following:

- Contaminated groundwater from fracking
- Earthquakes from fracking
- Explosions due to leaking pipelines and storage facilities
- Nitrogen oxides and other air pollutants from smokestacks at end-use facilities
- Upstream emissions of traditional air pollutants, such as smog- and soot-forming volatile organic compounds and air toxins such as benzene, a known carcinogen

Please include this impact in the Final Supplemental Environmental Impact Statement.

ATTN: Public Comment on DSEIS,

PSE LNG Project,

1904 Third Ave, Suite 105

Seattle, WA 98101

November 18, 2018

To PSCAA:

My name is Roger Martin. I am a retired Air Force combat pilot. Subsequent to that retirement, I worked as a training developer and instructor for the B-2 stealth bomber's initial cadre of pilots, then a systems engineer for military systems, and then a manager specializing in proposals for major defense contracts. I hold a BA in Biology and Oceanography from San Jose State College and an MS in Systems Management from the University of Southern California. I am currently the coordinator for my church's Greening Activity Group at United Church in University Place.

I am strongly opposed to acceptance of the 2018 Supplemental Environmental Impact Statement (SEIS) for, and to the installation of, the LNG facility proposed for the Tacoma Tide Flats. This is for several reasons.

1. First, the location.

   We have learned that this construction location is in a) a known earthquake-fault area; b) a tsunami hazard zone; c) on land fill; and d) adjacent to Native American tribal land. For an installation that is to contain pressurized flammable gases, mixed with toxic, volatile organic compounds, in an installation that will reportedly stand 16 stories tall that is near highly populated urban areas, and be an installation and within a few miles of the West Coast's primary north-south roadway is pretty-near insane. In my lifetime, I have observed from a distance, and among other events related to manmade facilities (not in order): a) the Three Mile Island nuclear meltdown; b) the Chernobyl nuclear meltdown; c) the Exxon Valdez grounding and oil spill; d) the Deep Water Horizon explosion and oil spill; e) the Fukushima Daiichi earthquake and tsunami nuclear disaster; f) numerous railcar de-railings, chemical and petroleum leaks, fires, and explosions; g) the Shell Oil Kulluk floating oil-rig disaster (twice in one trip!) between Alaska and Washington State; h) leaks of natural-gas storage facilities (most notably Porter

Ranch in Southern California); i) numerous leaks along existing oil pipelines, including the Keystone XL and feeder pipelines; and j) one I will recount in more detail here, based on my eyewitness observation.

I was married in a full military wedding on February 2, 1969 in Santa Clara, California. Not having a lot of money, we decided to honeymoon on the beach in Southern California, complete with a drive in our two-seat, red, British TR-4 convertible, along California Highway 1. Our first night of the trip was going to be in Carmel by the Sea. Our second night was going to be in Santa Barbara, where we had dinner reservations at the end of the pier. So, on February 4, 1969, we went to that restaurant and saw oil-soaked pelicans and seagulls bobbing around in the water under the restaurant--from the Santa Barbara oil spill. 'Heck of a honeymoon, but a real lesson for a freshly graduated biology/oceanography major and newly commissioned military officer.

Although I am likely to come back to some of these issues later, I wanted to lay down some markers here. I will proceed to other matters below before coming back to detailed reflection. The big point here is that in every case, when these projects and facilities were proposed, each was going to be using the latest, greatest, most-foolproof-possible safety measures to prevent any possible accident that could ever occur, and that if one ever did occur (which we are told simply *can't* happen), it would be resolved quickly and without any damage or loss of life, because we had thought of everything and prepared for every contingency, and the government would make sure every rule and promise would be followed and kept.

2. Indian treaties

- (Quoted from the *Advisory Council on Historic Preservation Handbook* [ACHP]:) "The National Historic Preservation Act (NHPA), (16 U.S.C. Section 470f) Section 106, requires federal agencies to take into account the effects of their undertakings on historic properties and provide the Advisory Council on Historic Preservation (ACHP) a reasonable opportunity to comment on those undertakings. communication that may include written correspondence, meetings, telephone conferences, site visits, and e-mails." And, "Consultation constitutes more than simply notifying an Indian tribe about a planned undertaking."
- In addition, the Environmental Review Toolkit, published by the Federal Government, says, "The National Environmental Policy Act of 1969 (NEPA) requires the preparation of an environmental impact statement (EIS) for any proposed major Federal action that may significantly affect the quality of the human environment. The statutory language of NEPA does not mention Indian tribes. However, the Council on Environmental Quality regulations do require agencies to contact Indian tribes and provide them with opportunities to participate in various stages of preparation of an EIS."

- According to several speakers at the recent Tacoma public hearings on the proposed SEIS for the LNG facility, these consultation requirements have not even been minimally met.

3. Data are not current or accurate

   As was reported by numerous speakers at the Tacoma SEIS public hearings, the original, proposed EIS had incomplete and inaccurate data for computations used to support the Study's findings. The data in the former EIS relied heavily on information that had been available in 2007. "Placeholder" data were used in that study, based either on best-available values from studies up to that time, or estimates based on best guesses. More-accurate data were understood to be inserted as time went on and real studies were done with ever-improving and -widening information became available from better equipment and additional sampling and trend analysis. Reportedly, such data became updated in 2009, and later in 2013. Fortunately, there was an additional full IPCC report very close to submittal of this SEIS. And, although available, none of the latest data were used in the proposed SEIS. Indeed, many of the original best-guess placeholders from 2007 are still in the new document, even though new, and real, data are available.

   The Tacoma SEIS public hearings provided clear and consistent insight into how inclusion of best current data would affect the findings of the proposed SEIS. Environmental impact and possible damage from gas leakage and accidents are grossly underestimated in the current study, based on the outdated information contained in there. One witness—a college teacher (he claimed)—stated that greenhouse-gas leakage, by his quick calculations using new, accurate numbers, were roughly 2.5 times as great as those presented in the proposed SEIS.

I would like to get back to some of my earlier reflections. Specifically, I'd like to get back to some of the nuclear-plant lessons. At least, three nuclear power plants were somehow built right next to the open ocean: Diablo Canyon and San Onofre in California, and Fukushima Daiichi in Japan. At that time, several people who studied oceanography (I was an oceanography student back then) had already warned that predicted greenhouse gases would raise the sea level. But they built these plants there anyway. Brilliant, eh? The movie *The China Syndrome* was, fascinatingly, shot largely at Diablo Canyon. This was not one of the plants that did melt down. One of those that did was in Ukraine (then part of the Soviet Union), and the other was in the middle of a river in Pennsylvania.

The worst nuclear-plant disaster can be disputed as either Chernobyl or Fukushima. Again, promises were made that the safety designs were impeccable. At Fukushima, nothing could happen that could not be overcome by the wonderful safety standards that

Japan had put into place. (Apparently, nobody noticed the big ocean outside, even after all the movie monsters that had come out of it going back decades before.) People were allowed to build residences and businesses ever closer to the reactor as time went on—after all, what could happen? Other nuclear plants had been around, and hadn't blown up or been overwhelmed by a tsunami. So, why should this one? And it had been built to handle earthquakes, anyway, right? And *to government safety standards! Right?*

Then, the earthquake and the tsunami hit in 2011. In that accident, there were three nuclear meltdowns, multiple hydrogen explosions, and an estimated 1600 deaths, from a "safe" nuclear plant, because somebody had studied all the possibilities and nothing could happen that existing designs and safety procedures couldn't handle.

San Onofre was the first of the two, aforementioned US coastal plants identified for decommissioning. For a while, talk was that they could re-start it after an attempt to repair and replace parts that wore out before their initial studies had said they would (What? Overoptimistic estimates?). They also looked at what happened at Fukushima two years earlier, and perhaps started to notice that the sea-level rise predicted when they originally designed the plant was a bit underestimated (Gee, do you think so?). So, in 2013, they shut it down, never to be opened again.

Now, folks have decided it might be smart to pull the plug on Diablo Canyon too. There seems to be a trend here: Building facilities with stuff that can blow up and also contaminate a populated an area near where there are earthquakes and possible tsunamis might not be the indication of high intelligence.

So, for building on fill: San Francisco has some experience with that. In 1906, they had an earthquake. After the quake, they decided to use rubble from the earthquake and some dredging from the Bay to build a location for the Panama-Pacific International Exhibition, which then became the Marina District. In 1989, the Loma Prieta Earthquake hit at the very summit of Highway 17 between San Jose and Santa Cruz, and the land fill in the San Francisco Marina District liquified from the vibrations. In addition to water mains breaking, natural-gas (hmmm) lines broke, and fires broke out. Because of the broken water lines, water from the Bay had to be used to extinguish the fires. Land fill and gas lines have a history of being a bad idea then, don't they?

In San Francisco, there are two other buildings that were subsequently built on land fill. They are the Millennium Tower luxury high-rise, and the new bus terminal, built closely to each other. The Tower is sinking and has been discussed on several TV shows, including *60 Minutes*, and the other is the new bus terminal, which has shown structural cracking before it has even opened for regular business. How much is that all going to cost to make safe…or not? Furthermore, the entire area known as Foster City, just south of San Francisco International Airport, is sinking, at the same time the sea level is rising.

Foster City was built on land fill. And PSE (an Australian company, by the way) thinks it is just fine to build a 16-story-tall container of explosive and toxic gas onto land fill in an earthquake and tsunami zone. Brilliant!

As somebody who was college-trained as a scientist, flew in combat, authored training and technical publications both at the Air Force's Headquarters Strategic Air Command, and later, for the most-expensive combat airplane ever built, and in the defense industry was the principal manager responsible for the Technical Volumes of several DoD multi-million-dollar contract proposals, I am absolutely appalled at what was presented in this official government SEIS. It clearly needs to be re-written using current, accurate, and complete data, and with actual consultation with Indian tribes.

Disregard for federal law in consulting with native tribes, *knowingly* using outdated and misleading data on which to base conclusions that can result in disasters similar to what we have witnessed in documented events ranging from the Santa Barbara oil spill up until the immediately recent fires caused by faulty power lines in California, accepting this widely disproven SEIS would be insane, and hopefully prosecutable as a crime of fraud for which anybody who signs off on this currently proposed SEIS would be culpable.

Sincerely,

Roger T. Mart

Subject: Tacoma LNG SEIS Project Comment
Date: Sunday, October 21, 2018 3:04:28 PM

Dear Responsible Official,

I strongly oppose the LNG project proposed by Puget Sound Energy and Tote Marine.

Such a project only digs our west coast deeper into the fossil fuel pathway, which we need to replace with clean energy sources. Instead we need to urgently move away from fossil fuels.

Fracked gas is not a lesser evil. I understand that methane's impact on the climate continues to evolve- fracking allows more methane escapement than we had previously knew. The impact of methane on the climate, particularly in the short term, is even more serious than had been previously understood. You must take this fact into your decision about this project.

I applaud your decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct this more rigorous analysis. Thank you.

I join others urging you to revise the analysis to account for the following:

1. Methane should be counted as 86 times more potent than CO2 based on the current IPCC analysis (AR5 rather than AR4) considering a 20 year timeframe (rather than the 100-year).

2. Revise the analysis of the impacts of fracking in British Columbia based on recent research(1) demonstrating that methane escapement has been dramatically under-estimated.

3. Revise the "no-action alternative" to include a clean energy alternative in which PSE provides electricity not with a different source of fracked gas, but with renewable energy and energy efficiency.

4. Revise the "no-action alternative" to include the assumption that Tote Marine will achieve a 50% GHG reduction, in line with the International Maritime Agency's established goals. This reduction might alternatively be achieved by a combination of fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion or many other alternatives besides fracked LNG.(2) For clean local emissions requirements, Tote Marine can achieve virtually all of the localized lower-particulate and lower SOx and NOx benefits claimed for LNG propulsion by opting for low-sulfur marine gas oil over heavy fuel oil, and installing selective catalytic reducers and diesel particulate filters.(3)

5. This more accurate analysis will show that the project has a significant and unmitigated impact on the global climate, which
should be seen as a sufficient basis for denial of the Notice of Construction application.

Thank you for your time and consideration of these comments.

To Whom it may concern:

I am writing to you today as a resident of Tacoma and as President of Patriot Fire Protection. Speaking for 250 of our employees here in the Northwest, we have been installing quality fire protection systems for Northwest facilities for over 25 years. Our work includes significant amounts of installed fire sprinklers and other types of similar suppression systems in over 300 million square feet of facilities throughout the region.

Patriot Fire Protection considers itself a leader in our industry, we understand and protect against varied hazards, whether storing highly combustible materials in a warehouse, fire control in a 50 story Hi-rise in Seattle, or Special Hazard protection for unique manufacturing facilities. I have watched Puget Sound Energy's attempt to build a Liquified Natural Gas (LNG) facility and TOTE Maritime's innovative and environmentally friendly initiative to convert its Alaska bound ORCA class vessels to LNG very closely after the last year. Fire Protection is not an unresolved concern.

From a Fire Safety standpoint, The National Fire Protection Association has written Standard 59A. The specific standard was written for the sole purpose of providing fire safety for "The Production, Storage, and Handling of Liquefied Natural Gas". The Origin of 59A goes back to a technical committee dealing with the risks associated with LNG, they first met in 1960. The standard has been updated over a dozen times in the last 50 years and has now been adopted into the National Fire Codes. By comparison, NFPA Standard 70 is our National Electric Code. I would urge the Puget Sound Air Agency to follow the extensive data, analysis, and engineering that has been completed. The City of Tacoma has completed an Environmental Impact Statement that includes all extensive analysis of the safety of the LNG facility. In addition, the City of Tacoma Fire Department commissioned an additional independent safety review of the facility done by Braemar, a widely respected safety firm that further evaluated the design, siting, and overall safety of the facility. The analysis concludes: "The technical review of Tacoma's LNG fire and safety systems did not reveal any fatal flaws or visible design deficiencies. Tacoma LNG

PATRIOT FIRE PROTECTION, INC.
Fire Sprinklers Save Lives!
2707 70TH Avenue East
Tacoma, WA 98424
TEL: (253) 926 2290
FAX: (253) 922 6150

was designed to applicable codes and standards with significant attention to detail, a perceived objective of becoming a best in class LNG Facility." Put simply, this facility is being built to the highest standards in the industry with State-of-the-art safety standards.

As a fire protection professional, it is important that we take every step to ensure the safety of the facility, but it is irresponsible to ignore data, science, engineering, and simply "shout out" false assumptions on the safety of the facility. In our day to day lives, there is nothing we do that is risk free. However, I praise the City of Tacoma for going the extra mile to seek an independent review to address safety issues of the LNG facility. Now it is time to follow the data and issue all the permits necessary to get the LNG facility operational.

Tacoma and Pierce County benefit a great deal with the construction of the LNG facility and TOTE's conversion to LNG fueled ships. We stay competitive in the world shipping market and we improve our local air and water quality. Let me close with the environmental data to date:

100% reduction in Sulphur Oxides
99% reduction in Particulate Matter
90% reduction in Nitrogen Oxides
13.5% overall reduction in greenhouse gases as outlined in your draft Supplemental Environmental Impact Statement.

Again, I would urge you to follow the data, the science, and engineering analysis. This process has gone on way too long and the delays in issuing all the appropriate permits flies in the face of the data. What will we be telling the larger community and all current and future businesses interested in innovation by providing environmental leadership if we say no after all the data and merits say yes.

Thank you for considering my comments.

Sincerely,

James Boulanger

Subject: Public Comment on DSEIS, PSE LNG Project

Hello,

I am writing to ask the Clean Air Agency *not* to allow a permit for the PSE LNG project in the Tacoma tide flats.

I am deeply concerned about the safety for people and the animals that will be affected by the project, as well as the environmental impact, and believe that there isn't enough reason to warrant the risks involved.

This is a seismically active area and experts say that we are due for a major earthquake. I do not have confidence that PSE can guarantee that the LNG plant will not add to the catastrophic effects of such an earthquake. I look at so many other industrial plants for which there must have been assurances that they were safe and yet they contributed greatly to terrible events that occurred, the Fukushima Power Plant failure comes to mind.

Also, the Puyallup River is one of the threatened rivers on the USGS "Mount Rainier Lahar Hazard Map." Although there would probably be signs of an impending Mt. Rainier volcanic eruption, lahars can happen apart from such eruptions, with absolutely no warning, and they are extremely quick. This could be quite devastating downriver in the Port of Tacoma; has PSE planned for this and if so is it possible to absolutely guarantee that the LNG plant will not be compromised? Could there be an explosion or a leak into the atmosphere?

Saches, mini-tsunamis, if you will, also occur in the Puget Sound area; can we be guaranteed that a sache in the Tacoma tideflats would not cause damage to the LNG plant, and consequent disastrous effects in the local area?

How will this plant affect the salmon, and, downstream, the marine animals in Puget Sound? It cannot be good for them and the risk for them is huge. I have not yet studied this aspect of the plan, but it's my understanding that a large amount of water from the Puyallup River will be used for the LNG plant (for cooling purposes?); this surely will have a negative impact on the struggling salmon population and consequently on the struggling Orca population.

As for the question of explosions, this is controversial. The Tacoma Fire Dept. does not seem to be concerned about this possibility and yet it does appear that LNG vapor can explode (I read this here: http://www.energy.ca.gov/lng/faq.html#700).

After attending the most recent public hearing (I have not been able to get to any of the others) I was alarmed to hear of the methodology regarding the impact of methane in the local area. I was already dead-set against this project but to hear of the questionable methodology is particularly alarming.

I understand that TOTE needs to meet emission requirements and that they are looking for a way to do that, but it makes no sense fulfill a requirement designed to protect the health of people and the environment by setting up another situation in which there is immense risk to people and the environment. I believe there are other methods that TOTE could employ to meet the emission requirements.

Please, please, I beg you to put public and environmental safety first and don't approve the PSE LNG project. No risk is acceptable in such an unstable, volcanically threatened, populous and sensitive area. It is our generation that knows better and can act; please do not allow this additional threat to the health of the people, animals, and environment that are within and nearby the Tacoma tide flats. We turn to you as our last protection from this threat.

Thank-you for your attention.
Sincerely, Susan Manning, 253-879-1176, 3141 N. Mullen St., Tacoma 98407

PSCAA
ATTN: Public Comment
1904 3rd Ave, Suite 105
Seattle, WA 98101

Dear PSCAA:

I am writing to express my support for the environment by advocating approval for the facilities permits for Puget Sound Energy, which will enable TOTE Maritime Alaska to convert their ORCA Class Vessels to LNG.

I work for Foss Maritime Company as the Sr. Director of Operations, and formed and led the team that operates the first LNG tank barge in North America, the *Clean Jacksonville*. I have observed first-hand TOTE's commitment to safety and the environment as they have worked with local officials and the United States Coast Guard to safely operate the two LNG Marlin Class Vessels which service Puerto Rico. TOTE has recognized the impact that human activity has had on our environment and is demonstrating industry strategic leadership through their desire to be good stewards of the environment.

LNG has been safely handled over the last 45 years, and the industry has maintained an enviable safety record. LNG vessels have traveled more than 128 million miles during the past 45+ years and have made more than 105,000 LNG carrier voyages without major accidents or safety problems, either in port or at sea. Furthermore, the SEIS study cited the environmental benefits of converting to LNG which include:

- 100% reduction in SOx
- 99% reduction in particulate matter
- 90% reduction in nitrogen oxides
- 13.5% reduction in greenhouse gases

LNG is a safe, proven fuel. If LNG is not available at the Port of Tacoma, the only viable alternative would be for Alaska-bound cargo vessels to utilize diesel fuel, which burns much less cleanly than LNG, and would exacerbate the harmful effects of climate change. For the sake of our posterity, please issue Puget Sound Energy their permits on schedule so that TOTE can start utilizing LNG.

Sincerely,

John P. Marcantonio

Steve: Okay. Next up is Jamie Margolin. Jamie Margolin?

Jamie: I know you've heard a lot of people talk today, but I need you to listen to me and listen to what my friend, Zoe, just said because we are the youth, and we are the ones who your decisions are impacting. My name is Jamie Margolin. I'm 16 years old. I'm a junior in high school. And I am taking time out of school and homework not because I am paid to do so or because I have to be here, but because my life depends on it.

[03:42:00] Because my entire generation and all future generations depend on me stopping you from making a huge, reckless mistake. The building of the liquid natural gas plant needs to stop immediately because it is criminal to my generation. Continuing to construct and let this plant open is not just breaking any old law, it is directly against the constitution. I know my rights. We Americans have the right to life, liberty, and the pursuit of happiness. And in the constitution in the state of Washington, there is this thing called a public trust doctrine.

It states that young generations have the rights to the natural resources of the state that we need in order to live. And by going through with the construction of LNG plant, you are destroying the environment for my generation and locking in decades more of climate change into Washington State, poisoning the air, poisoning the water, and securing a dirty fossil fuel future, instead of the clean energy future my generation deserves.

[03:43:00] The first step to getting out of a hole is to stop digging. And, in terms of climate, it means to stop digging for fossil fuels. Stop burning fossil fuels, whether it be coal, oil, or this disgusting, earth warming fracked gas that people are claiming to be clean, even though it's the same old pollution. Every day, I am afraid. As a young person growing up in this world wrecked by climate change, it's hard for me to plan my future without worrying whether the earth is still going to be livable by the time I'm older. So, please, listen to the cries of your children and halt LNG construction now.

Dear Port of Kalama, and Cowlitz County,

Dear Puget Sound Clean Air Agency,

2075-1 3. Outside of SEIS Scope

I am concerned about the effects on water from fracking. Fracking requires a lot of water, which is mixed with toxic chemicals. Some are left in the ground, which may cause problems decad from now. Some of the water comes back to the surface, where treatment is inadequate. Water is a precious resource, essential for life. Fracked gas is not essential, and the damage and pollution is not properly assessed economically.

Please include this impact in the Final Supplemental Environmental Impact Statement.

Name: Don Marsh	Email: don.m.marsh@gmail.co

Dear Puget Sound Clean Air Agency,

2076-1 3. Outside of SEIS Scope

I am concerned about the health effects of leaked methane and other pollutants from gas fracking. I just learned that over 15 million Americans live within one mile of a fracked gas well head. Who knows what kind of health problems may arise in the future?

Please include this impact in the Final Supplemental Environmental Impact Statement.

Name: Don Marsh	Email: don.m.marsh@gmail.com

Dear Port of Kalama, and Cowlitz County,

Dear Puget Sound Clean Air Agency,

2077-1 3. Outside of SEIS Scope

I am concerned about the climate impacts of methane emissions from fracked gas. It appears that it might be worse than coal, according to measurements done by researchers from Cornell. This could be bad for our global climate!

Please include this impact in the Final Supplemental Environmental Impact Statement.

Name: Don Marsh	Email: don.m.marsh@gmail.com

ear Port of Kalama, and Cowlitz County,

ear Puget Sound Clean Air Agency,

I am concerned about the increasing percentage of fracked gas in our production of natural gas. This is a concern, because fracking has much harsher ecological effects than previous extraction methods - higher use of water, more chemicals, and higher emissions of methane. If natural gas really ever was a "bridge fuel" to renewables, fracked gas most definitely IS NOT!!

lease include this impact in the Final Supplemental Environmental Impact Statement.

2078

Dear Port of Kalama, and Cowlitz County,

Dear Puget Sound Clean Air Agency,

2061-1 6. Purpose and Need

Both the backers of the LNG facility and the Methanol Refinery have used the rationale that they are displacing coal, oil or bunker fuels as a platform for greenwashing. It's more likely that these projects will add to fossil fuel use, rather than displace it. In the case of Methanol, we know fracked gas is at least as harmful to the environment as coal, when lifecycle emissions are considered. The SEIS docs need to focus on the added envir impacts of the proposals without assuming they will displace other dirty fuels.

Please include this impact in the Final Supplemental Environmental Impact Statement.

Name: Ruth Marsh	Email: ruthmarsh@live.com
Address: 4411 137th Ave SE Bellevue WA 98006	Phone: 425-502-8279

Dear Port of Kalama, and Cowlitz County,

Dear Puget Sound Clean Air Agency,

2072-1 3. Outside of SEIS Scope

fossil fuel companies seeking to fast-track the permitting process have a history of stating they will not operate at full capacity, and convincing permitting agencies to study on the envir impacts of the refinery operating below capacity. We need to know the FULL envir impacts of the refinery operating at FULL Capacity. Ensure permitting agencies study the envir impacts of the project operating at FULL CAPACITY

Please include this impact in the Final Supplemental Environmental Impact Statement.

Name: Ruth Marsh	Email: ruthmarsh@live.com
Address: 4411 137th Ave SE Bellevue, WA 98006	Phone: 425-502-8271

Dear Port of Kalama, and Cowlitz County,

Dear Puget Sound Clean Air Agency,

2080-1 3. Outside of SEIS Scope

By increasing the demand for natural gas in NW these projects will increase the demand for fracking. 2/3 of all "natural" (nothing natural about it) gas in the US is fracked. Fracking damages public health, pollutes water, and contributes to climate change. The SEIS must include the environmental impacts associated w/ continued and increased fracking

Please include this impact in the Final Supplemental Environmental Impact Statement.

Subject: Puget Sound Energy's LNG facility
Date: Monday, November 19, 2018 2:54:49 PM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

They say is not dependable. It is well known that fracked gas leaks greatly and dangerous. Remember the faucet water throwing flame. Fracking causes earth quakes also. Fracking should be banned period. Too many reasons to go 100% alternative energy for the future.
r8dmarshall

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

At this point, we know that the Trump Administration, installed the corrupt and incompetent Scott Pruitt as head of the EPA, Trump also installed the corrupt and incompetent Ryan Zinke as secretary of the interior and all systems are "GO" on giant poorly planned and ill-conceived fossil fuel projects all over the nation.

Projects like the Tar Sands Pipeline, uranium mining near the Grand Canyon, shrinking Bears Ears for drilling and mining and building a methane plant on the Columbia River. All these projects double down on faulty slip shod biased "data" that any reasonable body would reject. Specifically, the information in the SEIS proposal is incorrect because it is too old, the conclusions are are faulty because the information is vague and biased in a way towards the fossil fuel industry such that it is insulting to people who are are not in the pockets of the fossil fuel industry.
- The SEIS is not using the best available science for the Global Warming Potential (GWP) of methane. It uses the 100-year GWP of methane and not the 20-year value which is much more relevant given the urgency in addressing the climate crisis. The appropriate 20-year GWP value to use is 96. - The SEIS claims emissions benefits from customers that Puget Sound Energy simply does not have. According to PSE and the City of Tacoma, the only maritime customer is TOTE with its two vessels which have already delayed their conversion to consume LNG.
One of the reasons the citizens of the United States elected a democratic wave of congresspeople back into office was precisely this kind of corrupt abusive, anti-science anti common sense project that will pollute the region, cost billions and only further our dependance of outdated, dangerous and ultimately deadly technology.
Please re-think this plan and call it what it really is: a give away to the billionaires that do not seek steward ship of our beautiful planet; rather they would sell it out for profits... which in the end will kill us all.

1532-1 22. General Opposition
1532-2 12. LCA Inputs and Assumptions - Global Warming Potential Value
1532-3 6. Purpose and Need

Carole: Thank you. And Diane Martin?

Diane: Hi. My name is Diane Martin, and I'm a resident of Tacoma. The International Marine Organization, the IMO, mandated by January 1, 2020 that marine vessels redesign their ships to use a less sulfur fuel.

[02:57:07] They offered different options. But the fuel that they seemed to push was called liquified natural gas, LNG. Now, I applaud IMO's efforts to prevent and control pollution from ships. However, I feel this organization is out of step with regards to reducing greenhouse gas emissions through the use of LNG, as a better fuel option for marine vessels. Yes, LNG will burn cleaner, as an end fuel for ships. But that being said, LNG is not cleaner, is not greener in the long run. As you know, liquified natural gas is, basically, methane. It is a fossil fuel. In over a 20 year period, natural gas produces more greenhouse gas emissions than carbon dioxide.

[02:58:03] You are aware that the most recent intergovernmental panel on climate change study paints a grim picture of what our world will look like, in a very short period of time, if we do not address greenhouse gas emissions. LNG fuel to power the shipping industry is not in step with a global solution to climate change. Much of LNG produced today is from a process called fracking.

It is expensive, pollutant driven, and because it is a fossil fuel, it has a limited value as a fuel source and will become more costly and deadly in the future because the leaks of methane along the thousands of miles of pipeline only cause more harm to water supplies, in our air and threatens the health of millions of citizens along with animals and plant life.

[02:59:00] Plus, there is another matter that needs to be addressed with this project. It is the concern by the Puyallup Nation that this project is not in step with Medicine Creek Treaty of 1854. We must honor their wish to not see this project go forward. So, I would ask the PSCAA to create a pause in this process, in order to allow global citizens to confront the fallacy of the IMO's use of LNG as a source of marine fuel and plus the local issue of the Puyallup Nation's desire not to allow this project on their land. Thank you.

Carole: Thank you. So, it is 5:00. So, if everybody could please leave the auditorium. And, actually, I think they're going to lock the outer doors of the building until 6:30. The hearing will resume then.

Hello,

I'm so sorry. I submitted my comment earlier today and found I had made a mistake. I used the word "methanol" when I knew the word I should have used is "methane". I apologize for this error. Therefore, I re-submit my comment as attached.

Diane Martin

Puget Sound Clean Air Agency
Attn: Public Comment on DSEIS PSE LNG Project
1904 Third Avenue, Suite 105
Seattle, WA 98101

October 31, 2018

I am writing in regard to the January 1, 2020 mandate to reduce greenhouse gas emissions (GHG) by marine vessels to .50 percent mass by mass(m/m). My understanding of the International Marine Organization (IMO) proposal to reduce Greenhouse Gas (GHG) emissions is to mandate marine vessels to redesign their ships to use either a less GHG fuel then the current use of diesel or oil, or for the use of "scrubbers" that would produce less GHG. The fuel that IMO seems particularly interested in is liquefied natural gas (LNG).

The IMO Mission Statement states "The Mission Statement of the International Maritime Organization (IMO) as a United Nations specialized agency is to promote safe, secure, environmentally sound, efficient and sustainable shipping through cooperation. This will be accomplished by adopting the highest practicable standards of maritime safety and security, efficiency of navigation and prevention and control of pollution from ships, as well as through consideration of the related legal matters and effective implementation of IMO's instruments with a view to their universal and uniform application".

I applaud IMO's efforts to prevent and control pollution from ships. However, I feel this organization is out of step with regards to reducing GHG through the use of LNG as a better fuel option for marine vessels. Yes, LNG will burn cleaner as an end fuel for ships. That being said, LNG is not cleaner or greener in the long run. As you know, liquefied natural gas is basically methane. It's a fossil fuel. Over a 20 year period, natural gas produces more GHG emissions than carbon dioxide.

I'm sure you are aware of the most recent Intergovernmental Panel on Climate Change (IPCC) study. This study paints a grim picture of what our world will look like in a very short period of time if we do not address GHG emissions. LNG fuel to power the shipping industry is not in step with a global solution to Climate Change. Much of the LNG produced today is from a process called "fracking". It is an expensive and "pollutant driven" process and because it is a fossil fuel, it has a limited value as a fuel source and will become more costly in the future. Plus the leaks of methane along the miles and miles of pipeline only cause more harm to water supplies, air that becomes contaminated and threatens the health of millions of citizens along with animal and plant life. IMO’s push for marine vessels to use LNG as a fix to reduce GHG is in direct conflict with the IPCC study.

In addition, the IMO statement that the January 1, 2020 deadline cannot be changed is flawed. Why would we seek a push to mandate a harmful fuel that does not allow the industry to forge a zero m/m without harming the environment and humans?

There is another matter that needs to be addressed with this project. It is the concern by the Puyallup Nation that this project is not in step with the Medicine Creek Treaty of 1854. We must honor their wish to not see this project go forward.

I would ask the PSCAA to create a “pause” in this process in order to allow global citizens to confront the fallacy of the IMO’s use of LNG as a source of marine fuel, plus the local issue of the Puyallup Nation’s desire to not allow this project on their land.

Sincerely,

Diane Martin

Puget Sound Clean Air Agency

ATTN: Public Comment on DSEIS,

PSE LNG Project,

1904 Third Ave, Suite 105

Seattle, WA 98101 November 18, 2018

To PSCAA:

My name is Roger Martin. I am a retired Air Force combat pilot. Subsequent to that retirement, I worked as a training developer and instructor for the B-2 stealth bomber's initial cadre of pilots, then a systems engineer for military systems, and then a manager specializing in proposals for major defense contracts. I hold a BA in Biology and Oceanography from San Jose State College and an MS in Systems Management from the University of Southern California. I am currently the coordinator for my church's Greening Activity Group at United Church in University Place.

I am strongly opposed to acceptance of the 2018 Supplemental Environmental Impact Statement (SEIS) for, and to the installation of, the LNG facility proposed for the Tacoma Tide Flats. This is for several reasons.

1. First, the location.

   We have learned that this construction location is in a) a known earthquake-fault area; b) a tsunami hazard zone; c) on land fill; and d) adjacent to Native American tribal land. For an installation that is to contain pressurized flammable gases, mixed with toxic, volatile organic compounds, in an installation that will reportedly stand 16 stories tall that is near highly populated urban areas, and be an installation and within a few miles of the West Coast's primary north-south roadway is pretty-near insane. In my lifetime, I have observed from a distance, and among other events related to manmade facilities (not in order): a) the Three Mile Island nuclear meltdown; b) the Chernobyl nuclear meltdown; c) the Exxon Valdez grounding and oil spill; d) the Deep Water Horizon explosion and oil spill; e) the Fukushima Daiichi earthquake and tsunami nuclear disaster; f) numerous railcar de-railings, chemical and petroleum leaks, fires, and explosions; g) the Shell Oil Kulluk floating oil-rig disaster (twice in one trip!) between Alaska and Washington State; h) leaks of natural-gas storage facilities (most notably Porter

1281-2 cont'd 3. Outside of SEIS Scope
1281-3 5. Regulatory Framework

Ranch in Southern California); i) numerous leaks along existing oil pipelines, including the Keystone XL and feeder pipelines; and j) one I will recount in more detail here, based on my eyewitness observation.

I was married in a full military wedding on February 2, 1969 in Santa Clara, California. Not having a lot of money, we decided to honeymoon on the beach in Southern California, complete with a drive in our two-seat, red, British TR-4 convertible, along California Highway 1. Our first night of the trip was going to be in Carmel by the Sea. Our second night was going to be in Santa Barbara, where we had dinner reservations at the end of the pier. So, on February 4, 1969, we went to that restaurant and saw oil-soaked pelicans and seagulls bobbing around in the water under the restaurant--from the Santa Barbara oil spill. 'Heck of a honeymoon, but a real lesson for a freshly graduated biology/oceanography major and newly commissioned military officer.

Although I am likely to come back to some of these issues later, I wanted to lay down some markers here. I will proceed to other matters below before coming back to detailed reflection. The big point here is that in every case, when these projects and facilities were proposed, each was going to be using the latest, greatest, most-foolproof-possible safety measures to prevent any possible accident that could ever occur, and that if one ever did occur (which we are told simply *can't* happen), it would be resolved quickly and without any damage or loss of life, because we had thought of everything and prepared for every contingency, and the government would make sure every rule and promise would be followed and kept.

2. Indian treaties

- (Quoted from the *Advisory Council on Historic Preservation Handbook* [ACHP]:) "The National Historic Preservation Act (NHPA), (16 U.S.C. Section 470f) Section 106, requires federal agencies to take into account the effects of their undertakings on historic properties and provide the Advisory Council on Historic Preservation (ACHP) a reasonable opportunity to comment on those undertakings. communication that may include written correspondence, meetings, telephone conferences, site visits, and e-mails." And, "Consultation constitutes more than simply notifying an Indian tribe about a planned undertaking."
- In addition, the Environmental Review Toolkit, published by the Federal Government, says, "The National Environmental Policy Act of 1969 (NEPA) requires the preparation of an environmental impact statement (EIS) for any proposed major Federal action that may significantly affect the quality of the human environment. The statutory language of NEPA does not mention Indian tribes. However, the Council on Environmental Quality regulations do require agencies to contact Indian tribes and provide them with opportunities to participate in various stages of preparation of an EIS."

1281-3 cont'd 5. Regulatory Framework
1281-4 10. LCA Calculations

- According to several speakers at the recent Tacoma public hearings on the proposed SEIS for the LNG facility, these consultation requirements have not even been minimally met.

3. Data are not current or accurate

As was reported by numerous speakers at the Tacoma SEIS public hearings, the original, proposed EIS had incomplete and inaccurate data for computations used to support the Study's findings. The data in the former EIS relied heavily on information that had been available in 2007. "Placeholder" data were used in that study, based either on best-available values from studies up to that time, or estimates based on best guesses. More-accurate data were understood to be inserted as time went on and real studies were done with ever-improving and -widening information became available from better equipment and additional sampling and trend analysis. Reportedly, such data became updated in 2009, and later in 2013. Fortunately, there was an additional full IPCC report very close to submittal of this SEIS. And, although available, none of the latest data were used in the proposed SEIS. Indeed, many of the original best-guess placeholders from 2007 are still in the new document, even though new, and real, data are available.

The Tacoma SEIS public hearings provided clear and consistent insight into how inclusion of best current data would affect the findings of the proposed SEIS. Environmental impact and possible damage from gas leakage and accidents are grossly underestimated in the current study, based on the outdated information contained in there. One witness—a college teacher (he claimed)—stated that greenhouse-gas leakage, by his quick calculations using new, accurate numbers, were roughly 2.5 times as great as those presented in the proposed SEIS.

I would like to get back to some of my earlier reflections. Specifically, I'd like to get back to some of the nuclear-plant lessons. At least, three nuclear power plants were somehow built right next to the open ocean: Diablo Canyon and San Onofre in California, and Fukushima Daiichi in Japan. At that time, several people who studied oceanography (I was an oceanography student back then) had already warned that predicted greenhouse gases would raise the sea level. But they built these plants there anyway. Brilliant, eh? The movie *The China Syndrome* was, fascinatingly, shot largely at Diablo Canyon. This was not one of the plants that did melt down. One of those that did was in Ukraine (then part of the Soviet Union), and the other was in the middle of a river in Pennsylvania.

The worst nuclear-plant disaster can be disputed as either Chernobyl or Fukushima. Again, promises were made that the safety designs were impeccable. At Fukushima, nothing could happen that could not be overcome by the wonderful safety standards that

Japan had put into place. (Apparently, nobody noticed the big ocean outside, even after all the movie monsters that had come out of it going back decades before.) People were allowed to build residences and businesses ever closer to the reactor as time went on—after all, what could happen? Other nuclear plants had been around, and hadn't blown up or been overwhelmed by a tsunami. So, why should this one? And it had been built to handle earthquakes, anyway, right? And *to government safety standards! Right?*

Then, the earthquake and the tsunami hit in 2011. In that accident, there were three nuclear meltdowns, multiple hydrogen explosions, and an estimated 1600 deaths, from a "safe" nuclear plant, because somebody had studied all the possibilities and nothing could happen that existing designs and safety procedures couldn't handle.

San Onofre was the first of the two, aforementioned US coastal plants identified for decommissioning. For a while, talk was that they could re-start it after an attempt to repair and replace parts that wore out before their initial studies had said they would (What? Overoptimistic estimates?). They also looked at what happened at Fukushima two years earlier, and perhaps started to notice that the sea-level rise predicted when they originally designed the plant was a bit underestimated (Gee, do you think so?). So, in 2013, they shut it down, never to be opened again.

Now, folks have decided it might be smart to pull the plug on Diablo Canyon too. There seems to be a trend here: Building facilities with stuff that can blow up and also contaminate a populated an area near where there are earthquakes and possible tsunamis might not be the indication of high intelligence.

So, for building on fill: San Francisco has some experience with that. In 1906, they had an earthquake. After the quake, they decided to use rubble from the earthquake and some dredging from the Bay to build a location for the Panama-Pacific International Exhibition, which then became the Marina District. In 1989, the Loma Prieta Earthquake hit at the very summit of Highway 17 between San Jose and Santa Cruz, and the land fill in the San Francisco Marina District liquified from the vibrations. In addition to water mains breaking, natural-gas (hmmm) lines broke, and fires broke out. Because of the broken water lines, water from the Bay had to be used to extinguish the fires. Land fill and gas lines have a history of being a bad idea then, don't they?

In San Francisco, there are two other buildings that were subsequently built on land fill. They are the Millennium Tower luxury high-rise, and the new bus terminal, built closely to each other. The Tower is sinking and has been discussed on several TV shows, including *60 Minutes*, and the other is the new bus terminal, which has shown structural cracking before it has even opened for regular business. How much is that all going to cost to make safe…or not? Furthermore, the entire area known as Foster City, just south of San Francisco International Airport, is sinking, at the same time the sea level is rising.

Foster City was built on land fill. And PSE (an Australian company, by the way) thinks it is just fine to build a 16-story-tall container of explosive and toxic gas onto land fill in an earthquake and tsunami zone. Brilliant!

As somebody who was college-trained as a scientist, flew in combat, authored training and technical publications both at the Air Force's Headquarters Strategic Air Command, and later, for the most-expensive combat airplane ever built, and in the defense industry was the principal manager responsible for the Technical Volumes of several DoD multi-million-dollar contract proposals, I am absolutely appalled at what was presented in this official government SEIS. It clearly needs to be re-written using current, accurate, and complete data, and with actual consultation with Indian tribes.

Disregard for federal law in consulting with native tribes, *knowingly* using outdated and misleading data on which to base conclusions that can result in disasters similar to what we have witnessed in documented events ranging from the Santa Barbara oil spill up until the immediately recent fires caused by faulty power lines in California, accepting this widely disproven SEIS would be insane, and hopefully prosecutable as a crime of fraud for which anybody who signs off on this currently proposed SEIS would be culpable.

Sincerely,

Roger T. Mart

Dear PSCAA

We request additional studies that are more in depth of the entire environmental impact than the original insufficient EIS, especially regarding air quality for not only Tacoma & the local area but all along the route, from fracking to shipping & the end use, which blows back to us from Asia. The SEIS must account for greenhouse gas emissions & a life cycle analysis of fracked gas.

I've been upset by the continuing construction in spite of your not having approval to continue!

Do not accept the current EIS, as it is totally inadequate.

Julianne Marlinson
Everett, WA 9820

ATTN: Public Comment on DSEIS, PSE LNG Project
Dear Puget Sound Clean Air Agency,
I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to deny the permit because the Draft Supplemental Environmental Impact Statement does not accurately represent the true greenhouse gas emission profile of the project. I have the following specific concerns:

THIS PROJECT IS IN DIRECT CONTRADICTION TO THE IPCC RECOMMENDATIONS & WILL LEAD TO ADDITIONAL CO_2 EMISSIONS — WE CANNOT AFFORD THESE IMPACTS IF WE ARE TO CONTROL WARMING OF THE PLANET.

(Check here to continue comments on the other side).

In addition, a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required and adequate consultation with the Puyallup Tribe and other neighbors of the project should be conducted.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

A future fueled by fossils will lead to the death of the planet within decades. Cut your losses and give us the clean energy we need to survive. North Carolina flooding, heat waves and droughts leading to California forest fires are just some of the consequences of burning the fossil fuels. That price is too damn high. No more fossil fuels.

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

I'm an elderly woman who suffers from various breathing difficulties now. The choice of confirming LNG will only exacerbate these issues. As a result ,medical care will increase as will as a need for meds. Most of us seniors AND families on reduced incomes will suffer. I think at that point, lawsuits will be appropriate. On an issue, why is capitalism taking a priority over humans on this planet? When are we going to wake up and begin to care for the planet we call home? Why is a foreign country stealing from the people of Tacoma and surrounding towns and communities. What about our wildlife that depend on us for protections? So many layers of concern. This is the wrong choice at the wrong time.

Sincerely,

Rosalie Mcallister

Having 4 kids, ~~cant~~ doing anything we can to better the environment seems like a no brainer. Don't wait, take steps now to better the future for our kids.

[03:17:12] So, first up, David Bluhm. Come to the microphone up front. David Bluhm here? No. Nathan McCurtain?

Nathan: Oh, good, first. Hi. My name is Nathan McCurtain, and I'm a Tacoma resident and have been a resident of the Puget Sound area, since I was 4 years old. I am asking that this permit be denied and the LNG project be halted because the process has lacked transparency and has failed to meet its obligations to the Puyallup Nation. First, the LNG plant facility is too large for what it's stated usage is.

[03:18:03] And we don't know what they will do with that extra capacity. Next, the SEIS assumes converting marine shipping customers to LNG, but a majority of these buyers have remained unidentified. So, we cannot know the full impact for this facility. Finally, this is the home of the Puyallup Nation and its people. It has been for hundreds of years. Throughout history, Native people have had to fight for respect and the right to live. And this project grossly violates both of those struggles. The tribe was not properly or meaningfully consulted. Obviously, this lack of consultation is because this project is a threat to the Puyallup People's health and their way of life.

We need a more comprehensive SEIS and full consultation with the tribe. Until and unless a comprehensive process has been followed, including the consultation with the tribe and the client, safety, and environmental impacts of this project are accurately accounted for, this project cannot be properly evaluated.

[03:19:00] And the permit should be denied. Do not lock us into a fossil fuel future. Thank you.

To Whom It May Concern:

My family has lived in the same house in Federal Way for more than 20 years. We get our water and most of our air from Tacoma. Now I see that our home is within the blast zone of the LNG plant under construction.

Steven Storms and a number of others with extensive understanding of chemical reactions have already submitted vast volumes to anyone who would read them, concerning the hazards of this plant. Having had only a few college chemistry courses, I will leave that to them. I just know I don't want this population center exposed to these chemicals, or the great potential for other disasters this plant will impose. This Puyallup Tribe land is also in an earthquake, lahar and tsunami zone. What could possibly go wrong?

Climate change has been proven. We are feeling the effects of horrific weather and wildfires. Operating a new fracking and natural gas facility would be a gigantic, foolish step backward at best.

Please stop the LNG.

Respectfully,

Kathy McFall-Butler

Dear PS Clean Air Agency,

As a Pierce County resident, I am writing to urge you to draft a new SEIS. Local researchers and scientists have collaborated to confirm that the current draft is flawed. It does not account for the full climate impacts of fracked gas.

First, communities which will be mostly impacted by LNG from the extraction site to the end location are, primarily, low income communities of color and indigenous communities. In Tacoma, within a two (2) mile radius of the LNG project are three majority minority schools, the Hilltop neighborhood, the Detention Center and the Puyallup Tribe. These communities will suffer the most from poor air quality. Numerous First Nations in Canada are suffering the consequences of toxic emissions due to fracking, according to studies not incorporated in PSCAA's draft SEIS.

Furthermore, the proposed LNG project is a direct affront to the Puyallup Tribe, putting their treaty rights and community at risk, first, and disproportionately affected. Tribal Councilwoman, Annette Bryan, says there was never government to government consultation which is in violation of the Medicine Creek Treaty, the supreme law of the land. Please stand with the Puyallup Tribe in opposition to the LNG facility.

With all due respect, I implore you to consider and act in a moral and just way as you make decisions regarding this effort. Many lives depend on it!

Regards,

Eve Bowen

Dear Puget Sound Clean Air Agency,
Thank you for the opportunity to comment on the DSEIS for Tacoma's LNG Project.
With concern about the **ongoing construction on the project without adequate consultation with the impacted Puyallup Tribe**, I attended the public hearing on October 30th. Listening to testimonies during the afternoon and evening sessions convinced me to question the continuation of the project. It demonstrates lack of responsibility to proceed without further, comprehensive consultation with Puyallup, who will be most negatively affected by the project's completion.

To refresh your memory on some highlights from the hearing, I am including this 5-minute VIDEO LINK HERE.

I urge you to reject the DSEIS in its current form.
Sincerely,
Bonnie McKinlay

Dear Members of PSCAA,
I comment here on the DSEIS for PSE's LNG project in Tacoma.
I have a number of concerns with the DSEIS, deepest is the very notion of constructing the LNG terminal in the face of **scientific evidence calling for the immediate need to limit, not *expand,* the fossil fuel industry**.
The data used in the DSEIS is out-dated and flawed.
Please do not accept the DSEIS in its current form.

To supplement your evaluation of the DSEIS, I am including this article by Bill McKibben that was issued online today by *The New Yorker*: How Extreme Weather Is Shrinking The Planet. 11/18.

Thank you for consideration of my comment.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

It is very important that you are listening to public comment on the DSEIS PSE LNG project. This is a destructive and dangerous plan. It puts us all at risk by its construction, by methane leakage from pipelines, transfer and storage of methane, a gas, liquefied or not that is notoriously hard to contain.

If we are to avoid a climate catastrophe which is fast approaching we must do all we can to transition to sustainable wind, solar and wave energy as quickly as possible. Don't be taken in by corporations that will make some money in the short run and doom millions of living organisms in the medium run. We can do better than a leaking, polluting, energy guzzling liquification plant in an earthquake zone which is run on fracked gas.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Puget Sound Energy is trying to build a Liquefied Natural Gas (LNG) refinery, storage and distribution facility in the Tideflats area of Tacoma. It is sited on Puyallup Tribal lands and is being built without their consent. There are many concerns about the project including taxpayer and ratepayer subsidization, safety issues, environmental impact, and the effect on our climate.
The Puget Sound Clean Air Agency (PSCAA) found the initial Environmental Impact Statement (EIS) lacking, and they opened up a Supplemental Environmental Impact Statement (SEIS) process to take into account the full life cycle impacts of natural gas (mostly fracked these days) in terms of its role in climate change. This could set an important precedent for how future projects are evaluated.
The Draft of the Supplemental Environmental Impact Statement (SEIS) was released Monday, October 8th. The draft analysis came to the conclusion that there would be less greenhouse gas produced if the project is built than if it isn't! Needless to say, their analysis is extremely flawed - let's make this point with comments to PSCAA!. Public comments will be accepted from Oct 8 until midnight on Nov 21.

Subject: Puget Sound Energy LNG Project
Date: Wednesday, October 31, 2018 10:19:33 PM

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

Thank you for allowing me to comment on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. Since fracking was introduced, it has created a series of environment problems -- from earthquakes to poisoned groundwater, to being a major contributor to the increasing concentration of greenhouse gases in our atmosphere.

I am deeply concerned about the impact of this project on air and water quality. Already we have some serious issues in Tacoma with our air quality during high pressure systems that cap the pollutants over the city. I think we need transparent reporting of our air quality and the plant is likely to contribute to smog and toxins in the Port of Tacoma.

That it is being build on alluvial land that is at the base of a fault and on the Sound that is already struggling with toxins and overfishing - a waterway already stressed to the point that we are in danger of driving the orcas extinct -- is appalling. These issues are also linked to the question of clean air because spills, earthquakes, and the like, will - we are told - dissipate into the atmosphere further eroding it.

In the draft SEIS, there are several sections that are missing data and so we can not accurately assess the quality of the report and understand how certain conclusions are reached. Because of that, I request that you complete this report, reissue it, and then reset the public comment period so that we have time to review the completed report thoroughly.

I am dubious about the marginal improvements in emissions the study claims for the project. We need to think short-term about our emissions because it seems we are far closer to catastrophe than the fossil fuel companies would like us to believe. The idea that we will help reduce emissions in shipping is naive because we will ultimately have to stop engaging in our current scale of trans-oceanic trade if there is to be any hope of preventing environmental collapse.

Thanks again taking on this important review of the LNG facility. I hope that you will take the best available science into consideration when revising this draft SEIS and think about the negative impacts that this project will have if it goes ahead not only on the people in the city of Tacoma and surrounding regions, but on the health and well-being of our planetary home as a whole.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. I'm concerned that your review of the greenhouse gas impacts of the natural gas used in this project finds a net negative in emissions if this project is built, when all research tells us that we can't build any more fossil fuel plants (if we are to stick to 2C warming).

Since methane is more destructive in the short term, and we just got word from the IPCC that we need to change our fuel mix in 12 years to avert disaster in 22, you should be using the 20-year GWP value vs. the 100. Also, your claim that BC gas is cleaner, based on industry self reporting, is a problem because they don't report on fugitive emissions from leakage, experienced by 85% of wells in Canada -- which recent atmospheric testing has shown to be a real problem in some areas of Canada, where the emissions have been found to be as much as 3.6 times what was previously thought. I'll just close by pointing out that this also doesn't make economic sense -- since the fracking boom began in 2008, the industry is $280B in debt and 29 of 33 major companies involved are in the red.

Many of the issues here are global, but I am motivated to comment on this project for a personal reason as well. I lived and worked in Tacoma for a couple years after college, in sustainable agriculture and the emergency food system. It is a special place, still home to friends of mine, and this project would be reverting back to the old ways of extractive economics (such as the ASARCO smelting plant, which 20 years later lives on via soil pollution) instead of looking to the future that the city is trying to build for itself (e.g. building up tourism). They deserve better, we all deserve better.

Thank you for your consideration. Sincerely,
Ellen Mickle

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

My sister lives in a part of the country whose water supply has been totally contaminated by fracking. We in the Northwest want nothing to do with this poisonous process, whether that be shipping or fracking itself. We are one of the few remaining relatively unpolluted places in the U.S. and we cannot have the intrusion of toxicity for the sake of profit for anyone, including Asian markets and our own North American markets.

There were 230 natural gas explosions between 2010 and 2016 causing $3.4 billion in damages. More recently, Wisconsin in July, Denver in August and Massachusettes in September... you can read about natural gas explosions / fires and human incompetence for hours online. No way would this big huge LNG fiasco be worth the risk. No way.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Please stop the illegal seizure of Native Land. Enough us enough, let the natives keep their land. Stop fracking because it; 1. Polutes our air 2. Contaminates ground water 3. Poisons animals, plants and people 4. Can explode and harm communities and workers alike. 5. Increases climate change and is a bad idea over all. Say no to the project please. God Bless. Stop Mother Earth from being raped. Thanks.

1544-1 12. LCA Inputs and Assumptions - Global Warming Potential Value

From: Jason Monk
To: Public Comment
Subject: Comment on Puget sound energy LNG project
Date: Tuesday, November 20, 2018 9:01:53 PM

Hello to whom it may concern at pscaa,
I am writing to voice my concern about and opposition to the LNG project proposed at tidewater flats in the Puget Sound region.

My concern is that the supplemental environmental impact statement does inadequately address the true value of green house gas warming potential of methane. The report from pse uses outdated data from 2007, based on a 100 year projected impact. It's important that the report accurately represent the true warming potential of methane based on up to date science from 2016, dealing with a 20 year time frame. The truth of our situation is that the most radical changes in our energy sector need to occur within the next 20 years in order to address climate change ASAP. Using these up to date numbers, the plant becomes %150 dirtier by it's gwp than previously reported.

Thanks for the work you do and for reading my comment. It is of concern to me that these energy projects are still being proposed on the west coast, when we should be focusing our resources into development of Renewable energy infrastructure.

Subject: Support LNG

Dale Monroe
360-815-2316

I wish to express my support for Puget Sound Energy's (PSE) liquefied natural gas (LNG) facility at the Port of Tacoma. This letter reflects my comments in support of the Puget Sound Clean Air Agency (PSCAA) finalizing its SEIS consistent with the draft it issued on October 8, 2018 and timely issuing PSE the necessary permit(s) to proceed.

There are many stakeholders in the effort to reduce emissions, and even more moving parts to the actual process of doing so. In the last five years alone, the Port of Tacoma, the Port of Seattle and the Vancouver Fraser [Canada] Port Authority have created an updated Northwest Ports Clean Air Strategy with the objectives of reducing port-related air quality impacts of diesel particulate matter, reducing greenhouse gas emissions, and helping meet air quality standards and objectives for the airshed. The PSCAA itself is a partner in the implementation of this effort, along with agencies including the Environmental Protection Agency (EPA).

The PSE LNG facility is one part of the task of reducing diesel emissions. LNG fuel cuts particulate matter (PM) emissions produced by ships by more than 85%. These particulates are extremely harmful to the lung health of dock workers and those in the surrounding neighborhoods. According to dock workers, they not only see the black diesel particulates floating in the air, but they breathe them in as well while ships (still burning diesel) are waiting to dock. Besides eliminating the PM emissions, LNG fuel also reduces greenhouse gas emissions by nearly 15%, sulfur dioxide (SOx) emissions by over 99% and nitrogen oxide (NOx) emissions by nearly 85%. Another important environmental advantage of LNG as fuel is that in the unlikely event of a spill, LNG turns into vapor and dissipates with no lasting effects on water or marine life.

Reducing these real-time emissions is a matter of social justice. Port workers should not be subjected to this polluted air just for doing their jobs. Workers all across the West Coast ports have been vocal about the need to reduce these emissions in their work place, and they have played an integral role in supporting ports' efforts such as the Northwest Ports Clean Air Strategy to reduce emissions. Locating the Tacoma LNG facility within the Port of Tacoma advances the effort to reduce emissions at their source.

Beyond emissions affecting ports and immediately adjacent neighborhoods, the United States has staked out the position that vessels must control emissions when travelling America's coastlines up and down the Pacific Ocean. Annex 6 to the MARPOL Treaty, for which the EPA is the enforcing agency, requires Jones Act-flagged ships that travel near to shore to significantly reduce their emissions by using cleaner fuels. TOTE's use of fuel from Tacoma LNG to power its fast-transit, near-shore ships allows the company to substantially exceed its regulatory commitment to the EPA. By using

LNG, TOTE will provide major emissions reductions benefitting public health for all communities and residents along its West Coast route, which transits nearly all of Puget Sound and ends in Anchorage, Alaska.

The Tacoma LNG facility is a project that allows multiple stakeholders – coastal communities, the Port of Tacoma, adjacent neighborhoods, PSCAA, EPA and TOTE - to affirmatively advance their interests in emissions reductions. Speaking for the dock and port workers, both our health and economic well-being are furthered by wrapping up this project's environmental review and permit effort promptly without undue delay. Please, let's keep those good, family wage jobs at the Port of Tacoma and make the air the workers breathe healthier.

The draft SEIS, prepared by Ecology and Environment, Inc. and released by PSCAA on October 8, 2018, stated "When evaluating direct, upstream, and end use GHG emissions, replacing a diesel propulsion engine with a pure LNG propulsion engine results in reduced life-cycle GHG emissions."

Taking into consideration the overall reduction in greenhouse gas emissions confirmed by the draft SEIS for Tacoma LNG, and the human and environmental benefits of such reductions, I fully support PSCAA finalizing its SEPA review and granting the necessary permit(s) so this important addition to our region can be completed within its new scheduled timeframe.

[05:40:25] So, Joanna Monroe?

Joanna: I think it's important to remember that there is a lot more that we have in common than what divides us. I think all of us can agree we want to see living wage jobs, affordable housing, great schools, and, of course, a clean environment. The use of LNG moves us toward that shared vision by reducing greenhouse gases, while keeping our port competitive.

[05:41:00] And, if there was ever a time to look at the facts and to look at the science, it's now. I'm Joanna Monroe. I'm a business woman. I'm an attorney. And I've raised my family in this community for two decades. I support the construction of an LNG facility at the Port of Tacoma. And, at this point, in the process, with all that's been done, it is an easy endorsement. As you know, the environmental impact statement was evaluated by numerous agencies.

The Department of Transportation, the Army Corps of Engineers, the Coast Guard, the National Marine and Fisheries Service, the Port of Tacoma, Department of Fish and Wildlife, Department of Archeology and Historic Preservation, the city of Tacoma, Pierce County, and the city of Fife. All of these folks have had a chance to weigh in and evaluate this. And there are three things that I take away from it. 1) That LNG is safe. 2) That it will be a much cleaner fuel than diesel. And 3) that it exceeds all federal, state, and local requirements.

[05:42:00] The objective data, the science in front of you, unequivocally shows that moving to LNG would have a positive benefit on this community. And I implore the Air Agency to stick to the facts because to delay the environmental benefits of this project is simply unconscionable. No matter how loud the protest, at some point, we have to rely on the facts in front of us, the things that have been verified, and not rely on wildly distorted gossip or piece together studies that are not supported by the evidence. We have to listen to the scientists over the shouting of activists.

Steve: Please let the speaker speak.

Joanna: I have nothing further. Thank you.

Re: Support of LNG and Tote Maritime

Regardless of our differences, all in our community want living wage jobs, affordable housing, great schools, and a clean environment. The use of LNG moves us toward that shared vision by reducing greenhouse gasses while keeping our port competitive.

As a business woman, an attorney and a mother who has raised my family in this community for the last 2 decades, I support the construction of an LNG facility at the Port of Tacoma.

The Final Environmental Impact Statement - which was evaluated by numerous agencies - including the DOT, Army Corps of Engineers, Coast Guard, National Marine Fisheries Service, Port of Tacoma, Department of Fish and Wildlife, Department of Archaeology and Historic Preservation, Department of Ecology, City of Tacoma, Pierce County and the City of Fife - concluded that:

- LNG was safe
- It will be a much cleaner fuel than diesel
- And that it exceeds all federal, state and local air quality requirements

The objective data, analysis and science unequivocally shows that moving to LNG would have a positive benefit on the environment and failing to convert would negatively impact the environment.

I implore the Air Agency on this critically-important project, to stick to the facts because to delay the environmental benefits of this project is unconscionable. No matter how loud the protest, at some point we have to rely on what we know and verified by statistically valid analysis and testing, not wildly-distorted gossip and pieced-together “studies” from activists shouting over scientists.

Thank you

Joanna Monroe

There are so many reasons the Tacoma Tide flats should not be where the LNG facility is built and LNG stored.

The one that concerns me the most is that it's on an earthquake fault and thousands of people live in the "blast zone."
The other reason I oppose the project is that the Puyallup Tribe hasn't given permission to build on their tribal land.

thank you,

Melanie Moor
1506 N. 8th St
Tacoma 98043

Carole: Thank you. Bliss Moore?

Bliss: First, thanks to Puget Sound Clean Air Agency for having this hearing. This is an extremely vital hearing. I'm a resident of Tacoma for the last 31 years. I lived out on a clean up site called the Asarco. It's transformed. It was a terrible place. Anyway, getting on, I think this, clearly, this SEIS is totally unacceptable for all of the reasons that have been brought up by many others this evening.

[01:33:09] I would like to mention I want to thank Debbie Cochran of the TNT for this article a few days ago that outlines the issues of this SEIS. And I think it was very useful. I urge people to read it, if they want to know more about it. I'm not going to go into a lot of detail of what's been said tonight. I'm an active member of the Sierra Club. I'm, currently, the vice chair of the local group for Pierce County. We've worked closely with the Puyallup Tribe.

[01:34:00] And I'm also encouraged opposing this for a whole host of reasons that have been brought up tonight. I'm very pleased to hear that the Citizens for a Healthy Bay has taken a position against this. It's a very well respected environmental agency, local environmental agency, of this whole Commencement Bay area. And I'll just say the issues of methane leakage is a huge one because it's 85 or 86, 87 times worse as a greenhouse gas. There are safety hazards at the plant, too. Look at the state of California. They have banned any LNG facilities there like we're going to have as proposed here.

[01:35:07] Why did they do that? For safety reasons. They had serious issues of fires and such. Anyway, that's about all I really have to say. But this is totally unacceptable. We've got to go back to the drawing boards and get good data. The data that was used, as pointed out in the TNT article, clearly shows that this needs to be done. Thank you.

Carole: Thank you. Darren Moore?

[01:45:00]

Darren: Hello, again. Thank you, guys, for having this hearing. We have to stop meeting like this. I want to take the time to recognize that we're on the ancestral lands of the Puyallup Tribe, and we're discussing a project that sits directly on Medicine Creek tree land. My name is Darren Moore. I am a Tacoma resident. I'm a homeowner in Tacoma. I am deeply concerned at the risk this project represents to my family and my friends. My wife grew up here in Tacoma. As a family, we moved here as part of a program to relocate Native people away from their reservations.

She is an enrolled of the Standing Rock Sioux Tribe in North Dakota. Together, we are the co-founders of Native Daily Network and have been very active in covering the local and tribal opposition to this facility. Today, some people more eloquent and better educated than I will explain to you the folly of the SEIS that was published on October 8. They will explain why it's not really supplemental to the original EIS and that it is based on a lot of guess work and some very narrowly defined and unrealistic outcomes. For me, due to my family, my community, and my work, I am particularly concerned for my tribal relatives.

[01:46:04] There is a narrative in American life regarding liberty and freedom. The Native people of the Americas were free before genocide, an American holocaust. It wiped out tens of millions. Genocide was further perpetuated through the removal of land and eradication of the First People's way of life. The latter portion was done via treaties, which left most Native people with just a small fraction of their original homelands. Even after the treaties, settlers continued to commit a slow but steady genocide on the Native populations by building on their land or impacting their treaty rights to the point that they were no longer able to practice them.

Those who have done this have gotten away with it because they have been enabled by agency after agency. And they have been complicit in that genocide. The Puyallup Tribe, the Salmon People, have a treaty right to fish. They site where the LNG facility sits is directly outside of their reservation boundaries but firmly within their protected treaty territory. They have never seeded their fishing rights.

[01:47:00] The board decision, which was upheld by the US Supreme Court in

’75, reaffirmed their fishing rights in usual and accustomed places. The tide flats, their estuary, was such a place where the salmon spawned, and they collected crustaceans. The city and the port have contended that the tribe gave up title and rights to this area under a 1990 land claim settlement. But as this site is off reservation, they could never have given up title to it. The city and port have been lying to everyone and have been getting away with it due to enabling agencies. Let’s put a stop to that today.

The treaties come with a federal trust responsibility, which Annette alluded to earlier meaning that any change that may impact the treaties must come with a government to government negotiation. If the tribe says no, then, it doesn’t happen. No, it happens, really does mean no. I understand that the responsibility to decide on this permit has been delegated to you. But with that, you have also inherited the federal trust responsibility. You must negotiate with the tribe. To ignore that would be to enable the further eradication of the Native people and would be tantamount to continuing genocide and holocaust.

[01:48:04] As the First People lose their ability to practice their culture, eventually, they will cease to exist. I leave you with a rhetorical question. If and/or when you make a decision that negatively impacts the tribe, when you go home to your families, celebrate Thanksgiving, or when you look at your children, will you be honest enough to tell them that, at work, you helped to commit genocide and that you actively and willingly participated in their holocaust? I have a feeling history will, eventually, tell the truth. Where will your name be? What legacy will you leave?

November 19, 2018

Puget Sound Clean Air Agency (PSCAA)
1904 Third Avenue, Suite 105
Seattle, Washington 98101

Public Comment for Draft Supplemental Environmental Impact Statement (DSEIS), Puget Sound Energy (PSE) Liquefied Natural Gas (LNG) Project, Tacoma, Washington

I have read the DSEIS evaluating greenhouse gas (GHG) emissions for the PSE LNG project and urge PSCAA to approve the Proposed Action for construction and operation of the facility. The SEIS presents a balanced and comprehensive study of life cycle GHG emissions and concludes that that the project would significantly reduce emissions by replacing diesel and marine fuels with cleaner-burning LNG. This reduction of GHGs by up to 57,000 tonnes per year represents a tremendous environmental benefit for the Puget Sound region and beyond. The more that LNG can replace diesel and marine fuels, the greater the benefit to the environment.

As an environmental professional in the Puget Sound area for 30 years, I have had the privilege of working on many environmental projects at the Port of Tacoma. These projects not only improve the health of our environment, but also help sustain and preserve public and commercial infrastructure vital to our community. In this same way, the LNG project directly serves maritime transport services by providing cleaner-burning LNG as a fuel source. The project also provides a reliable source of natural gas for peak shaving to enhance the resiliency of the gas distribution system during periods of high demand. As a result, the LNG project is estimated to achieve annual social benefits of $5.7 million from these end uses.

The LNG project offers a viable and sustainable opportunity for substantial environmental and socioeconomic benefits that support the continued prosperity of the region. The No Action Alternative cannot achieve these same benefits, and to the contrary, would result in higher levels of GHG emissions that would continue to degrade air quality. The Proposed Action should be approved promptly to facilitate permitting and construction of the LNG facility so that the benefits of the project can be realized.

Sincerely,

Richard J. Moore

0473-1 22. General Opposition

Dear Puget Sound Clean Air Agency,

I am a resident of the north End of Tacoma, I am a Tacoma native and have lived with the ill effects of the Arsarco Smelter all my life. I remember being pregnant and eating lettuce out of my garden in Old Town. Two weeks after picking and eating greens I read a small article in the paper telling the community that their had been a burn out at Asarco releasing arsenic + lead which would concentrate in the green plants of gardens + They should not be eaten. It was too late, I had already done that. I have lived with not trusting the soil on my property & the air.

Please include this in the final supplemental environmental impact statement.

I feel that we should not have to live with the threat of air pollution or fire or explosion.

Name: Marion Morford	Phone: (253) 759-4352
Address: 3716 North Madison	Email: marionruthmorford@gmail.com

Clean air is a basic human right. Please re-do the SEIS using current models and consider whether an LNG plant is really the right, cleaner option for the tideflats of Tacoma

0474-1 22. General Opposition

Dear Puget Sound Clean Air Agency,

I am a Tacoma native and have grown up near the Asarco Smelter. I have lived with an the threat of increased risk of cancer, etc. My father had a rare form of bladder cancer associated with living near Asarco. I have had to come to grips with living in a place that is as polluted as Love Canal. Tacoma needs a clean environment future. We cannot accept any more assaults to our environment. Please enforce the highest standards for our community.

Please include this in the final supplemental environmental impact statement.

Subject: Tacoma LNG SEIS Project Comment
Date: Tuesday, October 23, 2018 12:43:14 PM

Dear Responsible Official,

Please help stop the proposed 14-story tall fracked gas tank at the Port of Tacoma! As a major project of Puget Sound Energy and Tote Marine, it would contribute significant amounts of air and water pollution to the Pacific NW. As you know, using gas and petroleum products contributes to climate chaos: the IPCC has given us a clear warning that we must urgently move away from fossil fuels, so, help stop a fracking tower.

Fracked gas is not a lesser evil. Scientists' understanding of methane's impact on the climate continues to evolve, and at every step along the way we learn that fracking allows more methane escapement than we had previously observed and that the impact of methane on the climate, particularly in the short term, is even more serious than had been previously understood.

I applaud your decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct this more rigorous analysis. Thank you. Please consider these actions:

1. Revise the analysis of the impacts of fracking in British Columbia based on recent research(1) demonstrating that methane escapement has been dramatically under-estimated.

2. Revise the "no-action alternative" to include a clean energy alternative in which PSE provides electricity not with a different source of fracked gas, but with renewable energy and energy efficiency.

3. Revise the "no-action alternative" to include the assumption that Tote Marine will achieve a 50% GHG reduction, in line with the International Maritime Agency's established goals. This reduction might alternatively be achieved by a combination of fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion or many other alternatives besides fracked Liquid Natural Gas.

This more accurate analysis will show that the project has a significant and unmitigated impact on the global climate, which
should be seen as a sufficient basis for denial of the Notice of Construction application.

Thank you for your time and consideration of these comments. Our children
deserve to inherit a planet worth living on.

Sincerely,
Donna Morin

Subject: Puget Sound Energy - LNG Facility Tacoma, Draft Supplemental Environmental Impact Statement
Date: Wednesday, October 31, 2018 3:33:57 PM

To whom it may concern,

The PSE LNG project has violated the terms of the Medicine Creek Treaty.

Fracked gas from BC is not cleaner and does not have lower rate of methane leaks. We should not take self reports from the natural gas industry as reliable evidence.

We should not be allowing more fossil fuel infrastructure to be built. This project relies on fracked gas. Fracking pollutes the air, water and soil. This project would locking us into more polluting, climate change causing, antiquated technology.

This is irresponsible.

Our beautiful deepwater port could be promoted as a whale sanctuary, which would promote clean air, science, education, tourism, etc.

No LNG. Sustainable future for the kids.

"Open letter to Puget Sound Clean Air Agency, regarding your draft report on the Tacoma LNG facility"

1. You need to go back and start over, using the best available CURRENT SCIENCE. Your draft does not account for the FULL climate impacts of fracked gas, as it is unacceptably flawed.
2. You must accept the historic treaty rights of the Puyallup Tribe.
3. I stand with the Puyallups in opposing this LNG facility for many reasons, some of which I present here:
   a) Climate impacts of leaked gas are 87 times worse than CO2 at warming the environment over a 20-year period of time. Leakage rates of 3% are very conservative estimates; consider the BC gas pipeline explosion a few weeks ago, which released natural gas into the environment.
   b) The emissions of ammonia, arsenic, cadmium, hydrogen sulfide, sulphur dioxide, and flared VOCs may include chemicals linked to birth defects, cause cancer, and damage the nervous system of humans.
   c) This facility will be subject to rising sea levels, lahars, earthquakes, and tsunamis, and in any of these incidents, is at great risk of spilling its contents of LNG.
4. This draft SEIS is incomplete in more than 10 locations in this report, where there is incomplete information, or where it is stated that there is more information needed from Puget Sound Energy Corporation. This incompleteness makes your draft report analysis unacceptable.

My organization, the Backbone Campaign, supports the testimony of the Puyallup Tribe.

It is fiscally & morally irresponsible to build new fossil fuel infrastructure at this time in Washington State.

PSE is the biggest polluter in WA State. This will make our air dirtier. We cannot afford this facility.

1725-1 12. LCA Inputs and Assumptions - Global Warming Potential Value

From: 350 Seattle
To: Public Comment
Subject: Puget Sound Energy's LNG facility
Date: Monday, November 19, 2018 8:55:35 AM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

The Clean Air Agency's analysis is based on 100-year, not 20-year, global warming potential (GWP) values. Given the IPCC report that was released last month indicating that we have 12 years to avoid climate catastrophe, the Clean Air Agency should be using the 20-year numbers, as that is the timeframe where action is needed. Using the most recent 20-year value of 96 makes LNG 150% dirtier than the "dirty fuel" it's supposed to replace.

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

PSE's fracked gas LNG facility is being built on Puyallup land without their consent. First honor the Treaties, and reject the Clean Air Permit for this dirty project! Second, with ten years to mitigate climate change, we cannot be using gas, oil or coal. Reject this permit so that we can convert to solar, wind, water and geothermal power.

Sincerely,

Nancy Mueller

Name Gaila Muir

Address or email 3724 38th Ave S, Seattle, WA 98144

I am extremely concerned the "fugitive emissions" and marine emissions the Tacoma LNG facility will produce, if allowed to proceed with its building (without essential permits). Fugitive emissions have proven to be much higher than estimated - above 10% in some areas. Since methane is much more toxic than CO^2 in its 1st 20 years, this is extremely alarming.

LNG tankers will release marine emissions, a threat to marine wildlife and to humans' hearts and lungs.

As an open-water swimmer and older adult, I see the LNG facility as both →

a personal and a community risk.
Please deny the final permits for this LNG
tremendous mistake.

Thank you —

Gaila Muir

Subject: Comment on PSE LNG Project
Date: Sunday, November 4, 2018 2:25:51 PM

I am writing to express my deep fear about the PSE LNG Project. The final permit(s) MUST be denied, and this dangerous project stopped immediately. I am a "regular citizen" who has studied this issue and who cares about the health and safety of our citizens, communities, and region.

The LNG facility is a direct threat to life for living things on land and in the water in our region. PSE's LNG facility is located on the Cascadian fault, in a zone at risk for earthquakes and tsunamis, in an area that the City of Tacoma predicts will be flooded by 2050. If the tank were to explode, the blast zone would decimate everything within three miles. A leak into Puget Sound of the coolant necessary to run the plant would literally freeze sea life.

We must also consider the pipelines that carry methane gas to the PSE LNG Project. Methane gas escapes during extraction and transportation. Methane gas is three times more potent in producing the greenhouse effect than the diesel gas currently used for shipping. "Fugitive" and marine leaks and emissions are inevitable, and currently occurring with existing pipelines. Methane is 86 times worse than carbon dioxide as a greenhouse gas over a 20-year period. That is terrible news for air quality and safety.

The Puget Sound Clean Air Agency MUST deny any further permits, and put an immediate halt to this for-profit, Australian-owned project.

Thank you.

Sincerely, Guila Muir

Dear Puget Sound Clean Air Agency,

I am writing regarding the Puget Sound Energy LNG gas project that is proposed (and currently being built, unpermitted!) in Tacoma. Thank you for undertaking this review process; as the recently-released IPCC report indicates, it is critical that we fully understand the greenhouse gas implications of any proposed energy infrastructure projects, and that we must act boldly to block fossil fuel projects that will further imperil our climate.

There are innumerable issues with the draft SEIS as written. Perhaps most importantly, the SEIS does not use the appropriate Global Warming Potential (GWP) values for methane. The report relies on the 100-year values listed in the 2007 IPCC report (25), whereas the 2013 IPCC report updated this value to 28, and a more recent scientific paper (also by the IPCC authors), concludes the value is actually 32. Using the updated GWP figures would dramatically change the conclusions reached in the SEIS.

Furthermore, it is actually inappropriate to be using 100 year values at all. Given the urgency of the climate crisis (the IPCC report, typically a fairly conservative assessment, concludes that we have little over a decade to get our greenhouse gases to dramatically reduce our greenhouse gas emissions), it is not reasonable to be using 100-year GWP values at all. Methane is a far more potent greenhouse gas over a shorter time frame. Using the out-dated IPCC report, the 20-year GWP of methane is 72, and the value is 86 in the 2013 IPCC report. Obviously, using these more appropriate values would completely change the conclusions reached in the SEIS.

I respectfully request that the SEIS be revised to reflect the best available science and that a new comment period be opened following this revision.

Sincerely,

Dr. Katherine Muller

Dear Puget Sound Clean Air Agency,

I am writing to you regarding the Puget Sound Energy LNG gas project proposed for construction in Tacoma. I thank you for undertaking this review process; as the recently-released IPCC report indicates, it is critical that we fully understand the greenhouse gas implications of any proposed energy infrastructure projects, and that we must act boldly to block fossil fuel projects that will further imperil our climate.

The current draft SEIS is incomplete and relies on faulty assumptions. One of the assumptions is that Puget LNG will receive greenhouse gas reduction credits for additional maritime customers who don't yet exist. That's a little bit like my going to buy a car and saying "I'd like to take the car now and I'll pay for it later because I think I can probably get a job in the future. Do you think that the car salesman would let me leave the lot with a new car on the basis of an expectation that I could pay for it with my hypothetical new job? I don't think so.

The SEIS also assumes that the gas would come from British Columbia and that fracked gas from BC has much lower leakage rates than gas sourced from other areas. Most estimates of leakage come from the fossil fuel companies themselves and recent analyses from 2017 and 2018 indicate that most fracked gas wells are significantly under-reporting their methane leakage numbers. Thus, the BC leakage values used are not the most current or most accurate values. Furthermore, even if BC did have substantially lower methane leakage rates, there is no way to guarantee (or require) that the project utilize fracked gas from a specific source.

I respectfully request that the SEIS be revised to utilize more realistic assumptions and that a new comment period be opened following this revision.

Sincerely,

Dr. Katherine Muller

ATTN: Public Comment on DSEIS, PSE LNG Project
Dear Puget Sound Clean Air Agency,
I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to deny the permit because the Draft Supplemental Environmental Impact Statement does not accurately represent the true greenhouse gas emission profile of the project. I have the following specific concerns:

RECEIVED
NOV 19 2018
Puget Sound Clean Air Agency

The Global Warming Potential values that were used in this draft supplemental EIS are not the latest accepted values. Using these outdated values (25 for 100 yr GWP) vs. the currently accepted values (32 for 100 GWP) greatly undervalues the global warming implications of this project. ~~Plus~~ This is a critical flaw (Check here to continue comments on the other side.)

In addition, a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required and adequate consultation with the Puyallup Tribe and other neighbors of the project should be conducted.

To: Public Comment
Subject: Tacoma Liquified Natural Gas Project DSEIS--Public Comment
Date: Tuesday, October 9, 2018 10:51:31 AM

The DSEIS uses either antiquated data or incomplete data to make the case that natural gas from BC is acceptable.

The 100 year residence time in the atmosphere for methane emissions is terribly out-of-date. The IPCC AR4 used it eleven-going-on-twelve years ago. That was when climate change was off in the future. Since then the IPCC AR5 has also offered more reasonable time frames such as 20 years, 12 years, and even 10 years. If 10 years is used then methane is over 100 times worse than CO2 rather than 25 times worse as the DSEIS calculates. In fact, the DEIS doesn't even upgrade the 100 year figure to the current 33 times worse of the IPCC AR5 of 2013! In fact, there is no discussion of the reasonableness of the 10, 12, or 20 year time frames or the possibilities of coordinating these time frames with the 100 year CO2 metric.

One can even question whether the 100 year time frame for CO2 is even appropriate since only one-third of its effects happen within 100 years and a lot of them extend out 350 years. The IPCC current position is that methane is one-half the problem we have over current short term time frames. If we really want to do something about climate change we should not be permitting any more natural gas infrastructure. Over a 10 year time frame we can incur very serious feedback loops of loss of albedo in the arctic, release of methane from clathrates in shallow arctic seas, and release of methane from warming permafrost. It doesn't make any sense to extend out measuring effects for a century even considering The Project has a 40 year life span. It probably will become a stranded asset within twenty years as the entire planet transitions to solar where efficiencies are projected to double along with battery storage. Why not measure effects at 1,000 years and do away with all effects?

The second questionable data area concerns the BC-sourced natural gas. How do we know their supposed leakage rate is only .26%? Because BC says so? The Brandt study is not well discussed. Lots of non-quantified suppositions are thrown around like 'newer wells' but did anybody do an airborne independent study? Was the data just based on cherry-picked sites by industry? It is very curious that the BC leakage is roughly the same whether using conventional gas wells or fracked wells in contrast to US. US leakage data has also varied greatly over time and methodology.

In fact, "Data on sources of natural gas has been requested" is suspicious as foot-dragging. Supposedly it will fall somewhere around .26% but the whole murky data picture of BC is a real serious problem when trying to accurately decide whether diesel use is more polluting than natural gas or not. The DSEIS admits US natural gas is worse because of the leakage.

Has any research been done on none-fossil fuel replacements for diesel?

We need a way more rigorous look at the BC sources and more rigorous and up-to-date climate calculations before permitting more fossil fuel infrastructure. Climate change and its feedback loops are happening as we speak. We risk catastrophic feed-back loops and a 100 year time frame is not appropriate.

I live within 1 mile of the LNG Tank. I think there should have given more thought into placing this tank there. + Planning

when we want to remodel or construct a home we are required to obtain approved permits. Not sure how they were able to construct without proper permits. Money should not override rule of law and treaties.

Would also like to see more come out on the alternatives to LNG. All we hear about is how LNG is the only way to clean air and reducing pollutants.

If this doesn't get stopped we will have no choice but sell our house and move further away.

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

I live less than a mile from the site of the PSE Storage facility. I have over 20 years experience in Hazardous Materials as a Haz Mat Technician for South King Fire and Rescue. I have been highly trained to respond to emergencies at storage facilities and dispersal sites, which includes Natural Gas. I am very concerned due to the size and the proximity to housing for the PSE facility.

I also am concerned with the statements made by PSE as to the reduction in airborne pollution by having ships convert to Natural Gas.

The newest research that is being done show that Fracted Natural Gas production releases many times the reported amount of Methane. This Methane is many times more destructive in the short term than Carbon Dioxide to Global Warming. PSE has also been bombarding the airwaves with very misleading television commercials. The facts are not being portrayed accurately. There are many shippers that meet the current regulations using bunker fuel, the addition of scrubbers cleans up the emissions and actually releases fewer of the most dangerous types of gases that are the most damaging to Global Warming.

First of all, I want to thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. With our climate in grave peril, as emphatically stated in the latest IPCC report, your review of the greenhouse gas impacts of the natural gas used in this project couldn't be more important. Those scientists make clear that we cannot, and must not, allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.

My first concern with this draft SEIS is that it's not complete. There are several sections that are missing data and so we can not accurately assess the quality of the report and understand how certain conclusions are reached. Because of that, I request that you complete this report, reissue it, and then reset the public comment period so that we have time to review the completed report thoroughly.

With that said, I am aware of several issues with the current draft report you issued on October 8th. It is my belief that if these issues are given proper attention and addressed with best available science, it will show that the marginal improvements in emissions the study claims will disappear and the project will in fact be worse for the climate than doing nothing at all.

Here are some of the issues as I understand them:

- The SEIS is not using the best available science for the Global Warming Potential (GWP) of methane. It uses the 100-year GWP of methane and not the 20-year value which is much more relevant given the urgency in addressing the climate crisis. The appropriate 20-year GWP value to use is 96.
- This facility is projected to have a 40 year lifespan, so why does the report project out to 100 years, which is 90 years beyond the time we need to have taken decisive action?
- The SEIS claims emissions benefits from customers that Puget Sound Energy simply does not have. According to PSE and the City of Tacoma, the only maritime customer is TOTE with its two vessels which have already delayed their conversion to consume LNG. Securing new customers (there are only just over 100 LNG ships in operation out of a worldwide fleet of 90,000) as well as the additional permitting could take years and is not guaranteed.
- The SEIS says that emissions will only be reduced if the natural gas comes from Canada, because leakage rates are reportedly lower there than in the US. Shockingly, most leakage rates were self-reported by the fossil fuel industry based on models and recent measurements taken in the field have shown that leakage rates are much much worse.
- How can it be guaranteed that PSE is sourcing its gas from BC anyway? Their recent filings show they relied on gas from BC, Alberta, and the US. And with the recent pipeline explosion in BC that interrupted PSE's supply, we know it's not always available.
- When ships use any fuel, a certain percentage of it escapes without combusting through the exhaust system and into the atmosphere. This is known as slippage and the SEIS uses a lower rate than is considered best practice.

Thanks again for initiating this crucially important review of this facility and I hope that you will take best available science into consideration when revising this draft SEIS.

Puget Sound Clean Air Agency,

PSE has shown its incompetence and its history needs to be included in the FEIS. Here are a few examples:

-You (the PSCAA) issued a notice of violation because PSE started construction without going through the agency's process. These small penalties do not affect big polluters like PSE.
-PSE did not evaluate tank safety & risks, only looked at small pipeline leaks
-PSE "safety recommendation" to handle leaks are for staff to wrap towels around leaks. LNG is
minus 260 and causes cryogenic burns or even death when in contact with the human body
-In 2016, a PSE gas line exploded and destroyed the Greenwood neighborhood in Seattle. They were fined $2,750,000 but only had to pay $1,500,000. PSE has not taken care of the community after the explosion. How will they manage a dangerous situation with the LNG facility? Since they are a Limited Liability Corporation, they will most likely pack up their things and leave since they won't be held liable.
-PSE has constructed the LNG without the proper permits. How can we trust them to uphold the conditions of the air permit? They have completely disregarded the public including the ratepayers.

I hope the PSCAA grows a spine and does not allow this to go on any longer.

To whom concerns,

I am very disappointed that the PSCAA did not consult the Puyallup tribe about the LNG plant. It is in direct violation to the Medicine Creek Treaty of 1854. The LNG project will be detrimental to the Puyallup Tribe by putting their treaty rights and community at risk. Treaty rights have more authority than any other governing body and they have been ignored throughout this whole process. I don't have much faith that the PSCAA will take what we say into account after all of the corruption I have seen in the last couple of years with this LNG plant, but I hope the PSCAA does the right thing and respect the Original People of the land by including the Puyallup Tribe in the SEIS.

On a personal note, I am part Native. The Great Sioux Nation to be specific, from a reservation in Eastern Montana, close to the area where some of the fracking will take place in North Dakota. In fact my reservation is just across the Missouri river from the fracking areas. As a result, I am getting harmed two fold because I am also a Tacoma resident and taxpayer.

Date: Saturday, October 27, 2018 1:17:15 PM

Dear PSCAA,

When I found out about the public hearing for the LNG facility, I wanted to know more about the Puget Sound Clean Air Agency. I went on your website and looked at the 2014-2020 Strategic Plan and saw a list of “commitments”. As you know, they are:
-Be good and wise stewards of the resources you give us
-Defend the future
-Prevent and reduce risk to you by upholding and enforcing the law
-Protect you from air pollution
-Tell you what’s in the air you are breathing

If you approve the LNG facility, you will be doing the complete opposite for each one of these commitments and you will be deemed untrustworthy to residents.

Subject: LNG facility and environmental racism (public comment for SEIS)
Date: Friday, October 26, 2018 1:48:09 PM

Dear PSCAA,

This is a public comment for the LNG facility at the Port of Tacoma. My concern is on environmental justice. The communities most impacted by fracking and LNG plants are communities of color. This includes from the extraction site to the final destination; numerous Tribes in B.C. and North Dakota (extraction sites), the Puyallup Tribe and the Northwest Detention Center aka immigration prison (final destination).

At public information meetings in 2017, the Puget Sound Air Agency informed us that the facility would release ammonia, arsenic, cadmium, hydrogen sulfide, and sulfur dioxide. LNG facilities threaten human and wildlife health by destroying air quality. The emissions units in this LNG facility will have a ground flare and vaporizer unit that will emit VOCs which have been linked to birth defects, cancer, and causing damage to the nervous system.

How can the PSCAA in good conscience approve the LNG facility. Please do not put anyone at risk.

Subject: Regarding LNG (public comment)
Date: Tuesday, October 23, 2018 9:50:55 PM

Dear PSCAA,

Have you heard of Talequah? She is a 20-year-old female orca who gave birth to a female calf that died after half an hour. While many orca mothers have been seen carrying the bodies of their dead calves for a day or so, Tahlequah did so for 17 days showing humanity the damage we have done. I weeped for them.

In August, biologists tried to help an emaciated and ailing three year-old killer whale (born December 2014), J50 also known as Scarlet, of the critically endangered Southern Resident population. J50 appeared lethargic. Scientists observing her agreed that she was in poor condition and may not survive. Responders from NOAA Fisheries and partner organizations were exploring options ranging from no intervention to providing medical treatment, potentially delivered in a live Chinook salmon, which has never before been attempted in the wild. J50 has not been seen since September 13th.

New fossil fuel projects have absolutely no business in such a fragile and diverse area like the Salish Sea, especially when the effects of these projects on the wildlife is not included in the SEIS. I am requesting that the local wildlife including endangered species like orcas, be included in the FEIS. They are a part of the web of life and this is not some hippy-dippy philosophy, this is science and truth.

From: Roxann Murray
To: Public Comment
Subject: Regarding LNG public comment
Date: Wednesday, October 24, 2018 7:43:29 PM

To whom it concerns,

I am not understanding why the LNG facility has a 40 year plan even though the United Nations Intergovernmental Panel on Climate Change reports that we must change our fuels in the next 12 years or face severe consequences (where hurricanes are just seen as the weather and all the polar bears are extinct because there is no more ice in the Arctic). The LNG plant will speed up methane emissions and also lock Washington State into a 40 year plan, well beyond the 12 years we have to clean up our act. Also, this facility will be impacted by rising sea levels due to climate change at the Port of Tacoma.

I encourage you to read the IPCC report here:

Dear PSCAA,

This is concerning the LNG facility in Tacoma. As a Tacoma resident and taxpayer, I request that the SEIS includes an analysis of cleaner peak shaving alternatives and look into where all of this fracked gas is going to be used.

To whom it concerns,

The SEIS for the fracked gas facility should include the effects from the extraction site to the production site. This LNG facility does not stop at Tacoma. For example, the current analysis does not include the effects of using and transporting sand/water for the fracking wells. 2-8 million gallons of water may be used to frack a well. Some wells consume much more. A well may be fracked multiple times, with each frack increasing the chances of chemical leakage into the soil and local water sources. The SEIS also does not include GHG emissions from diesel trucks that are used to transport water and sand to the wells.

Hello - I am writing on behalf of my students and neighbors. I have been on the faculty at UW Tacoma for the past 15 years. I teach ecological art and my students and I are very aware of the superfund sites in the Port of Tacoma as well as the contamination of the water of Commencement Bay and the soil in the area.

We are very concerned about the proposed LNG refinery financed by the Australian multi-national corporation called Puget Sound Energy. We don't think that they care about our local community, and are willing to spend $$$$ to convince us that this project is safe. It is not safe. Fracked gas is not safe. LNG is not safe. There have been explosions at many LNG refineries across the nation. This is a very dangerous project and at UWT we are in the "blast zone." We are already contending with unhealthful air many days per year, and having this refinery in the Port will not improved things in any way. The risks are far too great to allow this refinery to go online.

When I try to teach my students about the potential to heal superfund sites and develop remediation projects to make our community healthier and happier, the fact that city authorities are inviting more fossil fuel companies to contaminate our Port makes no sense. Our students experience a cognitive dissonance. It makes them feel that no one cares about their safety or the health of their families.

Please act with caution and do not approve PSE's permit. We need a fossil fuel free port filled with remediation projects, truly green energy and permaculture design. All of the latter will create more jobs and more community health.

THANKS!

Sincerely,

Beverly Naidus
Associate Professor of Interdisciplinary Arts
UW Tacoma

1242-1 23. General Support

Steve: Thank you. Next up is Abigail Castle. Abigail? Lynn Fitz Hugh? Lynn? Meredith Neal?

Meredith: Good evening. My name is Meredith Neal, and I am the director of the Manufacturing Industrial Council for the South Sound. I encourage you to approve the air permit for the Tacoma liquid natural gas facility.

[03:49:00] We all want a cleaner future. I live here in Tacoma, and I'm raising my kids here. And I want to make sure that my children and all of our children grow up in a place that is healthy and vibrant. LNG is an incrementally better step towards a cleaner future. Bunker fuel is a dirty fuel that is terrible for local air quality releasing high particular matter, sulfur, and nitrogen oxides into the air. Commercial vessels of all sizes are looking for a cleaner alternative. The fuel of choice is LNG. We have a wonderful resource here with the Port of Tacoma with over 40,000 jobs, good family wage jobs.

We need to make sure that our port remains competitive. And having the preferred fuel source available is an important step in keeping global trade lines open. We recognize a shared responsibility for a clean community. Industry in the tide flats continues to lead by introducing clean energy options and transforming old materials into new products. Change takes time and requires infrastructure and demand for emerging options.

[03:50:03] There is demand for LNG from the maritime industry. Please allow this facility to open and start fueling. I want a region with opportunity for all. A vibrant tide flats area with good living wage jobs that is moving towards sustainability is the key to shared prosperity in our region. I encourage you to issue the air permit without delay and improve our local air quality. Thank you.

Steve: Okay. Let me identify the next group after the first five coming up. It's Nanette Reetz, Seth Storset, Melissa Malott, Nickie Walters, and Elisabeth Parker.

Subject: Puget Sound Energy's LNG facility
Date: Thursday, November 15, 2018 9:27:46 PM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

PSE's LNG project increases our greenhouse gas emissions and fuels climate change - which means more wildfires and smoke for our region. The resulting air pollution makes us sick and leads to higher rates of asthma attacks, heart problems and cancer in our communities.

Sincerely,

Erika Nedderman
ehnedderman@gmail.com
98117

Steve: Thank you.

[06:15:00] Next up is Ben Nelson.

Ben: Thanks for letting me have a second up here to chat about this, too. My name is Ben Nelson. I'm 27 years old. I grew up in Portland, Oregon. I spent four years of my time in Eugene going to school down there. And, at the forefront of education, for me, was always innovation and environment. And it's funny that we get here today, and that's exactly what we're looking at. My last six years in Tacoma, frankly, started out a little rocky. It did have the Tacoma aroma, the place that smelled kind of funny between Portland and Seattle. That's what I grew up knowing it as. And over the last six years, I've learned to call this home.

It's everything that I've wanted in a city, and it's showing innovation. It is where I want to be. It is where I want to raise a family. I don't want to run back to Portland. I don't want to be next to where my family is. And a lot of that has to do with the innovation that Tacoma has shown, the gentrification that's taken place here, over the last number of years.

[06:16:04] And a lot of that TOTE has shown as well. And I don't claim to be a scientist, but it's easy to see the facts. And people have run through them a number of times tonight, but 100% reduction in SOx, 99% reduction in particular matter, the smoke that we're breathing, 90% reduction in nitrogen oxides, 13.5% reduction in greenhouse gases. Again, I don't claim to be a scientist, but I do claim to know how to read and to vet what you guys have put out there in the EIS. Maybe I am dyslexic.

Nonetheless, in conclusion, I speak in full support of the LNG plant and innovation that's been shown by PSE, the initiative to move forward and be a trendsetter in the industry by TOTE. And, frankly, just the continued growth of Tacoma. I'm proud to be here. Thank you guys very much.

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

I am writing to urge reconsideration of the SEIS for Puget sound Energy's fracked gas project in Tacoma.

The draft SEIS is flawed and thus highly misleading. It uses an outdated methane global warming potential (GWP) value – the UN's 2007 value of 25 instead of the 2016 value of 32. The SEIS fails to take into account that methane is significantly more potent in the near-term (the analysis only looks at long term impact). The SEIS also fails to take into account that the burning, production, processing, storage, transmission, and distribution of fracked gas causes significant leakage of methane into the atmosphere. Including likely methane leaks in the analysis shows fracked gas to have climate impacts that rival those of coal.

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Puget Sound Clean Air Agency,

I'm writing to voice my concern with the October 8 draft report on the Puget Sound Energy Liquefied Natural Gas project proposed for Tacoma. I urge you to consider, when revising the draft SEIS, the following important technical deficiencies that have been pointed out by analysts –
1. It's not possible to guarantee that PSE will source all of its natural gas from Canada, where leakage rates are reportedly lower.
2. The report uses a 100 year span for its estimates, even though the lifespan of the facility is supposed to be 40 years.
3. The report should use the 20 year value for the methane's GWP rather than the 100 year value. 20 year is by far the more relevant time frame given the absolute urgency of acting on climate change.

Correcting these deficiencies changes the outcome of the analysis, showing that the project will indeed be a significant burden for our climate, and one that we can NOT afford.

The IPCC's most recent report is both alarming and compelling. The panel scientists are unequivocal that we must transition immediately to renewable, carbon-free energy sources. We CAN NOT afford to further the use of fossil fuels by continuing to build infrastructure such as the Tacoma project and stoke markets around the world. It is a human health imperative. It's an environmental imperative. And it's a moral imperative. We CAN NOT continue to ruin the world that has to sustain our children.

Hope U.S. can be like Germany and create 400 thousand (400,000) green jobs in the green renewable energy industries:

Solar panels manufacturing;
tidal turbine manufacturing;
wind turbine manufacturing;
geothermal development;
algae growing;
AND the maintenance of all the above.

Carole: Thank you. The next set of five is Pamela Ng, Derek Patches, Stuart Zimmerman, Dr. Lisa Johnson, and Mary Paynter. So, Pamela Ng is the first one. And two minutes, please.

Pamela: I wasn't expecting I was the first one. I probably won't take two minutes.

[01:52:00] I am a citizen of the US and on earth, actually. And I probably won't live long enough to see how the earth, the environment has been damaged. But I would like to see the Clean Air Agency take a step back, instead of just concentrating on clean air, think about the clean environment. And, actually, the natural gas that's fracked is damaging the entire environment, instead of just clean air. So, before we even breathe in the methane, breathe in the small particulates in the air that's been burned, the water would be bad, in the fracking process.

[01:53:00] So, I would like to see the Clean Air Agency take a step back and think about the whole environment. And I'm so glad the corporations have actually admitted that they are putting in a lot of money and investment into this project, or their projects. But I would like to think that they can take a different focus into thinking about other renewable resources, other renewable energies, so they can put in money, investment in solar energy, tidal turbines, wind turbines, and all of that. But they probably lack the determination. So, maybe the government can give them that determination and give them that push, the jolt in doing that.

[01:54:00] Thank you.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

To the Puget Sound Clean Air Agency,
The latest IPCC report emphasizes that building any new fossil fuel infrastructure is an unconscionable threat to our homes and families. Yours and mine. I used to worry about a retirement plan. Now I'll be happy to settle for a livable retirement planet.
Considering that, thank you for reviewing the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. While requiring an SEIS was a good idea, the actual SEIS produced is woefully lacking in scientific rigor, and needs to be updated accordingly

Here are some of the scientific issues with the SEIS as I understand them:
The SEIS used the 100-year Global Warming Potential (GWP) of methane, when the 20-year value is much more relevant given the urgency in addressing the climate crisis. The appropriate 20-year GWP value to use is 96.
The facility is projected to have a 40 year lifespan, so there is no legitimate reason to average out the impact over 100 years.
The SEIS claims emissions benefits from customers that Puget Sound Energy does not have and is unlikely to get. According to PSE and the City of Tacoma, the only maritime customer is TOTE with its two vessels which have already delayed their conversion to consume LNG. In a worldwide fleet of 90,000 ships, considerably less than 1% use LNG. The timing and extent of further LNG conversions is uncertain at best.
The SEIS should emphasize clearly that the plant will increase emissions when any natural gas is sourced from the US--particularly considering that recent measurements taken in the field have shown that leakage rates are much much worse in the US than in Canada. PSE's recent filings show they relied on gas from BC, Alberta, and the US—with no provisions to exclude gas from the US. With the recent pipeline explosion in BC that interrupted PSE's supply, Canadian gas is not always available.
The SEIS uses a lower rate for fuel slippage in ships, than is considered best practice. But then I suppose since PSE made up imaginary ships, why not imagine unrealistically clean and efficient ships?

Beyond these scientific shortcomings, my other issues with the project include the legal and moral risks related to its siting on Puyallup Tribal lands without consent; taxpayer and ratepayer subsidization, and safety issues at multiple scales (local, regional, global).
Thanks again for initiating this crucially important review of this facility. Please use the best available science and risk management when revising this draft SEIS.
Thank you,

Few people are fooled by the constantly-running ad that tries to contrasts “dirty bunker fuel” with “clean-burning LNG”. Yes, if all goes right (no accidents with the LNG for at least a millennium, long after we are all dead but our descendants are not), the actual burning of the fuel is indeed “cleaner” … BUT HOW DID WE GET THAT FUEL?

Luckily for us, our Washington State geological structure does not include oil trapped in shale rock buried deep underground, so we can pretend that what takes place elsewhere on our planet, in our country, doesn’t affect us - because we don’t see it daily. Permanent poisoning of the water table. Earth turned into pools and pits of deadly poisons. Air so toxic people must move far away from their family’s homestead (at whose expense?). Animals - both pets and food sources - poisoned. No healing possible for thousands of years. And that’s only the extraction process of hydraulic fracturing (“fracking”). Transporting and storage? Industry is blissfully childlike in thinking of consequences in terms of tiny little increments of time (“Should be safe for the next 20 years…”)

What’s utterly lacking in this oh-so-limited focus on immediate bottom-line financial benefits is an interconnected, long-range, planetary scale of judgment. If our descendants are still alive 500 years from now, what will their world, their health, their hopes for the future be like? If deciders today honestly don’t care, because they will be long dead by that time, then acknowledge this in your ads! Juxtapose those shots of Commencement Bay, with blue skies in the horizon, with shots of some Wyoming cesspool of horrors, with abandoned farmhouses and ghastly animal corpses all affected by the fracking process. Only then can you contextualize the true cost of ending the burning of “dirty bunker fuel”. It is time to prioritize non-deadly, truly long-range, planetary scale alternatives!

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Dear Puget Sound Clean Air Agency,

Thank you for providing this opportunity to comment on the life cycle environmental impacts of the proposed Puget Sound Energy (PSE) Liquefied Natural Gas (LNG) project in Tacoma. As you're aware, the recent Intergovernmental Panel on Climate Change (IPCC) report gives our global economy 12 years to change our energy infrastructure (among others) to avoid the most catastrophic effects of climate change. Your willingness to examine the impacts of natural gas on the climate during this critical phase is commendable.

As others have called out, there are some issues with your draft report from October 8th. First is the issue of methane leakage. The report claims that all gas for the project will come from British Columbia, and that gas from BC is "cleaner" than from other sources due to lower rates of leakage. However, PSE's own filings indicate that gas will also come from Alberta and various sources in the United States. Even if the assumption about BC gas being cleaner were true, BC wouldn't be the sole source of gas. Beyond that, the given rate of leakage for BC gas was provided by industry reports instead of by impartial analysts. Correct estimates of methane leakage are significantly higher, and it is critical that accurate estimates are used.

Second, the report uses the 100-year Global Warming Potential (GWP) value for methane. The 20-year value would be far more relevant given both the narrow 12-year window for action recommended by the IPCC and given the lifespan of methane in the atmosphere. Methane will have over 80 times as much of an impact on climate change as carbon during this critical 12-year time. Although it will decay faster than carbon in the atmosphere, that will happen long after we're able to stop the worst predictions for the climate. Please use the more relevant 20-year GWP value.

On a more personal note... I grew up in the Puget Sound area and still visit frequently. PSE was my energy provider for many, many years. It is difficult to watch the northwest face fires fueled by climate change, to see people walking down the streets with face masks to try and stave off the negative health effects of the smoke. The fact that PSE is willing to contribute to this crisis, to bank on an energy source that is helping blanket the northwest in smoke, is deeply saddening. At the very least, PSE owes the communities they'll be affecting an accurate estimate of their impacts.

Thank you again for this opportunity to comment.

Sincerely,
Kayleigh O'Hara

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

It must take a particularly virulent sort of psychopath to steal the future from one's own grandchildren. No one who is honest about it, who has half a brain, an ounce of integrity and even a smidgen of education in science, can any longer deny that climate change is here, that it is caused by humans stupidly dumping greenhouse gasses into the atmosphere, that it is already costing us billions of dollars and innocent lives and creating climate refugees right here in the U.S.A. and in the Middle East, and contributing to our ongoing, accelerating mass extinction. You don't have to study much paleontology to realize that we—you—are trying to recreate the End Permian mass extinction, in which 90% of everything died out, dumping CO2 and methane into the atmo until both ends of the planet melt and rot and belch megatons of methane, in an exponentially self-reinforcing feedback loop that can shoot the temperature of the planet up five degrees or more practically overnight—and that we will not be able to stop once it is well started. And it is already started. That you in the fossil fuel industry would knowingly condemn you own children or grandchildren to misery and death and the human race to possible extinction just to line your own pockets a little longer makes yours the worst crimes against humanity in the long sad history of crimes against humanity.

The deliberate flaws in your SEIS are obvious. You deliberately used obsolete numbers for the global warming potential of methane, deliberately underestimated the amount you leak to atmosphere—much of it bubbling up through and destroying groundwater resources on the way—and overestimated the number of customers for your LNG. You are ignoring the treaty rights of the Puyallup Tribe, the harm you are doing to the native peoples of British Columbia, and the poisons--ammonia, arsenic, cadmium, hydrogen sulfide, sulfur dioxide—you will dump into the Seattle-Tacoma airshed and into already-moribund Puget Sound. Like the Republicans in congress you have bribed out of any integrity they ever had, you will lie, cheat, and steal to go from filthy rich to filthier. I want the lot of you, the entire fossil-fuel industry, prosecuted for that.

By eminent domain if nothing else, the fossil fuels under this land belong to the people. You steal them at 12 cents on the dollar, suck them out of the ground and sell them off to China AFAP, inefficiently and wastefully to keep it cheap, knowing that you are accelerating global warming like pumping gasoline on a high-rise fire and knowing full well what the consequences for the future of the human race will be. You—the fossil fuel industry—squander these the people's resources deliberately, to bring back scarcity and high prices, from which you profit more than from the current glut; and some of you to bring back war for other people's oil, from which you profit far more, at taxpayer expense. We have not forgotten Dick

Cheney and Haliburton and millions of meals not served.

I can’t imagine being so completely selfish. And I am tired of living in a world run by psychopaths. Psychopathy may be at least partly genetic. Maybe there is a key in that to weeding it out of the human gene pool. If we survive you long enough.

Subject: Tacoma LNG SEIS Project Comment
Date: Sunday, October 21, 2018 12:54:41 PM

Dear Responsible Official,

Puget Sound Energy and Tote Marine can NOT bring a clean energy future by continuing to use fossil fuels, with all their catastrophically bad impacts. This proposed LNG project is another step toward climate chaos at a moment when the IPCC has given us a clear warning that we must urgently move away from fossil fuels.

Fracked gas is not a lesser evil. Scientists' understanding of methane's impact on the climate continues to evolve, and at every step along the way we learn that fracking allows more methane escapement than we had previously observed and that the impact of methane on the climate, particularly in the short term, is even more serious than had been previously understood.

I applaud your decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct this more rigorous analysis. Thank you.

I urge you to revise the analysis to account for the following:

1. Methane should be counted as 86 times more potent than CO2 based on the current IPCC analysis (AR5 rather than AR4) considering a 20 year timeframe (rather than the 100-year).

2. Revise the analysis of the impacts of fracking in British Columbia based on recent research(1) demonstrating that methane escapement has been dramatically under-estimated.

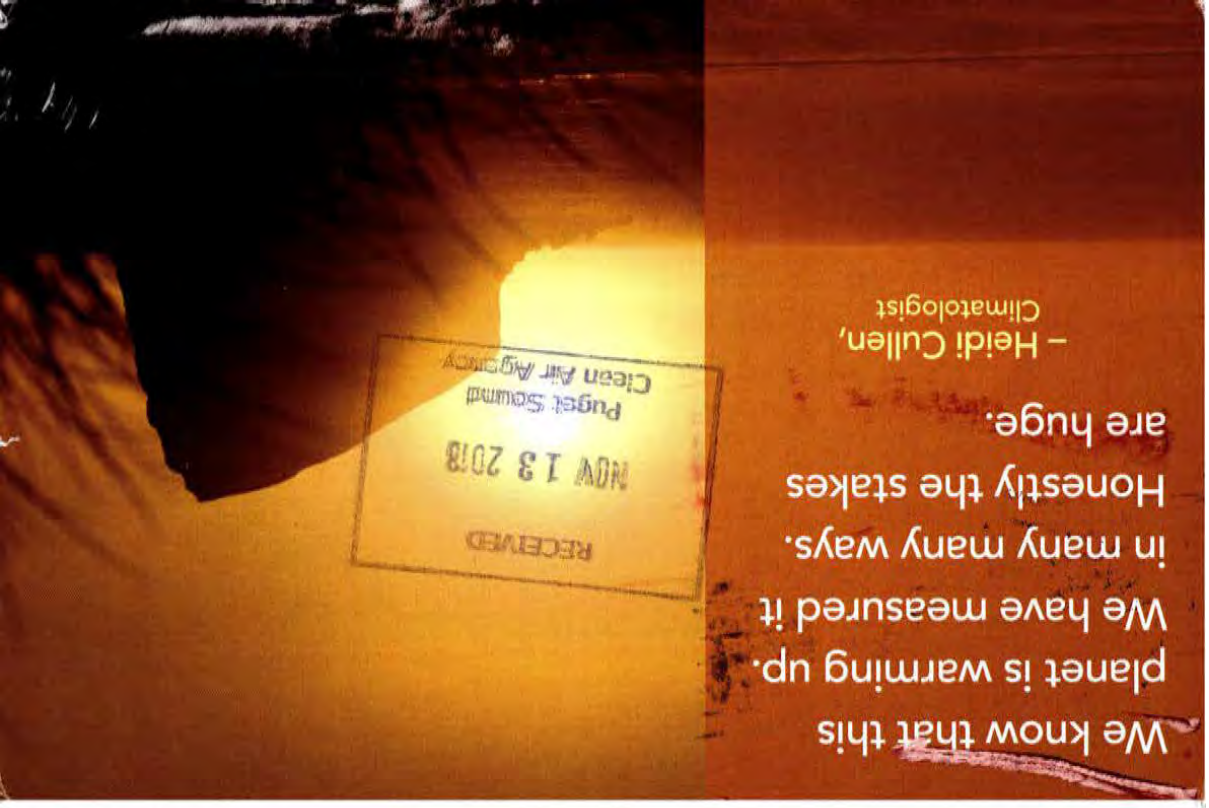
3. Revise the "no-action alternative" to include a clean energy alternative in which PSE provides electricity not with a different source of fracked gas, but with renewable energy and energy efficiency.

4. Revise the "no-action alternative" to include the assumption that Tote Marine will achieve a 50% GHG reduction, in line with the International Maritime Agency's established goals.

This reduction might alternatively be achieved by a combination of fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion or many other alternatives besides fracked LNG.(2)

For clean local emissions requirements, Tote Marine can achieve virtually all of the localized lower-particulate and lower SOx and NOx benefits claimed for LNG propulsion by opting for low-sulfur marine gas oil over heavy fuel oil, and installing selective catalytic reducers and diesel particulate filters.(3)

5. This more accurate analysis will show that the project has a significant and unmitigated impact on the global climate, which
should be seen as a sufficient basis for denial of the Notice of Construction application.



Thank you for your time and consideration of these comments.

Carole: Thank you. Stacy Oaks?

[02:28:00]

Stacy: Hello. My name is Stacy Oaks. I'm a wife, a sister, daughter, an auntie, and a grandmother. I've been blessed to live along the Salish Sea my entire life. I'm a water protector and an organizer with 350 Seattle. I want to first acknowledge because it's really important that we are standing here today on the land of the Puyallup Nation, on land that they have cared for since time immemorial and that they still care for today. The bones and the souls of their ancestors are in everything that we see and touch today.

And it's really sad that we are standing here debating the negative effects of a project that they have said they don't want here. I want to officially say that, on behalf of 350 Seattle, we incorporate by reference the comments of the Puyallup Tribe and agree with their statements.

[02:29:06] And I want to use the rest of my time to talk to you in my official capacity as an auntie and a grandmother. We only have a handful of years left. And I think you all know that, like know that. And so, if we don't do our part right now, the young ones in our lives today don't even get a chance. The door will be shut. We're beyond them doing what we should be doing right now. So, with that in mind, thinking of them, hold them in your thoughts the entire time you're working on this project. Every decision you make should be from here. Every one. Are you going to be able to look them in the eye in 10 years and say I did everything I could?

[02:30:02] Or are you going to have to say that you let corporations self-report and that you didn't even use best available science because of technicalities? What will you do with your handful of years?

Subject: Puget Sound Energy's LNG facility
Date: Sunday, November 18, 2018 7:56:47 PM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

The Clean Air Agency's analysis is based on 100-year, not 20-year, global warming potential (GWP) values. Given the IPCC report that was released last month indicating that we have 12 years to avoid climate catastrophe, the Clean Air Agency should be using the 20-year numbers, as that is the timeframe where action is needed. Using the most recent 20-year value of 96 makes LNG 150% dirtier than the "dirty fuel" it's supposed to replace.

Our children's future is on the line - using old data is absolutely criminal with the stakes so high.

Sincerely,

Stacy Oaks

Subject: Puget Sound Energy's LNG facility
Date: Thursday, November 15, 2018 9:23:47 AM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

PSE's LNG project increases our greenhouse gas emissions and fuels climate change - which means more wildfires and smoke for our region. The resulting air pollution makes us sick and leads to higher rates of asthma attacks, heart problems and cancer in our communities.

We cannot fix one air problem by causing another.

Please do everything in your power to look beyond the industry tainted data presented in the draft SEIS.

Sincerely,

Stacy Oaks

Subject: An appeal for common sense regarding Tacoma LNG SEIS
Date: Wednesday, November 21, 2018 8:17:21 PM

Dear Puget Sound Clean Air Agency,

As a child psychologist and trauma specialist I appeal the you to prevent the Tacoma LNG SEIS From going online. This is not a "green solution" as PSE has billed it. Nor is it for our communities served by them. Rather it is an extreme danger to those near it on the reservation particularly, but also to the industry around it as well as the nearby school and daycare center. I do not need to give you the scientific details. I am sure you have researched them and the accidents from this kind of terminal. The trauma of even a small accident will cost much in suffering and resources.

An acceptable environmental impact report is not done. The Puyallup tribal treaty has not been respected. The financial impact on surrounding industry as well as any boat traffic/ shipping has not been considered well enough. Tankers coming in and leaving require that no water traffic be within 1 mile on each side of them.

Aside from the immorality of this proposal, putting profit above humanity, the economic costs,even without any accidents, are huge.What sense does it make to put online another fossil fuel project, for it is that despite PSEs claim, when the terminal will be obsolete before a decade is out?

Thank you for conducting a supplemental environmental review of the greenhouse gas emissions for PSE's proposed LNG facility on the Tacoma Tideflats.

As a member of Earth Ministry/Washington Interfaith Power & Light, which has been working closely with scientists and policy experts to review the SEIS, I am concerned that the document does not fully analyze the climate impacts of this project.

Please address the following in the Tacoma LNG SEIS:

1. Methane's impact on climate – The SEIS uses a dated value for the 100-year Global Warming Potential (GWP) for methane from 2007 when updated values were published 2013 and then again in 2016. Using the best available science shows the plant would have higher greenhouse gas emissions. Additionally, given the short timeframe required to address climate change as recently noted by the United Nations, the SEIS should use the 20-year GWP for methane, which shows that the plant will be more than 50% dirtier over the next two decades.

2. Source of fracked gas – It is a false assumption that British Columbia would be the only gas source for this facility and this requirement is not enforceable. In addition, the SEIS relies upon self-reported pollution data on BC gas from the fossil fuel industry. It also failed to incorporate multiple, recent independent studies showing methane pollution rates as much higher than those reported by the fossil fuel industry.

3. Lack of alternative options – TOTE is already using ultra-low sulfur diesel (ULSD) and other companies are also using ULSD or scrubbers to meet emission requirements. The no action alternative assumes that LNG is required for TOTE to meet its emission requirement, when these alternatives already exist and are in use.

4. Alterations to the original proposal – Deviating from PSE's proposal, the SEIS included bunkering more than the two TOTE vessels on the Blair Waterway. The SEIS should instead provide an analysis using only secured customers.

5. Incomplete information – Use of placeholder values, incorrect units of measurement, and the stated need for more data from PSE makes the analysis incomplete and hard to follow. The draft SEIS should be thoroughly edited and released for a new full public comment period.

The Puyallup Tribe, citizens of Tacoma, and residents of the Salish Sea have a right to know the total local and

global impacts of this proposal. With missing data and alterations to the project, this draft SEIS does not account for full climate impacts.

I ask that the PSCAA live into its self-proclaimed commitment to be good and wise stewards of our shared resources. Please re-start this review with complete information and additional opportunity for comment.

Thank you for caring for creation and our community.

Sincerely,
Dr Heather Ogilvy

PSCAA
Attn: Public Comment
1904 3rd Ave
Suite 105
Seattle, WA 98101

Thank you for the opportunity to comment on your Agency's supplemental Environmental Impact Statement (SEIS). I am writing today in support of TOTE Maritime ships being converted to LNG.

I am a Fisheries Biologist and own and operate Angling Unlimited, a charter fishing and lodge in Sitka, Alaska. I have been a resident of Washington State and the bulk of our fishing clientele is from the State. As someone who is on the water fishing well over 100 days a year, I believe it is very important that you consider the positive benefits LNG powered ships will have on the marine environment as opposed to diesel.

The data is clear. TOTE's use of LNG on their ships will:

- Reduce Sulphur Oxides by 100%
- Reduce Particulate Matter by 99%
- Reduce Nitrogen Oxides by 90%
- Your own SEIS documents show an overall reduction of greenhouse gases by 13.5%

Having TOTE ships moving from Tacoma to Alaska powered by LNG will reduce the negative impacts these ships currently have on Puget Sound and our coastal waters. It is imperative you recognize the fragile state of our Puget Sound and coastal ecosystem. Carbon, particulate matter and fossil fuels are contributors to ocean acidification which directly affects salmon and orca whale survival.

I would urge you to issue the necessary air permits for Tote's conversion to LNG. It is important to all of us from Tacoma, Washington to Sitka, Alaska.

Tom Ohaus

To: Public Comment
Subject: Puget Sound Energy - LNG facility Tacoma
Date: Wednesday, November 21, 2018 9:27:02 AM

Dear Friends –

I would like to comment on the draft SEIS for PSE's proposed LNG facility on the Tacoma Tideflats.

I am a lifelong resident of Tacoma. All four of my grandparents moved to the Tacoma area in the 1920s and 1940s. My dad was a WWII vet who worked in Tacoma, including on the Tideflats all his life.
My children were born in Tacoma, attended Tacoma Public Schools and now live and work in Tacoma. My husband and I run a nonprofit business in Tacoma that employs seven people, which is located in a historic building that we bought and restored in the 1970s.

I strongly request that the PSCAA reject the SEIS and start over. The current draft has been deemed totally flawed by a number of groups who are experts in the field of environmental quality and scientific research, such as the Sierra Club, Sightline Institute, 350 Tacoma, Redefine Tacoma and others. I support their statements. Due to the dire predictions about the rapid advance of climate change, no responsible government body can afford to make decisions based on outdated data.

I am concerned about the lack of consultation with the Puyallup Tribe and support the statements of the Tribe and their members. We have seen time and time again how tribal people have been marginalized by the majority culture, industry, and government, and it is time to do better by the folks whose land and wealth we have exploited for our gain.

I am concerned that this plant is not needed but is being pushed by wealthy fossil fuel interests. If we remind ourselves of the mistakes of the past, jobs and economic growth are usually given as reason to ignore problems that will have lasting impact on the health of people and of the planet that we depend on for the air, water and soil that give us life. We can no longer afford to ignore the dangers inherent in fracking natural gas, whether or not it will affect our local air quality – someone's air quality will be affected, and it will contribute to climate change.

Jobs or healthy air is a false dichotomy that we no longer have to buy into. We can have clean air and a thriving economy and plenty of jobs with clean industries. We just have to make the right choices. We are depending on the PSCAA to make the right choice on behalf of all of us.

Regards,
Debra Olsen

ATTN: Public Comment on DSEIS, PSE LNG Project
Dear Puget Sound Clean Air Agency,
I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to deny the permit because the Draft Supplemental Environmental Impact Statement does not accurately represent the true greenhouse gas emission profile of the project. I have the following specific concerns:

The project is using a totally dodgy and outdated global warming value for methane. How can we take this DSEIS seriously when it uses such outdated science! I don't want this stuff polluting my air!

(Check here to continue comments on the other side).

In addition, a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required and adequate consultation with the Puyallup Tribe and other neighbors of the project should be conducted.

Dear Responsible Official,

Puget Sound Energy and Tote Marine need a place to store LNG. For the time being LNG is one of the most cost effective fuel sources.

I do urge the enforcement and strict compliance with safety regulations to make sure that the Environment is properly protected.

Sincerely,
Jason Palmer

October 31, 2018

Dear Carole J. Cenci,

The proposed LNG project is a dangerous step and should be stopped now, for many reasons. I will deal with one that may not have been mentioned by other writers.

I am the Chairperson of the Jefferson County Immigrant Rights Advocates, an organization that offers legal advice and family support for immigrants. We have ongoing contact with immigrants in the Northwest Detention Center in Tacoma, near the proposed project. Detainees have long suffered from degraded air quality, "living" in an area specifically limited to non-residential uses. Most detainees have resided there for months, some more than a year, especially as immigration courts are overwhelmed by demand.

We have visited and interviewed detainees who specifically mention the industrial gases they are exposed to and how their breathing has been compromised by those gases. Scientists have demonstrated that methane has a huge impact on the climate and that fracking allows more methane escapement than previously thought. Short term impacts of methane may be serious as long term impacts.

We suggest that these health impacts be considered in reaching a Denial of the Notice of Construction application.

Thank you for your time and consideration of these comments.

Libby

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Dear Puget Sound Clean Air Agency,

First of all, I want to thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. It is clear that fossil fuel usage is a huge contributor to our climate change that is damaging so many people and places. I am sure that if you consider issues that were not considered on the October 8th report, you will see that this project will only make this worse.
Please consider the following items"
1. The Global Warming Potential of methane.
2. The projected lifespan is far beyond the time we need to take action.
3. Leakage rates from Canadian natural gas are much worse than originally stated.

These are just a few of crucially important items needing review for this facility. Please take into consideration what is best for people and the atmosphere ... not just what big business wants.

Sincerely,

1814-1 22. General Opposition

Subject: Revise the draft SEIS
Date: Thursday, November 15, 2018 8:03:42 AM

Please revise the draft SEIS so that it is comprehensive (e.g., includes analysis such as explosion probability based on accurate wind data, missing data from PSE, etc.) and leverages updated science (e.g., 2016 GWP value).

If PSE builds a plant unlawfully without permits and disregards the safety of those living nearby, how can we expect them to follow the rules for safely operating their LNG infrastructure?

Hoa Pantastico

Steve: Thank you. Malcolm Russell? Wendy Pantoja?

Wendy: Good evening. My name is Wendy Pantoja. I'm a part of the detention center system. I am a social anthropologist, too.

[05:31:00] So, I would like to say I think that people know. So, it looks like people from Tacoma will be paying for the water who LNG will be using. And we think water is life. And this is our life. We would like to know why we have to pay for that facility they should be using. So, I would like to say also Cascade Falls is really close to Tacoma in the cascades. Cascade is really close to here. If fracking gas techniques move tectonic plates, it will tend to be a big disaster, tsunamis, earthquakes, and more. Leaking is dangerous. Salmon, our waters will die. Look to now **[inaudible] [05:31:47]**. **[Inaudible]** is polluted.

Tacoma's shamefully known by Tacoma aroma and pollutions because politicians make decisions who don't consult the people, who don't respect Mother Earth.

[05:32:04] And we don't want air emissions and more asthma. Tacoma has a horrible detention center. A week ago, there was a big fight in **[inaudible]**, and Tacoma Port was closing operations. The air was toxic. And all of the people here, many people from Tacoma and other places, have to breathe that toxic air. So, are there not monitors in the areas? And about jobs, people are coming from different places to Washington because they say there are better ways here. And that is because Washington people fight to do better. We fight. In other states, I don't know, but we fight. And we know our main business in LNG, and we know.

We live here. Business leaves when polluted place and leave workers and people die from pollution.

[05:33:04] Money is important, yes, but money is not life. Water is life. And it is our life. This land is from Puyallup Tribe. Please be respectful on our ancestral land of our brothers and sisters because, when you don't, Mother Earth will be making people pay with life. And water is life. Thank you.

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

Thank you for opening up the review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma.

Climate change is real, except to a few deniers. Your IPCC review of the greenhouse gas impacts of the natural gas used in this project is important.

Scientists make clear that we cannot, and must not, allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.

I am concerned that the draft SEIS is not complete. There are several sections that are missing data; so one can not accurately assess the quality of the report or understand how certain conclusions are reached.

Please complete the report, reissue it, and then reset the public comment period so that we have time to review the completed report thoroughly.

There are several issues with the current draft report you issued on October 8th. There is a possibility that if these issues are given proper attention and addressed with best science, it will show that the marginal improvements in emissions the study claims will disappear and the project will in fact be worse for the climate than doing nothing at all.

Here are some of the issues as presented:

- The SEIS is not using the best available science for the Global Warming Potential (GWP) of methane.

It uses the 100-year GWP of methane and not the 20-year value which is much more relevant given the urgency in addressing the climate crisis. The appropriate 20-year GWP value to use is 96.

- This facility is projected to have a 40 year lifespan, so why does the report project out to 100 years, which is 90 years beyond the time we need to have taken decisive action?

- The SEIS claims emissions benefits from customers that Puget Sound Energy simply does not have.

According to PSE and the City of Tacoma, the only maritime customer is TOTE with its two vessels which have already delayed their conversion to consume LNG. Securing new

customers (there are only just over 100 LNG ships in operation out of a worldwide fleet of 90,000) as well as the additional permitting could take years and is not guaranteed.

- The SEIS says that emissions will only be reduced if the natural gas comes from Canada, because leakage rates are reportedly lower there than in the US. Most leakage rates were self-reported by the fossil fuel industry based on models; recent measurements taken in the field have shown that leakage rates are worse.

- How can one guarantee that PSE is sourcing its gas from BC anyway?

Their recent filings show they relied on gas from BC, Alberta, and the US. And with the recent pipeline explosion in BC that interrupted PSE's supply, we know it's not always available.

- When ships use any fuel, a certain percentage of it escapes without combusting through the exhaust system and into the atmosphere. This is known as slippage and the SEIS uses a lower rate than is considered best practice.

Thanks again for initiating this crucially important review of this facility and I hope that you will take best available science into consideration when revising this draft SEIS.

I'm Elisabeth, a mom, member of the Wisible, & local resident.
Aside from all the urgent issues regarding health, climate safety, the environment, & tribal rights, LNG is a TERRIBLE investment. The American Geosciences Institute warns that we only have 86 years of natural gas left.

The cost to ratepayers alone is $133 million of the $310 million total, according to local expert Todd Hay. He spoke earlier & the details of his pros & cons analysis is on ToddHay.com.

That's $1,546,511.627906 million a YEAR before there's no gas left. And we - ratepayers - only get 7% for 15 years meanwhile, we're pitting clean energy against good jobs, but that's not how it works. We should have both. Sound like socialized risk & privatized profit? You betcha.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Dear Puget Sound Clean Air Agency,
Thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. I am one of a growing number of concerned citizens that see this project as dangerous and damaging to our environment. We must reduce use of fossil fuels and utilize renewable energy sources to address climate impacts.

The SEIS does not show due diligence by relying on outdated formulas and understating the full effect of fracking. I refer to a recent report from The Pembina Institute.

RE: Comments for PSCAA draft SEIS for the Puget Sound Energy LNG facility

To Puget Sound Clean Air Agency,

I am a Puget Sound Energy (PSE) employee and strongly support the proposed PSE LNG facility at the Port of Tacoma.

The environmental and health benefits of LNG are very important. LNG is a cleaner alternative to conventional fuels such as diesel. The PSCAA's Draft SEIS, published on October 8, 2018, confirms this. Switching to LNG reduces greenhouse gas emissions by nearly 15% and eliminates visible particulate emissions produced by ships by more than 85%. This helps improve air quality and reduce health risks, while helping local employers like TOTE comply with new stricter low-sulfur emission standards.

I believe that the proposed PSE facility represents a very significant benefit to both the environment and financial health of Tacoma and the entire South Sound area and that TOTE's leadership in successfully converting to LNG will set a very positive example for other shipping companies.

I encourage PSCAA to move forward and approve the air quality permit(s) necessary for the facility's completion now that the agency has independently verified, through its own SEPA review, the project's environmental benefits and overall reduction in greenhouse gas emissions. I fully support this project and am confident it will provide great benefits to the residents and businesses of Pierce County and the Puget Sound region for years to come.

Thank you for your consideration.

Regards,

Robert C. Parker III

Subject: comments on DEIS for Tacoma LNG plant
Date: Tuesday, November 6, 2018 6:06:36 PM

Dear Puget Sound Clean Air Agency:

Thank you for the opportunity to comment on the Draft EIS for Puget Sound Energy's proposed LNG plant in Tacoma.

Pertinent questions have been raised about whether the DEIS uses the most reliable current estimates of (1) the global warming potential (GWP) of methane relative to CO_2 and (2) the amount of methane leakage at natural-gas extraction sites. Upward revision of either or both of these parameters could significantly decrease the calculated benefits of constructing the LNG plant. We respectfully urge you to address these concerns.

Date: Saturday, October 27, 2018 3:17:53 PM

Dear Responsible Official,

Hello - I am an Oregon citizen writing to encourage the most comprehensive analysis of air quality issues for the Tacoma LNG terminal. The emissions from this project will add green house gasses to the atmosphere and therefore contribute to the overall heating of the planet. This affects me even though I don't live near Tacoma. Natural gas is methane which traps heat many times more efficiently than CO2. Natural gas inevitably leaks along the supply chain. If it leaks more than 3%, it is the equivalent of burning coal. Although it burns cleaner than coal and oil, it still emits carbon when it is burned and we are already seriously overbudget on atmospheric carbon. A huge majority of climate scientists say we must stop using fossil fuels altogether. In that case, and I believe the science, we should not be expanding the use of fossil fuels by building new infrastructure.
If it is in your purview, please explore and encourage renewable energy alternatives. We do not have a lot of time left to stop runaway climate change.
Thank you. Carolyn Partridge

Fracked gas is not a lesser evil. Scientists' understanding of methane's impact on the climate continues to evolve, and at every step along the way we learn that fracking allows more methane escapement than we had previously observed and that the impact of methane on the climate, particularly in the short term, is even more serious than had been previously understood.

I applaud your decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct this more rigorous analysis. Thank you.

I urge you to revise the analysis to account for the following:

1. Methane should be counted as 86 times more potent than CO2 based on the current IPCC analysis (AR5 rather than AR4) considering a 20 year timeframe (rather than the 100-year).

2. Revise the analysis of the impacts of fracking in British Columbia based on recent research(1) demonstrating that methane escapement has been dramatically under-estimated.

3. Revise the "no-action alternative" to include a clean energy alternative in which PSE provides electricity not with a different source of fracked gas, but with renewable energy and energy efficiency.

4. Revise the "no-action alternative" to include the assumption that Tote Marine will achieve a 50% GHG reduction, in line with the International Maritime Agency's established goals. This reduction might alternatively be achieved by a combination of fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion or many other alternatives besides fracked LNG.(2) For clean local emissions requirements, Tote Marine can

2537-4 cont'd 8. No Action Alternative

achieve virtually all of the localized lower-particulate and lower SOx and NOx benefits claimed for LNG propulsion by opting for low-sulfur marine gas oil over heavy fuel oil, and installing selective catalytic reducers and diesel particulate filters.(3)

5. This more accurate analysis will show that the project has a significant and unmitigated impact on the global climate, which
should be seen as a sufficient basis for denial of the Notice of Construction application.

Thank you for your time and consideration of these comments.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Dear Puget Sound Clean Air Agency,
First of all, I want to thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. With our climate in grave peril, as emphatically stated in the latest IPCC report, your review of the greenhouse gas impacts of the natural gas used in this project couldn't be more important. Those scientists make clear that we cannot, and must not, allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.

The Puyallup Tribe of Indians opposes the refinery. The location of the site is directly on top of their traditional tribal lands that are both culturally important and treaty-protected. The Tribe was not meaningfully consulted on the project as is a further requirement of a 1990 Land Claim Settlement.

This plan is NOT supported by the people that live in this region. Do NOT continue with the planned building of this project.

Thank you,
Clea Partridge

Carole: Thank you. Derek Patches?

Derek: Hi, thank you. My name is Derek Patches. I've been a Pierce County resident since I was discharged from the Army 20 years ago. I have a wife, two daughters. One of the reasons we decided to stay here is because of the beautiful environment we all get to enjoy. We are truly concerned about the health of our home and our families. This whole thing has been brought forth to be a cleaner fuel source for ships. It's going to help folks in the port clean up the pollutants down there and the surrounding communities. It's better for all workers really and families, in this area. We need to agree that it's a step in the right direction.

[01:55:02] The do nothing or no action approach is just that. We're just going to keep plodding along here, bickering back and forth, and getting nothing accomplished. So, I support the Clean Air Agency finalizing this review and issuing the permits to the LNG facility. And, hopefully, we can do so sooner than later. Thank you.

I support the use of LNG Due to the simple fact of health. The Pacific Northwest is known for it Fresh Clean Cascade Crisp air. If you would like to keep that a Clean environment For our families, Kids, Parents, and future Generations then support for this is needed. The LNG Facility is also Very beneficial for our economy and growth as a community. Not only creating jobs for our Workers but creating consistant Economical growth. We could set the example for the future and maybe others would follow our footsteps. So please approve the permits and construct, employ and produce this facility... our families need it. Thank you

Dear Puget Sound Clean Air Agency;

I am writing to comment on one aspect of the Draft SEIS for Puget Sound Energy's proposed LNG plant in Tacoma. Thank you for your diligence in making this process fair, comprehensive, and truthful.

One of the most alarming mistakes in the draft SEIS is its use of a global warming potential (GWP) for fossil fuel gas (mostly methane, CH4) from the 2007 IPCC AR4 rather than the 2016 value derived by the same lead scientist who updated the GWP in 2013 with the IPCC AR5. Why did the authors of the draft SEIS use the outdated GWP value from the 2007 IPCC AR4?

Another alarming mistake in the draft SEIS is its use of a 100 year period for the GWP of gas (methane). 100 year periods are frequently used for carbon dioxide where a 100 year period is appropriate because CO2 stays in the atmosphere for centuries. Gas or methane (CH4), however, does not stay in the atmosphere for centuries. Instead, its warming potential for the 0-20 year period after it is emitted is 86 or 87 times more than the warming potential of CO2 in the same 20 year period. The next 0-20 years are crucial for our success or failure in stopping the emission of greenhouses gases into the atmosphere. Why did the authors of the draft SEIS for this project use a 100-year GWP scale rather than a 10 and 20 year scale additionally or instead of the 100-year scale? A 100 year measurement is not the appropriate measurement for this SEIS.

The SEIS needs to be revised using the 2016 GWP value of 96 for a 20 year period. If it is not so revised, it is clear that the intention of the draft SEIS is to avoid the truth of methane as a extremely harmful greenhouse gas. We need an SEIS that does not obfuscate but tells the truth clearly, honestly, directly.

Another area of grave concern in the draft SEIS is PSE's claim that all the gas piped into the plant at the Tacoma tideflats/Port of Tacoma will come from British Columbia. I don't know how PSE can gurantee the source of the gas over a period of several decades. But let us for the sake of this comment assume that all the gas will come from BC gas mines. One concern that many of us who oppose this project have is for the Missing and Murdered Indigenous Women, a phenomenon of violence that correlates the presence of "man camps" (predominantly men hired to dig and lay pipelines and work at extraction sites) with the disappearance and murder of First Nations and Native American Indian women. I do not know if Puget Sound Clean Air Agency can consider this violence in its decision-making regarding the Tacoma LNG project. But perhaps it is within the scope of PSCAA's evalulation to consider this examination of the potential impact -- cultural, health, climate change -- of unconventionally mined gas (i.e. shale gas, fracked gas) on the Fort Nelson First Nations people and their land and water in northeastern British Columbia. This study, its questions and findings, need to be part of the PSE Tacoma LNG SEIS.

Another alarming mistake that is made in the draft SEIS for the PSE LNG plant is in regard to

the data it offers for leakage of methane at extraction sites. It is increasingly evident that gas companies under-report methane emissions, either because they intentionally avoid accurate measurements or because they intentionally lie about what they measure. When independent scientists measure real emissions, what they find is alarming. Three cases in point are the Denver Basin, the Uinta Basin in Utah, and the Los Angeles basin. Looking at extraction sites alone (leaving aside for the moment the reality of leaks during pipeline transportation), these three geographic examples show leakage alarmingly above the 3% threshold that would make natural gas/methane as bad as coal in its impact as a greenhouse gas. In Denver, National Oceanic and Atmospheric Administration (NOAA) scientists measured an average of 4% leakage at extraction sites. In Utah, Picarro scientists measured an average of 11% leakage. And in LA, NOAA again measured an average of 17% methane leakage from oil and gas extraction sites. (My source for these figures is the same video report linked above, "Chasing Methane with Mark Bittman" from the New York Times.) What would truthful, accurate, up-to-date measurements of methane leakage at the British Columbia sites show? What would truthful, accurate, up-to-date measurements of methane leakage during transportation via pipelines and compressor stations show? The sources used in the current draft SEIS are not reliable; the SEIS must be revised to give us scientifically accurate information about methane leakage rates.

Finally, the draft SEIS needs to include citations from and a serious consideration of the work of Robert Howarth,Tony Ingraffeo, and others at the Cornell University Methane Project. These presentation slides (November 2017) evaluating the possible sources of increased methane in the atmosphere are a beginning (the graph on slide #2 shows that emissions of CO2, CH4, and black carbon must all be responded to if we are to succeed in keeping global warming under 2 degrees C). Another important reference is an article by Howarth available for download as a pdf in this link (please see graph, page 5).

Thank you for considering these comments. Your decision of whether to accept the draft SEIS or require revisions is of great importance, as you know.

Sincerely,
Mary Paterson

SHALE GAS DEVELOPMENT IN FORT NELSON FIRST NATION TERRITORY:

Potential Regional Impacts of the LNG Boom

KATHRYN H. GARVIE, LANA LOWE, AND KARENA SHAW*

OVER THE PAST DECADE, abundant "unconventional" gas reserves throughout North America have become economically and technically viable through the combined use of two extraction technologies – horizontal drilling and hydraulic fracturing (or "fracking") – and, as a result, production on the continent has boomed.[1] In 2012, the Government of British Columbia released a Natural Gas Strategy outlining its vision to dramatically increase provincial natural gas production and exports (BC Ministry of Energy and Mines 2012a). To escape the gas glut (and subsequent low prices) in North America, British Columbia is pursuing growing Asian markets. In order to be exported to Asia, the gas must be piped to the province's west coast, liquefied (i.e., turned into "liquefied natural gas" – LNG – at coastal plants), and then shipped in tankers across the Pacific Ocean. In the BC Jobs Plan (Government of BC 2011), the Liberal government committed to having three LNG plants up and running by 2020. The year 2014 will be pivotal in British Columbia's energy history as a number of proponents working towards a 2020 opening decide on final investments (Government of BC n.d.).

It is widely accepted that at most only a few of the more than twelve proposed LNG plants will ever be built. Even so, independent researchers have raised concerns about the potential implications of these developments for British Columbia's efforts to reduce greenhouse gas (GHG) emissions (Jaccard and Griffin 2010; Stephenson, Doukas, and Shaw

* This research was funded by Carbon Management Canada, Project D215, and a SSHRC Master's Fellowship. The authors would like to express their thanks to Roberto Concepcion, Trevor Lantz, Ellie Stephenson, Joanna Reid, Graeme Wynn, and three anonymous reviewers for their thoughtful assistance with this article.

[1] Hydraulic fracturing injects large volumes of water mixed with sand and chemicals underground at high pressures to create fissures in the rock, allowing the trapped gas to flow into the well.

2012). What is less widely appreciated – and has not been adequately researched or assessed – is the issue of the upstream environmental impacts of the LNG industry (Council of Canadian Academies 2014). In British Columbia, the expansion of natural gas production for LNG exports means the development of unconventional gas reserves. For example, between 2005 and 2010, the percentage of wells in the Horn River Basin targeting shale gas jumped from 3.4 to 85.4 percent of all new wells drilled (BC Oil and Gas Commission 2010). Under the current environmental assessment regime, only those impacts associated with pipelines and gas processing plants are systematically assessed. However, First Nations in the shale gas plays that will feed the LNG industry are already experiencing a much wider range of effects. One of the nations most directly affected is the Fort Nelson First Nation (FNFN), whose territory includes three of the four major shale gas plays in British Columbia.[2]

This research, conducted with the Fort Nelson First Nation Lands Department, was prompted by concerns that the province has not meaningfully assessed the risks and impacts of an unconventional gas industry in FNFN territory. Nor is there adequate data or resources available for the nation to assess the risks on its own. In what follows, we tell the story of the rapid expansion of natural gas developments in the FNFN's territory through figures developed by the FNFN Lands Department. These figures reveal a race for industrial tenure, landscape disturbance on a massive scale, threats to wildlife, risks to water quality and quantity, and a high level of GHG emissions. After a short description of the treaty rights and land uses of the FNFN and the policy context of the BC natural gas industry, we present and describe these impact-related figures in turn, also referring to a wider literature on natural gas development in British Columbia and elsewhere. We aim to illustrate the scale and pace of industrial expansion and to identify a range of associated impacts. This investigation of potential impacts reveals an urgent need for a strategic assessment of the cumulative upstream effects of the LNG industry. Appeals for baseline studies and cumulative environmental assessments of the oil and gas industry in northeast British Columbia are widespread, coming from First Nations, researchers, and non-governmental organizations alike (West Coast Environmental

[2] The four major shale gas plays in British Columbia are the Liard Basin, the Horn River Basin, the Cordova Embayment, and the Montney Trend. The first three fall almost entirely within FNFN territory (see Figure 1); the majority of the Montney shale gas play, however, lies farther south. In this article, we focus largely on the plays within FNFN territory but also draw, where relevant, from research regarding shale gas developments in the Montney Trend.

Law 2004; Parfitt 2011; Campbell and Horne 2011; University of Victoria Environmental Law Centre 2013; Gale and Lowe 2013; Garvie and Shaw 2014 (this issue). Assessing, understanding, and mitigating cumulative effects is an essential precondition to the LNG industry proceeding in a way that protects the ecological and social resilience of the region, including the constitutionally protected treaty rights of the Treaty 8 First Nations on whose territory this development will proceed. An informed understanding of cumulative effects, in turn, should be the basis for any decision making around how the industry develops.

CRITICAL CONTEXT

Fort Nelson First Nation

The Fort Nelson First Nation is made up of fourteen extended families, whose traditional languages are Dene and Cree. The FNFN territories cover approximately seventy-two thousand square kilometres of northeast British Columbia. Since time immemorial, FNFN ancestors have lived and travelled throughout their traditional territories on seasonal rounds to hunt, fish, trap, and gather. Family groups travelled on their individual seasonal rounds between villages, fishing and hunting camps, and traplines by riverboat, dogteam, horseback, and foot. Families were dispersed among ten different village sites before moving to the main reserve six kilometres south of the town of Fort Nelson in the 1960s. Members of the FNFN continue to visit the village sites and actively hunt and trap in their family hunting grounds, but recent shale gas developments are making it increasingly difficult to do so. The FNFN's territory contains three large shale gas basins – the Liard Basin, the Horn River Basin, and the Cordova Embayment (see Figure 1) – within which extraction-related activities have rapidly expanded over the last ten years.

The FNFN has shared its territories with settlers and their industries for decades. Some families have supplemented their incomes by working with local guide outfitters and prospectors as well as in forestry and oil and gas extraction. The conventional oil and gas industry has been operating within FNFN territory since the 1940s, but the rise of unconventional gas has ushered in a new era of development. This shale gas era is placing immense pressure on existing regulation, and provincial oil and gas governance structures, to evolve with the changing character of the industry and to address novel environmental concerns (Stefik and Paulson 2010).

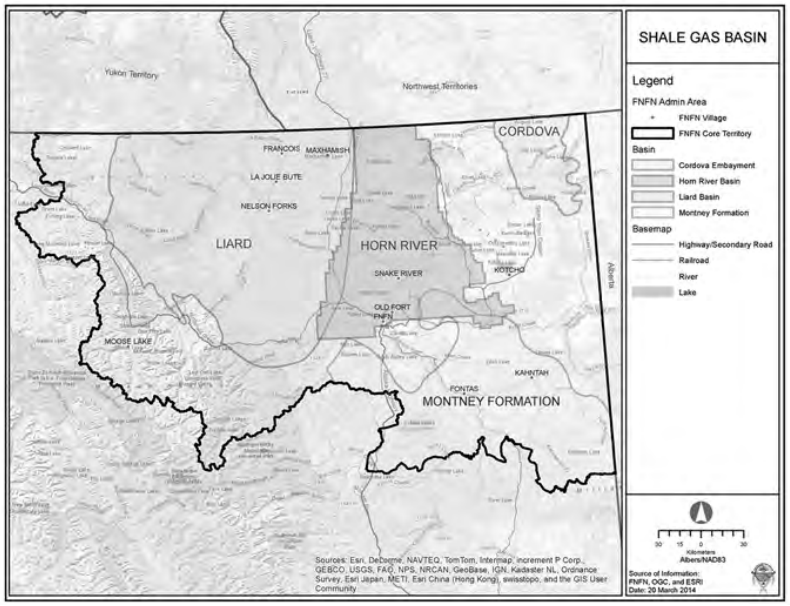

Figure 1. Shale gas basins in Fort Nelson First Nation's territory. *Source*: Fort Nelson First Nation Lands Department.

The FNFN understands its relationship to the Crown through Treaty 8. When the FNFN signed on to Treaty 8 in 1910, it agreed to share the land on the condition "that the treaty would not lead to any forced interference with their mode of life"; this included the right to "be as free to hunt and fish after the treaty as they would be if they had never entered into it" (Laird, Ross, and McKenna 1899). As unconventional gas development accelerates, the FNFN is concerned that these rights are not being respected and protected by government regulators (see Garvie and Shaw 2014). This concern was highlighted on 16 April 2014 when the province made the decision to exempt sweet gas plants from environmental assessment requirements without consulting with First Nations. After a quick and united response from BC First Nations, the province retracted the decision within twenty-four hours (CBC News 2014; Prystupa 2014). There is a growing demand from First Nations for collaborative, culturally and scientifically sound research to be gathered prior to any decisions being made on the future of the BC LNG industry (Garvie and Shaw 2014). As the FNFN chief Sharleen Gale and lands director Lana Lowe explain in a *Globe and Mail* opinion piece: "To truly have peace, we as a people must be able to share the wealth and protect

the integrity of our land. We need new mechanisms for decision-making and both the industry and government must be willing to change their ways" (Gale and Lowe 2013). Imminent decisions on how British Columbia's LNG and shale gas industries advance have the potential to strongly influence the province's relationship with First Nations.

The Rush for Tenure

Shale gas development is different from the conventional oil and gas development that has been occurring in FNFN territory since the 1940s in at least two ways: (1) it is happening at an increased pace and scale and (2) the use of hydraulic fracturing introduces new environmental concerns, especially regarding water. The sudden economic viability of shale gas extraction in North America due to a combination of new technologies and higher natural gas prices created a tenure buying frenzy in northern British Columbia between approximately 2005 and 2010. By the time FNFN members heard about shale gas and fracking at a town hall meeting hosted by an industry proponent in 2008, petroleum and natural gas tenure sales had already peaked in the Horn River Basin at $1.1 billion (C. Adams 2011). Oil and gas company Devon Canada set a provincial record in August 2008 for the largest single bonus paid at a petroleum and natural gas rights disposition when it purchased a 5,789-hectare drilling licence in the Horn River Basin for $75.8 million. By 2010, industry had bought up tenures covering over 75 percent of the Horn River Basin and had moved on to the Liard Basin, spending $47 million and $110 million on tenures in 2009 and 2010, respectively (ibid.). Despite lower natural gas prices, prolific production rates at test wells in the Liard are still anticipated to offset the higher production costs in the remote northeast area (Apache 2012). According to the Northern Rockies Regional Municipality (n.d.), at the end of 2012, the provincial government had accrued more than $3.6 billion from land sales and royalties in the Horn River Basin and the Liard Basin. Figure 2 compares tenure holdings in FNFN territory in 2006 and 2013. The FNFN was not consulted on petroleum and natural gas tenure sales until June 2012, despite the implications of these sales for the future of FNFN territory and the ability to practice constitutionally protected treaty rights.

The tenure rush in British Columbia was followed by a relative lull in development as the economic recession slowed American markets and they became saturated with domestic shale gas, which was also being rapidly developed. US gas prices have remained below six dollars per million British thermal units (mmBtu) since 2009, after a 2008 peak of

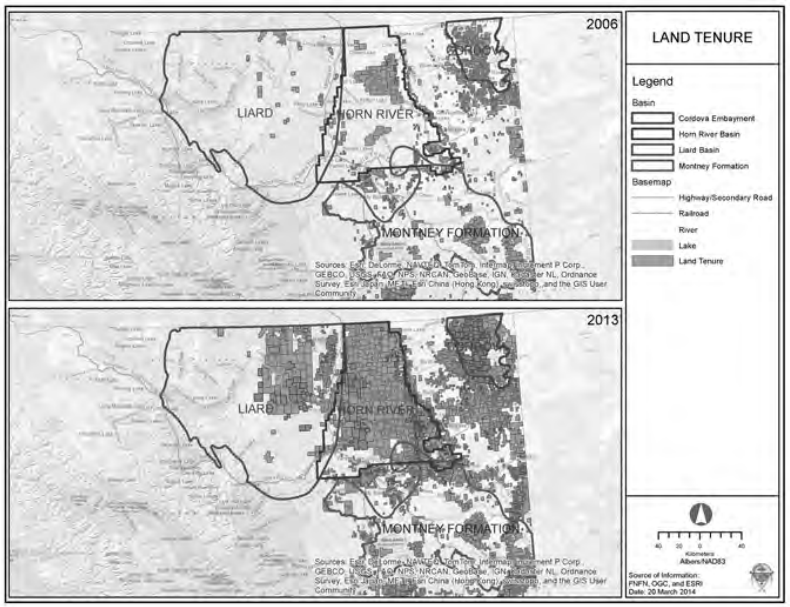

Figure 2. Petroleum and natural gas tenures in FNFN territory in 2006 and 2013. *Source*: Fort Nelson First Nation Lands Department.

more than thirteen dollars (Nasdaq n.d.). As a consequence, there is ongoing restructuring in the industry (Jang 2014; Lewis 2014; Penner 2014). For example, Devon Canada is looking to sell off its assets in the Horn River Basin, which it set records purchasing just six years ago (Cattaneo 2013). However, other companies are investing for the long haul, building processing facilities and pipelines and conducting seismic exploration while they wait for better markets (e.g., Apache n.d.; Quicksilver Resources Inc. n.d.).[3]

While industry is preparing for the coming LNG boom, the provincial government appears less than motivated to develop governance and regulatory frameworks that will protect environmental and social conditions upstream (CBC News 2014; CCA 2014). The FNFN Lands Department

[3] One study into the long-term viability of the BC LNG industry cited research from other jurisdictions that shows that production rates at individual shale gas wells have been found to drop significantly after the first couple of years (Hughes 2014). It is unknown whether this kind of drop in well productivity is affecting the industry restructuring in British Columbia's northeast because well depletion rates are not publicly available. However, based on shale gas well production rates elsewhere, David Hughes (2014) predicts that industry will require continual well development in the northeast to maintain production rates over time, resulting in fifty thousand new wells by 2040.

is working to fill this critical gap, but, as stated previously, there are currently no regulatory requirements for industry to carry out baseline studies on its tenures. Without this information, the scope and scale of development impacts on First Nations territories and cultural practices cannot be fully understood as development progresses (Tollefson and Wipond 1998; Booth and Skelton 2011).

Once tenure has been acquired, all development – with the exception of projects that trigger an environmental assessment (i.e., pipelines and gas processing plants) – must be approved through the Oil and Gas Commission's permitting process.[4] As explained in Garvie and Shaw 2014, approval of developments proceeds on an individual, permit-by-permit basis. No long-term, landscape-scale plans are made available to the public or affected parties such as the FNFN.[5] As a consequence, assembling a landscape-scale picture of present impacts, let alone potential future impacts, requires mapping hundreds of different permits individually. The FNFN's Lands Department is currently undertaking this work. In what follows, we document the scale of development that has taken place to date on the tenures purchased in FNFN territory and explore some of the potential impacts of this development.

The Development Footprint

Figure 3 displays the cumulative oil and gas activities in the FNFN's traditional territories as of March 2014. The solid patches are grids of seismic lines one to three metres in width, occurring approximately every 240 metres across the landscape. If all of the linear disturbance in the Liard, Horn River, and Cordova basins were laid end to end, it would wrap almost two times around the planet. In the most heavily affected areas of the FNFN's territory, there are over 9.98 kilometres of linear disturbance per square kilometre.

Figure 4 illustrates what this level of disturbance looks like at Two Island Lake, an area of particular cultural importance to the FNFN (FNFN 2012a). A number of families continue to hunt, fish, trap, and gather in the area, despite industry's extensive impacts on the landscape. Within the 100-square-kilometre area represented in Figure 4, there are 90 wells, 25 pipeline right-of-ways, 7 processing facilities, 114 water withdrawal points, and 2,385 kilometres of seismic lines. As of March 2014, there

[4] For more information on responsibilities of the BC OGC, see https://www.bcogc.ca/about-us.

[5] This lack of long-term, landscape-scale oversight is in contrast to industries with similar landscape-scale impacts such as forestry, where companies must have a Forest Stewardship Plan approved for their licence area before submitting site-specific permit applications (Forest and Range Practices Act SBC 2002 c. 69).

has been no systematic assessment of the cumulative impacts of these developments on the wildlife and ecosystems of the northeast.

The pace and scale of development depicted in these figures have a wide array of potential impacts on the region that go almost entirely unstudied. In the following sections, we discuss the potential risks to wildlife, water, air, and human health based on northeast British Columbia's unique environmental and social characteristics and research conducted in other jurisdictions where shale gas development is taking place.

POTENTIAL IMPACTS

Threats to Wildlife

The development footprint in FNFN territory displayed in Figure 3 and Figure 4 also undeniably tells a story of changing wildlife habitat in northeast British Columbia. The impacts these changes are having on wildlife are unknown since the necessary research has not been conducted. Potential impacts, however, can be extrapolated not only from a number of studies on wildlife experiencing comparable levels of habitat disturbance from other industries but also from studies on livestock living in close proximity to conventional and unconventional oil and gas operations in other places. The threats to wildlife fall into two categories: (1) spatial changes to habitat (which alter predator-prey and wildlife-human interactions) and (2) degradation of habitat (which has impacts on wildlife health).

One of the few species that has been extensively researched in the northeast is the boreal woodland caribou; we use it here as an example of how the industrial footprint of unconventional gas development can have a variety of far-reaching effects on wildlife. The boreal woodland caribou appears on both provincial and federal "red lists" of endangered species. The FNFN territory contains five of the six boreal woodland caribou populations in the northeast. A 2009 government report identified oil and gas exploration as the greatest risk to northeast caribou populations (Goddard 2009). Seismic lines and roadways have been found to alter predator-prey relationships, resulting in increased caribou mortalities and decreasing populations (James and Stuart-Smith 2000; Latham et al. 2011). Additionally, noise and lighting from roadways, processing facilities, and well sites deter wildlife and alter habitat ranges (Dyer et al. 2001; Sorensen et al. 2008). Twelve of the fifteen core caribou habitat areas in northeast British Columbia have surpassed the

61 percent anthropogenic impact threshold (Theissen 2009), at which point a population becomes unsustainable (Sorensen et al. 2008). The preservation of remaining caribou habitat in the northeast is critical.

Similar studies have not been conducted on culturally significant species to the FNFN such as moose and beaver. However, it is well known that habitat fragmentation and degradation is associated with significant species loss (Fahrig 2003). Baseline studies are critical in order to determine how much development can take place before species loss begins. In the Peace-Moberly region of the northeast (south of FNFN territory) it is already too late: a study conducted in 2008 found that the cumulative effects of landscape change from industrial development (namely, conventional oil and gas development, mining, forestry, and agriculture) are synergistic, additive, and antagonistic in nature, and have reached a point at which they are threatening the ecological integrity of the area as a whole (Nitschke 2008). The alarming results of this study highlight the need for better industry regulation in FNFN territory to ensure that this region does not suffer the same fate.

Degraded habitats threaten wildlife health in numerous ways. If the land and waterways become contaminated, so, too, will the animals that are sustained by them. Studies have not been conducted in the northeast, but there are first-hand accounts from hunters about increasing rates of sick animals with tumours and failing organs. Outside British Columbia, where much shale gas development is occurring in more populated areas, the majority of research on fracking and animal health concerns livestock. In the United States, proximity to shale gas developments and exposure to frack fluids has been found to cause negative health effects in livestock, including increased mortality (Bamberger and Oswald 2012). In a 2014 article, Bamberger and Oswald draw connections between livestock health close to drilling operations and food safety in the United States. Additionally, studies conducted in conventional oil and gas fields in Alberta have found decreased fertility in cattle and increased calf mortality rates due to air pollution (Waldner 2008). In the BC context, these kinds of risks could have serious health implications for wildlife as well as for community members hunting and trapping these animals.

Northeast British Columbia is one of the few remaining places on earth that still has boreal forest able to support a wide array of large mammals, including grizzly bears, American black bears, wood bison, bighorn sheep, moose, caribou, and wolves (Laliberte and Ripple 2004). The forests, muskeg, and lakes of FNFN territory are home to over thirty endangered or vulnerable species, including woodland boreal caribou, wood bison, grizzly bear, wolverine, and fisher, as well as a number

of culturally significant species, such as freshwater whitefish and bull trout (BC Ministry of Environment n.d.). Members of the FNFN are already speaking out about changes to the landscape and the health and behaviour of the animals, but without baseline data and ongoing monitoring, provincial regulators and industry representatives often reject community members' concerns as anecdotal. Allowing an information and data vacuum to persist in northeast British Columbia facilitates uninformed industry growth and the marginalization of FNFN concerns.

Water Use and Contamination

Concerns about water use and contamination arise virtually everywhere the shale gas industry has expanded (Freyman 2014; International Energy Agency 2012), and northeast British Columbia is no exception (Parfitt 2011; Campbell and Horne 2011). Until recently, to support the rapid development of the industry, almost all water use has been facilitated by "Section 8" water permits. Section 8 water permits are for short-term water use access and are issued by the Oil and Gas Commission (OGC) according to section 8 of the BC Water Act. As of 2011, water permits are required for surface water removal from any surface water body, including borrow pits (a human-made pit created during the removal of construction materials). Up until April 2014, British Columbia was the only Canadian province that did not regulate groundwater use.[6] Figure 5 displays all of the surface water diversion points approved under section 8 water permits in FNFN territory as of March 2014. These permits only represent a small fraction of water that would be required should LNG move forward at the pace anticipated by the provincial government.

In the shale gas industry water is primarily used for hydraulic fracturing. The amount of water required to frack a well varies dramatically, depending on the local geography. A report for the BC Ministry of Energy and Mines (MEM) found that, on average, 34,911 cubic metres of water are used per well in the Horn River Basin, while just 1,925 cubic metres are used per well in the Montney Trend (Johnson and Johnson 2012).[7] Apache holds the record for the world's largest frack job at a pad

[6] As of 29 April 2014, there is a new Water Sustainability Act in British Columbia. Of particular note is the introduction of groundwater regulation and environmental flow requirements. See Curran (2014) for a summary of the new legislation.

[7] A BC OGC factsheet documents much higher averages: 77,000 cubic metres per well in the Horn River Basin and 7,000 to 10,000 cubic metres per well in the Montney Trend (BC OGC 2014b). The discrepancy between these two sets of numbers – which both come from official provincial documents – reveals the ongoing uncertainty of data regarding water use for hydraulic fracturing in British Columbia.

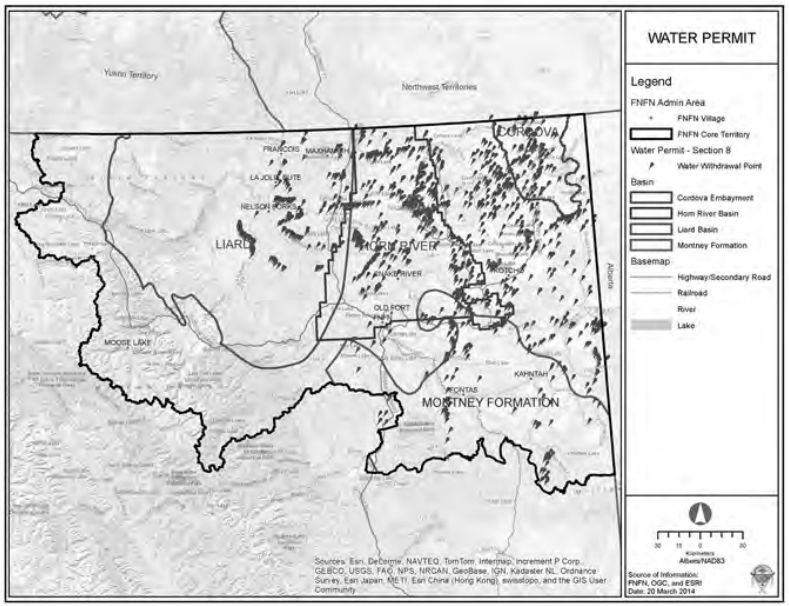

Figure 5. All of the water diversion points approved in FNFN territory through OGC-issued section 8 water permits as of March 2014. *Source*: Fort Nelson First Nation Lands Department.

with sixteen wells near Two Island Lake. It took 111 days to frack the sixteen wells a total of 274 times. In total, 980,420 cubic metres of water and 50,000 tons of sand were used during the operation (C. Adams 2011; Parfitt 2011). That volume of water is equivalent to 392 Olympic swimming pools' worth. Due to contamination, once water is used for fracking, it must be forever removed from the hydrologic cycle; in the absence of treatment facilities in the northeast, companies fulfill regulatory requirements by disposing of flowback in deep-injection wells.[8]

The vast majority of water being used by industry for fracking is surface water; just 7 percent comes from source wells, despite the fact that saline aquifers have been found beneath large areas of tenure (BC Oil and Gas Commission 2014a). While some companies are taking advantage of these sources, there are no regulatory requirements that ensure that non-potable sources are prioritized and that water recycling is carried out.

As the industry is becoming established, companies are moving towards long-term water licences. Nineteen water licences in the FNFN's

[8] Flowback is a highly saline, toxic solution containing both the frack fluid chemicals injected into the well during the fracking operation and naturally occurring toxins from within the shale formation, such as radioactive barium and arsenic (Vengosh et al. 2014).

territories are currently awaiting government approval. The first licence granted has resulted in a lawsuit by the FNFN alleging inadequate consultation in the granting of the licence and significant flaws in the licence itself, particularly in terms of the lack of regulatory oversight. The FNFN had experience with this lack of government oversight and enforcement when, in the summer of 2012, during a one-in-thirty-year drought, 182,785 cubic metres of water were removed from North Tsea Lake after the lake's discharge dropped below the zero withdrawal limit (Chapman 2013). The use of multi-well pads (such as the one at North Tsea Lake) increases the intensity of water demand over short periods of time (Rivard et al. 2014). The impacts of these withdrawals on the surrounding ecosystem will never be fully understood because no baseline data exist. There continues to be no systematic monitoring of impacts, despite the unprecedented scale of withdrawals relative to the water body's size allowed under the licence.

The OGC is working reactively to fill the regulatory gaps created by the widespread introduction of hydraulic fracturing, which has brought with it unique governance challenges, including water use and contamination (Stefik and Paulson 2010). In a recent effort to deal with increased water use by the oil and gas industry, the OGC has developed a publicly available NorthEast Water Tool (NEWT) that assesses water availability based on estimates of monthly and annual water flows and existing water permits and licences. It is used as a "decision-support tool" for short-term water permits and long-term water licences (BC Oil and Gas Commission n.d.). Environmental flow needs are also estimated; however, considering the limited baseline data for the region the accuracy of these estimates is questionable. The longer the OGC waits before implementing rigorous data collection the less useful the information will be because ecosystems will already be in an altered state.

Water acquisition is only part of the controversy surrounding hydraulic fracturing; water contamination is also a significant concern. According to the US Environmental Protection Agency (EPA) (2012), there are five stages in the hydraulic fracturing water cycle that could lead to groundwater contamination: (1) water acquisition, (2) chemical mixing, (3) well injection, (4) flowback and produced water, and (5) waste water treatment and waste disposal. The real contamination effects of these five stages remain largely unknown. Whether or not hydraulic fracturing is responsible for drinking water well contamination in a number of jurisdictions across the United States is highly contested; a lack of pre-drilling data makes it difficult to identify fracking as the

sole potential cause of contamination (Vidic et al. 2013), but there are a number of studies that have found a correlation between a drinking well's proximity to a shale gas well and contaminants in the water. For example, Fontenot et al. (2013) found that wells within three kilometres of active gas wells in the Bennett Shale had higher levels of arsenic, selenium, strontium, and total dissolved solids. In the Marcellus Shale in the Appalachian Basin, household wells less than one kilometre from gas wells had concentrations six times higher of methane and concentrations twenty-three times higher of ethane (Jackson et al. 2013).

In 2013, the US EPA backed away from finishing an independent, peer-reviewed study on contaminated wells in Pavillion, Wyoming, after releasing a draft report linking the contamination to fracking in the area (Vidic et al. 2013). The EPA passed the study off to the state of Wyoming in June of that year. The state will be working with Encana, a company with operations in the region, to complete the research (Office of Governor Matt Mead 2013). This sequence of events raises alarms for a number of reasons, not least of which is industry's involvement in research in which it has a strong vested interest. Water studies currently being conducted in FNFN territory are also industry funded. The BC government has installed six groundwater monitoring wells in the Montney Play but has yet to install a test well in the Horn River Basin (Rivard et al. 2014).

The shale gas reservoirs in northeast British Columbia lie at much greater depths than do the deposits in the United States, where groundwater contamination has been reported. However, there are still potential pathways through which contaminants could travel to water bodies. In 2012, the BC OGC completed a study that found that seismic events in "the Horn River Basin between 2009 and 2011 were caused by fluid injection during hydraulic fracturing in proximity to pre-existing faults" (BC Oil and Gas Commission 2012). The seismic events studied did not result in any wellbore deformation on vertical well sections (ibid.), but seismicity may be a risk to well casings over time, creating vertical fluid and gas migration pathways. Unlike other provinces, British Columbia does not require well casing integrity tests prior to fracking (Rivard et al. 2014). While integrity tests are required for deep injection wells, a report released by the University of Victoria Environmental Law Centre still raises concerns about the potential for compromised well casings, especially considering that 60 percent of the oil and gas industry's

waste (including flowback and produced water) has been injected into wells that are more than forty-three years old (Carr-Wilson 2014).[9]

Researchers have also raised concerns over fracking's effect on the speed of advective transport rates. Myers (2012) found that advective transport rates of contaminants up into aquifers are dramatically increased after hydraulic fracturing; modelling of the Marcellus Shale indicates that contaminant transport that naturally takes up to tens of thousands of years may only take tens or hundreds of years after hydraulic fracturing occurs (ibid.). Independent hydrologists in British Columbia have also raised concerns about advective transport and compromised well casings over time, but supporting research has not yet been conducted.

In addition to the potential for groundwater contamination during fracking or disposal, there is also the potential for surface water contamination from spills and the improper treatment, storage, and disposal of frack fluids and flowback. Less rigorous regulatory standards for disposal and storage in some states have resulted in numerous incidences of aquatic species death in rivers (Vengosh et al. 2014) and livestock mortality (Bamberger and Oswald 2014). A study of forest health after direct exposure to frack fluids in West Virginia resulted in 56 percent tree mortality within two years (M.B. Adams 2011; see also Warner et al. 2013). Other threats to surface water and surrounding ecosystems include increased sedimentation from road and pipeline development and elevated traffic levels (Entrekin et al. 2011).

In sum, even at current levels of development, industry demand for water has been significant and poorly regulated. Even with massive recent increases in shale gas development, there is currently no independent, publicly available assessment of the implications of water use at this scale or of the dangers of contamination in the northeast.

Air Quality and GHG Emissions

The emissions from shale gas developments are also drastically underresearched: preliminary analyses of the impacts on local air quality and global GHG emissions have shown cause for concern and the need for extensive and more comprehensive studies. Recent and preliminary work in northeast British Columbia has shown that shale gas development may affect local air quality in ways that have impacts on human health. In June 2012, the Fraser Basin Council released Phase One of a human

[9] See the University of Victoria Environmental Law Centre's report *Improving the Regulation of Fracking Wastewater Disposal in BC* for a list of fifteen recommendations to improve the safety of deep-injection wells in the oil and gas industry (Carr-Wilson 2014).

health risk assessment currently under way: *Identifying Health Concerns Relating to Oil and Gas Development in Northeast BC*. The BC Ministry of Health contracted the report after public concerns about oil and gas development began to grow with the industry's rapidly increasing activity (Fraser Basin Council 2012). The report documents numerous environmental pathways created by the oil and gas industry that could result in adverse human health effects: inhalation of "sour gas" (gas with a high hydrogen sulphide content), inhalation or ingestion of diesel dust from increased traffic and operating equipment, and the ingestion of contaminated wildlife and water (ibid., 25). Phase Two of the study is due later this year. Based on some of the concerns raised during Phase One, the Ministry of Health provided two additional air-monitoring sites in the South Peace (BC Ministry of Health 2012). In FNFN territory, however, there continue to be no provincial monitoring stations, despite rapid industrial growth in the Horn River Basin. Without air quality data, community concerns about risks to long-term health and ecological well-being remain unexplained and unaccounted for in scientific research and policy. This information gap raises serious concerns, particularly given what is known about the massive production of contaminants by the upstream oil and gas sector in Canada as a whole: in 2006, the sector accounted for 17 percent of sulphur oxide, 21 percent of nitrogen oxide, and 28 percent of volatile organic compounds in the country (Environment Canada 2013).

Numerous studies in the United States have linked air quality during well completion to human health effects. McKenzie et al. (2012) found that individuals living within 0.8 kilometres of a gas well completion are at a greater risk of contracting cancer from elevated benzene levels and that they also experience other subchronic health effects. An air quality study in Colorado conducted at wells during the initial drilling phase found non-methane hydrocarbons at levels beyond those that have been found to cause lower IQ scores in prenatally exposed children (Colborn et al. 2014). Adgate, Goldstein, and McKenzie (2014) argue that the research on populations living near unconventional gas developments has been scientifically limited in a number of ways (e.g., self-selected populations, small sample sizes, lack of consistently collected data) and that more substantive research on risks to human health risk assessments is needed.

The FNFN often hears the argument that local sacrifices will result in net benefits for the planet through reduced GHG emissions. In the fall of 2013, Premier Christy Clark declared that by developing shale

gas and LNG "we are doing the world a favour" (Canadian Press 2013). Not only is this ethically dubious, its validity has been questioned by several researchers. A number of studies indicate that emissions from shale gas over its full lifecycle are significantly higher than are the emissions from conventional gas (Jiang et al. 2011; Karion et al. 2013), and they are possibly as high as coal if carbon capture and storage (CCS) technologies and fugitive emission reduction measures are not adopted (Howarth, Santoro, and Ingraffea 2011).[10] Recent studies by Alvarez et al. (2012) and Caulton et al. (2014) highlight the need to reduce methane leakages and to improve scientific estimation methods in order to maximize climate benefits of switching from coal to natural gas. Full lifecycle emission calculations are particularly pertinent for gas extracted from the Horn River Basin, where shale gas has a CO_2 content as high as 12 percent (versus the 2 percent of conventional natural gas), and companies are not required to use emission-reducing CCS.

While the FNFN is being asked to think globally, the government has not adopted the necessary industry regulations to make real progress towards realizing its claim that British Columbia will have the world's cleanest LNG industry (Stephenson, Doukas, and Shaw 2012; Stephenson and Shaw 2013). Consideration of upstream impacts poses a clear challenge to the idea that LNG is "clean." A 2013 report by Clean Energy Canada concludes: "Without policy leadership, LNG produced in British Columbia would emit more than three times the carbon pollution of that produced in current world-leading operations. The finding is based not only on the emissions of the proposed LNG plants, but on the carbon footprint of the commodity they would produce – from wellhead to waterline" (Glave and Moorhouse 2013, 4). While the government claims to be focused on making LNG production as "clean" as possible on the coast (BC Ministry of Energy and Mines 2012b), it is upstream in FNFN territory where the most emissions will be produced (Horne 2012), as is shown in Figure 6.[11] Processing plants in FNFN territory will create nearly five times the GHG emissions of the liquefaction process on the coast (ibid.).

[10] See Cathles et al. (2012) for a critique of the assumptions and methods employed in the Howarth, Santoro, and Ingraffea (2011) study. Cathles et al. (2012) estimate that the shale gas's GHG footprint is at most half that of coal.

[11] Initially, the government was committing to use hydropower to run the LNG plants on the coast but has since signalled that the liquefaction process will be powered by natural gas, which it has named a "clean energy" when being used to power LNG plants (Government of BC 2012).

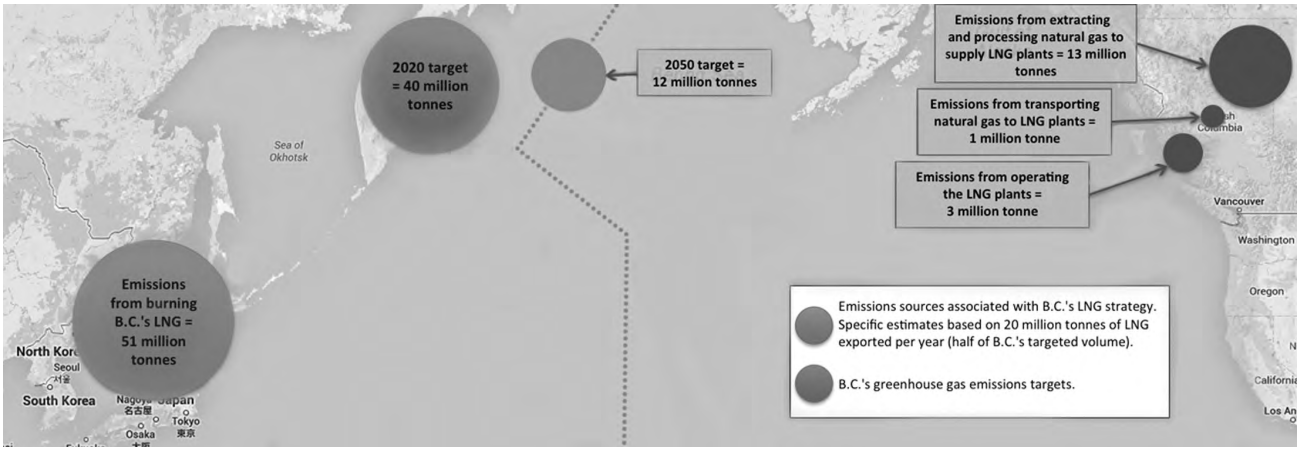

Figure 6. GHG emissions produced on the coast from LNG in contrast to GHG emissions produced in FNFN territory during shale gas extraction and processing. This figure first appeared in an article by Matt Horne from the Pembina Institute (Horne 2012).

DISCUSSION AND CONCLUSIONS

The nascent LNG industry in British Columbia is constantly in the news, but the direct connection between LNG and the industrial footprint of shale gas extraction in the northeast is rarely discussed. Despite aggressive provincial efforts to launch an LNG industry, there is no publicly available long-term development plan that connects LNG to shale gas development in the northeast and that considers the potential cumulative impacts to this region. We have sought here to illustrate the potential character of upstream impacts that are associated with unconventional gas extraction in the FNFN's traditional territory. Our analysis is preliminary; at this point, the research that would allow an assessment of these impacts and their potential trajectories under different scenarios of industrial development has simply not been done. But what our analysis makes clear is that more research is necessary before an informed decision on the pace and scale of shale gas development can be reached; impacts on ecosystems and on First Nations treaty rights must be better understood. Currently, all of the above-described development in FNFN territory is happening without systematic baseline studies, monitoring, or mitigation plans for cumulative impacts. We believe this is cause for alarm.

The FNFN territory contains three of British Columbia's four major basins and had experienced relatively limited industrial development before shale gas took off. The nation was in no way prepared for the rapid expansion in development. Nor, it appears, was the province: the industry has been launched in the absence of a regulatory framework capable of cumulative impact assessment or comprehensive monitoring that would enable the provincial government and industry to answer essential questions and concerns such as those raised by the FNFN. In the absence of independent scientific research, we cannot make the claim that the ecological integrity of the region is being compromised, but the impacts of large-scale oil and gas activity in northern Alberta – on ecosystems similar to those in northeast British Columbia – have been extensively researched. These studies document detrimental impacts to wildlife, biodiversity, and water (Kelly et al. 2009; Timoney and Lee 2009). Such changes, of course, have cascading impacts on the health and resilience of communities (Gosselin et al. 2010; Kelly et al. 2010; Tenenbaum 2009). In the context of British Columbia's northeast, numerous ENGOs and civil society groups have criticized the failure of oil and gas regulation to protect the environment (e.g., Campbell and Horne 2011; Parfitt 2011).

Crucially, the FNFN is reporting changes on the landscape and in the wildlife that are not being seriously investigated, let alone mitigated. From the FNFN's perspective, meaningful consultation on shale gas development is not taking place (Garvie and Shaw 2014). The FNFN – along with other Treaty 8 First Nations – has specific recommendations for the improvement of the consultative process (Garvie and Shaw, this issue). The FNFN has also clearly articulated its expectations of the research and regulatory changes that are necessary for shale gas development to take place within its territory. These expectations include but are not limited to (1) regional baseline studies before water licences are issued; (2) multi-year pre-development plans provided by both industry and government; (3) cumulative environmental assessment processes to ensure development is taking place sustainably; (4) the full protection of culturally significant land and water resources; and (5) third-party, independent monitoring and enforcement of all industry activities (FNFN 2012b). The potential impacts of shale gas development that we have explored in this article support these demands for informed decision making. Only when First Nations, provincial decision makers, and all British Columbians understand the potential impacts can the viability of an LNG industry be decided.

As the provincial government seeks to develop an LNG industry, it must build and mobilize an understanding of existing and potential impacts, both upstream and downstream, and create concrete plans to mitigate them. Currently, the FNFN is struggling to minimize the impacts within a system that is fundamentally unable to address concerns in anything more than a haphazard, superficial way (Garvie and Shaw 2014). Furthermore, the FNFN is but one example of numerous Indigenous and settler communities being affected by shale gas development and other regional transformations in both positive and negative ways. Treaty 8 communities in the Montney Trend are also experiencing unprecedented rates of shale gas development and in combination with numerous other energy industries, including mining developments, wind turbines, and the proposed Site C dam (Muir and Booth, 2011).

The challenge of launching the LNG industry in British Columbia is significant: gas markets are intensely competitive, a fact that puts tremendous pressure on governments to minimize the start-up and ongoing costs for the industry so companies can maximize economic benefits. Balancing this imperative with social, ecological, and governance needs is complex. However, protecting the environment – over both the short and long terms – is also crucial. When the industry is gone, British

Columbia will be left with its legacy: it is important for this legacy to be positive (Rondeau et al. 2013). Unfortunately, the provincial government's approach to developing the industry to date has been rushed and secretive. Consultations with affected communities or British Columbians have been extremely limited, hurried, and haphazard. In addition, there is no body of research identifying and assessing the social and environmental challenges the industry poses and considering how these could be mitigated; in fact, there is little indication the government is considering any of the industry's implications other than its potential to contribute to government coffers. This is a very risky way to proceed. If the province were to slow down, do the necessary research, and work to maximize the economic benefits over the long term, the environment could be better protected as well. Considering that the potential impacts of poorly regulated development are so profound, the FNFN and all British Columbians deserve a measured, well-researched approach.

REVIEW

Methane emissions and climatic warming risk from hydraulic fracturing and shale gas development: implications for policy

Robert W Howarth

Abstract: Over the past decade, shale gas production has increased from negligible to providing >40% of national gas and 14% of all fossil fuel energy in the USA in 2013. This shale gas is often promoted as a bridge fuel that allows society to continue to use fossil fuels while reducing carbon emissions since less carbon dioxide is emitted from natural gas (including shale gas) than from coal and oil per unit of heat energy. Indeed, carbon dioxide emissions from fossil fuel use in the USA declined to some extent between 2009 and 2013, mostly due to economic recession but in part due to replacement of coal by natural gas. However, significant quantities of methane are emitted into the atmosphere from shale gas development: an estimated 12% of total production considered over the full life cycle from well to delivery to consumers, based on recent satellite data. Methane is an incredibly powerful greenhouse gas that is >100-fold greater in absorbing heat than carbon dioxide, while both gases are in the atmosphere and 86-fold greater when averaged over a 20-year period following emission. When methane emissions are included, the greenhouse gas footprint of shale gas is significantly larger than that of conventional natural gas, coal, and oil. Because of the increase in shale gas development over recent years, the total greenhouse gas emissions from fossil fuel use in the USA rose between 2009 and 2013, despite the decrease in carbon dioxide emissions. Given the projections for continued expansion of shale gas production, this trend of increasing greenhouse gas emissions from fossil fuels is predicted to continue through 2040.

Keywords: shale gas, natural gas, methane, greenhouse gases, global warming, bridge fuel

Introduction

Shale gas is natural gas tightly held in shale formations, and as for conventional natural gas, shale gas is composed largely of methane. The difference between shale gas and conventional natural gas is the mode of extraction. Shale gas cannot be obtained commercially using conventional techniques and has entered the market only recently as industry has used two relatively new technologies to extract it: high-precision horizontal drilling with high-volume hydraulic fracturing. Over the past decade, shale gas development in the USA has increased rapidly, a trend that both the Energy Information Agency (EIA) of the US Department of Energy and the industry expect to continue[1–3] (Figure 1). To date, almost all shale gas production in the world has occurred in the USA, a condition likely to continue for at least another decade.[2] The EIA projections for future growth in shale gas development may well be too rosy because both the expense of developing shale gas and the pattern of production from a shale gas well have proven to differ dramatically from that seen in conventional gas wells, with very rapid declines over the first year or two.[4] An independent assessment concludes that

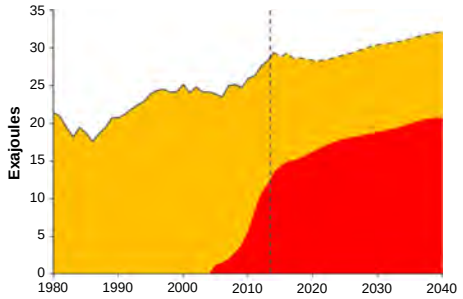

Figure 1 Natural gas production in the USA from 1980 to 2013 and future natural gas production until 2040 as predicted by the US Department of Energy in the *Annual Energy Outlook 2015*.[1] Conventional gas is indicated in yellow, shale gas in red.

shale gas production in the USA is likely to underperform the EIA estimates by almost 40% between now and 2040.[5] However, all these estimates are highly uncertain. If the EIA projections prove true, what might some of the environmental and public health consequences be?

Since shale gas development is a recent phenomenon, scientific investigations on its environmental and public health consequences are also quite new, with the first peer-reviewed studies published only in 2011.[6,7] Nonetheless, the literature has quickly grown, and evidence is accumulating of many adverse effects, including surface and groundwater contamination,[8] degraded air quality,[9,10] increased release of greenhouse gases,[11,12] increased frequency of earthquakes,[13] and evidence of harm to the health of humans and domestic animals, including farm livestock.[7,14–18]

The natural gas industry often points out that hydraulic fracturing has been in use for >60 years, implying that there is little new about shale gas development.[19] The scale of hydraulic fracturing used to develop shale gas, however, is far greater than the fracturing employed in previous decades for conventional gas, with two orders of magnitude increase in the volume of water and chemicals used from the hydraulic fracturing and even proportionally greater return of fracturing wastes to the surface.[6] Further, the use of high-volume hydraulic fracturing with high-precision directional drilling to develop shale gas leads to an intensity of development not generally seen with conventional natural gas and to the redevelopment of regions where conventional gas has largely played out, which may intensify some effects such as air emissions due to interactions with old wells and formations.[20] The appropriate focus when considering the environmental and public health effects of shale gas development is on the entire enterprise and use of the gas and not merely on the process of hydraulic fracturing.

This paper focuses on the role of methane emissions in determining the greenhouse gas footprint of shale gas. Natural gas, including shale gas, is often promoted as a bridge fuel that will allow society to continue to use fossil fuels over the coming decades while reducing carbon emissions. This was highlighted, for example, by President Obama in his State of the Union speech in January 2014.[21] For a given unit of energy consumed, the emissions of carbon dioxide from natural gas are substantially lower than from oil or coal,[11,22] which is the basis for the bridge fuel concept. However, natural gas is composed mostly of methane, a greenhouse gas that on a mass-to-mass basis is >100 times more powerful than carbon dioxide as an agent of global warming for the time when both gases persist in the atmosphere.[23] Consequently, even small releases of methane to the atmosphere from the development and use of shale gas can greatly influence the greenhouse gas footprint of shale gas.

How much methane is emitted?

My coauthors and I published the first peer-reviewed assessment of methane emissions from shale gas development in 2011.[11] We concluded that 3.8% (±2.2%) of the total lifetime production of methane from a conventional gas well is emitted into the atmosphere, considering the full life cycle from well to final consumer.[11] The data available for estimating emissions from shale gas were more scarce and more poorly documented at that time, but we estimated that the full life cycle emissions of shale gas were ~1.5-fold higher than that of conventional natural gas, or 5.8% (±2.2%).[11] We attributed the higher emissions to venting of gas during the flowback period following high-volume hydraulic fracturing, although a subsequent study identified other sources as well, such as drilling through strata previously developed for coal and conventional natural gas.[20] For both conventional gas and shale gas, we estimated the "downstream" emissions associated with storing gas and delivering it to market to be 2.5% (±1.1%), so our estimates for "upstream" emissions at the well site and from gas processing averaged 1.3% for conventional natural gas and 3.3% for shale gas.[11,12]

Through 2010, the US Environmental Protection Agency (EPA) continued to estimate emissions for conventional natural gas as 1.1%, with 0.9% of this from downstream emissions and 0.2% from upstream emissions, based on a joint EPA and industry study from 1996, as I discuss elsewhere.[12]

They did not separately consider shale gas emissions. Soon after our paper was published in 2011, the EPA released new estimates that were very similar to ours in terms of upstream emissions: 1.6% for conventional natural gas and 3.0% for shale gas.[12] They kept their downstream emission estimates at 0.9%, yielding full life cycle emissions of 2.5% and 3.9%, respectively, for conventional gas and shale gas. EPA subsequently reduced their estimates for upstream emissions, cutting them approximately in half, relying on a non-peer-reviewed industry report[24] asserting that the 2011 estimates had been too high.[12,25] This yielded a full life cycle emission estimate for all natural gas in the USA, considering the contributions from both conventional and shale gas as of 2009, of 1.8%.[12] The inspector general of the EPA has called for improvements in the agency's approach in estimating emissions,[26] at least in part because of the 2013 decision to lower emission estimates.[12,25]

In our original 2011 paper, we called for new and better studies of methane emissions from the natural gas industry,[11] and in fact, many studies have been published in the subsequent 4 years. In 2014, I published a review of the new studies that had come out through February 2014.[12] One of these studies evaluated a large set of data from monitoring stations across the USA for the period 2007–2008, before the large increase in shale gas production, and concluded that the EPA estimate of 1.8% emission was clearly too low by a factor of at least 2 and that full life cycle emissions from conventional natural gas must be ≥3.6% on average across the USA.[27] Other, shorter term studies evaluated upstream emissions from shale gas and other unconventional gas development (ie, tight sands), with two finding high emissions (4%–9%)[25,28] and one published by Allen et al finding low emissions (0.4%).[29] In a summary published in early 2014, Brandt et al concluded that emissions from the natural gas industry, including both conventional gas and shale gas, could best be characterized as averaging 5.4% (±1.8%) for the full life cycle from well to consumer.[30] I accepted that conclusion and presented it as the best value in my 2014 review.[12]

Further thought and subsequent studies published since February 2014 have led me to reconsider. I now believe that emissions from conventional natural gas are somewhat <5.4%, based on the ^{14}C content of atmospheric methane globally, and emissions from shale gas are likely substantially more, based on global trends observed from satellite data and new evidence that the 2013 report by Allen et al of only 0.4% emissions[29] is likely to be flawed.

^{14}C content of methane and emissions from conventional natural gas

The ^{14}C radiocarbon content of methane in the planet's atmosphere provides a constraint on the emission rate from conventional natural gas systems. On average during the years 2000–2005, 30% of atmospheric methane was ^{14}C "dead", indicating that it came from fossil sources.[31,32] During this time period, the total global flux of methane to the atmosphere was probably in the range of 548 (±22) Tg CH_4 per year.[33] Therefore, the flux from fossil sources, 30% of the total flux, would have been ~165 Tg CH_4 per year. These fossil sources include fluxes associated with coal, oil, and natural gas development as well as natural seeps. Using global production data for coal and oil[34] and well-accepted methane emission factors for these two fuels as described elsewhere,[11] I estimate the combined methane emissions from oil and coal as ~50 Tg CH_4 per year. Using the 5.4% emission rate and global natural gas production estimates[34] for the years 2000–2005 yields a methane emission of 130 Tg CH_4 per year from the natural gas industry or 180 Tg CH_4 per year from all fossil fuels. This is too high compared to the ^{14}C constraint, suggesting that an emission rate of 5.4% for conventional gas is too high, even if natural seeps are negligible, as assumed by the Intergovernmental Panel on Climate Change (IPCC) in 2007 in their fourth assessment report.[35] Flux estimates from natural seeps are poorly constrained, but these natural emissions may be as great as 50 Tg CH_4 per year or higher.[31] If we instead use the mean emission factor from our 2011 paper for conventional natural gas of 3.8%,[11] the global flux from natural gas emissions is estimated as 91 Tg CH_4 per year, giving an emission flux from all fossil fuels of ~140 Tg CH_4 per year and an estimate of emissions from natural seeps of 15 Tg CH_4 per year. This combination is plausible, if uncertain, and the 3.8% factor agrees well with the robust conclusion from Miller et al that emissions from conventional natural gas systems in the USA, from before the shale gas boom, must have been at least 3.6% of production.[27]

How high are methane emissions from shale gas?

A paper published by Schneising et al in the fall of 2014 used satellite data to assess global and regional trends in atmospheric methane between 2003 and 2012.[36] Methane concentrations rose dramatically in the northern hemisphere, particularly after 2008. In a detailed comparison across the

USA for the time periods 2006–2008 (before there was much shale gas or shale oil development) and 2009–2011 (after shale gas and oil production began in earnest), atmospheric methane concentrations rose dramatically in many of the major shale-producing regions. By evaluating trends in drilling and hydraulic fracturing activity, Schneising et al estimated methane emission rates of 9.5% (±7%) in terms of energy content during the 2009–2011 period for the two large shale regions – the Eagle Ford in Texas and the Bakken in North Dakota – where they felt most comfortable in estimating emissions.[36] They reported similar methane emissions for the Marcellus shale, but with much greater uncertainty in the analysis of the satellite data because of sparser spacing of wells, the mountainous terrain, and the proximity of the region to the Great Lakes. For the Bakken, shale oil production was far greater than gas production during this time period,[37] and the methane emissions may have been more associated with the oil production. However, natural gas was the dominant form of shale energy produced in the Eagle Ford formation between 2009 and 2011, contributing 75% of all shale energy with oil contributing 25%.[37] For the Marcellus shale, virtually all shale energy production through 2011 came from shale gas and not oil.[37] Therefore, it seems reasonable to attribute a methane emission rate of ~9.5% to shale gas development in the Eagle Ford and Marcellus formations.

The satellite methane emission estimate is largely for upstream emissions and does not fully account for downstream emissions during storage and delivery of gas to customers, which may on average add another 2.5% of methane emission.[11,12,22] The conclusion is that shale gas development during the 2009–2011 period, on a full life cycle basis including storage and delivery to consumers, may have on average emitted 12% of the methane produced. This is more than twice what we had estimated for shale gas in our 2011 analysis,[11] but the satellite-based estimate is based on more robust data and integrates across a period of 2 years. These shale gas emissions already may have a globally observable effect on methane in the atmosphere.[36]

The satellite-based estimate is ~20-fold greater than the estimate presented by Allen et al,[29] a study that worked closely with industry to measure emissions from various component processes of shale gas development. In my 2014 review, I suggested that the study by Allen et al may represent a best-case scenario for low emissions, given that measurements were made only at sites where industry allowed.[12] Since then, two papers published in 2015 have indicated that in fact the data in the Allen et al's paper may be flawed. Allen et al used a high-flow analyzer that employs two independent sensors, switching between a catalytic oxidation detector when methane levels are low and a thermal conductivity detector when methane concentrations are greater. Howard et al noted that the high-flow analyzer is prone to underestimating methane fluxes when switching between detectors.[38] A follow-up paper by Howard et al carefully evaluated the use of a high-flow analyzer by Allen et al and concluded that "the data reported by Allen et al. (2013) suggest their study was plagued by such sensor failure", and as a result "their study appears to have systematically underestimated emissions."[39] The sensor failure issue may well have affected other data reported by industry to the EPA and used by the EPA in their assessment of methane emissions, leading to serious underestimation.[38,39]

Several other recent studies have estimated upstream methane emissions from shale gas and other unconventional natural gas development (ie, from tight-sand formations) using more robust and more integrated measurement techniques such as airplane flyovers, but still with highly variable results. Estimates were ~30% greater than the satellite-derived data for one gas field,[40] were comparable in two other cases,[20,25] were only about half as much for two sets of measurements in another gas field,[28,41] and were substantially less in three other cases.[40] Peischl et al have suggested that higher emissions are associated with wet-gas fields and lower emissions with dry-gas fields.[40] Alternatively, the variation in emissions may simply reflect variance in space and/or in time: many of these studies were quite short in duration, for example, based on measurements made during airplane flyovers of just 1–2 days.[20,40] It is also important to note that these emission estimates are given as percentages of the gas production rates. The activity of the natural gas industry and rates of production in various gas fields are quite variable in time, and some of the differences in percentage emission rates may reflect this variability. For instance, Caulton et al reported high emission rates in the southwestern Pennsylvania portion of the Marcellus shale based on a June 2012 flyover,[20] while Peischl et al reported a very low percentage of emission rate in the northeastern Pennsylvania portion of the Marcellus shale from a July 2013 flyover.[40] Between these two flights, gas drilling activity for shale gas fell by 64% due to low prices for gas,[42] yet shale gas production remained high based on prior drilling and hydraulic fracturing.[1] If methane emission is more related to drilling and hydraulic fracturing activity than to production, these rapid changes in activity may explain at least part of the differences between the two estimates for Marcellus shale.

I therefore conclude that the satellite data[36] provide the most robust estimates for upstream methane emissions from shale gas operations to date.

Is natural gas a bridge fuel?

Natural gas is widely promoted as a bridge fuel, a source of energy that allows society to continue to use fossil fuels while reducing greenhouse gas emissions over the next 2 decades or so, until renewable energy sources can more fully come on line. Our 2011 paper challenged that view because of methane emissions from natural gas, although we tempered our conclusion because of the uncertainty in methane emissions from shale gas development.[11] We also observed that the time frame over which one compares the consequences of emissions of carbon dioxide and methane is important in determining the overall greenhouse gas footprint of natural gas. While many studies have made this comparison only by averaging the radiative forcing of the two gases over a time of 100 years following emission, we compared on a 20-year timescale as well, following the lead of Hayhoe et al[22] and Lelieveld et al.[43] Methane has a residence time in the atmosphere of only 12 years,[23,33] while the influence of carbon dioxide emissions persists in the atmosphere for many hundreds of years or longer.[23] While both gases are in the atmosphere, the greenhouse warming effects of methane are >100-fold greater than for carbon dioxide on a mass-to-mass basis.[23] When compared on a 100-year average time after emission, the emitted methane is largely absent from the atmosphere for almost 90% of that time, which greatly underplays the importance of methane while it is in the atmosphere.

Our 2011 paper was criticized for comparing the consequences of methane and carbon dioxide over a 20-year period in addition to the 100-year period, with some authors stating that only a 100-year period should be used under the guidance of the IPCC.[44,45] This was never the case, and in the fourth synthesis report in 2007, the IPCC presented analyses based on both 20- and 100-year time periods.[35] Further, in the fifth synthesis report in 2013, the IPCC explicitly weighed in on this controversy, stating that "there is no scientific argument for selecting 100 years compared with other choices", and "the choice of time horizon […] depends on the relative weight assigned to the effects at different times".[23]

So what is the best choice of timescale? Given current emissions of greenhouse gases, the Earth is predicted to warm by 1.5°C above the preindustrial baseline within the next 15 years and by 2°C within the next 35 years.[46,47] Not only will the damage caused by global warming increase markedly but also at these temperatures, the risk of fundamentally altering the climate system of the planet becomes much greater.[48,49] Further, reducing emissions of carbon dioxide will do little if anything to slow the rate of global warming over these decadal time periods.[47] On the other hand, reducing emissions of methane has an immediate effect of slowing the rate of global warming.[47] For these reasons, comparing the global warming consequences of methane and carbon dioxide over relatively short time periods is critical. The use of a global warming potential (GWP) estimate for the 20-year time period from the IPCC fifth assessment report provides a convenient approach for doing so.[23] This GWP value of 86 is the relative radiative forcing for methane compared to that of carbon dioxide, averaged over 20 years, for two equal masses of the gases emitted into the atmosphere today.

Figure 2 compares the greenhouse gas footprint of shale gas with that of conventional natural gas, oil, and coal. Methane emissions of shale gas are derived from the satellite-based estimates of Schneising et al[36] with an additional 2.5% emission rate assumed from downstream transport, storage, and distribution systems.[11,12,22] Methane emissions for the other fuels are those used in our 2011 paper, which is 3.8% (±2.2%) for conventional natural gas.[11] Methane emissions are converted to carbon dioxide equivalents using the 20-year GWP value of 86 from the IPCC assessment.[23] While for a

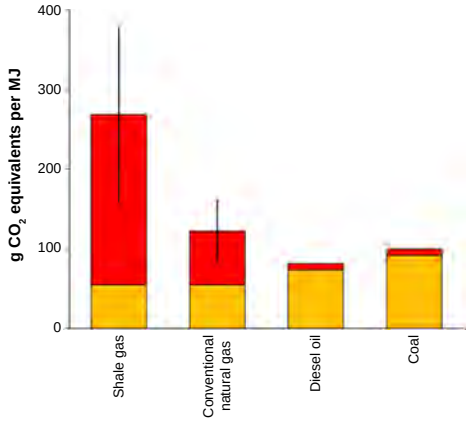

Figure 2 The greenhouse gas footprints of shale gas, conventional natural gas, oil, and coal expressed as g CO_2 equivalents per MJ of heat produced.
Notes: Yellow indicates direct and indirect emissions of carbon dioxide. Red indicates methane emissions expressed as CO_2 equivalents using a global warming potential of 86. Vertical lines for shale gas and conventional natural gas indicate the range of likely methane emissions. Emissions for carbon dioxide for all fuels and for methane from conventional natural gas, oil, and coal are as in Howarth et al.[11] Mean methane emission estimate of shale gas is taken as 12% based on Schneising et al[36] as discussed in the text.

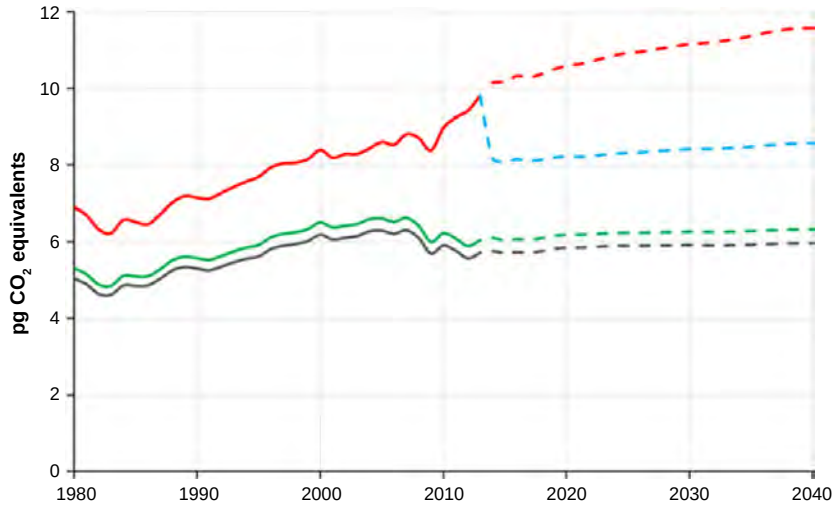

Figure 3 Trends in greenhouse gas emissions from fossil fuel use in the USA from 1980 to 2013 and future trends predicted until 2040 based on historical energy use and energy predictions in the *Annual Energy Outlook 2015*.[1] Shown are: emissions just for carbon dioxide (gray line); emissions for carbon dioxide and for methane using EPA assumptions, which undervalue the importance of methane (green line); emissions for carbon dioxide and methane based on emission factors for conventional natural gas, oil, and coal from Howarth et al,[11] mean methane emission estimates for shale gas of 12% based on Schneising et al[36] as discussed in the text, and a global warming potential for methane of 86 (red line); and future emissions for carbon dioxide and methane based on the same assumptions as for the red line, except assuming that shale gas emissions can be brought down to the level for conventional natural gas (blue line). Historical data are shown by solid lines; dashed lines represent future predictions.
Abbreviation: EPA, Environmental Protection Agency.

given unit of energy produced, carbon dioxide emissions are less for shale gas and conventional natural gas than those for oil and coal, the total greenhouse gas footprint of shale gas is substantially greater than that of the other fossil fuels when methane emissions are included (Figure 2). Note that this is true even for the low-end estimates of methane emissions from the Schneising et al study. The greenhouse gas footprint of conventional natural gas is also higher than that of conventional oil and coal for the mean estimate of methane emissions and still greater than or comparable to that of these other fuels even at the low-end estimate for methane emissions. Natural gas – and shale gas in particular – is not a bridge fuel when methane emissions are considered over an appropriate timescale.

Trends in greenhouse gas emissions from fossil fuels in the USA

Figure 3 shows the greenhouse gas emissions from all use of fossil fuels in the USA from 1980 to 2013 and projections for emissions through 2040, based on data for fossil fuel use and projections of future use from the EIA *Annual Energy Outlook 2015* report[1] and carbon dioxide emissions per unit of energy produced for each fuel.[11,22] Total carbon dioxide emissions fell in the early 1980s due to economic recession, but as the economy recovered, emissions rose steadily until the great recession of 2008. Carbon dioxide emissions continued to fall from 2008 to 2013 and are predicted to remain relatively flat through 2040.[1] President Obama and others have attributed the decrease in carbon dioxide emissions since 2008 to a switch from coal to shale gas,[21,50] although a recent analysis by Feng et al concludes that the sluggish economy was the more significant cause.[51]

When methane emissions are included in the analysis, we see some important differences in trends in national greenhouse gases. For the top line in Figure 3, methane emissions are included as carbon dioxide equivalents using the 20-year GWP of 86 from the IPCC fifth assessment[23] and methane emission factors from the 2011 study by Howarth et al[11] for coal, conventional oil, and conventional natural gas and a factor of 12% based on the satellite data discussed earlier for shale gas. In this analysis, methane contributes 28% of total fossil fuel emissions for the USA in 1980 and 42% in 2013 (Figure 3). The increasing trend in the relative importance of methane in the greenhouse gas emissions of the USA is due to

Energy and Emission Control Technologies downloaded from https://www.dovepress.com/ by 71.212.22.129 on 03-Nov-2018
For personal use only.

an increasingly large portion of the nation's fuel mix coming from natural gas and particularly from shale gas for the time since 2009.[1] Shale gas production was negligible before 2005 (Figure 1) but rose to contribute 14% of all fossil fuel energy used in the USA in 2013.[1] Importantly, while carbon dioxide emissions fell between 2008 and 2013, total greenhouse gas emissions including methane fell only briefly in 2008 before beginning a rapid increase that lasted through 2013 and are projected to continue to rise through 2040.

The US EPA includes methane emissions in the natural gas inventory, but they do so in a manner that greatly undervalues their importance. This can be seen in Figure 3, where the green line that is just above and closely tracks the gray line for carbon dioxide emissions is based on EPA assumptions: a methane emissions rate of only 1.8% from natural gas and a GWP of 21 based on the 100-year time period from the second IPCC assessment from 1996.[52] Note that the EPA used this GWP value of 21 for many years, through 2013, before switching to the 100-year value of 25 in 2014 from the IPCC fourth assessment from 2007. The 2013 assessment of the IPCC gives a GWP value of 34 for the 100-year period but, as noted earlier, also states that the 100-year time frame is arbitrary. A shorter time frame, such as the 20-year GWP of 86 used in the top line in Figure 3, far better accounts for the importance of methane to global warming in the critical next few decades as the temperature is predicted to reach 1.5°C–2°C above the preindustrial baseline if methane emissions are not reduced.

Implications for policy on shale gas

As of January 2015, the US EPA has taken some steps to reduce emissions from shale gas, but how effective these will be in reducing methane emissions remains unclear. A draft regulation proposed in 2012 would have prevented the venting of methane during the flowback period following hydraulic fracturing, with some exceptions such as for wells in frontier regions not yet serviced by pipelines.[53] This would be important, since such venting can emit a large amount of methane.[11] However, the final regulation distinguishes between two phases of flowback, an "initial flowback stage" and a "separation flowback stage". Venting of methane and other gas is explicitly allowed during the initial stage, and recovery of the gas is only required during the separation stage.[53] The separation stage is supposed to commence as soon as it is technically feasible to use a flowback gas separator. At this stage, EPA requires that the gas be sold to market, reinjected into the ground, used as an onsite fuel, or, if none of these are possible, flared (ie, burned). No direct venting of gas is allowed during this separation flowback stage, "except when combustion creates a fire or safety hazard or can damage tundra, permafrost or waterways".[53] Much is left to operator judgment as to when the shift from the initial stage to the separation stage occurs and whether an exception is necessary, which would seem to make enforcement of these regulations difficult.

Further, EPA continues to ignore some methane emission sources, such as during the drilling phase. Caulton et al identified many wells that were emitting high levels of methane during this drilling phase, before the drillers had even reached the target shale, and long before hydraulic fracturing,[20] perhaps because drillers were encountering pockets of methane gas from abandoned conventional gas wells or abandoned coal mines. Our understanding of emission sources remains uncertain, with the study of shale gas methane emissions commencing only in the past few years.[6] Adequate regulation to reduce emissions requires better knowledge of sources, as well as better oversight and enforcement.

Nonetheless, methane emissions from shale gas can be reduced to some extent. I suggest that the best-case scenario would have these emissions reduced to the level for conventional natural gas, or ~3.8% for the full well-to-consumer life cycle. This best-case scenario is explored in Figure 3 (dashed blue line), where it is assumed that shale gas methane emissions are reduced from 12% to 3.8% as of 2014. Even still, methane accounts for 30% of total greenhouse gas emissions from fossil fuels in the USA throughout the period from 2014 to 2040 under this scenario, and total emissions continue to rise, albeit more slowly than without the aggressive reduction in shale gas methane emissions. This best-case scenario seems unlikely, and actual emissions from shale gas are likely to range between 3.8% and 12%, giving total greenhouse gas emissions for all fossil fuels that lie between the dashed red and blue lines in Figure 3.

Methane emissions severely undercut the idea that shale gas can serve as a bridge fuel over the coming decades, and we should reduce our dependence on natural gas as quickly as possible. One of the most cost-effective ways to do so is to replace in-building use of natural gas for domestic space and water heating with high-efficiency heat pumps. Even if the electricity that drives these heat pumps comes from coal, the greenhouse gas emissions are far less than from the direct use of natural gas.[12] Heating is the major use for natural gas in the USA, making this change of use imperative.

Concluding thoughts and a path forward

Should society continue to use coal rather than convert toward more electricity production from shale gas? Absolutely not. The carbon dioxide emissions from burning any fossil fuel will continue to influence the climate for hundreds of years into the future, and coal is the worst of the fossil fuels in terms of carbon dioxide emissions. Given the imperative of also reducing methane emissions to slow global warming over the coming few decades, though, the only path forward is to reduce the use of all fossil fuels as quickly as possible. There is no bridge fuel, and switching from coal to shale gas is accelerating rather than slowing global warming.

Fortunately, society does have a path forward: recent studies for the State of New York[54] and for the State of California[55] have demonstrated that we can move from a fossil fuel-driven economy to one driven totally by renewable energy sources (largely solar and wind) in a cost-effective way using only technologies that are commercially available today. The major part of the transition can be made within the next 15 years, largely negating the need for shale gas, with a complete transition possible by 2050. A critical part of these plans is to use modern, efficient technologies such as heat pumps and electric vehicles, which greatly reduce the overall use of energy. The cost of the transition is less than the cost currently paid for death and illness related to air pollution from using fossil fuels.[54] The costs of renewable energy today are equal to or lower than those from using fossil fuels, when the external costs to health and the climate are considered.

In June 2015, six of the largest oil and gas companies in Europe including BP and Shell called for a carbon tax as a way to slow global warming.[56] An editorial in the *New York Times* endorsed this idea,[56] and indeed, a carbon tax is perhaps the best way to equalize the playing field for renewable energy technologies. The International Monetary Fund estimates that subsidies to fossil fuels globally are in the range of $5 trillion per year, with much of this due to the effects of global warming and consequences on human health.[57] A carbon tax would help rectify these subsidies and help promote renewable energy. However, the editorial in the *Times* made a fundamental error by ignoring methane emissions when they wrote "this tax would reduce demand for high-carbon emission fuels and increase demand for lower emission fuels like natural gas".[56]

Any carbon tax should recognize the two faces of carbon: the two major greenhouse gases, carbon dioxide and methane, are both carbon gases. Both of these carbon gases are critically important, and the 2013 IPCC synthesis report tells us that the effects of global methane being emitted today matches the consequences of carbon dioxide emissions as drivers of global warming.[23] The modes of interaction with the planetary climate system are dramatically different, though. The climate is slow to respond to changes in carbon dioxide emissions, and so immediate reductions in emissions would take 30–40 years before having an influence on slowing warming, but the emissions have a warming effect on the climate that will persist for hundreds of years.[23,46,47] The climate responds quickly to changes in methane emissions, and reducing methane emissions is essential for slowing climate change over the coming 30–40 years; however, the methane remains in the atmosphere for little more than 1 decade, and methane emissions have no lasting influence on the Earth's climate systems in future centuries, unless global warming over the coming decades leads to fundamental thresholds and changes in the climate.[12,23,46,47]

A carbon tax that adequately addresses the immediacy of global climate change must include both carbon gases. Methane emissions should be taxed using the best available information on methane emissions. And the tax on methane should adequately reflect the importance of methane in current global warming and its influence in global warming over the critically important next few decades. Taxing methane emissions at 86 times the tax for carbon dioxide emissions, using the 20-year GWP from the most recent IPCC synthesis report,[23] would accomplish this.

Acknowledgments

The author thanks Tony Ingraffea for his continued support and collegial interaction over the past 6 years in the joint work that has helped to lead to this paper. Funding was provided by the Park Foundation and an endowment given by David R Atkinson to Cornell University to support my position. Roxanne Marino and Melanie Hayn assisted with drafting the figures, and the manuscript benefited from advice and input from Roxanne Marino, my wife and long-term colleague. Two anonymous reviewers provided very helpful comments.

Subject: Concern #3 re draft SEIS for PSE LNG - leakage rates of methane
Date: Sunday, November 11, 2018 6:55:23 PM
Attachments: EECT-61539-perspectives-on-air-emissions-of-methane-and-climatic-warmin_100815-2.pdf

Dear Puget Sound Clean Air Agency,

An alarming mistake that is made in the draft SEIS for the PSE LNG plant is in regard to the data it offers for leakage of methane at extraction sites. It is increasingly evident that gas companies under-report methane emissions, either because they intentionally avoid accurate measurements or because they intentionally lie about what they measure.

When independent scientists measure real emissions, what they find is alarming. Three cases in point are the Denver Basin, the Uinta Basin in Utah, and the Los Angeles basin. Looking at extraction sites alone (leaving aside for the moment the reality of leaks during pipeline transportation and processing), these three geographic examples show leakage alarmingly above the 3% threshold that would make natural gas/methane as bad as coal in its impact as a greenhouse gas. In Denver, National Oceanic and Atmospheric Administration (NOAA) scientists measured an average of 4% leakage at extraction sites. In Utah, Picarro scientists measured an average of 11% leakage. And in LA, NOAA again measured an average of 17% methane leakage from oil and gas extraction sites. (My source for these figures is the video report linked above, "Chasing Methane with Mark Bittman" from the New York Times.) What would truthful, accurate, up-to-date measurements of methane leakage at the British Columbia sites show? What would truthful, accurate, up-to-date measurements of methane leakage during transportation via pipelines and compressor stations show? The sources used in the current draft SEIS are not reliable; the SEIS must be revised to give us scientifically accurate information about methane leakage rates.

Finally, the draft SEIS needs to include citations from and a serious consideration of the work of Robert Howarth,Tony Ingraffeo, and others at the Cornell University Methane Project. These presentation slides (November 2017) evaluating the possible sources of increased methane in the atmosphere are a beginning (the graph on slide #2 shows that emissions of CO2, CH4, and black carbon must *all* be greatly reduced if we are to succeed in keeping global warming under 2 degrees C). Another important reference is an article by Howarth available for download as a pdf in this link (please see graph, page 5).

Hoping and praying that these comments are taken seriously,
Mary Paterson

Attachments: 184887-Article Text-196156-1-10-20150204-1.pdf

Dear Puget Sound Clean Air Agency,

I submitted a comment approximately one week ago with three comments rolled together in one email. I am re-sending concerns 2 and 3 separately to make sure they are "counted" in your tallies and in your consideration. (Concern #1 was the draft SEIS reliance on an outdated study from 2007 for assessing the Global Warming Potential of methane and, related to that, using a 100-period only for assessing the impact of methane leakage and slippage -- not a 10 and/or a 20-year-period, which is the crucial period that we face according to the very recent UN IPCC report.)

I am very concerned that the draft SEIS is based solely on PSE's claim that all the gas piped into the plant at the Tacoma tideflats/Port of Tacoma will come from British Columbia. I don't know how PSE can guarantee the source of the gas over a period of several decades. But let us for the sake of this comment assume that all the gas will come from BC gas mines. One concern that many of us who oppose this project have is for the Missing and Murdered Indigenous Women, a phenomenon of violence that correlates the presence of "man camps" (predominantly men hired to dig and lay pipelines and work at extraction sites) with the disappearance and murder of First Nations and Native American Indian women. I do not know if it is "within the scope" of Puget Sound Clean Air Agency's mission to consider this violence in its decision-making regarding the Tacoma LNG project. But perhaps it is within the scope of PSCAA's evalulation to consider this examination of the potential impact -- cultural, health, climate change -- of unconventionally mined gas (i.e. shale gas, fracked gas) on the Fort Nelson First Nations people and their land and water in northeastern British Columbia. This study, its questions and findings, need to be part of the PSE Tacoma LNG SEIS.

Thank you again for your diligence in pursuing a truthful SEIS for the PSE LNG project. I feel strongly that the current draft of the SEIS is not just inadequate but in fact untruthful about the air impact of the PSE LNG project in Tacoma.

Sincerely,
Mary Paterson

SHALE GAS DEVELOPMENT IN FORT NELSON FIRST NATION TERRITORY:

Potential Regional Impacts of the LNG Boom

KATHRYN H. GARVIE, LANA LOWE, AND KARENA SHAW*

OVER THE PAST DECADE, abundant "unconventional" gas reserves throughout North America have become economically and technically viable through the combined use of two extraction technologies – horizontal drilling and hydraulic fracturing (or "fracking") – and, as a result, production on the continent has boomed.[1] In 2012, the Government of British Columbia released a Natural Gas Strategy outlining its vision to dramatically increase provincial natural gas production and exports (BC Ministry of Energy and Mines 2012a). To escape the gas glut (and subsequent low prices) in North America, British Columbia is pursuing growing Asian markets. In order to be exported to Asia, the gas must be piped to the province's west coast, liquefied (i.e., turned into "liquefied natural gas" – LNG – at coastal plants), and then shipped in tankers across the Pacific Ocean. In the BC Jobs Plan (Government of BC 2011), the Liberal government committed to having three LNG plants up and running by 2020. The year 2014 will be pivotal in British Columbia's energy history as a number of proponents working towards a 2020 opening decide on final investments (Government of BC n.d.).

It is widely accepted that at most only a few of the more than twelve proposed LNG plants will ever be built. Even so, independent researchers have raised concerns about the potential implications of these developments for British Columbia's efforts to reduce greenhouse gas (GHG) emissions (Jaccard and Griffin 2010; Stephenson, Doukas, and Shaw

* This research was funded by Carbon Management Canada, Project D215, and a SSHRC Master's Fellowship. The authors would like to express their thanks to Roberto Concepcion, Trevor Lantz, Ellie Stephenson, Joanna Reid, Graeme Wynn, and three anonymous reviewers for their thoughtful assistance with this article.

[1] Hydraulic fracturing injects large volumes of water mixed with sand and chemicals underground at high pressures to create fissures in the rock, allowing the trapped gas to flow into the well.

2012). What is less widely appreciated – and has not been adequately researched or assessed – is the issue of the upstream environmental impacts of the LNG industry (Council of Canadian Academies 2014). In British Columbia, the expansion of natural gas production for LNG exports means the development of unconventional gas reserves. For example, between 2005 and 2010, the percentage of wells in the Horn River Basin targeting shale gas jumped from 3.4 to 85.4 percent of all new wells drilled (BC Oil and Gas Commission 2010). Under the current environmental assessment regime, only those impacts associated with pipelines and gas processing plants are systematically assessed. However, First Nations in the shale gas plays that will feed the LNG industry are already experiencing a much wider range of effects. One of the nations most directly affected is the Fort Nelson First Nation (FNFN), whose territory includes three of the four major shale gas plays in British Columbia.[2]

This research, conducted with the Fort Nelson First Nation Lands Department, was prompted by concerns that the province has not meaningfully assessed the risks and impacts of an unconventional gas industry in FNFN territory. Nor is there adequate data or resources available for the nation to assess the risks on its own. In what follows, we tell the story of the rapid expansion of natural gas developments in the FNFN's territory through figures developed by the FNFN Lands Department. These figures reveal a race for industrial tenure, landscape disturbance on a massive scale, threats to wildlife, risks to water quality and quantity, and a high level of GHG emissions. After a short description of the treaty rights and land uses of the FNFN and the policy context of the BC natural gas industry, we present and describe these impact-related figures in turn, also referring to a wider literature on natural gas development in British Columbia and elsewhere. We aim to illustrate the scale and pace of industrial expansion and to identify a range of associated impacts. This investigation of potential impacts reveals an urgent need for a strategic assessment of the cumulative upstream effects of the LNG industry. Appeals for baseline studies and cumulative environmental assessments of the oil and gas industry in northeast British Columbia are widespread, coming from First Nations, researchers, and non-governmental organizations alike (West Coast Environmental

[2] The four major shale gas plays in British Columbia are the Liard Basin, the Horn River Basin, the Cordova Embayment, and the Montney Trend. The first three fall almost entirely within FNFN territory (see Figure 1); the majority of the Montney shale gas play, however, lies farther south. In this article, we focus largely on the plays within FNFN territory but also draw, where relevant, from research regarding shale gas developments in the Montney Trend.

Law 2004; Parfitt 2011; Campbell and Horne 2011; University of Victoria Environmental Law Centre 2013; Gale and Lowe 2013; Garvie and Shaw 2014 (this issue). Assessing, understanding, and mitigating cumulative effects is an essential precondition to the LNG industry proceeding in a way that protects the ecological and social resilience of the region, including the constitutionally protected treaty rights of the Treaty 8 First Nations on whose territory this development will proceed. An informed understanding of cumulative effects, in turn, should be the basis for any decision making around how the industry develops.

CRITICAL CONTEXT

Fort Nelson First Nation

The Fort Nelson First Nation is made up of fourteen extended families, whose traditional languages are Dene and Cree. The FNFN territories cover approximately seventy-two thousand square kilometres of northeast British Columbia. Since time immemorial, FNFN ancestors have lived and travelled throughout their traditional territories on seasonal rounds to hunt, fish, trap, and gather. Family groups travelled on their individual seasonal rounds between villages, fishing and hunting camps, and traplines by riverboat, dogteam, horseback, and foot. Families were dispersed among ten different village sites before moving to the main reserve six kilometres south of the town of Fort Nelson in the 1960s. Members of the FNFN continue to visit the village sites and actively hunt and trap in their family hunting grounds, but recent shale gas developments are making it increasingly difficult to do so. The FNFN's territory contains three large shale gas basins – the Liard Basin, the Horn River Basin, and the Cordova Embayment (see Figure 1) – within which extraction-related activities have rapidly expanded over the last ten years.

The FNFN has shared its territories with settlers and their industries for decades. Some families have supplemented their incomes by working with local guide outfitters and prospectors as well as in forestry and oil and gas extraction. The conventional oil and gas industry has been operating within FNFN territory since the 1940s, but the rise of unconventional gas has ushered in a new era of development. This shale gas era is placing immense pressure on existing regulation, and provincial oil and gas governance structures, to evolve with the changing character of the industry and to address novel environmental concerns (Stefik and Paulson 2010).

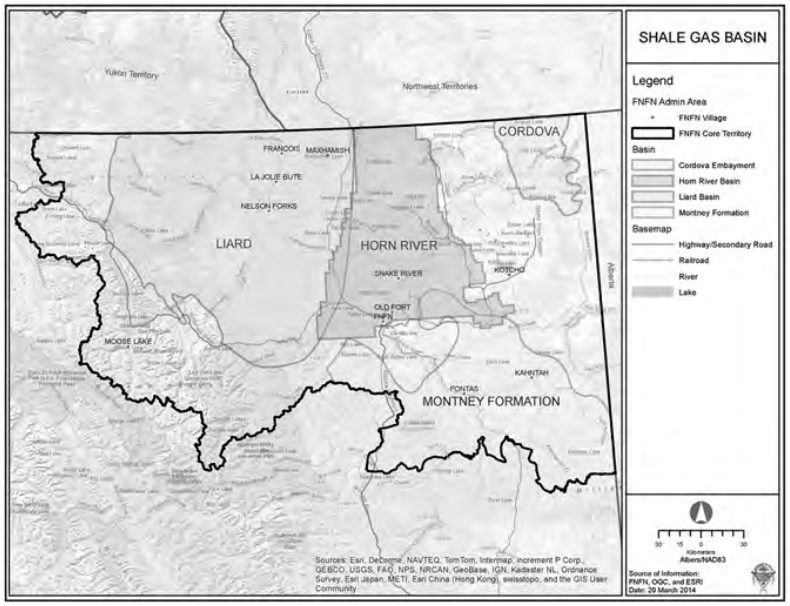

Figure 1. Shale gas basins in Fort Nelson First Nation's territory. *Source*: Fort Nelson First Nation Lands Department.

The FNFN understands its relationship to the Crown through Treaty 8. When the FNFN signed on to Treaty 8 in 1910, it agreed to share the land on the condition "that the treaty would not lead to any forced interference with their mode of life"; this included the right to "be as free to hunt and fish after the treaty as they would be if they had never entered into it" (Laird, Ross, and McKenna 1899). As unconventional gas development accelerates, the FNFN is concerned that these rights are not being respected and protected by government regulators (see Garvie and Shaw 2014). This concern was highlighted on 16 April 2014 when the province made the decision to exempt sweet gas plants from environmental assessment requirements without consulting with First Nations. After a quick and united response from BC First Nations, the province retracted the decision within twenty-four hours (CBC News 2014; Prystupa 2014). There is a growing demand from First Nations for collaborative, culturally and scientifically sound research to be gathered prior to any decisions being made on the future of the BC LNG industry (Garvie and Shaw 2014). As the FNFN chief Sharleen Gale and lands director Lana Lowe explain in a *Globe and Mail* opinion piece: "To truly have peace, we as a people must be able to share the wealth and protect

the integrity of our land. We need new mechanisms for decision-making and both the industry and government must be willing to change their ways" (Gale and Lowe 2013). Imminent decisions on how British Columbia's LNG and shale gas industries advance have the potential to strongly influence the province's relationship with First Nations.

The Rush for Tenure

Shale gas development is different from the conventional oil and gas development that has been occurring in FNFN territory since the 1940s in at least two ways: (1) it is happening at an increased pace and scale and (2) the use of hydraulic fracturing introduces new environmental concerns, especially regarding water. The sudden economic viability of shale gas extraction in North America due to a combination of new technologies and higher natural gas prices created a tenure buying frenzy in northern British Columbia between approximately 2005 and 2010. By the time FNFN members heard about shale gas and fracking at a town hall meeting hosted by an industry proponent in 2008, petroleum and natural gas tenure sales had already peaked in the Horn River Basin at $1.1 billion (C. Adams 2011). Oil and gas company Devon Canada set a provincial record in August 2008 for the largest single bonus paid at a petroleum and natural gas rights disposition when it purchased a 5,789-hectare drilling licence in the Horn River Basin for $75.8 million. By 2010, industry had bought up tenures covering over 75 percent of the Horn River Basin and had moved on to the Liard Basin, spending $47 million and $110 million on tenures in 2009 and 2010, respectively (ibid.). Despite lower natural gas prices, prolific production rates at test wells in the Liard are still anticipated to offset the higher production costs in the remote northeast area (Apache 2012). According to the Northern Rockies Regional Municipality (n.d.), at the end of 2012, the provincial government had accrued more than $3.6 billion from land sales and royalties in the Horn River Basin and the Liard Basin. Figure 2 compares tenure holdings in FNFN territory in 2006 and 2013. The FNFN was not consulted on petroleum and natural gas tenure sales until June 2012, despite the implications of these sales for the future of FNFN territory and the ability to practice constitutionally protected treaty rights.

The tenure rush in British Columbia was followed by a relative lull in development as the economic recession slowed American markets and they became saturated with domestic shale gas, which was also being rapidly developed. US gas prices have remained below six dollars per million British thermal units (mmBtu) since 2009, after a 2008 peak of

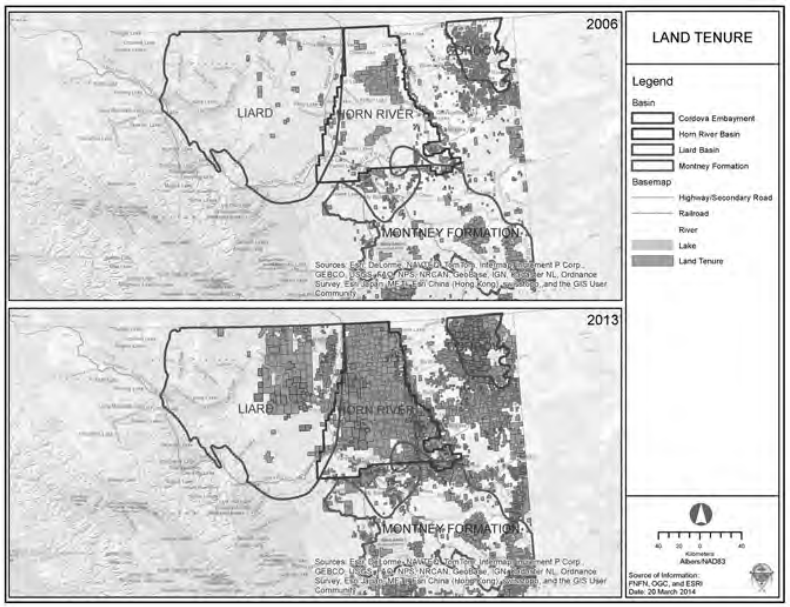

Figure 2. Petroleum and natural gas tenures in FNFN territory in 2006 and 2013. *Source*: Fort Nelson First Nation Lands Department.

more than thirteen dollars (Nasdaq n.d.). As a consequence, there is ongoing restructuring in the industry (Jang 2014; Lewis 2014; Penner 2014). For example, Devon Canada is looking to sell off its assets in the Horn River Basin, which it set records purchasing just six years ago (Cattaneo 2013). However, other companies are investing for the long haul, building processing facilities and pipelines and conducting seismic exploration while they wait for better markets (e.g., Apache n.d.; Quicksilver Resources Inc. n.d.).[3]

While industry is preparing for the coming LNG boom, the provincial government appears less than motivated to develop governance and regulatory frameworks that will protect environmental and social conditions upstream (CBC News 2014; CCA 2014). The FNFN Lands Department

[3] One study into the long-term viability of the BC LNG industry cited research from other jurisdictions that shows that production rates at individual shale gas wells have been found to drop significantly after the first couple of years (Hughes 2014). It is unknown whether this kind of drop in well productivity is affecting the industry restructuring in British Columbia's northeast because well depletion rates are not publicly available. However, based on shale gas well production rates elsewhere, David Hughes (2014) predicts that industry will require continual well development in the northeast to maintain production rates over time, resulting in fifty thousand new wells by 2040.

is working to fill this critical gap, but, as stated previously, there are currently no regulatory requirements for industry to carry out baseline studies on its tenures. Without this information, the scope and scale of development impacts on First Nations territories and cultural practices cannot be fully understood as development progresses (Tollefson and Wipond 1998; Booth and Skelton 2011).

Once tenure has been acquired, all development – with the exception of projects that trigger an environmental assessment (i.e., pipelines and gas processing plants) – must be approved through the Oil and Gas Commission's permitting process.[4] As explained in Garvie and Shaw 2014, approval of developments proceeds on an individual, permit-by-permit basis. No long-term, landscape-scale plans are made available to the public or affected parties such as the FNFN.[5] As a consequence, assembling a landscape-scale picture of present impacts, let alone potential future impacts, requires mapping hundreds of different permits individually. The FNFN's Lands Department is currently undertaking this work. In what follows, we document the scale of development that has taken place to date on the tenures purchased in FNFN territory and explore some of the potential impacts of this development.

The Development Footprint

Figure 3 displays the cumulative oil and gas activities in the FNFN's traditional territories as of March 2014. The solid patches are grids of seismic lines one to three metres in width, occurring approximately every 240 metres across the landscape. If all of the linear disturbance in the Liard, Horn River, and Cordova basins were laid end to end, it would wrap almost two times around the planet. In the most heavily affected areas of the FNFN's territory, there are over 9.98 kilometres of linear disturbance per square kilometre.

Figure 4 illustrates what this level of disturbance looks like at Two Island Lake, an area of particular cultural importance to the FNFN (FNFN 2012a). A number of families continue to hunt, fish, trap, and gather in the area, despite industry's extensive impacts on the landscape. Within the 100-square-kilometre area represented in Figure 4, there are 90 wells, 25 pipeline right-of-ways, 7 processing facilities, 114 water withdrawal points, and 2,385 kilometres of seismic lines. As of March 2014, there

[4] For more information on responsibilities of the BC OGC, see https://www.bcogc.ca/about-us.

[5] This lack of long-term, landscape-scale oversight is in contrast to industries with similar landscape-scale impacts such as forestry, where companies must have a Forest Stewardship Plan approved for their licence area before submitting site-specific permit applications (Forest and Range Practices Act SBC 2002 c. 69).

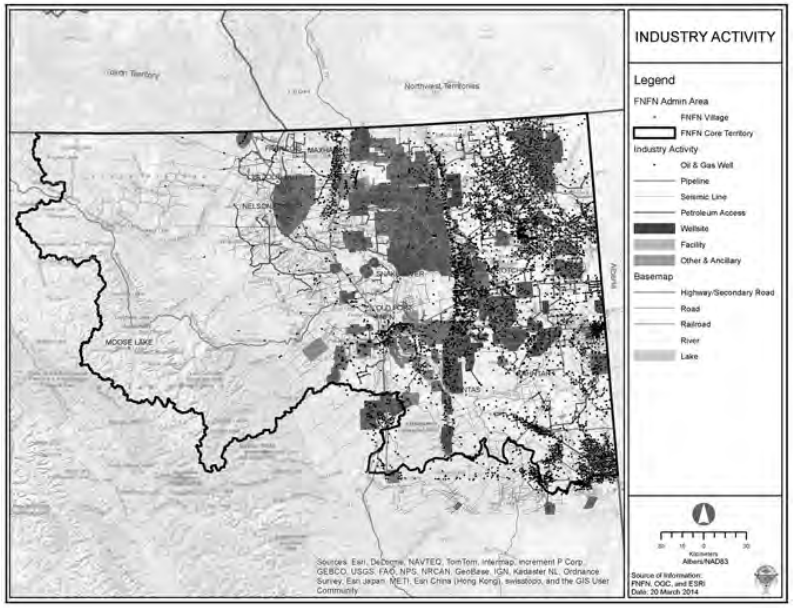

Figure 3. All oil and gas activity in FNFN territory as of March 2014. *Source*: Fort Nelson First Nation Lands Department.

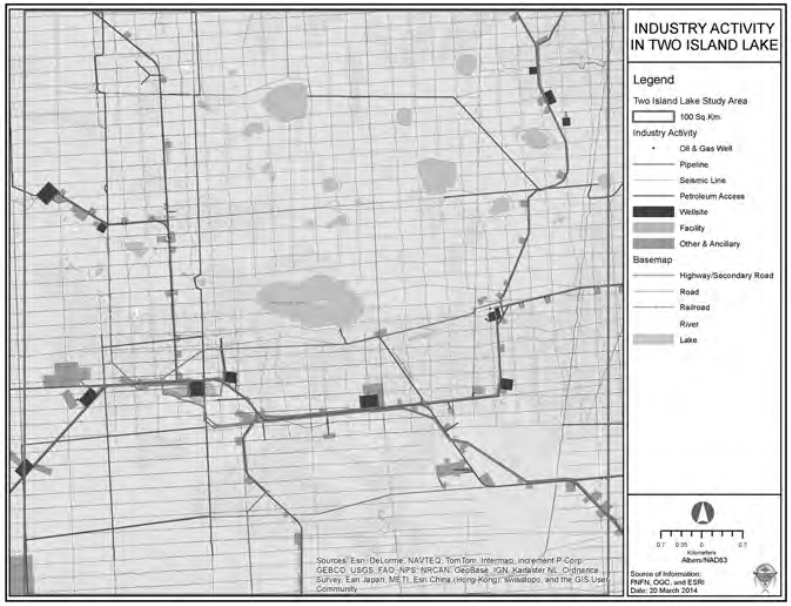

Figure 4. All oil and gas activity in a one-hundred-square-kilometre area around Two Island Lake as of March 2014. *Source*: Fort Nelson First Nation Lands Department.

has been no systematic assessment of the cumulative impacts of these developments on the wildlife and ecosystems of the northeast.

The pace and scale of development depicted in these figures have a wide array of potential impacts on the region that go almost entirely unstudied. In the following sections, we discuss the potential risks to wildlife, water, air, and human health based on northeast British Columbia's unique environmental and social characteristics and research conducted in other jurisdictions where shale gas development is taking place.

POTENTIAL IMPACTS

Threats to Wildlife

The development footprint in FNFN territory displayed in Figure 3 and Figure 4 also undeniably tells a story of changing wildlife habitat in northeast British Columbia. The impacts these changes are having on wildlife are unknown since the necessary research has not been conducted. Potential impacts, however, can be extrapolated not only from a number of studies on wildlife experiencing comparable levels of habitat disturbance from other industries but also from studies on livestock living in close proximity to conventional and unconventional oil and gas operations in other places. The threats to wildlife fall into two categories: (1) spatial changes to habitat (which alter predator-prey and wildlife-human interactions) and (2) degradation of habitat (which has impacts on wildlife health).

One of the few species that has been extensively researched in the northeast is the boreal woodland caribou; we use it here as an example of how the industrial footprint of unconventional gas development can have a variety of far-reaching effects on wildlife. The boreal woodland caribou appears on both provincial and federal "red lists" of endangered species. The FNFN territory contains five of the six boreal woodland caribou populations in the northeast. A 2009 government report identified oil and gas exploration as the greatest risk to northeast caribou populations (Goddard 2009). Seismic lines and roadways have been found to alter predator-prey relationships, resulting in increased caribou mortalities and decreasing populations (James and Stuart-Smith 2000; Latham et al. 2011). Additionally, noise and lighting from roadways, processing facilities, and well sites deter wildlife and alter habitat ranges (Dyer et al. 2001; Sorensen et al. 2008). Twelve of the fifteen core caribou habitat areas in northeast British Columbia have surpassed the

61 percent anthropogenic impact threshold (Theissen 2009), at which point a population becomes unsustainable (Sorensen et al. 2008). The preservation of remaining caribou habitat in the northeast is critical.

Similar studies have not been conducted on culturally significant species to the FNFN such as moose and beaver. However, it is well known that habitat fragmentation and degradation is associated with significant species loss (Fahrig 2003). Baseline studies are critical in order to determine how much development can take place before species loss begins. In the Peace-Moberly region of the northeast (south of FNFN territory) it is already too late: a study conducted in 2008 found that the cumulative effects of landscape change from industrial development (namely, conventional oil and gas development, mining, forestry, and agriculture) are synergistic, additive, and antagonistic in nature, and have reached a point at which they are threatening the ecological integrity of the area as a whole (Nitschke 2008). The alarming results of this study highlight the need for better industry regulation in FNFN territory to ensure that this region does not suffer the same fate.

Degraded habitats threaten wildlife health in numerous ways. If the land and waterways become contaminated, so, too, will the animals that are sustained by them. Studies have not been conducted in the northeast, but there are first-hand accounts from hunters about increasing rates of sick animals with tumours and failing organs. Outside British Columbia, where much shale gas development is occurring in more populated areas, the majority of research on fracking and animal health concerns livestock. In the United States, proximity to shale gas developments and exposure to frack fluids has been found to cause negative health effects in livestock, including increased mortality (Bamberger and Oswald 2012). In a 2014 article, Bamberger and Oswald draw connections between livestock health close to drilling operations and food safety in the United States. Additionally, studies conducted in conventional oil and gas fields in Alberta have found decreased fertility in cattle and increased calf mortality rates due to air pollution (Waldner 2008). In the BC context, these kinds of risks could have serious health implications for wildlife as well as for community members hunting and trapping these animals.

Northeast British Columbia is one of the few remaining places on earth that still has boreal forest able to support a wide array of large mammals, including grizzly bears, American black bears, wood bison, bighorn sheep, moose, caribou, and wolves (Laliberte and Ripple 2004). The forests, muskeg, and lakes of FNFN territory are home to over thirty endangered or vulnerable species, including woodland boreal caribou, wood bison, grizzly bear, wolverine, and fisher, as well as a number

of culturally significant species, such as freshwater whitefish and bull trout (BC Ministry of Environment n.d.). Members of the FNFN are already speaking out about changes to the landscape and the health and behaviour of the animals, but without baseline data and ongoing monitoring, provincial regulators and industry representatives often reject community members' concerns as anecdotal. Allowing an information and data vacuum to persist in northeast British Columbia facilitates uninformed industry growth and the marginalization of FNFN concerns.

Water Use and Contamination

Concerns about water use and contamination arise virtually everywhere the shale gas industry has expanded (Freyman 2014; International Energy Agency 2012), and northeast British Columbia is no exception (Parfitt 2011; Campbell and Horne 2011). Until recently, to support the rapid development of the industry, almost all water use has been facilitated by "Section 8" water permits. Section 8 water permits are for short-term water use access and are issued by the Oil and Gas Commission (OGC) according to section 8 of the BC Water Act. As of 2011, water permits are required for surface water removal from any surface water body, including borrow pits (a human-made pit created during the removal of construction materials). Up until April 2014, British Columbia was the only Canadian province that did not regulate groundwater use.[6] Figure 5 displays all of the surface water diversion points approved under section 8 water permits in FNFN territory as of March 2014. These permits only represent a small fraction of water that would be required should LNG move forward at the pace anticipated by the provincial government.

In the shale gas industry water is primarily used for hydraulic fracturing. The amount of water required to frack a well varies dramatically, depending on the local geography. A report for the BC Ministry of Energy and Mines (MEM) found that, on average, 34,911 cubic metres of water are used per well in the Horn River Basin, while just 1,925 cubic metres are used per well in the Montney Trend (Johnson and Johnson 2012).[7] Apache holds the record for the world's largest frack job at a pad

[6] As of 29 April 2014, there is a new Water Sustainability Act in British Columbia. Of particular note is the introduction of groundwater regulation and environmental flow requirements. See Curran (2014) for a summary of the new legislation.

[7] A BC OGC factsheet documents much higher averages: 77,000 cubic metres per well in the Horn River Basin and 7,000 to 10,000 cubic metres per well in the Montney Trend (BC OGC 2014b). The discrepancy between these two sets of numbers – which both come from official provincial documents – reveals the ongoing uncertainty of data regarding water use for hydraulic fracturing in British Columbia.

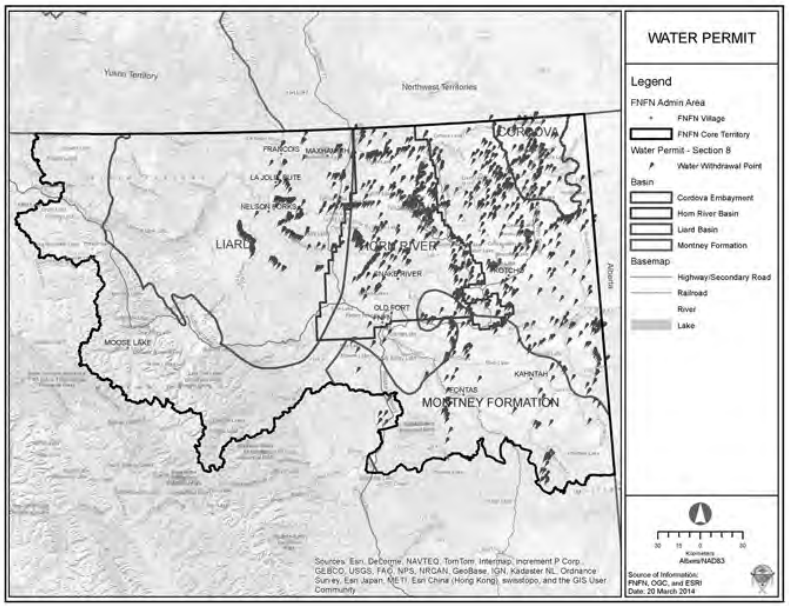

Figure 5. All of the water diversion points approved in FNFN territory through OGC-issued section 8 water permits as of March 2014. *Source*: Fort Nelson First Nation Lands Department.

with sixteen wells near Two Island Lake. It took 111 days to frack the sixteen wells a total of 274 times. In total, 980,420 cubic metres of water and 50,000 tons of sand were used during the operation (C. Adams 2011; Parfitt 2011). That volume of water is equivalent to 392 Olympic swimming pools' worth. Due to contamination, once water is used for fracking, it must be forever removed from the hydrologic cycle; in the absence of treatment facilities in the northeast, companies fulfill regulatory requirements by disposing of flowback in deep-injection wells.[8]

The vast majority of water being used by industry for fracking is surface water; just 7 percent comes from source wells, despite the fact that saline aquifers have been found beneath large areas of tenure (BC Oil and Gas Commission 2014a). While some companies are taking advantage of these sources, there are no regulatory requirements that ensure that non-potable sources are prioritized and that water recycling is carried out.

As the industry is becoming established, companies are moving towards long-term water licences. Nineteen water licences in the FNFN's

[8] Flowback is a highly saline, toxic solution containing both the frack fluid chemicals injected into the well during the fracking operation and naturally occurring toxins from within the shale formation, such as radioactive barium and arsenic (Vengosh et al. 2014).

territories are currently awaiting government approval. The first licence granted has resulted in a lawsuit by the FNFN alleging inadequate consultation in the granting of the licence and significant flaws in the licence itself, particularly in terms of the lack of regulatory oversight. The FNFN had experience with this lack of government oversight and enforcement when, in the summer of 2012, during a one-in-thirty-year drought, 182,785 cubic metres of water were removed from North Tsea Lake after the lake's discharge dropped below the zero withdrawal limit (Chapman 2013). The use of multi-well pads (such as the one at North Tsea Lake) increases the intensity of water demand over short periods of time (Rivard et al. 2014). The impacts of these withdrawals on the surrounding ecosystem will never be fully understood because no baseline data exist. There continues to be no systematic monitoring of impacts, despite the unprecedented scale of withdrawals relative to the water body's size allowed under the licence.

The OGC is working reactively to fill the regulatory gaps created by the widespread introduction of hydraulic fracturing, which has brought with it unique governance challenges, including water use and contamination (Stefik and Paulson 2010). In a recent effort to deal with increased water use by the oil and gas industry, the OGC has developed a publicly available NorthEast Water Tool (NEWT) that assesses water availability based on estimates of monthly and annual water flows and existing water permits and licences. It is used as a "decision-support tool" for short-term water permits and long-term water licences (BC Oil and Gas Commission n.d.). Environmental flow needs are also estimated; however, considering the limited baseline data for the region the accuracy of these estimates is questionable. The longer the OGC waits before implementing rigorous data collection the less useful the information will be because ecosystems will already be in an altered state.

Water acquisition is only part of the controversy surrounding hydraulic fracturing; water contamination is also a significant concern. According to the US Environmental Protection Agency (EPA) (2012), there are five stages in the hydraulic fracturing water cycle that could lead to groundwater contamination: (1) water acquisition, (2) chemical mixing, (3) well injection, (4) flowback and produced water, and (5) waste water treatment and waste disposal. The real contamination effects of these five stages remain largely unknown. Whether or not hydraulic fracturing is responsible for drinking water well contamination in a number of jurisdictions across the United States is highly contested; a lack of pre-drilling data makes it difficult to identify fracking as the

sole potential cause of contamination (Vidic et al. 2013), but there are a number of studies that have found a correlation between a drinking well's proximity to a shale gas well and contaminants in the water. For example, Fontenot et al. (2013) found that wells within three kilometres of active gas wells in the Bennett Shale had higher levels of arsenic, selenium, strontium, and total dissolved solids. In the Marcellus Shale in the Appalachian Basin, household wells less than one kilometre from gas wells had concentrations six times higher of methane and concentrations twenty-three times higher of ethane (Jackson et al. 2013).

In 2013, the US EPA backed away from finishing an independent, peer-reviewed study on contaminated wells in Pavillion, Wyoming, after releasing a draft report linking the contamination to fracking in the area (Vidic et al. 2013). The EPA passed the study off to the state of Wyoming in June of that year. The state will be working with Encana, a company with operations in the region, to complete the research (Office of Governor Matt Mead 2013). This sequence of events raises alarms for a number of reasons, not least of which is industry's involvement in research in which it has a strong vested interest. Water studies currently being conducted in FNFN territory are also industry funded. The BC government has installed six groundwater monitoring wells in the Montney Play but has yet to install a test well in the Horn River Basin (Rivard et al. 2014).

The shale gas reservoirs in northeast British Columbia lie at much greater depths than do the deposits in the United States, where groundwater contamination has been reported. However, there are still potential pathways through which contaminants could travel to water bodies. In 2012, the BC OGC completed a study that found that seismic events in "the Horn River Basin between 2009 and 2011 were caused by fluid injection during hydraulic fracturing in proximity to pre-existing faults" (BC Oil and Gas Commission 2012). The seismic events studied did not result in any wellbore deformation on vertical well sections (ibid.), but seismicity may be a risk to well casings over time, creating vertical fluid and gas migration pathways. Unlike other provinces, British Columbia does not require well casing integrity tests prior to fracking (Rivard et al. 2014). While integrity tests are required for deep injection wells, a report released by the University of Victoria Environmental Law Centre still raises concerns about the potential for compromised well casings, especially considering that 60 percent of the oil and gas industry's

waste (including flowback and produced water) has been injected into wells that are more than forty-three years old (Carr-Wilson 2014).[9]

Researchers have also raised concerns over fracking's effect on the speed of advective transport rates. Myers (2012) found that advective transport rates of contaminants up into aquifers are dramatically increased after hydraulic fracturing; modelling of the Marcellus Shale indicates that contaminant transport that naturally takes up to tens of thousands of years may only take tens or hundreds of years after hydraulic fracturing occurs (ibid.). Independent hydrologists in British Columbia have also raised concerns about advective transport and compromised well casings over time, but supporting research has not yet been conducted.

In addition to the potential for groundwater contamination during fracking or disposal, there is also the potential for surface water contamination from spills and the improper treatment, storage, and disposal of frack fluids and flowback. Less rigorous regulatory standards for disposal and storage in some states have resulted in numerous incidences of aquatic species death in rivers (Vengosh et al. 2014) and livestock mortality (Bamberger and Oswald 2014). A study of forest health after direct exposure to frack fluids in West Virginia resulted in 56 percent tree mortality within two years (M.B. Adams 2011; see also Warner et al. 2013). Other threats to surface water and surrounding ecosystems include increased sedimentation from road and pipeline development and elevated traffic levels (Entrekin et al. 2011).

In sum, even at current levels of development, industry demand for water has been significant and poorly regulated. Even with massive recent increases in shale gas development, there is currently no independent, publicly available assessment of the implications of water use at this scale or of the dangers of contamination in the northeast.

Air Quality and GHG Emissions

The emissions from shale gas developments are also drastically underresearched: preliminary analyses of the impacts on local air quality and global GHG emissions have shown cause for concern and the need for extensive and more comprehensive studies. Recent and preliminary work in northeast British Columbia has shown that shale gas development may affect local air quality in ways that have impacts on human health. In June 2012, the Fraser Basin Council released Phase One of a human

[9] See the University of Victoria Environmental Law Centre's report *Improving the Regulation of Fracking Wastewater Disposal in BC* for a list of fifteen recommendations to improve the safety of deep-injection wells in the oil and gas industry (Carr-Wilson 2014).

health risk assessment currently under way: *Identifying Health Concerns Relating to Oil and Gas Development in Northeast BC*. The BC Ministry of Health contracted the report after public concerns about oil and gas development began to grow with the industry's rapidly increasing activity (Fraser Basin Council 2012). The report documents numerous environmental pathways created by the oil and gas industry that could result in adverse human health effects: inhalation of "sour gas" (gas with a high hydrogen sulphide content), inhalation or ingestion of diesel dust from increased traffic and operating equipment, and the ingestion of contaminated wildlife and water (ibid., 25). Phase Two of the study is due later this year. Based on some of the concerns raised during Phase One, the Ministry of Health provided two additional air-monitoring sites in the South Peace (BC Ministry of Health 2012). In FNFN territory, however, there continue to be no provincial monitoring stations, despite rapid industrial growth in the Horn River Basin. Without air quality data, community concerns about risks to long-term health and ecological well-being remain unexplained and unaccounted for in scientific research and policy. This information gap raises serious concerns, particularly given what is known about the massive production of contaminants by the upstream oil and gas sector in Canada as a whole: in 2006, the sector accounted for 17 percent of sulphur oxide, 21 percent of nitrogen oxide, and 28 percent of volatile organic compounds in the country (Environment Canada 2013).

Numerous studies in the United States have linked air quality during well completion to human health effects. McKenzie et al. (2012) found that individuals living within 0.8 kilometres of a gas well completion are at a greater risk of contracting cancer from elevated benzene levels and that they also experience other subchronic health effects. An air quality study in Colorado conducted at wells during the initial drilling phase found non-methane hydrocarbons at levels beyond those that have been found to cause lower IQ scores in prenatally exposed children (Colborn et al. 2014). Adgate, Goldstein, and McKenzie (2014) argue that the research on populations living near unconventional gas developments has been scientifically limited in a number of ways (e.g., self-selected populations, small sample sizes, lack of consistently collected data) and that more substantive research on risks to human health risk assessments is needed.

The FNFN often hears the argument that local sacrifices will result in net benefits for the planet through reduced GHG emissions. In the fall of 2013, Premier Christy Clark declared that by developing shale

gas and LNG "we are doing the world a favour" (Canadian Press 2013). Not only is this ethically dubious, its validity has been questioned by several researchers. A number of studies indicate that emissions from shale gas over its full lifecycle are significantly higher than are the emissions from conventional gas (Jiang et al. 2011; Karion et al. 2013), and they are possibly as high as coal if carbon capture and storage (CCS) technologies and fugitive emission reduction measures are not adopted (Howarth, Santoro, and Ingraffea 2011).[10] Recent studies by Alvarez et al. (2012) and Caulton et al. (2014) highlight the need to reduce methane leakages and to improve scientific estimation methods in order to maximize climate benefits of switching from coal to natural gas. Full lifecycle emission calculations are particularly pertinent for gas extracted from the Horn River Basin, where shale gas has a CO_2 content as high as 12 percent (versus the 2 percent of conventional natural gas), and companies are not required to use emission-reducing CCS.

While the FNFN is being asked to think globally, the government has not adopted the necessary industry regulations to make real progress towards realizing its claim that British Columbia will have the world's cleanest LNG industry (Stephenson, Doukas, and Shaw 2012; Stephenson and Shaw 2013). Consideration of upstream impacts poses a clear challenge to the idea that LNG is "clean." A 2013 report by Clean Energy Canada concludes: "Without policy leadership, LNG produced in British Columbia would emit more than three times the carbon pollution of that produced in current world-leading operations. The finding is based not only on the emissions of the proposed LNG plants, but on the carbon footprint of the commodity they would produce – from wellhead to waterline" (Glave and Moorhouse 2013, 4). While the government claims to be focused on making LNG production as "clean" as possible on the coast (BC Ministry of Energy and Mines 2012b), it is upstream in FNFN territory where the most emissions will be produced (Horne 2012), as is shown in Figure 6.[11] Processing plants in FNFN territory will create nearly five times the GHG emissions of the liquefaction process on the coast (ibid.).

[10] See Cathles et al. (2012) for a critique of the assumptions and methods employed in the Howarth, Santoro, and Ingraffea (2011) study. Cathles et al. (2012) estimate that the shale gas's GHG footprint is at most half that of coal.

[11] Initially, the government was committing to use hydropower to run the LNG plants on the coast but has since signalled that the liquefaction process will be powered by natural gas, which it has named a "clean energy" when being used to power LNG plants (Government of BC 2012).

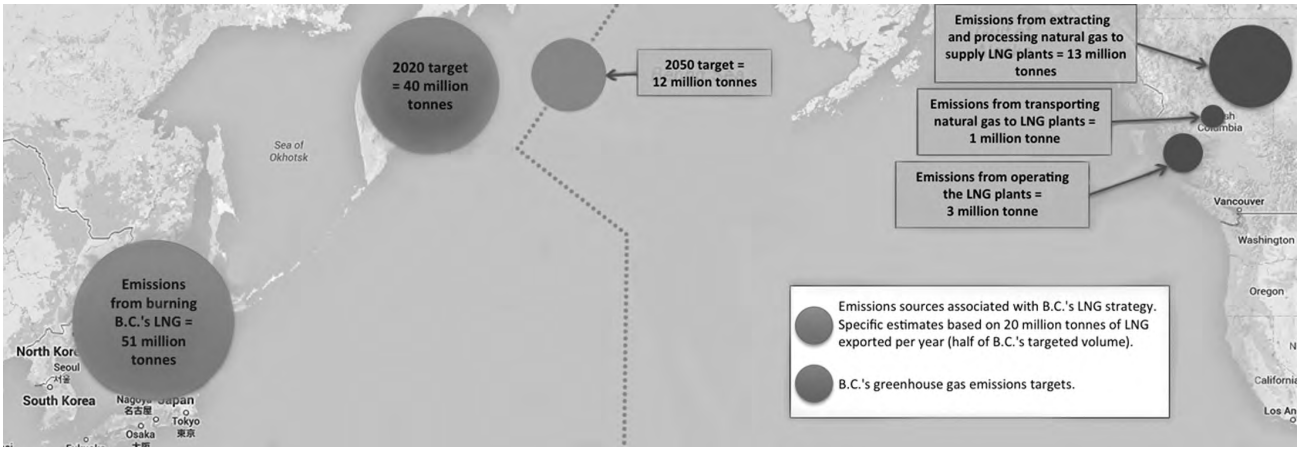

Figure 6. GHG emissions produced on the coast from LNG in contrast to GHG emissions produced in FNFN territory during shale gas extraction and processing. This figure first appeared in an article by Matt Horne from the Pembina Institute (Horne 2012).

DISCUSSION AND CONCLUSIONS

The nascent LNG industry in British Columbia is constantly in the news, but the direct connection between LNG and the industrial footprint of shale gas extraction in the northeast is rarely discussed. Despite aggressive provincial efforts to launch an LNG industry, there is no publicly available long-term development plan that connects LNG to shale gas development in the northeast and that considers the potential cumulative impacts to this region. We have sought here to illustrate the potential character of upstream impacts that are associated with unconventional gas extraction in the FNFN's traditional territory. Our analysis is preliminary; at this point, the research that would allow an assessment of these impacts and their potential trajectories under different scenarios of industrial development has simply not been done. But what our analysis makes clear is that more research is necessary before an informed decision on the pace and scale of shale gas development can be reached; impacts on ecosystems and on First Nations treaty rights must be better understood. Currently, all of the above-described development in FNFN territory is happening without systematic baseline studies, monitoring, or mitigation plans for cumulative impacts. We believe this is cause for alarm.

The FNFN territory contains three of British Columbia's four major basins and had experienced relatively limited industrial development before shale gas took off. The nation was in no way prepared for the rapid expansion in development. Nor, it appears, was the province: the industry has been launched in the absence of a regulatory framework capable of cumulative impact assessment or comprehensive monitoring that would enable the provincial government and industry to answer essential questions and concerns such as those raised by the FNFN. In the absence of independent scientific research, we cannot make the claim that the ecological integrity of the region is being compromised, but the impacts of large-scale oil and gas activity in northern Alberta – on ecosystems similar to those in northeast British Columbia – have been extensively researched. These studies document detrimental impacts to wildlife, biodiversity, and water (Kelly et al. 2009; Timoney and Lee 2009). Such changes, of course, have cascading impacts on the health and resilience of communities (Gosselin et al. 2010; Kelly et al. 2010; Tenenbaum 2009). In the context of British Columbia's northeast, numerous ENGOs and civil society groups have criticized the failure of oil and gas regulation to protect the environment (e.g., Campbell and Horne 2011; Parfitt 2011).

Crucially, the FNFN is reporting changes on the landscape and in the wildlife that are not being seriously investigated, let alone mitigated. From the FNFN's perspective, meaningful consultation on shale gas development is not taking place (Garvie and Shaw 2014). The FNFN – along with other Treaty 8 First Nations – has specific recommendations for the improvement of the consultative process (Garvie and Shaw, this issue). The FNFN has also clearly articulated its expectations of the research and regulatory changes that are necessary for shale gas development to take place within its territory. These expectations include but are not limited to (1) regional baseline studies before water licences are issued; (2) multi-year pre-development plans provided by both industry and government; (3) cumulative environmental assessment processes to ensure development is taking place sustainably; (4) the full protection of culturally significant land and water resources; and (5) third-party, independent monitoring and enforcement of all industry activities (FNFN 2012b). The potential impacts of shale gas development that we have explored in this article support these demands for informed decision making. Only when First Nations, provincial decision makers, and all British Columbians understand the potential impacts can the viability of an LNG industry be decided.

As the provincial government seeks to develop an LNG industry, it must build and mobilize an understanding of existing and potential impacts, both upstream and downstream, and create concrete plans to mitigate them. Currently, the FNFN is struggling to minimize the impacts within a system that is fundamentally unable to address concerns in anything more than a haphazard, superficial way (Garvie and Shaw 2014). Furthermore, the FNFN is but one example of numerous Indigenous and settler communities being affected by shale gas development and other regional transformations in both positive and negative ways. Treaty 8 communities in the Montney Trend are also experiencing unprecedented rates of shale gas development and in combination with numerous other energy industries, including mining developments, wind turbines, and the proposed Site C dam (Muir and Booth, 2011).

The challenge of launching the LNG industry in British Columbia is significant: gas markets are intensely competitive, a fact that puts tremendous pressure on governments to minimize the start-up and ongoing costs for the industry so companies can maximize economic benefits. Balancing this imperative with social, ecological, and governance needs is complex. However, protecting the environment – over both the short and long terms – is also crucial. When the industry is gone, British

Columbia will be left with its legacy: it is important for this legacy to be positive (Rondeau et al. 2013). Unfortunately, the provincial government's approach to developing the industry to date has been rushed and secretive. Consultations with affected communities or British Columbians have been extremely limited, hurried, and haphazard. In addition, there is no body of research identifying and assessing the social and environmental challenges the industry poses and considering how these could be mitigated; in fact, there is little indication the government is considering any of the industry's implications other than its potential to contribute to government coffers. This is a very risky way to proceed. If the province were to slow down, do the necessary research, and work to maximize the economic benefits over the long term, the environment could be better protected as well. Considering that the potential impacts of poorly regulated development are so profound, the FNFN and all British Columbians deserve a measured, well-researched approach.

Subject: Comment re draft SEIS for Tacoma LNG
Date: Wednesday, November 14, 2018 10:33:51 AM

Dear Puget Sound Clean Air Agency,

Thank you for your consideration of this comment regarding Puget Sound Energy's illegal Liquefied Natural Gas project at the Tacoma tideflats/port of Tacoma. I say illegal because they have been arrogantly building without a permit for many months and because they have not meaningfully consulted the Puyallup Tribe whose land/water they may in fact be building on, not just building next to.

I question the argument that ships using LNG as fuel represent a reduction in greenhouse gas emissions and emissions of other pollutants compared to doing nothing. Given that the two TOTE ships slated for conversion to LNG are already burning ultra-low sulfur diesel and plugging into electricity when in port, it seems likely that what they are doing is already cleaner in respect to air quality impact than what they would be doing if they complete their conversion to LNG and start burning it. I base this statement on the fact that the LNG facility will be releasing arsenic, cadmium,, hydrogen sulfide, sulfur dioxide, and volatile organic compounds (VOCs), all of which are known threats to human health. (This may be among the reasons that the industry recommends natural gas facilities be built three miles away from human populations, which obviously the PSE LNG plant in Tacoma is not.) My concern that ships burning LNG represents any kind of improvement over the present is heightened in consideration of NOAA scientists' and other scientists' independent measurements of methane leaks at the point of extraction: in the Denver Basin, the Uinta Basin, and the Los Angeles basin, methane leaks at the point of extraction alone have been measured to be 4%, 11%, and 17% respectively, well above the 3% threshold that makes methane as a fuel worse than coal in terms of its GHG emissions.

Furthermore, the draft SEIS is written with the false assumption that there are no alternatives for the shipping industry in respect to meeting new emission standards or seeking to go beyond those standards in facing the reality of climate change. Three Horizon ships have already met the new emission standards by purchasing sulfur scrubbers from the Netherlands (please see Gillie, J. 2015, February 2, "Horizon Lines to modify Alaska ships," Tacoma *News Tribune*. Retrieved from http://www.thenewstribune.com/news/business/article26251261.html). And the international shipping industry has published a broad list of ways ships can reduce their emissions, increase their efficiency, and completely de-carbonize by 2035, including technological, operational, and alternative fuel-based methods (Please see "Decarbonizing Martime Transport Pathways to zero-carbon shipping by 2035," published by the International Transport Forum, pp. 25-30).

The SEIS for the PSE LNG project needs to be rewritten in light of documented fact that the shipping industry already has alternative technologies and methods for reducing its carbon footprint: LNG as a fuel is far from the only alternative. In fact, it is a worse alternative.

We await your evaluation with great hope and anticipation!

REVIEW

Methane emissions and climatic warming risk from hydraulic fracturing and shale gas development: implications for policy

Robert W Howarth

Abstract: Over the past decade, shale gas production has increased from negligible to providing >40% of national gas and 14% of all fossil fuel energy in the USA in 2013. This shale gas is often promoted as a bridge fuel that allows society to continue to use fossil fuels while reducing carbon emissions since less carbon dioxide is emitted from natural gas (including shale gas) than from coal and oil per unit of heat energy. Indeed, carbon dioxide emissions from fossil fuel use in the USA declined to some extent between 2009 and 2013, mostly due to economic recession but in part due to replacement of coal by natural gas. However, significant quantities of methane are emitted into the atmosphere from shale gas development: an estimated 12% of total production considered over the full life cycle from well to delivery to consumers, based on recent satellite data. Methane is an incredibly powerful greenhouse gas that is >100-fold greater in absorbing heat than carbon dioxide, while both gases are in the atmosphere and 86-fold greater when averaged over a 20-year period following emission. When methane emissions are included, the greenhouse gas footprint of shale gas is significantly larger than that of conventional natural gas, coal, and oil. Because of the increase in shale gas development over recent years, the total greenhouse gas emissions from fossil fuel use in the USA rose between 2009 and 2013, despite the decrease in carbon dioxide emissions. Given the projections for continued expansion of shale gas production, this trend of increasing greenhouse gas emissions from fossil fuels is predicted to continue through 2040.

Keywords: shale gas, natural gas, methane, greenhouse gases, global warming, bridge fuel

Introduction

Shale gas is natural gas tightly held in shale formations, and as for conventional natural gas, shale gas is composed largely of methane. The difference between shale gas and conventional natural gas is the mode of extraction. Shale gas cannot be obtained commercially using conventional techniques and has entered the market only recently as industry has used two relatively new technologies to extract it: high-precision horizontal drilling with high-volume hydraulic fracturing. Over the past decade, shale gas development in the USA has increased rapidly, a trend that both the Energy Information Agency (EIA) of the US Department of Energy and the industry expect to continue[1–3] (Figure 1). To date, almost all shale gas production in the world has occurred in the USA, a condition likely to continue for at least another decade.[2] The EIA projections for future growth in shale gas development may well be too rosy because both the expense of developing shale gas and the pattern of production from a shale gas well have proven to differ dramatically from that seen in conventional gas wells, with very rapid declines over the first year or two.[4] An independent assessment concludes that

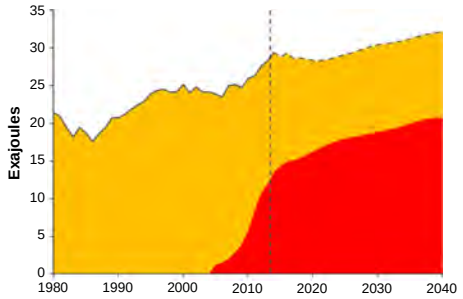

Figure 1 Natural gas production in the USA from 1980 to 2013 and future natural gas production until 2040 as predicted by the US Department of Energy in the *Annual Energy Outlook 2015*.[1] Conventional gas is indicated in yellow, shale gas in red.

shale gas production in the USA is likely to underperform the EIA estimates by almost 40% between now and 2040.[5] However, all these estimates are highly uncertain. If the EIA projections prove true, what might some of the environmental and public health consequences be?

Since shale gas development is a recent phenomenon, scientific investigations on its environmental and public health consequences are also quite new, with the first peer-reviewed studies published only in 2011.[6,7] Nonetheless, the literature has quickly grown, and evidence is accumulating of many adverse effects, including surface and groundwater contamination,[8] degraded air quality,[9,10] increased release of greenhouse gases,[11,12] increased frequency of earthquakes,[13] and evidence of harm to the health of humans and domestic animals, including farm livestock.[7,14–18]

The natural gas industry often points out that hydraulic fracturing has been in use for >60 years, implying that there is little new about shale gas development.[19] The scale of hydraulic fracturing used to develop shale gas, however, is far greater than the fracturing employed in previous decades for conventional gas, with two orders of magnitude increase in the volume of water and chemicals used from the hydraulic fracturing and even proportionally greater return of fracturing wastes to the surface.[6] Further, the use of high-volume hydraulic fracturing with high-precision directional drilling to develop shale gas leads to an intensity of development not generally seen with conventional natural gas and to the redevelopment of regions where conventional gas has largely played out, which may intensify some effects such as air emissions due to interactions with old wells and formations.[20] The appropriate focus when considering the environmental and public health effects of shale gas development is on the entire enterprise and use of the gas and not merely on the process of hydraulic fracturing.

This paper focuses on the role of methane emissions in determining the greenhouse gas footprint of shale gas. Natural gas, including shale gas, is often promoted as a bridge fuel that will allow society to continue to use fossil fuels over the coming decades while reducing carbon emissions. This was highlighted, for example, by President Obama in his State of the Union speech in January 2014.[21] For a given unit of energy consumed, the emissions of carbon dioxide from natural gas are substantially lower than from oil or coal,[11,22] which is the basis for the bridge fuel concept. However, natural gas is composed mostly of methane, a greenhouse gas that on a mass-to-mass basis is >100 times more powerful than carbon dioxide as an agent of global warming for the time when both gases persist in the atmosphere.[23] Consequently, even small releases of methane to the atmosphere from the development and use of shale gas can greatly influence the greenhouse gas footprint of shale gas.

How much methane is emitted?

My coauthors and I published the first peer-reviewed assessment of methane emissions from shale gas development in 2011.[11] We concluded that 3.8% (±2.2%) of the total lifetime production of methane from a conventional gas well is emitted into the atmosphere, considering the full life cycle from well to final consumer.[11] The data available for estimating emissions from shale gas were more scarce and more poorly documented at that time, but we estimated that the full life cycle emissions of shale gas were ~1.5-fold higher than that of conventional natural gas, or 5.8% (±2.2%).[11] We attributed the higher emissions to venting of gas during the flowback period following high-volume hydraulic fracturing, although a subsequent study identified other sources as well, such as drilling through strata previously developed for coal and conventional natural gas.[20] For both conventional gas and shale gas, we estimated the "downstream" emissions associated with storing gas and delivering it to market to be 2.5% (±1.1%), so our estimates for "upstream" emissions at the well site and from gas processing averaged 1.3% for conventional natural gas and 3.3% for shale gas.[11,12]

Through 2010, the US Environmental Protection Agency (EPA) continued to estimate emissions for conventional natural gas as 1.1%, with 0.9% of this from downstream emissions and 0.2% from upstream emissions, based on a joint EPA and industry study from 1996, as I discuss elsewhere.[12]

They did not separately consider shale gas emissions. Soon after our paper was published in 2011, the EPA released new estimates that were very similar to ours in terms of upstream emissions: 1.6% for conventional natural gas and 3.0% for shale gas.[12] They kept their downstream emission estimates at 0.9%, yielding full life cycle emissions of 2.5% and 3.9%, respectively, for conventional gas and shale gas. EPA subsequently reduced their estimates for upstream emissions, cutting them approximately in half, relying on a non-peer-reviewed industry report[24] asserting that the 2011 estimates had been too high.[12,25] This yielded a full life cycle emission estimate for all natural gas in the USA, considering the contributions from both conventional and shale gas as of 2009, of 1.8%.[12] The inspector general of the EPA has called for improvements in the agency's approach in estimating emissions,[26] at least in part because of the 2013 decision to lower emission estimates.[12,25]

In our original 2011 paper, we called for new and better studies of methane emissions from the natural gas industry,[11] and in fact, many studies have been published in the subsequent 4 years. In 2014, I published a review of the new studies that had come out through February 2014.[12] One of these studies evaluated a large set of data from monitoring stations across the USA for the period 2007–2008, before the large increase in shale gas production, and concluded that the EPA estimate of 1.8% emission was clearly too low by a factor of at least 2 and that full life cycle emissions from conventional natural gas must be ≥3.6% on average across the USA.[27] Other, shorter term studies evaluated upstream emissions from shale gas and other unconventional gas development (ie, tight sands), with two finding high emissions (4%–9%)[25,28] and one published by Allen et al finding low emissions (0.4%).[29] In a summary published in early 2014, Brandt et al concluded that emissions from the natural gas industry, including both conventional gas and shale gas, could best be characterized as averaging 5.4% (±1.8%) for the full life cycle from well to consumer.[30] I accepted that conclusion and presented it as the best value in my 2014 review.[12]

Further thought and subsequent studies published since February 2014 have led me to reconsider. I now believe that emissions from conventional natural gas are somewhat <5.4%, based on the ^{14}C content of atmospheric methane globally, and emissions from shale gas are likely substantially more, based on global trends observed from satellite data and new evidence that the 2013 report by Allen et al of only 0.4% emissions[29] is likely to be flawed.

^{14}C content of methane and emissions from conventional natural gas

The ^{14}C radiocarbon content of methane in the planet's atmosphere provides a constraint on the emission rate from conventional natural gas systems. On average during the years 2000–2005, 30% of atmospheric methane was ^{14}C "dead", indicating that it came from fossil sources.[31,32] During this time period, the total global flux of methane to the atmosphere was probably in the range of 548 (±22) Tg CH_4 per year.[33] Therefore, the flux from fossil sources, 30% of the total flux, would have been ~165 Tg CH_4 per year. These fossil sources include fluxes associated with coal, oil, and natural gas development as well as natural seeps. Using global production data for coal and oil[34] and well-accepted methane emission factors for these two fuels as described elsewhere,[11] I estimate the combined methane emissions from oil and coal as ~50 Tg CH_4 per year. Using the 5.4% emission rate and global natural gas production estimates[34] for the years 2000–2005 yields a methane emission of 130 Tg CH_4 per year from the natural gas industry or 180 Tg CH_4 per year from all fossil fuels. This is too high compared to the ^{14}C constraint, suggesting that an emission rate of 5.4% for conventional gas is too high, even if natural seeps are negligible, as assumed by the Intergovernmental Panel on Climate Change (IPCC) in 2007 in their fourth assessment report.[35] Flux estimates from natural seeps are poorly constrained, but these natural emissions may be as great as 50 Tg CH_4 per year or higher.[31] If we instead use the mean emission factor from our 2011 paper for conventional natural gas of 3.8%,[11] the global flux from natural gas emissions is estimated as 91 Tg CH_4 per year, giving an emission flux from all fossil fuels of ~140 Tg CH_4 per year and an estimate of emissions from natural seeps of 15 Tg CH_4 per year. This combination is plausible, if uncertain, and the 3.8% factor agrees well with the robust conclusion from Miller et al that emissions from conventional natural gas systems in the USA, from before the shale gas boom, must have been at least 3.6% of production.[27]

How high are methane emissions from shale gas?

A paper published by Schneising et al in the fall of 2014 used satellite data to assess global and regional trends in atmospheric methane between 2003 and 2012.[36] Methane concentrations rose dramatically in the northern hemisphere, particularly after 2008. In a detailed comparison across the

USA for the time periods 2006–2008 (before there was much shale gas or shale oil development) and 2009–2011 (after shale gas and oil production began in earnest), atmospheric methane concentrations rose dramatically in many of the major shale-producing regions. By evaluating trends in drilling and hydraulic fracturing activity, Schneising et al estimated methane emission rates of 9.5% (±7%) in terms of energy content during the 2009–2011 period for the two large shale regions – the Eagle Ford in Texas and the Bakken in North Dakota – where they felt most comfortable in estimating emissions.[36] They reported similar methane emissions for the Marcellus shale, but with much greater uncertainty in the analysis of the satellite data because of sparser spacing of wells, the mountainous terrain, and the proximity of the region to the Great Lakes. For the Bakken, shale oil production was far greater than gas production during this time period,[37] and the methane emissions may have been more associated with the oil production. However, natural gas was the dominant form of shale energy produced in the Eagle Ford formation between 2009 and 2011, contributing 75% of all shale energy with oil contributing 25%.[37] For the Marcellus shale, virtually all shale energy production through 2011 came from shale gas and not oil.[37] Therefore, it seems reasonable to attribute a methane emission rate of ~9.5% to shale gas development in the Eagle Ford and Marcellus formations.

The satellite methane emission estimate is largely for upstream emissions and does not fully account for downstream emissions during storage and delivery of gas to customers, which may on average add another 2.5% of methane emission.[11,12,22] The conclusion is that shale gas development during the 2009–2011 period, on a full life cycle basis including storage and delivery to consumers, may have on average emitted 12% of the methane produced. This is more than twice what we had estimated for shale gas in our 2011 analysis,[11] but the satellite-based estimate is based on more robust data and integrates across a period of 2 years. These shale gas emissions already may have a globally observable effect on methane in the atmosphere.[36]

The satellite-based estimate is ~20-fold greater than the estimate presented by Allen et al,[29] a study that worked closely with industry to measure emissions from various component processes of shale gas development. In my 2014 review, I suggested that the study by Allen et al may represent a best-case scenario for low emissions, given that measurements were made only at sites where industry allowed.[12] Since then, two papers published in 2015 have indicated that in fact the data in the Allen et al's paper may be flawed. Allen et al used a high-flow analyzer that employs two independent sensors, switching between a catalytic oxidation detector when methane levels are low and a thermal conductivity detector when methane concentrations are greater. Howard et al noted that the high-flow analyzer is prone to underestimating methane fluxes when switching between detectors.[38] A follow-up paper by Howard et al carefully evaluated the use of a high-flow analyzer by Allen et al and concluded that "the data reported by Allen et al. (2013) suggest their study was plagued by such sensor failure", and as a result "their study appears to have systematically underestimated emissions."[39] The sensor failure issue may well have affected other data reported by industry to the EPA and used by the EPA in their assessment of methane emissions, leading to serious underestimation.[38,39]

Several other recent studies have estimated upstream methane emissions from shale gas and other unconventional natural gas development (ie, from tight-sand formations) using more robust and more integrated measurement techniques such as airplane flyovers, but still with highly variable results. Estimates were ~30% greater than the satellite-derived data for one gas field,[40] were comparable in two other cases,[20,25] were only about half as much for two sets of measurements in another gas field,[28,41] and were substantially less in three other cases.[40] Peischl et al have suggested that higher emissions are associated with wet-gas fields and lower emissions with dry-gas fields.[40] Alternatively, the variation in emissions may simply reflect variance in space and/or in time: many of these studies were quite short in duration, for example, based on measurements made during airplane flyovers of just 1–2 days.[20,40] It is also important to note that these emission estimates are given as percentages of the gas production rates. The activity of the natural gas industry and rates of production in various gas fields are quite variable in time, and some of the differences in percentage emission rates may reflect this variability. For instance, Caulton et al reported high emission rates in the southwestern Pennsylvania portion of the Marcellus shale based on a June 2012 flyover,[20] while Peischl et al reported a very low percentage of emission rate in the northeastern Pennsylvania portion of the Marcellus shale from a July 2013 flyover.[40] Between these two flights, gas drilling activity for shale gas fell by 64% due to low prices for gas,[42] yet shale gas production remained high based on prior drilling and hydraulic fracturing.[1] If methane emission is more related to drilling and hydraulic fracturing activity than to production, these rapid changes in activity may explain at least part of the differences between the two estimates for Marcellus shale.

I therefore conclude that the satellite data[36] provide the most robust estimates for upstream methane emissions from shale gas operations to date.

Is natural gas a bridge fuel?

Natural gas is widely promoted as a bridge fuel, a source of energy that allows society to continue to use fossil fuels while reducing greenhouse gas emissions over the next 2 decades or so, until renewable energy sources can more fully come on line. Our 2011 paper challenged that view because of methane emissions from natural gas, although we tempered our conclusion because of the uncertainty in methane emissions from shale gas development.[11] We also observed that the time frame over which one compares the consequences of emissions of carbon dioxide and methane is important in determining the overall greenhouse gas footprint of natural gas. While many studies have made this comparison only by averaging the radiative forcing of the two gases over a time of 100 years following emission, we compared on a 20-year timescale as well, following the lead of Hayhoe et al[22] and Lelieveld et al.[43] Methane has a residence time in the atmosphere of only 12 years,[23,33] while the influence of carbon dioxide emissions persists in the atmosphere for many hundreds of years or longer.[23] While both gases are in the atmosphere, the greenhouse warming effects of methane are >100-fold greater than for carbon dioxide on a mass-to-mass basis.[23] When compared on a 100-year average time after emission, the emitted methane is largely absent from the atmosphere for almost 90% of that time, which greatly underplays the importance of methane while it is in the atmosphere.

Our 2011 paper was criticized for comparing the consequences of methane and carbon dioxide over a 20-year period in addition to the 100-year period, with some authors stating that only a 100-year period should be used under the guidance of the IPCC.[44,45] This was never the case, and in the fourth synthesis report in 2007, the IPCC presented analyses based on both 20- and 100-year time periods.[35] Further, in the fifth synthesis report in 2013, the IPCC explicitly weighed in on this controversy, stating that "there is no scientific argument for selecting 100 years compared with other choices", and "the choice of time horizon […] depends on the relative weight assigned to the effects at different times".[23]

So what is the best choice of timescale? Given current emissions of greenhouse gases, the Earth is predicted to warm by 1.5°C above the preindustrial baseline within the next 15 years and by 2°C within the next 35 years.[46,47] Not only will the damage caused by global warming increase markedly but also at these temperatures, the risk of fundamentally altering the climate system of the planet becomes much greater.[48,49] Further, reducing emissions of carbon dioxide will do little if anything to slow the rate of global warming over these decadal time periods.[47] On the other hand, reducing emissions of methane has an immediate effect of slowing the rate of global warming.[47] For these reasons, comparing the global warming consequences of methane and carbon dioxide over relatively short time periods is critical. The use of a global warming potential (GWP) estimate for the 20-year time period from the IPCC fifth assessment report provides a convenient approach for doing so.[23] This GWP value of 86 is the relative radiative forcing for methane compared to that of carbon dioxide, averaged over 20 years, for two equal masses of the gases emitted into the atmosphere today.

Figure 2 compares the greenhouse gas footprint of shale gas with that of conventional natural gas, oil, and coal. Methane emissions of shale gas are derived from the satellite-based estimates of Schneising et al[36] with an additional 2.5% emission rate assumed from downstream transport, storage, and distribution systems.[11,12,22] Methane emissions for the other fuels are those used in our 2011 paper, which is 3.8% (±2.2%) for conventional natural gas.[11] Methane emissions are converted to carbon dioxide equivalents using the 20-year GWP value of 86 from the IPCC assessment.[23] While for a

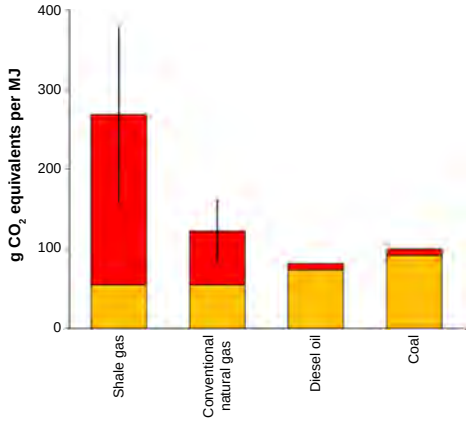

Figure 2 The greenhouse gas footprints of shale gas, conventional natural gas, oil, and coal expressed as g CO_2 equivalents per MJ of heat produced.
Notes: Yellow indicates direct and indirect emissions of carbon dioxide. Red indicates methane emissions expressed as CO_2 equivalents using a global warming potential of 86. Vertical lines for shale gas and conventional natural gas indicate the range of likely methane emissions. Emissions for carbon dioxide for all fuels and for methane from conventional natural gas, oil, and coal are as in Howarth et al.[11] Mean methane emission estimate of shale gas is taken as 12% based on Schneising et al[36] as discussed in the text.

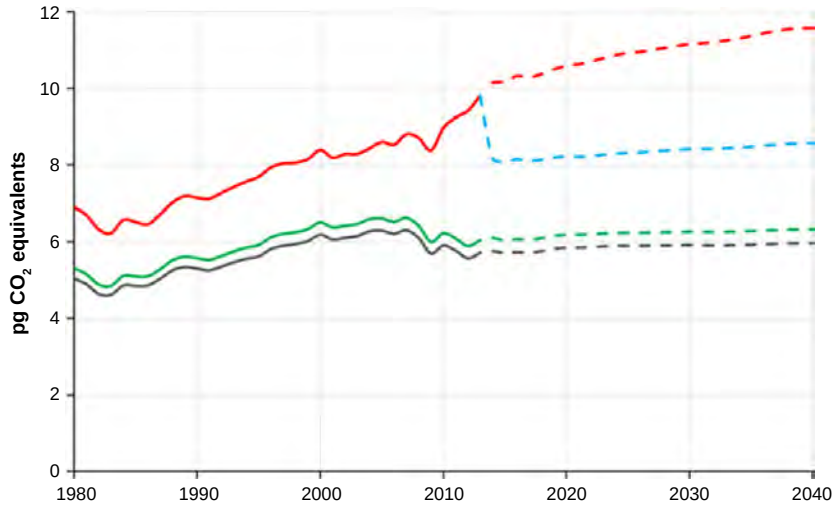

Figure 3 Trends in greenhouse gas emissions from fossil fuel use in the USA from 1980 to 2013 and future trends predicted until 2040 based on historical energy use and energy predictions in the *Annual Energy Outlook 2015*.[1] Shown are: emissions just for carbon dioxide (gray line); emissions for carbon dioxide and for methane using EPA assumptions, which undervalue the importance of methane (green line); emissions for carbon dioxide and methane based on emission factors for conventional natural gas, oil, and coal from Howarth et al,[11] mean methane emission estimates for shale gas of 12% based on Schneising et al[36] as discussed in the text, and a global warming potential for methane of 86 (red line); and future emissions for carbon dioxide and methane based on the same assumptions as for the red line, except assuming that shale gas emissions can be brought down to the level for conventional natural gas (blue line). Historical data are shown by solid lines; dashed lines represent future predictions.
Abbreviation: EPA, Environmental Protection Agency.

given unit of energy produced, carbon dioxide emissions are less for shale gas and conventional natural gas than those for oil and coal, the total greenhouse gas footprint of shale gas is substantially greater than that of the other fossil fuels when methane emissions are included (Figure 2). Note that this is true even for the low-end estimates of methane emissions from the Schneising et al study. The greenhouse gas footprint of conventional natural gas is also higher than that of conventional oil and coal for the mean estimate of methane emissions and still greater than or comparable to that of these other fuels even at the low-end estimate for methane emissions. Natural gas – and shale gas in particular – is not a bridge fuel when methane emissions are considered over an appropriate timescale.

Trends in greenhouse gas emissions from fossil fuels in the USA

Figure 3 shows the greenhouse gas emissions from all use of fossil fuels in the USA from 1980 to 2013 and projections for emissions through 2040, based on data for fossil fuel use and projections of future use from the EIA *Annual Energy Outlook 2015* report[1] and carbon dioxide emissions per unit of energy produced for each fuel.[11,22] Total carbon dioxide emissions fell in the early 1980s due to economic recession, but as the economy recovered, emissions rose steadily until the great recession of 2008. Carbon dioxide emissions continued to fall from 2008 to 2013 and are predicted to remain relatively flat through 2040.[1] President Obama and others have attributed the decrease in carbon dioxide emissions since 2008 to a switch from coal to shale gas,[21,50] although a recent analysis by Feng et al concludes that the sluggish economy was the more significant cause.[51]

When methane emissions are included in the analysis, we see some important differences in trends in national greenhouse gases. For the top line in Figure 3, methane emissions are included as carbon dioxide equivalents using the 20-year GWP of 86 from the IPCC fifth assessment[23] and methane emission factors from the 2011 study by Howarth et al[11] for coal, conventional oil, and conventional natural gas and a factor of 12% based on the satellite data discussed earlier for shale gas. In this analysis, methane contributes 28% of total fossil fuel emissions for the USA in 1980 and 42% in 2013 (Figure 3). The increasing trend in the relative importance of methane in the greenhouse gas emissions of the USA is due to

Energy and Emission Control Technologies downloaded from https://www.dovepress.com/ by 71.212.22.129 on 03-Nov-2018
For personal use only.

an increasingly large portion of the nation's fuel mix coming from natural gas and particularly from shale gas for the time since 2009.[1] Shale gas production was negligible before 2005 (Figure 1) but rose to contribute 14% of all fossil fuel energy used in the USA in 2013.[1] Importantly, while carbon dioxide emissions fell between 2008 and 2013, total greenhouse gas emissions including methane fell only briefly in 2008 before beginning a rapid increase that lasted through 2013 and are projected to continue to rise through 2040.

The US EPA includes methane emissions in the natural gas inventory, but they do so in a manner that greatly undervalues their importance. This can be seen in Figure 3, where the green line that is just above and closely tracks the gray line for carbon dioxide emissions is based on EPA assumptions: a methane emissions rate of only 1.8% from natural gas and a GWP of 21 based on the 100-year time period from the second IPCC assessment from 1996.[52] Note that the EPA used this GWP value of 21 for many years, through 2013, before switching to the 100-year value of 25 in 2014 from the IPCC fourth assessment from 2007. The 2013 assessment of the IPCC gives a GWP value of 34 for the 100-year period but, as noted earlier, also states that the 100-year time frame is arbitrary. A shorter time frame, such as the 20-year GWP of 86 used in the top line in Figure 3, far better accounts for the importance of methane to global warming in the critical next few decades as the temperature is predicted to reach 1.5°C–2°C above the preindustrial baseline if methane emissions are not reduced.

Implications for policy on shale gas

As of January 2015, the US EPA has taken some steps to reduce emissions from shale gas, but how effective these will be in reducing methane emissions remains unclear. A draft regulation proposed in 2012 would have prevented the venting of methane during the flowback period following hydraulic fracturing, with some exceptions such as for wells in frontier regions not yet serviced by pipelines.[53] This would be important, since such venting can emit a large amount of methane.[11] However, the final regulation distinguishes between two phases of flowback, an "initial flowback stage" and a "separation flowback stage". Venting of methane and other gas is explicitly allowed during the initial stage, and recovery of the gas is only required during the separation stage.[53] The separation stage is supposed to commence as soon as it is technically feasible to use a flowback gas separator. At this stage, EPA requires that the gas be sold to market, reinjected into the ground, used as an onsite fuel, or, if none of these are possible, flared (ie, burned). No direct venting of gas is allowed during this separation flowback stage, "except when combustion creates a fire or safety hazard or can damage tundra, permafrost or waterways".[53] Much is left to operator judgment as to when the shift from the initial stage to the separation stage occurs and whether an exception is necessary, which would seem to make enforcement of these regulations difficult.

Further, EPA continues to ignore some methane emission sources, such as during the drilling phase. Caulton et al identified many wells that were emitting high levels of methane during this drilling phase, before the drillers had even reached the target shale, and long before hydraulic fracturing,[20] perhaps because drillers were encountering pockets of methane gas from abandoned conventional gas wells or abandoned coal mines. Our understanding of emission sources remains uncertain, with the study of shale gas methane emissions commencing only in the past few years.[6] Adequate regulation to reduce emissions requires better knowledge of sources, as well as better oversight and enforcement.

Nonetheless, methane emissions from shale gas can be reduced to some extent. I suggest that the best-case scenario would have these emissions reduced to the level for conventional natural gas, or ~3.8% for the full well-to-consumer life cycle. This best-case scenario is explored in Figure 3 (dashed blue line), where it is assumed that shale gas methane emissions are reduced from 12% to 3.8% as of 2014. Even still, methane accounts for 30% of total greenhouse gas emissions from fossil fuels in the USA throughout the period from 2014 to 2040 under this scenario, and total emissions continue to rise, albeit more slowly than without the aggressive reduction in shale gas methane emissions. This best-case scenario seems unlikely, and actual emissions from shale gas are likely to range between 3.8% and 12%, giving total greenhouse gas emissions for all fossil fuels that lie between the dashed red and blue lines in Figure 3.

Methane emissions severely undercut the idea that shale gas can serve as a bridge fuel over the coming decades, and we should reduce our dependence on natural gas as quickly as possible. One of the most cost-effective ways to do so is to replace in-building use of natural gas for domestic space and water heating with high-efficiency heat pumps. Even if the electricity that drives these heat pumps comes from coal, the greenhouse gas emissions are far less than from the direct use of natural gas.[12] Heating is the major use for natural gas in the USA, making this change of use imperative.

Concluding thoughts and a path forward

Should society continue to use coal rather than convert toward more electricity production from shale gas? Absolutely not. The carbon dioxide emissions from burning any fossil fuel will continue to influence the climate for hundreds of years into the future, and coal is the worst of the fossil fuels in terms of carbon dioxide emissions. Given the imperative of also reducing methane emissions to slow global warming over the coming few decades, though, the only path forward is to reduce the use of all fossil fuels as quickly as possible. There is no bridge fuel, and switching from coal to shale gas is accelerating rather than slowing global warming.

Fortunately, society does have a path forward: recent studies for the State of New York[54] and for the State of California[55] have demonstrated that we can move from a fossil fuel-driven economy to one driven totally by renewable energy sources (largely solar and wind) in a cost-effective way using only technologies that are commercially available today. The major part of the transition can be made within the next 15 years, largely negating the need for shale gas, with a complete transition possible by 2050. A critical part of these plans is to use modern, efficient technologies such as heat pumps and electric vehicles, which greatly reduce the overall use of energy. The cost of the transition is less than the cost currently paid for death and illness related to air pollution from using fossil fuels.[54] The costs of renewable energy today are equal to or lower than those from using fossil fuels, when the external costs to health and the climate are considered.

In June 2015, six of the largest oil and gas companies in Europe including BP and Shell called for a carbon tax as a way to slow global warming.[56] An editorial in the *New York Times* endorsed this idea,[56] and indeed, a carbon tax is perhaps the best way to equalize the playing field for renewable energy technologies. The International Monetary Fund estimates that subsidies to fossil fuels globally are in the range of $5 trillion per year, with much of this due to the effects of global warming and consequences on human health.[57] A carbon tax would help rectify these subsidies and help promote renewable energy. However, the editorial in the *Times* made a fundamental error by ignoring methane emissions when they wrote "this tax would reduce demand for high-carbon emission fuels and increase demand for lower emission fuels like natural gas".[56]

Any carbon tax should recognize the two faces of carbon: the two major greenhouse gases, carbon dioxide and methane, are both carbon gases. Both of these carbon gases are critically important, and the 2013 IPCC synthesis report tells us that the effects of global methane being emitted today matches the consequences of carbon dioxide emissions as drivers of global warming.[23] The modes of interaction with the planetary climate system are dramatically different, though. The climate is slow to respond to changes in carbon dioxide emissions, and so immediate reductions in emissions would take 30–40 years before having an influence on slowing warming, but the emissions have a warming effect on the climate that will persist for hundreds of years.[23,46,47] The climate responds quickly to changes in methane emissions, and reducing methane emissions is essential for slowing climate change over the coming 30–40 years; however, the methane remains in the atmosphere for little more than 1 decade, and methane emissions have no lasting influence on the Earth's climate systems in future centuries, unless global warming over the coming decades leads to fundamental thresholds and changes in the climate.[12,23,46,47]

A carbon tax that adequately addresses the immediacy of global climate change must include both carbon gases. Methane emissions should be taxed using the best available information on methane emissions. And the tax on methane should adequately reflect the importance of methane in current global warming and its influence in global warming over the critically important next few decades. Taxing methane emissions at 86 times the tax for carbon dioxide emissions, using the 20-year GWP from the most recent IPCC synthesis report,[23] would accomplish this.

Acknowledgments

The author thanks Tony Ingraffea for his continued support and collegial interaction over the past 6 years in the joint work that has helped to lead to this paper. Funding was provided by the Park Foundation and an endowment given by David R Atkinson to Cornell University to support my position. Roxanne Marino and Melanie Hayn assisted with drafting the figures, and the manuscript benefited from advice and input from Roxanne Marino, my wife and long-term colleague. Two anonymous reviewers provided very helpful comments.

Energy and Emission Control Technologies is an international, peer-reviewed, open access journal publishing original research, reviews, editorials and commentaries on developing technologies to optimize energy production and control of emissions. The manuscript management system is completely online and includes a very quick and fair peer-review system, which is all easy to use. Visit http://www.dovepress.com/testimonials.php to read real quotes from published authors.

Submit your manuscript here: http://www.dovepress.com/energy-and-emission-control-technologies-journal

Steve: Thank you. Mary Paterson?

Mary: Yeah, thanks. I'm Mary Patterson. I'm a settler from the Lake City neighborhood in Seattle. I'm Scottish, Irish, English descent. And I want to make these comments, in honor of my grandfather who was a coal miner's son in the lowlands of Scotland more than 100 years ago and who never knew his father because his father was one of the casualties of fossil fuel, in that era. He was killed in a coal mine. Two points, in addition to all of the great, beautiful statements that people have offered. One is that the ships and the shipping industry does not need liquified natural gas to meet the emission standards that they face.

[03:31:05] In 2015, *Tacoma Herald Tribune*, I believe, has an article on the Horizon Matson Line, meeting of standards by using sulfur scrubbers that they purchased from the Netherlands. The International Maritime Organization, I think, is the body that has published a 30 page report that includes recommendations of wind assistance as well as sleeker ship designs and a host of others that would meet those emission standards without using liquified natural gas. Second and last point is that methane leakage is the huge issue.

I want to, when I submit my written comments, point to the methane project out of Cornell University, Robert Haworth's work there, I believe. And also, NOAA's, National Oceanic Atmospheric Administration, work measuring leakage rates well about the three percent threshold that would make liquified natural gas, aka methane, as bad as coal.

[03:32:11] Well above. In the Denver basin, four percent. In Utah, 11%. In California LA basin, 17%, otherwise known as death by 1,000 cuts. So, I urge you to reject the drafted SEIS and get some real facts to work with. Thank you.

LNG Plant in Tacoma is bad for our children, bad for safety, bad for the tribes, bad for citizens. I DO NOT WANT more pollution, more danger that is represented by this facility being built

NO ON LNG

IN TACOMA

Carole: Thank you. Mary Paynter?

[01:58:00]

Mary: Thank you. My name is Mary Paynter. I live in Des Moines, not very far from here. And I'm pretty much discarding all of the notes that I carefully pre-wrote because it's all been said. But I do want to say I'm a veteran. Not a military veteran, but a veteran of these kinds of hearings. So, when I was sitting down to draft my comments for today, I had a preconceived notion that I would be totally against this LNG facility because I'm always testifying against fossil fuel facilities and export terminals and the like. But then, I kept running across the statement that replacing bunkered diesel fuel with LNG would reduce greenhouse gases.
And I thought so now what do I do. And I kept having this image. I think I've watched too many commercials for clean, natural gas. But I had this image of a little, blue flame replacing this ugly, oily diesel.

[01:59:06] And I thought, gosh, that seems good. Well, maybe ships can be electrified. So, I did a little research on that. And it turns out yeah, ferry boats, we can skip over LNG and go straight to electrification for them, short hops, but not really for trans ocean types journeys. So, but then, I go back to the bottom line. And this is really the crux of my argument is that, if you use the right numbers, this build option is dirtier than the no build option. So, we can't do what the gentleman that was up here before me just said. We've got to do something. No, we've got to do something that's the right thing to do.

And building this is not the right thing to do. Building the heroin dispensary is not the right thing to do. So, let's solve this problem of ships and their black spewing smoke stacks. Yeah. We have to solve it. I'm not a scientist or an engineer.

[02:00:00] And I can't do it. But this is not the answer, not if we use the right data. Thank you.

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

First of all, I want to thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. With our climate in grave peril, as emphatically stated in the latest IPCC report, your review of the greenhouse gas impacts of the natural gas used in this project couldn't be more important. Those scientists make clear that we cannot, and must not, allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.

You must be quite tired of reading letters, especially form letters. I will sum up: The numbers lie. You must deny!

Sincerely,

Mary Paynter

Subject: Tacoma LNG SEIS
Date: Tuesday, November 20, 2018 12:05:17 PM

Puget Sound Clean Air,

Thank you for providing the opportunity to review and comment on the PSE Tacoma LNG SEIS.

I live in Des Moines, about 16 miles from the proposed LNG facility.

It is tempting to believe that "natural" gas is cleaner than diesel and that replacing marine diesel with methane is an appropriate "bridge" to eventual electrification of ocean-going vessels. But it's just not true, when methane leaks, the extraction process, and the methane released during operation of the plant are taken into account. And if it's not true, that means the No Action alternative is better and cleaner than completing this LNG facility. The fact that this SEIS uses a 100-year measure for methane, when the plant's life span is 40 years, makes me question the whole document.

There are other issues with the SEIS: missing data, and no method of assuring the gas will come from BC.

The latest IPCC report is scarily clear. We are on the brink of an unthinkable, unprecedented global catastrophe. We are in an extremely deep hole and we must stop digging.

I'm 74. I have granddaughters. I want them to grow up in a world with glaciers and coral reefs and breathable air.

I am opposed to the PSE Tacoma LNG project. Please update the SEIS, reissue it when it is complete and credible, and then re-open the comment period.

Thank you. Sincerely,

Mary Paynter

To Whom It May Concern:

The Puget Sound Clean Air Agency is relying on a risky make-or-break assumption that the Tacoma LNG Project will ***only*** be supplied natural gas from British Columbia (BC). Is this based on PSE's word? How is it guaranteed/proven/enforced? I believe this assumption/expectation to be false.

Also, why do you accept the assertion that natural gas from BC is cleaner? Is this rooted in scientific evidence or based on self-reports from industry? "According to Natural Resources Canada, about 50 percent of Canadian gas was derived from fracking in 2014, and the figure is expected to increase to 80 percent by 2035." (Powell, Tarika. *Is Your "Natural" Gas Actually Fracked*? Sightline Institute. Web. 30 October 2017. www.sightline.org.)

Please consider PSE will say anything to get their LNG project approved.

On PSE's own website, www.tacomacleanlng.com, they have said many things on the subject. Below are excerpts from PSE materials and website content over time (see attachments):

Originally in PSE's FAQ piece they stated half of their gas comes from the United States:

> **Q: "**Does PSE produce natural gas?"
> **A:** "No, we purchase 100 percent of the natural gas supplies needed to serve our customers. About half the gas comes from British Columbia and Alberta and the rest comes from the Rocky Mountain states."
> **Q:** "Do you buy gas that has been fracked?"
> **A:** "About 50 percent of the natural gas in the US comes from hydraulic fracturing (fracking). While the debate regarding its effect on the environment will continue, we support rules and regulations that ensure safety and protection of ground water during the drilling of natural gas."

Then, as PSE started to receive pushback regarding the environmental

1291-3 cont'd 13. LCA Inputs and Assumptions - Natural Gas Source
1291-4 13. LCA Inputs and Assumptions - Natural Gas Source

degradation caused by fracking they revised their messaging to highlight horizontal drilling as an alternative yet they continued to say they get their gas from both Canada and the United States:

> **Q:** "Where does PSE get the natural gas for this facility?"
> **A:** "PSE has no natural gas wells of its own. We buy 100 percent of our natural gas, either from Canada or Rocky Mountain states. We are a local natural gas distribution company that supplies gas within the State of Washington. Fracking – hydraulic fracturing- has been employed by the natural gas industry for many years, though with the advancement of horizontal drilling technology, new supplies of natural gas are available for recovery."

Next, PSE starts to omit what extraction method will be used altogether but again maintains they get their gas from both Canada and the United States:

> **Q:** "Where does PSE get the natural gas for this facility?"
> **A:** "As a local gas distribution company, PSE provides natural gas to 800,000 customers throughout western Washington. We have no natural gas wells of our own. We buy 100 percent of our natural gas, either from Canada or the Rocky Mountain states."

Now, conveniently, PSE reports:

> **Q:** "Does PSE produce natural gas?"
> **A:** "No, we purchase 100 percent of the natural gas supplies needed to serve our customers. All gas for this facility will be brought from British Columbia, Canada."

The DSEIS's conclusion there will be an overall decrease in greenhouse gas (GHG) emissions relies on the sole source of natural gas coming from BC. If PSCAA were to abandon that assumption, would there still be a net reduction of GHG emissions? PSCAA should run the numbers showing other likely outcomes if something less than 100% of the gas were to come from BC. What if that number is reduced to 75%, 50%, or even 25%?

The Tacoma LNG Project should not be granted a NOC order of approval. The Puget Sound Clean Air Agency's DSEIS on the proposed Tacoma LNG project is unacceptable. If the permit is not denied outright, I am requesting you conduct a new study figuring that natural gas will come from a variety of locations. Once that is complete, please open another public comment period.

Our air is not for sale. Our health and safety and the sustainability of this planet is at stake. Don't gamble our future and lose on an erroneous assumption.

Sincerely,

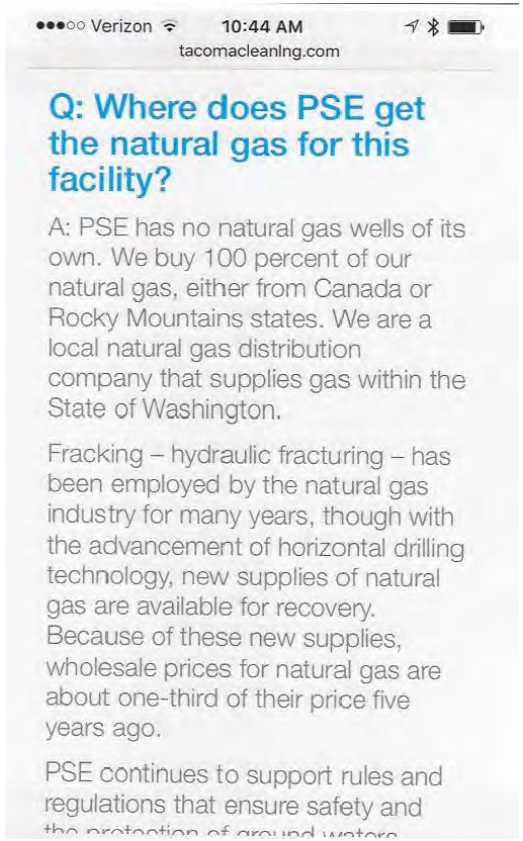
Valarie Peaphon

Resident of Tacoma

Natural Gas Pipelines

What material is used for gas pipelines?

How large is PSE's natural gas pipeline system?



What kind of maintenance is performed on PSE pipelines?

Are gas pipelines pressurized?

Does PSE produce natural gas?

Do you buy gas that has been fracked?

About 50 percent of the natural gas in the US comes from hydraulic fracturing (fracking). While the debate regarding its effect on the environment will continue, we support rules and regulations that ensure safety and protection of ground water during the drilling of natural gas.

●●●○○ Verizon 10:44 AM
tacomacleanlng.com
Q: Where does PSE get the natural gas for this facility?
A: PSE has no natural gas wells of its own. We buy 100 percent of our natural gas, either from Canada or Rocky Mountains states. We are a local natural gas distribution company that supplies gas within the State of Washington.
Fracking – hydraulic fracturing – has been employed by the natural gas industry for many years, though with the advancement of horizontal drilling technology, new supplies of natural gas are available for recovery. Because of these new supplies, wholesale prices for natural gas are about one-third of their price five years ago.
PSE continues to support rules and regulations that ensure safety and

Q: What is a peak shaving facility?

A: Peak shaving means that PSE will have dependable and cost-effective natural gas to serve local customers on the coldest days of the year. PSE requires 6 of the 8 million gallons of storage for the peak shaving function; the rest will serve transportation customers.

Q: How much will the facility cost to build?

A: We expect PSE's total investment in the project to be between $275 and $300 million.

Q: Will it be as bright as daylight when working at night?

A: No. All outdoor lighting will have hoods to protect the light, down and avoid any skyward illumination. There are no special requirements that would make it any brighter than any other port facility.

Q: How many jobs will be created at the facility?

A: Hundreds of family-wage jobs will be created, both directly and indirectly.

- 250+ construction jobs on site
- 300+ indirect jobs generated by associated economic activity of construction
- 125 jobs through economic activity once the facility is operational
- 18 jobs at the facility

In addition, the PSE LNG facility will generate millions of dollars in tax revenue for local schools, city services including fire safety and roads, and other state and local government services.

Q: What role does the Port of Tacoma play in approving the facility or overseeing its operations?

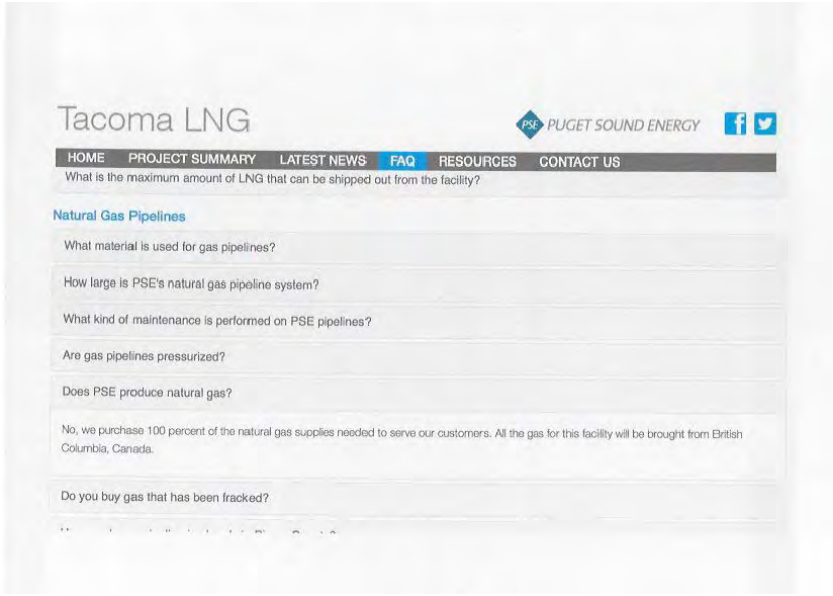
A: PSE is leasing land for the facility from the Port of Tacoma. Its ongoing role will be to ensure that PSE complies with the terms of the lease agreement.

Q: How much experience does PSE have with LNG?

A: In addition to providing natural gas service to some 800,000 customers throughout Western Washington, PSE has owned and operated an LNG storage facility used for peak shaving in Gig Harbor for more than a decade.

Q: Does PSE need to make any upgrades to its gas system in the surrounding area to support this facility?

A: Yes. Approximately 5 miles of new natural gas pipeline and related infrastructure will be built to support this project, mostly in the Port of Tacoma. For comparison, we own, operate, and maintain 3,315 miles of gas main in Pierce County and more than 21,000 miles within our service territory.



Q: Where does PSE get the natural gas for this facility?

A: As a local natural gas distribution company, PSE provides natural gas to 800,000 customers throughout western Washington. We have no natural gas wells of our own. We buy 100 percent of our natural gas, either from Canada or the Rocky Mountain states.

Q: Why is PSE advertising online and in the newspaper about the LNG facility?

A: Our recent efforts to educate and inform our customers and neighbors about the Tacoma LNG project are the direct result of recently emerging confusion and misinformation about the project. We want to set the record straight as to what the facility will and will not be, the actual properties of LNG, its difference from methanol and its use as a clean, cost-effective marine fuel.

1809-1 12. LCA Inputs and Assumptions - Global Warming Potential Value

From: Valarie Peaphon
To: Public Comment
Subject: Re: Public comment on Tacoma LNG project
Date: Monday, November 19, 2018 6:48:00 PM

To Whom It May Concern:

The Puget Sound Clean Air Agency's DSEIS on the proposed Tacoma LNG project is unacceptable because it uses outdated research from 2007 when weighing the lifecycle analysis of greenhouse gas emissions. If you had cancer would you opt to take the medication doctor's prescribed a decade ago or would you want to have the most updated and relevant medication (science) available?

It does not make sense to look at a 100-year timeframe for multiple reasons:

1. **Scientists report methane is most potent during its first 20 years in the atmosphere.**
2. **In a recent report just released in October of 2018, the UN Intergovernmental Panel on Climate Change (IPCC) warned the next 12 years are most critical in limiting climate change catastrophe.**
3. **PSE's lease with the Port of Tacoma is for 25-50 years. We should be looking at that same time frame.**

PSCAA must measure the effects of emissions over a shorter time frame. I am requesting you conduct another study using newer, more applicable science. Once that is complete, open another public comment period. This is too important to get wrong.

Respectfully,
Valarie Peaphon

Mahoney, Melisa

To Whom It May Concern at PSCAA:

The Puyallup Tribe does not want PSE's proposed LNG facility on their land. Full stop. That should be all the information you need. It is imperative you listen to and respect the decisions of the sovereign Puyallup Nation. Indigenous people have been stewards of this land for millennia. This project should have never been allowed to move forward as it is situated on their usual and accustomed tribal gathering and fishing grounds protected by the Medicine Creek Treaty. The very siting of this LNG facility is the textbook definition of environmental racism. It puts both the Puyallup Tribe and the detainees at the ICE detention center at terrible risk.

Protecting the climate is as an absolute necessity for planet survival and the LNG facility poses a very real danger to all living things along the Salish Sea.

1. **If the LNG facility becomes operational, how will the 24/7 output of toxic emissions impact local air quality?**
2. **In addition to the particulate matter, please review the volatile organic compounds and toxic air pollutants in a comprehensive and meaningful way.**
3. **What will the cumulative effect be when you add those pollutants emitted by the LNG facility with others emitted by already existing industry at the Port?**
4. **We cannot look at these emissions in a vacuum. Unfortunately, when we breathe the local air, we do not have the ability selectively inhale the toxins released from Schnitzer Steel or U.S. Oil or WestRock or Targa one at a time. All hazardous emissions mix and mingle to create the cocktail we have no choice but to breathe in.**
5. **Can you monitor the air in real time? Having industry self-report is unreliable. How many people incorrectly self-report their weight on their driver's license? How many people incorrectly self-report how many times they floss their teeth a day?**
6. **How will the additional amounts of Ammonia, Arsenic, Benzene, Cadium, Carbon, GHG, Hydrogen Sulfide, Sulfur Dioxide, and Toluene impact the air?**
7. **When the air is looked at in a cumulative and comprehensive way, how does it impact human health? How does it impact the ozone? How does sit impact the waters of the Salish Sea? How does it impact orca and salmon?**

I am requesting you conduct a new study looking at cumulative effects. Once that is complete, open another public comment period.

Sincerely,

Valarie Peaphon

Resident of Tacoma

Steve: Okay. Is Valarie Peaphon here?

[04:21:00] Am I saying that right?

Valarie: Hi. My name is Valarie Peaphon. I am a resident of Tacoma and a volunteer with the grass roots environmental group, Redefine Tacoma. I support and agree with the Puyallup Tribe in opposing the Tacoma LNG project. And I believe the draft SEIS is inadequate and obviously flawed. I incorporate, by reference, the tribe's previously made comments. Liquified natural gas is natural gas is fracked gas is methane gas. Let's call it what it is. Anyone saying this fossil fuel is the future is dead wrong. PSE has a 25 to 50 year lease, yet Puget Sound Clean Air Agency is evaluating the greenhouse gas emissions over a 100 year cycle.

This dilutes the true impact the methane gas will have in accelerating climate change. I urge you to reissue a new document using the 20 year values.

[04:22:00] Let's use the actual science available. Methane is at least 86 times more potent than carbon, in its first 20 years in the atmosphere. We are at a tipping point. I am deeply concerned about the future livability of the planet. Please give me hope. No permits for LNG, not now, not ever. Tonight, you have heard from tribal members, clergy members, scientists, professors, and doctors all opposed to the LNG project. Only labor reps and paid industry talking heads have supported it. When you know better, you do better. I have two words for the Puget Sound Clean Air Agency, do better.

Subject: Tacoma LNG SEIS Project Comment
Date: Sunday, October 21, 2018 10:44:05 AM

Dear Responsible Official,

I oppose this action because a fraked gas hub is extremely dangerous. It will cause great havoc when it explodes. Do not do this. Protect our safety

Puget Sound Energy and Tote Marine seem to imagine that a clean energy future can be arrived at by digging the fossil fuel hole deeper. This proposed LNG project is another step toward climate chaos at a moment when the IPCC has given us a clear warning that we must urgently move away from fossil fuels.

Fracked gas is not a lesser evil. Scientists' understanding of methane's impact on the climate continues to evolve, and at every step along the way we learn that fracking allows more methane escapement than we had previously observed and that the impact of methane on the climate, particularly in the short term, is even more serious than had been previously understood.

I applaud your decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct this more rigorous analysis. Thank you.

I urge you to revise the analysis to account for the following:

1. Methane should be counted as 86 times more potent than CO2 based on the current IPCC analysis (AR5 rather than AR4) considering a 20 year timeframe (rather than the 100-year).

2. Revise the analysis of the impacts of fracking in British Columbia based on recent research(1) demonstrating that methane escapement has been dramatically under-estimated.

3. Revise the "no-action alternative" to include a clean energy alternative in which PSE provides electricity not with a different source of fracked gas, but with renewable energy and energy efficiency.

4. Revise the "no-action alternative" to include the assumption that Tote Marine will achieve a 50% GHG reduction, in line with the International Maritime Agency's established goals. This reduction might alternatively be achieved by a combination of fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion or many other alternatives besides fracked LNG.(2) For clean local emissions requirements, Tote Marine can achieve virtually all of the localized lower-particulate and lower SOx and NOx benefits claimed for LNG propulsion by opting for low-sulfur marine gas oil over heavy fuel oil, and installing selective catalytic reducers and diesel particulate filters.(3)

5. This more accurate analysis will show that the project has a significant and unmitigated impact on the global climate, which
should be seen as a sufficient basis for denial of the Notice of Construction application.

Thank you for your time and consideration of these comments.

Puget Sound Clean Air Agency

Dear Puget Sound Clean Air Agency,
I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to deny the permit because the Draft Supplemental Environmental Impact Statement does not accurately represent the true greenhouse gas emission profile of the project. I have the following specific concerns:

This is a direct threat to the Puyallup tribe. It will raise methane by 3% & the communities most directly impacted have strongly opposed this pipeline.

(Check here to continue comments on the other side).

In addition, a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required and adequate consultation with the Puyallup Tribe and other neighbors of the project should be conducted.

ATTN: Public Co... NG Project

Steve: Next up is David Perk.

David: Thank you for those comments. It's an honor to be here on Puyallup land. You've heard a lot of very intelligent comments already. Mine are going to be very short and rather focused.

[04:54:00] I'm concerned about Puget Sound Clean Air Agency's reputation. If you let this draft environmental impact statement go forward without the appropriate revision to include the most contemporary best science, that's going to reflect very poorly on the agency. And that would be a real shame, given that you've asked for the upstream emissions in the first place. That was a big step forward, and that was something that gave a lot of people a great deal of hope. This state needs more of those kinds of analyses. And your analysis needs to be exemplary, so that it sets an example for the others that need to follow.

So, I really look forward to you doing the right thing. and I look forward to a revised draft that gets public comment. Thank you very much.

[04:27:00]

Steve: So, before I call up the next speaker, just to give a heads up, the next five after that would be Mark Martinez, Kenra Brewer, Jessica Wallach, Nikie Walters, and Kelly Scott. So, Sally Perkins?

Sally: My name is Sally Perkins. I live in the Hilltop in Tacoma. The draft SEIS is inadequate because it does not include or analyze wind direction data. The wind speed data it does include is from a site at the McChord Air Force Base that is not relevant to the tide flats from a weather standpoint. To understand the impacts of air pollution related to this proposed project and its operations to say nothing of a potential explosion and fire, you have to analyze not only if air pollution will occur but also who it will harm.

[04:28:09] Both the Hilltop and the east side, historically lower income and racially and ethnically diverse communities, are in direct proximity to this proposed project. Historically, communities of color and lower income neighborhoods are disproportionately negatively affected by pollution of all kinds. At my home in the Hilltop, I have tracked the direction of the wind because I have a weather station. And my observation is that the wind is from the east, the northeast, or the north, for some portion of the day, at least 20 days of every month. The wind data downloads every 30 minutes. I have several years of data, if you would like to look at it.

What that means is that the pollution from this plant goes to the Hilltop and to the east side. I assume that the Port of Tacoma has its own weather tracking capability, and could provide the necessary wind direction data for this critically important analysis.

[04:29:04] Hilltop and east side deserve to be protected, in this process. Our neighborhoods matter. Please do the wind direction analysis regarding air pollution from this plant. The draft SEIS is incomplete and inadequate without it. It needs to be reissued with this information included. Thank you.

Subject: Puget Sound Energy's LNG facility
Date: Friday, November 16, 2018 12:17:27 AM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

Puget sound faces increased air problems. As summers get hotter, we have more and more woldfires, which make the problem worse. PSE's LNG project will make this problem worse. This is not trivial - I knew several people who died of sudden heart attack during these "bad air" days. We need lean air more than anything - fossil fuel is worthless if we have no air to breathe.

Sincerely,

Natalya Peskin

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

I do not support this decision and I am a shareholder in this argument.

Carole: Thank you. Dominic Petoud? Dominic?

Dominic: Good afternoon. Thank you for letting me speak. First, I would like to thank the Puyallup Tribe whose land this is for their hospitality. And thank you, too, for being the Clean Air Bureau. On behalf of all breathing creatures, I thank you. And I would like to tell you a story. It's history.

[00:56:00] During the Civil War, right after the Civil War, they had a lot of veterans who were mutilated, terribly hurt. And a lot of them became morphine addicts. It was an enormous problem. And the scientists decided to do something for them and invent a substance that would replace morphine, so addicts wouldn't get sick anymore. And it succeeded. They invented some stuff that, when they gave it to the morphine addicts, they didn't want the morphine anymore. And they thought, a miracle. And they called it heroin. That's LNG as a transition fuel.

You know that the extraction of LNG releases a quantity of methane that will kill us. Oh, no, it won't kill us, we will be dead. Sorry. It will kill our children within 40 years.

[00:57:00] All of those gentlemen telling you that it burns cleaner, it burns cleaner, how do you get it? You get it by making the air dirtier and dirtier and trapping a lot more heat under all of that crud that should be here. You are the Clean Air Agency. They use placeholder values. They use placeholder values in the report. I can say, okay, I'm going to buy you five cars. And, right now, I'm going to say that each car is $5.00. And we're going to keep it like that just for convenience. And then, I'll tell you I can buy you five cars for five times five, is not a lot of money.

But that's not the real price of the car. Do not give an authorization to these plants before you have the real number.

[00:58:00] Save the air. Save us. Save us, please. If any one can, you can because you are the Clean Air Agency. Use that. Use it for the good of everything you love. You like to breathe. Everyone likes to breathe. Save us. Say no. Don't give them that permit. Please. Please. Please give life a chance. And that's all I have to say. Thank you for listening.

[04:13:00] So, next up would be David Phillips.

Unknown: Are you still on the afternoon people?

Steve: Yes, we are. We're getting close. David Phillips?

David: Thank you, guys. I'm not the most super educated person, kind of nervous, so please bear with us. I wasn't really planning to speak, but I got a wonderful seat here in the back overlooking a lot of the well dressed suits today smirking at the Tacoma people. Even the small children, as they fight for their future. I work with junior high kids in detention. And a lot of these guys look like they could spend some time in detention to think about what they're doing. A few things we have going on that I haven't heard yet today is that besides this land being on stolen land from our beautiful Puyallup Tribe, this land is subject to dangerous shaking, in terms of earthquakes.

[04:14:09] We are due to a large earthquake that could happen in this area, at any time. And I hope that you are considering that, in your illegal build of the project that, someday, this might just shake apart, and you might not have anything left of it. Also, I know that it didn't make it onto the ballot in Colorado, but there is an anti-fracking measure being put there. And, of course, it's being stamped upon by many rich oil companies. But people are sick of this. Yes, it is some good jobs. There are good working jobs, good blue collar jobs. But nowhere does it mean that if you're blue collar, you have to put up with detrimental environment.

You don't have to kill yourself to make a few bucks, while other people really dress nice, fly around, and spend more money on dinner than you make in a year.

[04:15:00] We want a bridge to a cleaner future, but this isn't it. I hope this is not a charade. And I don't believe in God, I don't have children, but I care more than many of these Christian fathers who come up here and talk. Thank you, guys.

With over 100,000 Frak wells in United States by just saying no to nlg fracking is not going anywhere. Cleaner, safer gas well fracking can be achieved by advocating the return of clean water, safe chemical legislation that we had under Pres. Obama. According to a article in scientific American, May 2013 shoddy well casings were the main problem of natural gas getting into the aqueducts and waterways. It is a absolute necessity to use non-toxic hydraulic fluids in the fracking process. The fracking regulations have been removed that the Obama administration had mandated. Plus Minimum methane leakage limits. It is estimated according to the majority of climate change scientists that the most of the greenhouse methane pollution is coming from animal livestock digestion and in second place is rice farming, which together far exceed methane leakage from natural gas processing as a greenhouse gas. it has been calculated that even though the burning of methane for better production of electricity is only half the CO2 as burning coal and when you put the methane leakage factor from the production of natural gas the greenhouse gas pollution is about the same contribution to global warming. But if you look at global warming's evil twin ocean acidification where the methane leakage is not a factor natural gas comes up 50% less CO2 contribution to ocean acidification. A few days ago, scientists working at Georgia Institute of technology have come up with solutions to make methane economical to produced fuel-cell electricity and also to produce low-cost hydrogen . The production of fuel-cell electricity would lower the carbon pollution substantially. I don't believe anymore methane burning electrical plants should be installed only fuel-cell methane electrical plants. David Phillips

My name is Elise Nordlund. I'm a resident of Hoodsport, WA. While not currently living with the estimated 60,000+ people in the immediately impacted communities of Tacoma, my community shares water and air with Tacoma as does the rest of Washington and British Columbia. In the event of a disaster, the toxic fumes from an explosion at the facility and the fallout polluting the waters will not be contained to just Tacoma or Pierce County. As the world turns and the waters flow, even here an hour west of the facility, we would eventually also be impacted. My question then is at what cost of potential disaster to the environment, land/air/sea creatures and human suffering in Tacoma and state/region-wide do we have to pay for this facility that profits PSE alone?

I've heard the maritime industry's and workers' arguments that we need to get off bunker fuels in our shipping vessels and wholly agree. However, I don't believe switching to a fuel such as LNG (which is so environmentally damaging and dangerous to workers from its extraction through to consumption) will actually make the shipping industry any less damaging to the planet or safer for workers. Perhaps I'm mistaken, but are any more fossils being made now that will replenish this finite energy source? If we understand that peak oil is real, then why are we still relying on soon-to-be depleted resources as sustainable replacements? Now is the time end our national addiction to fossil fuels and seek sustainable forms of energy for this and all other industries. Those of you on this commission have an incredible opportunity to be courageous, forward-thinking policy makers that can shut down dirty oil and its negative health impacts. In this moment, you have a great responsibility in this matter and hold a great amount of power as well.

I thank you all for the due diligence you have undertaken regarding this study. I thank you for taking the time to hold the public comments and sit through all those hours of testimony. I thank you for caring enough about our Air, our Environment, our collective community's Health, and the Wellness of Future Generations to take on this important work!

Hello,

I'm Robert W. Hunt a disabled Navy Veteran, water protector, and Iriquois tribe descendent. I come from a proud water dwelling people. Not just my first nations people but my Navy people, my Italian heritage is also a proud water dwelling people. I tell you this because you have a say about a project that could destroy the water where I now live. The water that supports the life of not only millions of people but of millions of species. You have an opportunity to say no to this nightmarish proposal of a supersized lng facility. There are many alternatives to this plant if your interest is to keep the port of Tacoma fiscally viable in the future. Those options include liquid hydrocarbon fuel which would give us the ability to re-use all the carbon in the atmosphere as fuel while controlling or even sequestering any amount of carbon we wish. This method alone would solve the carbon issue in our atmosphere. There is also the new hydrogen engine from hytech a local company that could add to the viability of our local economy. https://www.hytechpower.com/
We also have solar and wind. You could attach solar panels to every single shipping container and line the hulls of the ships and containers with batteries essentially turning the entire fleet and every port into power generation instead of power loss, also increasing your economic viability. The idea of a LNG or fracked gas reservoir is just a hold out from the petroleum industry which has been entirely obsolete for over 20 years. We no longer need to serve the oil barrens. Check out Tesla. They are earning money way faster at the creation of thier technology company than any oil barren did in the history of oil exploitation. If you want to continue to exploit free energy use the Sun. It is a larger supply, volume, and bandwidth. You will get more from that than you could from any source on our tiny planet. Please support the people that wish to have a sustainable and viable future. We need this LNG facility to appease people like the Koch brothers. But they can pull their money out of current investments. We cannot pull our sound, rivers, and air out of your project. If you do this you will be impacting yourself and the next seven generations of our shared people's. We are one people's especially with globalization. We need to work together instead of separately. I volunteer to help you generate the same amount of power you will get from this lng project. I will even promise more. My group is small but we will work as a non profit and get you everything you need to keep the port of Tacoma viabile. What's yet I can offer you a deal that the Puyallup tribe will accept. I know Robert Satiacum personally and he will come with me to any meeting you set to discuss this. Please do this in a good way and don't go for LNG. It is not environmentally friendly. They leave out the fact that methane is a bigger problem than CO2 in the estimation PSE mentioned in thier defense of LNG. https://blogs.princeton.edu/research/2014/03/26/a-more-potent-greenhouse-gas-than-co2-methane-emissions-will-leap-as-earth-warms-nature/

I am Robert W. Hunt. I hope this message reaches you well. I hope you read the whole thing. I know I would read your whole message

Sincerely,
Robert W. Hunt

Carole: Thank you. Lester Pogue?

Lester: Respect to the Puyallup Tribe.

Carole: Just confirming you are Lester Pogue?

Lester: Yes, I am Lester Pogue. I live in the Hilltop. I breathe this toxicity every day of my life. I was attending the PSCAA's public commentary session last year, when you started this process. And I felt confident that you were going to come through and do the right thing. From my reading, that hasn't happened.

[02:40:00] I support Todd Hay's observation to redo this study with proper data analysis with the most current data. I also wish that you would include the accumulative air quality and testing that is nonexistent in the Tacoma tide ports, which you all said that was unaffordable last year, a cost of $840,000.00. To my understanding, it was 2011, since the last accumulative air study. I think that needs to be done before we introduce any other toxins to the port whatever industry down there as well as Nalley Valley. I was awakened at 7:00 a.m. a couple of weeks ago with the lithium ion battery fire to unbreathable air.

I called Tacoma-Pierce County Health, they referred me to PSCAA.

[02:41:00] I spoke to one of your scientists, a gentleman named Eric. He referred to me that I was only breathing nuisance irritant. He was not present in Tacoma. He was in Olympia. And I was there speaking to him. I asked him under what guides are the industry down at the port held to. The Clean Air Act. I hope that PSCAA will reconsider their studies and emphasize our health. You are what we're relying on. I was disappointed in reading this draft SEIS and hope that you all come up on this.

The people of Tacoma, especially the folks in Hilltop, the Puyallup Tribe, need you to come through for us, do the right thing. This is financing the system of white supremacy, which is destroying this nation.

[02:42:00] Stop this. You see the representation from folks that work down at the port. There are no people of color that have come up here and spoke about the job creation and who is getting those jobs. Let's talk about that. Do what's right. You have the science.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

This project violates the Puyallup Tribe's treaty rights. Additionally, this project would exacerbate the climate crisis. We need to stop using fossil fuels ASAP so it makes no sense to invest in gas infrastructure any longer. We do not need it and instead should be investing in renewable energy projects.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Dear Puget Sound Clean Air Agency,
First of all, I want to thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. With our climate in grave peril, as emphatically stated in the latest IPCC report, your review of the greenhouse gas impacts of the natural gas used in this project couldn't be more important. Those scientists make clear that we cannot, and must not, allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.

With that said, I am aware of several issues with the draft report you issued on October 8th. It is my belief that if these issues are given proper attention and addressed with best available science, it will show that the marginal improvements in emissions the study claims will disappear and the project will in fact be worse for the climate than doing nothing at all.The draft SEIS for LNG facility in Tacoma does not account for the full climate impacts of fracked gas.

The methodology for measuring methane global warming potential (GWP) value is outdated, using United Nations' 2007 value of 25 for the 100-year number, whereas they should be using the 2016 value of 32, and a Furthermore, methane creates significantly more destructive greenhouse gases in the short term , and only the long-term impact is measured, minimizing the impact. The methodology also relies on the figures of industry (which will profit from the facility) to measure the cleanliness of the gas; there is no evidence that BC gas is as clean as claimed, or that the gas would come only from BC.

Perhaps most offensive of all, the draft SEIS is premised on a corrupt decision to (once again) violate the rights of indigenous people and usurp their land. Such action is insupportable!

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

This terminal is illegal, unnecessary, and dangerous. Do the right thing and stop this project immediately. Not only will there not be fewer emissions if the plant is built, no matter what other fuels people might be burning, the purpose of this pipeline is to expand our fossil fuel infrastructure at a time when the IPCC is telling world governments that we have officially run out of time for arguments and must make radical changes to survive the coming century as a species. The biosphere is on the brink of collapse, at which point you could have all the money in the world and it would be utterly meaningless as there would be no food to eat, and no water to drink. I am not an alarmist, I was warned of an impending crisis as a child, was glad to see global governments begin to tackle the crisis, and have subsequently been utterly betrayed by the "adults in the room" and now climate change is not some distant challenge it is here, now. One of the islands in the Hawaiian Archipelago was literally wiped off the map by a recent hurricane, and we can see the impacts of bigger and more powerful wildfires across the globe.

LNG is not cleaner than coal, as recent studies show that the overall emissions from fracked gas are actually HIGHER than other fuels like anthracite or even diesel. Don't believe the hype, LNG is a NO-GO!

Oh and lets not forget this terminal is being built without permission on unceded tribal lands of the Puyallup peoples, putting first foods at risk of contamination from the inevitable spills, and endangering the Salish Sea as a region.

Do what you know in your heart to be the right thing, and put an end to this disastrous project immediately!

To the Puget Sound Clean Air Agency,

As a 'from birth' resident of Washington State, I carefully watch what is going on in our region to determine what is best for my family, neighbors, and community. I feel very strongly about keeping our waterways and shorelines clean and safe, our air healthy, and our public services properly funded. It is from this perspective that I express my support for the Puget Sound Clean Air Agency (PSCAA) to finalize the draft SEIS it presented on October 8, 2018 and to issue the permit(s) that Puget Sound Energy (PSE) has requested for its liquefied natural gas (LNG) facility at the Port of Tacoma.

We all pay our fair share of taxes, and an important benefit of the LNG project is that it will generate millions of dollars in tax revenue for local schools and other state and local government services. I appreciate and value seeing projects that will lead to increased tax revenues to help our local schools and public safety departments.

Another thing is also clear: this will be good for our local economy. I strongly support the region's efforts to create a healthy business climate for local companies who choose to do business in Tacoma. Tacoma is a working industrial marine port-based community, and both TOTE and PSE are respected, long-time area businesses here. We all benefit from both the family wage jobs they provide within the Port, and the fact that both are committed to using the best available environmental technology to remain competitive in the world economy is a boon to our entire community.

The draft SEIS, prepared by Ecology and Environment, Inc. and released by PSCAA on October 8, 2018, stated "When evaluating direct, upstream, and end use GHG emissions, replacing a diesel propulsion engine with a pure LNG propulsion engine results in reduced life-cycle GHG emissions."

I am confident in the conclusion of the draft SEIS that the project will result in a decrease in GHGs. I look forward to publication of a Final SEIS that confirms the draft's conclusions about LNG fuel benefits. I urge you to move forward and approve the PSCAA permit(s) for Tacoma LNG. This project will provide great benefits to the citizens of Tacoma, Pierce County, and the South Sound region for years to come.

Nick Potts
Ferndale, WA

Dear Port of Kalama, and Cowlitz County,

Dear Puget Sound Clean Air Agency,

2054-1 3. Outside of SEIS Scope

There is no way to prove that the LNG facility or Methanol Refinery will displace other coal, oil or bunker fuel projects. This is a greenwashing platform by backers of these projects. This assumption should not be considered as part of the environmental impacts assessment; in fact, it more likely to add fossil fuel use.

Please include this impact in the Final Supplemental Environmental Impact Statement.

ear Puget Sound Clean Air Agency,

2055-1 3. Outside of SEIS Scope

With demand for natural gas in the US increasing, ~~these~~ projects such as Tacoma LNG and the Kalama Methanol Refinery will increase demand for fracking; two-thirds of all "natural" gas in the nation is fracked. Fracking is known to pollute air and water, damaging public health and contributing to climate change. The SEIS MUST include these factors when assessing fracking.

lease include this impact in the Final Supplemental Environmental Impact Statement.

Dear Port of Kalama, and Cowlitz County,

Dear Puget Sound Clean Air Agency,

2090-1 3. Outside of SEIS Scope

To operate at full capacity, the refinery needs onsite electricity generation, which would be an on-site fracked gas power plant. It is likely they will say they will operate at lower capacity or "stagger production" to avoid its use. SEIS needs to include full-capacity use of a power plant to accurately understand the environmental impact of this project.

Please include this impact in the Final Supplemental Environmental Impact Statement.

Dear Port of Kalama, and Cowlitz County,

Dear Puget Sound Clean Air Agency,

2091-1 3. Outside of SEIS Scope

A methanol spill could be devastating for salmon, and as such, should be studied. The impact on orcas, by exter will be terrible, with fewer salmon (orcas diet) reachir the Salish Sea. Kalama will take 5 million gallons/d of water from the Columbia River, and ship up to 6 tank of methanol /month on the river. The risk of a spill is statistically highly likely. Liquified gas will also likely get into the harbor. SEIS must consider the impact and include an analysis of a spill on marine life

Please include this impact in the Final Supplemental Environmental Impact Statement.

Dear Port of Kalama, and Cowlitz County,

Dear Puget Sound Clean Air Agency,

2092-1 12. LCA Inputs and Assumptions - Global Warming Potential Value

Methane, the primary component of fracked "natural" gas, is a greenhouse gas 86 times more powerful than CO_2, if assessed over a 20-year time period. Current estimates used for methane's impact are from out-of-date documents from the EPA & IPCC, and DSEIS will likely use these lower figures to understate their environmental impact. PLEASE ask permitting agencies to use the most UP-TO-date global warming potential for methane at [86] CO_2 equivalents.

Please include this impact in the Final Supplemental Environmental Impact Statement.

Subject: Puget Sound Energy's LNG facility
Date: Thursday, November 15, 2018 6:02:13 PM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

Tacoma is my home and the home of my future generations. The PSE's LNG project increases our greenhouse gas emissions and fuels climate change - which means more wildfires and smoke for our region. The resulting air pollution makes us sick and leads to higher rates of asthma attacks, heart problems and cancer in our communities. These are just some of the things I would not like to leave to the children of this community. Please help protect our children and mother Earth.

Sincerely,

Olga Prado

Date: Tuesday, October 16, 2018 4:15:54 PM

To Whom it May Concern,

I offer my full support of the Puget LNG facility moving forward with final permit approvals. With the approach of the IMO 2020 sulphur cap on the horizon, coupled with the need to work incrementally towards cleaner ports, LNG offers the most executable, and realistic solution for the shorter term. Unfortunately neither battery or wind-based solutions for large merchant ships is simply not an option to meet the power demand required to move such heavy ships across the oceans. Vessel owner and operators must come up with a strategy to meet the IMO's sulphur cap limits: There are few options which include burning the 0.5 sulphur compliant marine gas oil fuel, installing scrubbers and continue to burn Heavy Fuel Oil, or use LNG. While LNG is not a perfect fuel, and there are concerns about the upstream impacts of extraction, the alternatives present equally troubling human health impacts in way of particulate matter, NOx and SOx.

Having read the EIS, and followed Puget LNG's process to secure the permits associated with final approval, I have high confidence they did their due diligence in meeting or exceeding all requirements. Having served on President Obama's National Ocean Council staff, I know first hand how passionate our citizens are in protecting our environment and cultural resources (I share in those passions). However, our U.S. ports are the linchpins of our national economy and security - and ship's calling on our ports must fully comply with environmental regulations. Puget LNG is offering a viable solution for compliance that will directly result in cleaner air in and around our ports (driver for the new rules). Put simply there is no perfect fuel for large merchant ships that does not have some degree of negative impact on the environment - no way to get around that. Whether its LNG or a petroleum-based fuel, there are negative consequences somewhere along the life-cycle of that fuel. As citizens, we should demand LNG terminal operators comply fully with the environmental laws in the process of securing permits. Again, I strongly believe Puget LNG has fully complied, and in some cases, exceeded the requirements, and have been transparent throughout the process. Although I do not currently live in Seattle, it was my home for 10 of my 20 years of service in the U.S. Coast Guard.

I appreciate the opportunity to have commented,
Alisa L. Praskovich

This project threatens the local community and the stability of our climate by multiplying dirty energy. It was initially approved without any meaningful consultation with the Puyallup Tribe. Treaty rights have more authority than the rights of any other governing body or agency. The Puget Sound Clean Air Agency and all agencies involved in permitting this facility still need to consult with the Puyallup Tribe.

Steve: Thank you. Heather Price?

Heather: Hi. My name is Dr. Heather Price. I'm an atmospheric chemist and a climate scientist from Seattle, Washington. I have my PhD from the University of Washington, and I was a climate scientist with a group at Harvard. And I specialized in looking at methane. I looked at the impact of methane as a global warming gas.

[03:22:00] The impact statement that was put together is looking at global warming potential for methane that is looking at 100 year average, which really minimizes the impact of methane as a greenhouse gas. Really, it should be looking at the 20 year. And also, it's looking at an SEIS dated to 2007 rather than the most up-to-date 2016 numbers. They really should be using the 2016 and really should be using the 20 year average because this is an issue, according to the IPCC's latest report, October 8, 2018, we need to be dealing with this issue within the next 12 years. That is under the purview of the Clean Air Agency to also reduce greenhouse gases.

That is one of our air pollutants. So, we should be using the 2018. In addition, we should also be looking at the leakage rates. The leakage rates, if you have methane leaking at anywhere between two and three percent, it is as bad as coal for its global warming potential.

[03:23:06] Right now, they're using numbers coming out of BC of 0.4. That is ridiculous. Everything that I've seen and all of the emissions data that I have used has been anywhere from three percent is about the average. But it runs from about 1.9% leakage rate up to as high as 17% leakage rate. Their leakage rates are not reasonable. And they need to take into account that it's not just coming from Canada with those numbers that are really low that are coming out of the fossil fuel industry. They're not coming from emission data that is peer reviewed. Thank you.

Steve: So, before I call up the next person, I'll just give the next group of five a heads up. Benjamin Sibelman, Mary Paterson, Hillary Sanders, Holly Rydel Kelly, and Terry Velasco.

Dear Puget Sound Clean Air Agency,

Thank you for opening up the review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma, 1.5 miles from my parents house.

I'm an atmospheric chemist and climate scientist trained at University of Washington.

As a climate scientist, and based on the recommendations of the latest IPCC report, I am advising you that we cannot, and must not, allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.

My first concern with this draft SEIS is that it's using outdated data and/or unreliable sources for methane emissions, leak rates and global warming potential. There are also several sections missing data and so we can not accurately assess the quality of the report and understand how certain conclusions are reached. Because of that, I request that you complete this report, reissue it, and then reset the public comment period so that we have time to review the completed report.

If these issues are given proper attention and addressed with best available science, it will show that the marginal improvements in emissions the study claims will disappear and the project will in fact be worse for the climate than doing nothing.

Here are some of the issues I have with the current report.

The SEIS is not using the best available data for the Global Warming Potential (GWP) of methane. It uses the 100-year GWP of methane and not the 20-year value which is much more relevant given the urgency in addressing the climate crisis within the next decade as recommended in the latest IPCC report. The appropriate 20-year GWP value to use is 96.

This facility is projected to have a 40 year lifespan, so why does the report project out to 100 years, which is 90 years beyond the time we have to take decisive action to curb our greenhouse gas emissions?

The SEIS claims emissions benefits from customers that Puget Sound Energy simply does not have. According to PSE and the City of Tacoma, the only maritime customer is TOTE with its two vessels which have already delayed their conversion to consume LNG. Securing new customers (there are only just over 100 LNG ships in operation out of a worldwide fleet of 90,000) as well as the additional permitting could take years and is not guaranteed.

The leakage rates used in the SEIS are not peer reviewed nor are they reliable sources of data. A methane leakage rate of just >2-3% makes natural gas worse than coal for its climate impact. The claim that emissions will be reduced if the natural gas comes from Canada, because leakage rates are reportedly lower there than in the US, is ludicrous. The Canadian leakage rates were self-reported by the fossil fuel industry. More reliable, independently verified, and peer reviewed emissions and leak rates are available and should be used in the

report. Reliable data are based on models and recent measurements taken in the field, and show that leakage rates range from an unlikely 1.9% up to 17%. The latest peer reviewed estimate is 2.3% (journal article link below). This leak rate is within the calculated range of natural gas being worse than coal with respect to green house gas emissions.

http://science.sciencemag.org/content/early/2018/06/20/science.aar7204/tab-pdf

Also, there is no guaranteed that PSE is sourcing its gas from BC. Their recent filings show they relied on gas from BC, Alberta, and the US. And with the recent pipeline explosion in BC that interrupted PSE's supply, we know it's not always available.

When ships use any fuel, a certain percentage of it escapes without combusting through the exhaust system and into the atmosphere. This is known as slippage and the SEIS is again using a lower rate than is accepted in the literature.

Please update the SEIS with the most up to date and scientifically peer reviewed data available for methane emissions, leak and slippage rates, and global warming potentials.

Thanks again for initiating this crucially important review of this facility and I hope that you will take best available science and data into consideration when revising this draft SEIS.

Heather Price, PhD

[06:41:00] So, Susan Donaldson? Amy Provenzano?

Amy: Right here.

Steve: You get the last one.

Amy: Good evening. My name is Amy Provenzano. And I am here from Seattle. And every one has really spoken the facts better than I ever could. So, just coming from my heart, people are talking about current jobs surrounding this project. And it's just short sighted.

[06:42:00] If the fossil fuel industries would have listened to climate change facts from decades prior, we would not be here in this Rialto Theater today. Much more efficient, zero waste energy sources would be well established and old news. Jobs would be intact and thriving. LNG isn't thinking of what's next or how to continue improving. A 25 year lease or more is what they're seeking. They are not interested in evolving. I wonder what the situation would look like if money weren't wrapped around and through it.

[06:43:00] Democrat, Republican, healthcare, women's rights, proper wages, and race equality, none of that will matter without a livable planet. Thank you.

Steve: Thank you. So, it's 10:00. The public hearing on this is now closed. I just want to remind everybody, I apologize for those we didn't get to.

Subject: Tacoma LNG SEIS Project Comment
Date: Tuesday, October 30, 2018 9:07:42 PM

Dear Responsible Official,

I am concerned about the proposal by Puget Sound Energy to site a Liquid Natural Gas facility at the Port of Tacoma. I understand PSE ratepayers will be paying 43% of the estimated capital costs of the Project ($133 million of $300 million) . This project passes on the increased cost of LNG energy to ME! This project supports a 50 year reliance on fossil fuels. This is unacceptable. I want an energy future based on solar, wind, etc.

Sincerely,
Niki Quester
Indianola, WA 98342
nikiq@centurytel.net

Dear Port of Kalama, and Cowlitz County,
Dear Puget Sound Clean Air Agency,

2046-1 3. Outside of SEIS Scope

We cannot build the LGD site in Tacoma so close to daycares, schools. An explosion would threaten lives. And, the air pollution would hurt our youngest residents.

Please, please put my money to solar + wind. Trade ya!

Please include this impact in the Final Supplemental Environmental Impact Statement.

Dear Port of Kalama, and Cowlitz County,
Dear Puget Sound Clean Air Agency,

2047-1 3. Outside of SEIS Scope

We cannot have a methanol refinery on the Columbia. The river is a lifeline for food + recreation - not to mention pure beauty. If that refinery explodes people will die.
Let's move to solar + wind!
Come on WA! Lead the way!

Please include this impact in the Final Supplemental Environmental Impact Statement.

Name:	Bridget Quigg	Email:	bridgetjanequigg@gmail.com
Address:	1830 McGilvra Blvd E Seattle, WA 98112	Phone:	(206) 310-9056

ear Puget Sound Clean Air Agency,

2049-1 3. Outside of SEIS Scope

Why would we invest in facilities for dirty, polluting, earth structure disrupting natural gas? The holes used to store the water left after fracking destabilize the earth + cause earthquakes. Let's invest in sustainable solar + wind. Let WA state be a leader, like we were in ~~[illegible]~~ same sex marriage + Legal marijuana.

ease include this impact in the Final Supplemental Environmental Impact Statement.

Dear Port of Kalama, and Cowlitz County,
Dear Puget Sound Clean Air Agency,

2050

2050-1 3. Outside of SEIS Scope

I am concerned for the health of those people, particularly children pregnant women, who live near fracking sites. The chemicals in the water used for fracking aren't well understood but 50+ are cancer-causing. Please stop the natural gas facilities We need to move to solar + wind!

Please include this impact in the Final Supplemental Environmental Impact Statement.

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

It's insane to be building more fossil fuel infrastructure as we face the mounting climate change threat. Last week the fires enhanced by climate change in California hit close to home as my father's house burned to the ground near Paradise. I'm not asking you to stop the LNG Plant in Tacoma, I'm insisting that you stop the LNG Plant in Tacoma.

Stop doing immoral projects and protect us all by not approving this project.

Thank you

Ray Quisenberry

It seems to me that the Clean Air Agency should be concerned regarding the creation of a large Natural Gas facility on the shores of Commencement Bay. Along with many other environmental issues (at this location!), I'm sure that clean air would be impacted — especially in the event of leak or a spill — inevitable, no? Please consider opposing this establishment, even at this late hour. Thank you; Susan Rack, Vashon Island

ATTN: Public Comment on DSEIS,

PSE LNG Project,

1904 Third Ave, Suite 105

Seattle, WA 98101

November 18, 2018

To PSCAA:

My name is Roger Martin. I am a retired Air Force combat pilot. Subsequent to that retirement, I worked as a training developer and instructor for the B-2 stealth bomber's initial cadre of pilots, then a systems engineer for military systems, and then a manager specializing in proposals for major defense contracts. I hold a BA in Biology and Oceanography from San Jose State College and an MS in Systems Management from the University of Southern California. I am currently the coordinator for my church's Greening Activity Group at United Church in University Place.

I am strongly opposed to acceptance of the 2018 Supplemental Environmental Impact Statement (SEIS) for, and to the installation of, the LNG facility proposed for the Tacoma Tide Flats. This is for several reasons.

1. First, the location.

   We have learned that this construction location is in a) a known earthquake-fault area; b) a tsunami hazard zone; c) on land fill; and d) adjacent to Native American tribal land. For an installation that is to contain pressurized flammable gases, mixed with toxic, volatile organic compounds, in an installation that will reportedly stand 16 stories tall that is near highly populated urban areas, and be an installation and within a few miles of the West Coast's primary north-south roadway is pretty-near insane. In my lifetime, I have observed from a distance, and among other events related to manmade facilities (not in order): a) the Three Mile Island nuclear meltdown; b) the Chernobyl nuclear meltdown; c) the Exxon Valdez grounding and oil spill; d) the Deep Water Horizon explosion and oil spill; e) the Fukushima Daiichi earthquake and tsunami nuclear disaster; f) numerous railcar de-railings, chemical and petroleum leaks, fires, and explosions; g) the Shell Oil Kulluk floating oil-rig disaster (twice in one trip!) between Alaska and Washington State; h) leaks of natural-gas storage facilities (most notably Porter

Ranch in Southern California); i) numerous leaks along existing oil pipelines, including the Keystone XL and feeder pipelines; and j) one I will recount in more detail here, based on my eyewitness observation.

I was married in a full military wedding on February 2, 1969 in Santa Clara, California. Not having a lot of money, we decided to honeymoon on the beach in Southern California, complete with a drive in our two-seat, red, British TR-4 convertible, along California Highway 1. Our first night of the trip was going to be in Carmel by the Sea. Our second night was going to be in Santa Barbara, where we had dinner reservations at the end of the pier. So, on February 4, 1969, we went to that restaurant and saw oil-soaked pelicans and seagulls bobbing around in the water under the restaurant--from the Santa Barbara oil spill. 'Heck of a honeymoon, but a real lesson for a freshly graduated biology/oceanography major and newly commissioned military officer.

Although I am likely to come back to some of these issues later, I wanted to lay down some markers here. I will proceed to other matters below before coming back to detailed reflection. The big point here is that in every case, when these projects and facilities were proposed, each was going to be using the latest, greatest, most-foolproof-possible safety measures to prevent any possible accident that could ever occur, and that if one ever did occur (which we are told simply *can't* happen), it would be resolved quickly and without any damage or loss of life, because we had thought of everything and prepared for every contingency, and the government would make sure every rule and promise would be followed and kept.

2. Indian treaties

- (Quoted from the *Advisory Council on Historic Preservation Handbook* [ACHP]:) "The National Historic Preservation Act (NHPA), (16 U.S.C. Section 470f) Section 106, requires federal agencies to take into account the effects of their undertakings on historic properties and provide the Advisory Council on Historic Preservation (ACHP) a reasonable opportunity to comment on those undertakings. communication that may include written correspondence, meetings, telephone conferences, site visits, and e-mails." And, "Consultation constitutes more than simply notifying an Indian tribe about a planned undertaking."
- In addition, the Environmental Review Toolkit, published by the Federal Government, says, "The National Environmental Policy Act of 1969 (NEPA) requires the preparation of an environmental impact statement (EIS) for any proposed major Federal action that may significantly affect the quality of the human environment. The statutory language of NEPA does not mention Indian tribes. However, the Council on Environmental Quality regulations do require agencies to contact Indian tribes and provide them with opportunities to participate in various stages of preparation of an EIS."

- According to several speakers at the recent Tacoma public hearings on the proposed SEIS for the LNG facility, these consultation requirements have not even been minimally met.

3. Data are not current or accurate

   As was reported by numerous speakers at the Tacoma SEIS public hearings, the original, proposed EIS had incomplete and inaccurate data for computations used to support the Study's findings. The data in the former EIS relied heavily on information that had been available in 2007. "Placeholder" data were used in that study, based either on best-available values from studies up to that time, or estimates based on best guesses. More-accurate data were understood to be inserted as time went on and real studies were done with ever-improving and -widening information became available from better equipment and additional sampling and trend analysis. Reportedly, such data became updated in 2009, and later in 2013. Fortunately, there was an additional full IPCC report very close to submittal of this SEIS. And, although available, none of the latest data were used in the proposed SEIS. Indeed, many of the original best-guess placeholders from 2007 are still in the new document, even though new, and real, data are available.

   The Tacoma SEIS public hearings provided clear and consistent insight into how inclusion of best current data would affect the findings of the proposed SEIS. Environmental impact and possible damage from gas leakage and accidents are grossly underestimated in the current study, based on the outdated information contained in there. One witness—a college teacher (he claimed)—stated that greenhouse-gas leakage, by his quick calculations using new, accurate numbers, were roughly 2.5 times as great as those presented in the proposed SEIS.

I would like to get back to some of my earlier reflections. Specifically, I'd like to get back to some of the nuclear-plant lessons. At least, three nuclear power plants were somehow built right next to the open ocean: Diablo Canyon and San Onofre in California, and Fukushima Daiichi in Japan. At that time, several people who studied oceanography (I was an oceanography student back then) had already warned that predicted greenhouse gases would raise the sea level. But they built these plants there anyway. Brilliant, eh? The movie *The China Syndrome* was, fascinatingly, shot largely at Diablo Canyon. This was not one of the plants that did melt down. One of those that did was in Ukraine (then part of the Soviet Union), and the other was in the middle of a river in Pennsylvania.

The worst nuclear-plant disaster can be disputed as either Chernobyl or Fukushima. Again, promises were made that the safety designs were impeccable. At Fukushima, nothing could happen that could not be overcome by the wonderful safety standards that

Japan had put into place. (Apparently, nobody noticed the big ocean outside, even after all the movie monsters that had come out of it going back decades before.) People were allowed to build residences and businesses ever closer to the reactor as time went on—after all, what could happen? Other nuclear plants had been around, and hadn't blown up or been overwhelmed by a tsunami. So, why should this one? And it had been built to handle earthquakes, anyway, right? And *to government safety standards! Right?*

Then, the earthquake and the tsunami hit in 2011. In that accident, there were three nuclear meltdowns, multiple hydrogen explosions, and an estimated 1600 deaths, from a "safe" nuclear plant, because somebody had studied all the possibilities and nothing could happen that existing designs and safety procedures couldn't handle.

San Onofre was the first of the two, aforementioned US coastal plants identified for decommissioning. For a while, talk was that they could re-start it after an attempt to repair and replace parts that wore out before their initial studies had said they would (What? Overoptimistic estimates?). They also looked at what happened at Fukushima two years earlier, and perhaps started to notice that the sea-level rise predicted when they originally designed the plant was a bit underestimated (Gee, do you think so?). So, in 2013, they shut it down, never to be opened again.

Now, folks have decided it might be smart to pull the plug on Diablo Canyon too. There seems to be a trend here: Building facilities with stuff that can blow up and also contaminate a populated an area near where there are earthquakes and possible tsunamis might not be the indication of high intelligence.

So, for building on fill: San Francisco has some experience with that. In 1906, they had an earthquake. After the quake, they decided to use rubble from the earthquake and some dredging from the Bay to build a location for the Panama-Pacific International Exhibition, which then became the Marina District. In 1989, the Loma Prieta Earthquake hit at the very summit of Highway 17 between San Jose and Santa Cruz, and the land fill in the San Francisco Marina District liquified from the vibrations. In addition to water mains breaking, natural-gas (hmmm) lines broke, and fires broke out. Because of the broken water lines, water from the Bay had to be used to extinguish the fires. Land fill and gas lines have a history of being a bad idea then, don't they?

In San Francisco, there are two other buildings that were subsequently built on land fill. They are the Millennium Tower luxury high-rise, and the new bus terminal, built closely to each other. The Tower is sinking and has been discussed on several TV shows, including *60 Minutes*, and the other is the new bus terminal, which has shown structural cracking before it has even opened for regular business. How much is that all going to cost to make safe…or not? Furthermore, the entire area known as Foster City, just south of San Francisco International Airport, is sinking, at the same time the sea level is rising.

Foster City was built on land fill. And PSE (an Australian company, by the way) thinks it is just fine to build a 16-story-tall container of explosive and toxic gas onto land fill in an earthquake and tsunami zone. Brilliant!

As somebody who was college-trained as a scientist, flew in combat, authored training and technical publications both at the Air Force's Headquarters Strategic Air Command, and later, for the most-expensive combat airplane ever built, and in the defense industry was the principal manager responsible for the Technical Volumes of several DoD multi-million-dollar contract proposals, I am absolutely appalled at what was presented in this official government SEIS. It clearly needs to be re-written using current, accurate, and complete data, and with actual consultation with Indian tribes.

Disregard for federal law in consulting with native tribes, *knowingly* using outdated and misleading data on which to base conclusions that can result in disasters similar to what we have witnessed in documented events ranging from the Santa Barbara oil spill up until the immediately recent fires caused by faulty power lines in California, accepting this widely disproven SEIS would be insane, and hopefully prosecutable as a crime of fraud for which anybody who signs off on this currently proposed SEIS would be culpable.

Sincerely,

Roger T. Mart

1657-1 12. LCA Inputs and Assumptions - Global Warming Potential Value

From: Norma Ramirez
To: Public Comment
Subject: Puget Sound Energy LNG Project
Date: Tuesday, November 20, 2018 8:00:47 PM

Puget Sound Clean Air Agency,

The draft SEIS is terribly flawed and unacceptable. I write this to urge you to start over and do a new SEIS or change the current one. The draft SEIS uses an outdated methane global warming potential (GWP) from 2007. The 2007 value was used in the SEIS as that is what the Environmental Protection Agency currently uses and it is codifed in the Washington Administrative Code, WAC 173-441-040. However, we know that the UN value from 2007 is outdated and that the SEIS should use the most up to date value from 2016. This single change in the SEIS greenhouse gas model shows that the LNG plant will actually be dirtier regarding greenhouse gas emissions than if the LNG plant were not built. It is critical to use up to date values in order to get the most realistic model of what we're in for. Using outdated values creates a flimsy, fantasy model on which you are basing our future well-being.
Thank you.

1672-1 14. LCA Inputs and Assumptions - Leakage/Slippage

From: Norma Ramirez
To: Public Comment
Subject: Puget Sound Energy LNG Project
Date: Tuesday, November 20, 2018 8:03:24 PM

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

First of all, I want to thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma.
It is urgent that the flaws of the draft SEIS of the proposed Tacoma LNG facility be corrected before PSCAA decides on whether or not to grant an air permit for the facility. There is a gaping lack of evidence that the BC fracked gas is as clean as the draft assumes. The draft is relying mainly on reports by industry. One of the reports says it is using emissions that are lower than the industry average. So it doesn't make sense that the report extrapolates that report's methane leakage rate to all B. C. fracking wells. Also, the SEIS does not make use of methane leakage data from 2017 and 2018 reports that use empirical, independent physical studies at well sites. The 2018 report found that 85% of active wells are directly venting methane daily, and that those leakages have been in the past underreported. The same report found that methane emissions in BC are 2.5 times higher than reported. It is imperative that the SEIS base its conclusions of BC emissions on empirical, independent studies. Otherwise, these conclusions are flimsy and dangerous to our health.
Thank you.

From: Norma Ramirez
To: Public Comment
Subject: Puget Sound Energy LNG Project
Date: Wednesday, November 21, 2018 6:50:35 PM

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

I want to thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. The draft SEIS was released to the public about the same time that the report from the UN Intergovernmental Panel on Climate Change was released so the writers of the draft SEIS did not have the benefit of reading the UN report beforehand. However, good science is good science and the draft SEIS was not based on the most up to date science, putting us all at great risk for suffering dire consequences in 20 years because of climate change. The writers also did not read the recent scientific report predicting multiple climate change related crises happening at once all over the world and that these can be reduced to fewer happening at once if greenhouse gas emissions are drastically reduced immediately. But they could still have incorporated the most up to date science available. We are now depending on you for leadership. Ordinary citizens, like me, and our political leaders are not decreasing greenhouse gas emissions fast enough on our own. Please step up to the challenge and redo the SEIS of the proposed LNG. Use the 20 year time frame to analyze and predict the methane emissions of the LNG, when methane emissions are at their greatest and most dangerous levels, instead of the 100 year time frame currently used in the draft SEIS. This draft SEIS and its conclusions are worthless to carrying out your mission of clean air because it relies on science we know is wrong. We don’t have 100 years to make the dramatic decreases in greenhouse gases that will protect our families. Please do a new SEIS using up to date science values and knowledge.
Sincerely,
Norma Ramirez
819 N. Washington St.

[02:47:00] So, Alex Rammel is first.

Alex: Good afternoon. Alex Ramel, organizer with Stand Dot Earth. I want to start by commending you for taking on this difficult task of doing a lifecycle greenhouse gas analysis. In 2007, I was one of the lead authors of the local government greenhouse gas protocol, which is the set of standards that are used for cities and counties that wasn't to do greenhouse gas inventories. So, I know this is a big task. And I applaud you for taking it on. There are some important ways that this can be done more accurately. Others here have pointed out the Atherton research that demonstrates that BC's fracking is likely much more methane intensive than has been reported.

This is complicated stuff. They're measuring parts per billion of volatile chemicals that are highly reactive and moving in the wind. I urge you to apply the precautionary principle in doing this evaluation.

[02:48:00] The truth is that they're over 40 year lifetime for this project, PSE is likely to source their gas from more than one place. The methane emissions from those sources are going to vary. And our understanding of the science is going to evolve. My advice and the best practice, in this situation, where there's a lot of uncertainty, is to use a regional leakage rate rather than a source specific number, especially where the source specific numbers are so remarkably different than the average. The second thing I want to talk to you about is your baseline. The no action scenario assumes that TOTE Maritime will not reduce emissions in any way, over the next 40 years.

That's almost certainly incorrect. The International Maritime Organization is developing a plan to reduce greenhouse gas emissions by 50% from 2008 levels. It's debatable whether LNG belongs on the list of things that might reduce emissions from current levels, in the shipping industry. But it's absolutely clear that it's not the only option.

[02:49:00] It's not the most cost effective, and it's not the most significant. Ship routing efficiency, whole design, and slow steaming all would have a bigger impact. And they're going to be a part of the future for the industry. It should be factored into that baseline. Thanks.

Attachments: image001.jpg
image002.jpg
image003.jpg

To Whom It May Concern:

My name is Barbara P. Raper and I have been a resident in Tacoma for 34 years. I am writing to provide comment on the construction of a liquefied natural gas facility at the Port of Tacoma. I support construction of the facility because I want an alternative to diesel for maritime uses in Tacoma.

In many respects the voice of the average person in Tacoma has been out-shouted in public discussions about the facility. From my point of view, people who are opposed to it are against the use of fossil fuels in anything, for any purpose. Yet most of them drive cars powered by gasoline and would support the LNG facility if it was "not in their backyard." I, too, am concerned about global warming and the impact of fossil fuels and greenhouse gasses. But it is laughable that we will stop using fossil fuels overnight, even in ten – 20 years, and while we seek and develop new solutions, I view the use of liquefied natural gas as a major step in the right direction.

This blind spot when it comes to a move toward something better – albeit not perfect – is very frustrating to me. If we don't use LNG now, aren't we acquiescing to the nasty fumes of bunker diesel until cargo ships run on some zero-impact power source that does not exist and will not exist for the foreseeable future? If we don't agree that a step toward better fuels, and better air quality now, is better than the status quo, aren't we deliberately allowing the further degradation of the air we breathe, at the whim of their activists that offer NO realistic solutions of their own?

After decades of the "aroma of Tacoma," this project is a perfect example of one thing we can do to support local maritime, who is leading the way toward something better. We should be ashamed of ourselves if we don't support what they want to do for cleaner air and fewer air emissions. Please allow completion of the LNG facility at the Port of Tacoma.

Thank you for your consideration.

Respectfully,

B. Piilani Raper

Name

Puget Sound Clean Air Agency, 1904 Third Ave, Suite 105, Seattle, WA 98101
ATTN: Public Comment on DSEIS, PSE LNG Project
Dear Puget Sound Clean Air Agency,
I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to deny the permit because the Draft Supplemental Environmental Impact Statement does not accurately represent the true greenhouse gas emission profile of the project. I have the following specific concerns:

RECEIVED
NOV 19 2018
Puget Sound Clean Air Agency

"Natural Gas" is as beneficial as "natural" arsenic. Methane is natural gas & it has 86 x the global warming effect of carbon We are the Pacific Northwest & we have to lead the country in taking the steps to reduce NOT INCREASE the effects of climate change (Check here to continue comments on the other side.) ☐ ➡

In addition, a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required and adequate consultation with the Puyallup Tribe and other neighbors of the project should be conducted.

Name: Rick Kappler Email: rick@rickkappler.com

1624-1 5. Regulatory Framework

From: Pat Rasmussen
To: Public Comment
Subject: Public Comment on DSEIS, PSE LNG Project
Date: Tuesday, October 30, 2018 4:52:19 PM

Dear Decision Makers,

PSCAA did not consult the Puyallup tribe about the LNG plant. This is in direct violation of the Medicine Creek Treaty of 1854. The LNG project will be detrimental to the Puyallup Tribe by putting their treaty rights and community at risk. Treaties are the highest law of the land, according to the Constitution, yet they have been ignored throughout this whole process.

The SEIS must include consultation with the Puyallup Tribe. The other Tribes of the Medicine Creek Treaty - the Nisqually Tribe and the Squaxin Tribe - support the Puyallup Tribe.

The Puyallup Tribe is against the LNG plant and their position must be accepted. The LNG plant must be cancelled.

Thanks,

Pat Rasmussen

From: Pat Rasmussen
To: Public Comment
Subject: Public Comment on DSEIS, PSE LNG Project
Date: Tuesday, October 30, 2018 5:55:27 PM

Dear PSCAA,

The Endangered Southern Resident Orcas of the Salish Sea are threatened by the PSE LNG project. The increased ship traffic would harm their fishing abilities due to the noise. The Governor's Orca Recovery Task Force is looking for ways to decrease noise. The LNG project would increase noise and must be cancelled.

Talequah is a 20-year-old female orca who gave birth to a female calf that died after half an hour. While many orca mothers have been seen carrying the bodies of their dead calves for a day or so, Tahlequah did so for 17 days showing humanity the damage we have done.

In August, biologists tried to help an emaciated and ailing three year-old killer whale (born December 2014), J50 also known as Scarlet, of the critically endangered Southern Resident population. J50 appeared lethargic. Scientists observing her agreed that she was in poor condition and may not survive. Responders from NOAA Fisheries and partner organizations were exploring options ranging from no intervention to providing medical treatment, potentially delivered in a live Chinook salmon, which has never before been attempted in the wild. J50 has not been seen since September 13th.

New fossil fuel projects have absolutely no business in such a fragile and diverse area like the Salish Sea, especially when the effects of these projects on the wildlife is not included in the SEIS. I am requesting that the local wildlife including endangered species like orcas, be included in the FEIS.

Thanks,

Pat Rasmussen

Subject: Public Comment on DSEIS, PSE LNG Project

To whom it concerns,

The LNG facility has a 40 year plan even though the United Nations Intergovernmental Panel on Climate Change reports that we must change our fuels in the next 12 years or face severe consequences (where destructive hurricanes are normal and all the polar bears are extinct because there is no more ice in the Arctic). The LNG plant will speed up methane emissions and also lock Washington State into a 40 year plan, well beyond the 12 years we have to clean up our act. Also, this facility will be impacted by rising sea levels due to climate change at the Port of Tacoma.

I encourage you to read the IPCC report here:
http://www.ipcc.ch/report/sr15/

And listen by cancelling the LNG plant.

Thanks,

Pat

Subject: Public Comment on DSEIS, PSE LNG Project

Dear PSCAA,

This is a public comment on the LNG facility at the Port of Tacoma. My concern is environmental justice. The communities most impacted by fracking and LNG plants are communities of color. This includes from the extraction site to the final destination: numerous Tribes in B.C. and North Dakota (extraction sites), and the Puyallup Tribe (destination site).

At public information meetings in 2017, the Puget Sound Air Agency informed us that the facility would release ammonia, arsenic, cadmium, hydrogen sulfide, and sulfur dioxide. LNG facilities threaten human and wildlife health by destroying air quality. The emissions units in this LNG facility would have a ground flare and vaporizer unit that would emit VOCs which have been linked to birth defects, cancer, and causing damage to the nervous system. And this would happen right where people are living.

The LNG plant must be canceled.

Thanks,

Pat

Subject: Public Comment on DSEIS, PSE LNG Project

Dear PSCAA,

The Puyallup Tribe is strongly opposed to this facility right next to their marina on the Hylebos.

Puyallup treaty rights and fishing rights need to be respected by our local government. Twenty-eight Washington Tribes voted to oppose the PSE LNG. From the very beginning, the public was kept out of the loop. There was no notification to residents. Neighbors half a mile from the LNG tank proposal were not notified. As a result, SEPA only had a handful of comments from the general public. The city and port have been pushing for this development and Jake Fey, state representative, created a special LNG tax break several years ago after he was contacted by a PSE lobbyist. PSE has been spending millions on political campaigns and green-washing. The city is not acting as a neutral lead agency.

The project must be cancelled.

Thanks,

Pat Rasmussen

Subject: Public Comment on DSEIS, PSE LNG Project

Dear PSCAA,

This is a public comment against Puget Sound Energy's disastrous LNG project. PSE has shown its incompetence and its history needs to be included in the FEIS. Here are a few examples:

-You (the PSCAA) issued a notice of violation because PSE started construction without going through the agency's process. These small penalties do not affect big polluters like PSE.

-PSE did not evaluate tank safety & risks, only looked at small pipeline leaks.

-PSE "safety recommendation" to handle leaks are for staff to wrap towels around leaks. LNG is minus 260 and causes cryogenic burns or even death when in contact with the human body.

-In 2016, a PSE gas line exploded and destroyed the Greenwood neighborhood in Seattle. They were fined $2,750,000 but only had to pay $1,500,000. PSE has not taken care of the community after the explosion. How will they manage a dangerous situation with the LNG facility? Since they are a Limited Liability Corporation, they will most likely pack up their things and leave since they won't be held liable.

-PSE has constructed the LNG without the proper permits. How can we trust them to uphold the conditions of the air permit? They have completely disregarded the public including the ratepayers.

The LNG project must be canceled.

Thanks,

Pat Rasmussen

Dear PSCAA,

On your website the 2014-2020 Strategic Plan lists your "commitments". As you know, they are:

-Be good and wise stewards of the resources you give us
-Defend the future
-Prevent and reduce risk to you by upholding and enforcing the law
-Protect you from air pollution
-Tell you what's in the air you are breathing

If you approve the LNG facility, you will be doing the complete opposite for each one of these commitments.

Cancel the LNG project.

Thanks,

Pat Rasmussen

Subject: Public Comment on DSEIS, PSE LNG Project

Dear PSCAA,

The SEIS for the fracked gas facility should include the effects from the extraction site to the production site. This LNG facility does not stop at Tacoma. For example, the current analysis does not include the effects of using and transporting sand/water for the fracking wells. 2-8 million gallons of water may be used to frack a well. Some wells consume much more. A well may be fracked multiple times, with each frack increasing the chances of chemical leakage into the soil and local water sources. The SEIS also does not include GHG emissions from diesel trucks that are used to transport water and sand to the wells.

Thanks,

Pat Rasmussen

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

We must move away from carbon sources of energy as soon as possible. Fracked gas production is particularly bad. The method of fracking for gas causes the release of much more methane into the atmosphere than other methods. Methane is much worse for global warming than CO2 (~25 times worse). The recent science on global warming tell us that earth is heating up much faster than previously thought. We must dramatically reduce our dependency on fossil fuels - especially fracked gas!

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Dear Puget Sound Clean Air Agency, *
First of all, I want to thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. With our climate in grave peril, as emphatically stated in the latest IPCC report, your review of the greenhouse gas impacts of the natural gas used in this project couldn't be more important. Those scientists make clear that we cannot, and must not, allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.
With that said, I am aware of several issues with the draft report you issued on October 8th. It is my belief that if these issues are given proper attention and addressed with best available science, it will show that the marginal improvements in emissions the study claims will disappear and the project will in fact be worse for the climate than doing nothing at all.
Here are some of the issues as I understand them:
- The SEIS is not using the best available science for the Global Warming Potential (GWP) of methane. It uses the 100-year GWP of methane and not the 20-year value which is much more relevant given the urgency in addressing the climate crisis. The appropriate 20-year GWP value to use is 96.
- This facility is projected to have a 40 year lifespan, so why does the report project out to 100 years, which is 90 years beyond the time we need to have taken decisive action?
- The SEIS claims emissions benefits from customers that Puget Sound Energy simply does not have. According to PSE and the City of Tacoma, the only maritime customer is TOTE with its two vessels which have already delayed their conversion to consume LNG.
Securing new customers (there are only just over 100 LNG ships in operation out of a worldwide fleet of 90,000) as well as the additional permitting could take years and is not guaranteed.
- The SEIS says that emissions will only be reduced if the natural gas comes from Canada, because leakage rates are reportedly lower there than in the US. Shockingly, most leakage rates were self-reported by the fossil fuel industry based on models and recent measurements taken in the field have shown that leakage rates are much much worse.
- How can it be guaranteed that PSE is sourcing its gas from BC anyway? Their recent filings show they relied on gas from BC, Alberta, and the US. And with the recent pipeline explosion in BC that interrupted PSE's supply, we know it's not always available.
- When ships use any fuel, a certain percentage of it escapes without combusting through the exhaust system and into the atmosphere. This is known as slippage and the SEIS uses a lower rate than is considered best practice.
Thanks again for initiating this crucially important review of this facility and I hope that you

will take best available science into consideration when revising this draft SEIS.

*Clearly, this is a letter copied from those who have studied the science more than I have; however, it makes sense to me. I would like to add my own comments here. If the LNG business wants us to believe that they have our safety in mind, then why do we still have explosions of trains? They could upgrade the tracks, but they have not. They could use the new double layered oil cars, but they have not. It appears to me that it's all about the money, not about the human and environmental cost of accidents. For them, it's a cost of doing business. Oh wait, and who pays for fighting the fires and doing the cleanup? I refuse to be bullied by big business for their own profit at the cost of the environment and humankind.
Thanks for your attention.
Sincerely,

1794-1 22. General Opposition

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

The Clean Air Agency's analysis is based on 100-year, not 20-year, global warming potential (GWP) values. Given the IPCC report that was released last month indicating that we have 12 years to avoid climate catastrophe, the Clean Air Agency should be using the 20-year numbers, as that is the timeframe where action is needed. Using the most recent 20-year value of 96 makes LNG 150% dirtier than the "dirty fuel" it's supposed to replace.

Sincerely,

Nanette Reetz

As a resident of Tacoma I write to affirm that
✓ we do not need the hazards a LNG facility poses to our health and well-being
✓ we are co-creators and stewards of our earth and all its peoples
therefore we need to be mindful of the risks involved
✓ Northwest Detention Center houses 1,000-1,500 people and an explosion on the tide flats could bring death and destruction to those behind locked doors
✓ we need the science to provide the answers to the questions generated by the process
✓ we need to assure that treaty rights are honored and respected for people of the Puyallup nation.

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

The Puget Sound Clean Air Agency should go back to the drawing board. The draft SEIS does not account for the full climate impacts of fracked gas. The analysis is incredibly flawed and unacceptable, and we need the Air Agency to do better before they decide on the air permit for the facility.

The draft SEIS does not sufficiently cover issues of Environmental Justice. First, at public information meetings in 2017, the Air Agency shared that the facility would release ammonia, arsenic, cadmium, hydrogen sulfide, and sulfur dioxide. LNG facilities have been shown to threaten human health by significantly degrading air quality and contributing to health-harming pollution. The proposed emissions units in this facility include an enclosed ground flare and vaporizer unit that would emit volatile organic compounds (VOCs). VOCs include a chemical complex that has been linked to birth defects, shown to cause cancer, and negatively affect the nervous system.

Secondly, the communities being most impacted by the dangers of LNG, from the extraction site to the end location, are most often low income, communities of color; and most often indigenous communities as seen here in Tacoma with the Puyallup Tribe and in B.C. the numerous First Nations suffering the consequences of fracking.

In fact, the proposed project is a direct affront to the Puyallup Tribe, putting their treaty rights and community at risk first and worst. Treaty rights have more authority than the right of any other governing body or agency. The Medicine Creek Treaty is the supreme law of the land and has been violated throughout the process for this facility.

I stand with the Puyallup in opposition to the LNG facility. The Puget Sound Clean Air Agency and all agencies involved in permitting this facility still need to consult with the Puyallup Tribe.

Respectfully,
Marili Reilly

Subject: No LNG permit
Date: Wednesday, October 24, 2018 1:07:07 PM

To Whom it May Concern,

I was born and raised in Tacoma, WA. My ancestors have lived on this land for six generations. I strongly feel that your governing body does NOT have the moral authority to permit this LNG plant to become operational and pump toxic chemical emissions into the air that I breathe. You may have the legal authority to say yes. But you certainly do not have the moral authority. We need to be improving our air quality. Not lowering it. I deserve to breathe clean air. So does everybody else. This is a fundamental human right. Please do not say yes to this project.

Furthermore, I am very disappointed that the PSCAA did not consult the Puyallup tribe about the LNG plant. It is in direct violation to the Medicine Creek Treaty of 1854. The LNG project will be detrimental to the Puyallup Tribe by putting their treaty rights and community at risk. **Treaty rights have more authority than any other governing body and they have been ignored throughout this whole process.** I don't have much faith that the PSCAA will take what we say into account after all of the corruption I have seen in the last couple of years with this LNG plant, but I hope the PSCAA does the right thing and respect the original people of the land by including the Puyallup Tribe in the SEIS.

Hello,

I wish to express my support for Puget Sound Energy's (PSE) liquefied natural gas (LNG) facility. Based on draft SEIS issued by the Puget Sound Clean Air Agency (PSCAA) on October 8, 2018, I encourage the agency to issue the necessary permits for the project to proceed.

We all need to be good stewards of environment and make responsible decisions at local, state and federal levels. All the information reviewed thus far regarding this project gives me confidence that proceeding with the project is the responsible thing to do for the community and overall environment. LNG is a cleaner fuel than Diesel so PSCAA needs to act appropriately and support PSE in making this project a success.

Subject: Concerns with Tacoma LNG Plant Draft SEIS
Date: Wednesday, November 21, 2018 11:31:59 PM

I am writing today to voice my concern over the current state of the draft supplemental environmental impact statement prepared by the Puget Sound Clean Air Agency for the proposed Tacoma liquefied natural gas plant. I can see from the draft that there is a stated intent of the PSCAA to determine whether the installation of the plant will lead to a rise or fall in greenhouse gas emissions and subsequently encourage the least destructive alternative. As such the PSCAA has developed some compelling arguments in favor of the proposed action, but I believe that in its current state the SEIS makes certain assumptions and uses certain outdated data that may lead it to significantly underestimate the environmental impact of the Tacoma plant. The first and most alarming issue is that the SEIS currently assigns a global warming potential value of 25 to methane, a value apparently derived from a decade-old study that has since been revised upwards. The EPA currently estimates the 100-year GWP of methane at 28-36, quite a weighty difference from an analytical standpoint. Additionally, I have heard it argued fairly convincingly that GHGs with relatively shorter lives (such as methane) should have their 20-year GWP scrutinized as well. As methane's 20-year GWP shoots up to a value of 96, I would tend to agree that in the context of the recent UN report predicting serious climate change by 2030, a 20-year impact estimate would be well worth including. The report also assumes that the plant will only source natural gas from British Columbia on the grounds that such an arrangement is a "recommended requirement for an NOC Order of Approval". As there is at present only a recommendation and not a certainty, I would think it best for the SEIS to account for the possibility that British Colombia may not end up being the only source of natural gas for the plant. Furthermore, it has come up in the recent past that leaks and emissions associated with British Columbian natural gas wells are likely significantly underreported, a discrepancy that the SEIS does not seem to treat upon. Various other externalities associated with the acquisition of natural gas via fracking—such as the vast quantities of sand (5 million pounds for the average well, according to industry estimates) and water necessary to fracture shale rock—are also not properly addressed in the SEIS. Finally, even though this goes a little outside of the purview of the SEIS, the statement assumes that LNG from the Tacoma plant would be the only alternative to dirtier fuels being used to meet peak shaving needs. I emphatically agree that it is reasonable to only factor certainties (or at least certain uncertainties) into the analysis, but the policy wonk in me feels that the installation of the Tacoma plant would do nothing to incentivize an increase in renewable energy capacity to meet peak shaving needs. Overall, I applaud the PSCAA's commitment to finding the least harmful alternative out of two unappealing options, but the SEIS has too many impactful problems for it to be of use in deciding between the two. I have faith that these issues will be meaningfully addressed and accounted for, and I look forward to commenting upon the updated version of the SEIS.

Sincerely,
Jean-Michel Ricard

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

First and foremost, please reject Puget Sound Energy proposal to build the liquefied natural gas (LNG) facility at the Port of Tacoma. Puget Sound Energy is building a false solution on North America's natural gas reserves, cheap power, and abundant fresh water in a last gasp of fossil fuel extraction.
If you insist on moving forward with this dangerous, unsustainable project, please perform a complete quantitative analysis of GHG emissions upstream and downstream of the LNG facility operations.
1. Air quality impacts and leaks from LNG pumps, pipes, hoses, or tanks from proposed new and expanded pipelines from fracked gas that supply the proposed facility.
2. A process in place to baseline the air quality and leaks from LNG pumps, pipes, hoses, or tanks for the communities along the pipeline as well as the proposed facility in the port of Tacoma. How will you know if air quality discharges are too high if you do not have a baseline in which to measure against?
3. Enforceable limits on air discharges and leaks from LNG pumps, pipes, hoses, or tanks from all pipelines and facility in place to comply with binding limits.
4. Process to manage, monitor, and trigger notifications for air discharges and leaks from LNG pumps, pipes, hoses, or tanks exceeding limits against baselines.
5. A process to baseline, manage, monitor all local LNG transportation, including maritime vessels and forcible impacts.

The Tacoma LNG facility would add to the already unhealthy air quality of Tacoma. Building the LNG export facility is WRONG and will not sustain our clean energy future. Please do the right thing and reject this proposal, and all permits to stop this dangerous project.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Dear Puget Sound Clean Air Agency,

I appreciate this opportunity to voice my opposition to the Puget Sound Liquefied Gas project being built in Tacoma. I would like to state categorically that any fossil fuel project--whether aimed at extracting it or transporting it--negatively impacts the international struggle against global climate change. Instead of investing in energy sources that speed up climate change and its environmental impact (such as the drought and ensuing wildfires in California), we must invest in projects that support energy sources that help curb changes to our climate.

In the best interest of the citizens of Washington and the world, I implore you to re-evaluate your data supporting the project, because it does not seem to have followed best available scientific practice. I feel certain that upon re-evaluation that you will decide to reject the proposed refinery, storage and distribution facility in the Tideflats area.

Yours truly,
Kathy Riechel

Subject: Draft SEIS comments for LNG facility, Port of Tacoma
Date: Wednesday, November 21, 2018 2:21:29 PM

Dear Puget Sound Clean Air Agency,

Thank you for the supplemental study on LNG climate impacts.
Over the last several years I have been closely following this new fossil fuel facility in the Port of Tacoma. As a resident and someone who bikes, kayaks and recreates by and near the port, this project would directly affect me. I am also deeply concerned about climate chaos and unintended consequences.

After reading thought the SEIS it has become clear to me that the report is not thorough, lacks crucial data points in 23 areas:

- through put (page 68)
- fuel composition (page 72)
- source of Natural Gas (page 73)
- gas transport distances (page 73)
- captured and sold condensate (page 73)
- data on all aspects of facility operation (page 76)
- actual data (page 77)
- fuel use for each LNG application (page77)
- data on methane losses (page 78)
- fugitive emissions from operation (page 78)
- end use applications (PAGE 80)
- placeholder values (page 80)
- type of equipment (page 82
- natural gas properties (page82)
- trapped volumes for LNG transfers (page 82)
- additional data (page 82)
- data on construction materials (page 83)
- data on the end use of LNG (page 83)
- displacement of LNG for diesel fuels (page 83)
- emissions of CH4 and N2O (page 83)
- energy inputs, emission for alternative peak shaving (page 83)
- data requested (page 206)
- natural gas properties (page 208)

The report was prepared by Environment and Ecology Inc., the same company who produced the flawed LNG EIS for the City of Tacoma. I understand this company has never before completed a SEPA application before. Because of the missing data this report is incomplete and I request from the Clean Air Agency that a new, independent and thorough report be done with diligence and complete data. It is nearly impossible to make proper and informed comments on this report.

Dear Puget Sound Clean Air Agency,

Thank you for the supplemental study on LNG climate impacts.
Over the last several years, I have been closely following this new fossil fuel facility in the Port of Tacoma. As a resident and someone who bikes, kayaks and recreates by and near the port, this project would directly affect me. I am also deeply concerned about climate chaos and unintended consequences.

The original GHG emission numbers from the refinery alone according the FEIS totaled 20,751 tons per year at production numbers of 250,000 gal/LNG per year. Now in the SEIS we learned that production numbers have doubled and that GHG output has increased even more drastically due to a different ground flare design. The increased GHG gases now are over 100,000 tons each year at full production. Does this trigger an EPA permit and reporting requirement? Who sees to that? These substantial changes call for a new FEIS. Who holds the responsibility for that?

Puget Sound Energy sued the State of Washington over the clean air rule WAC 173 -442 Clean Air Rule (2016). Does this mean none of the clean air rules were applied in your report?

Who is covering the costs of the SEIS, including PSCAA staff time?

Due the massive increase of fracking for gas in B.C. to feed the LNG boom, new fracking wells in new and geographically different areas are now producing up to 50% condensate, a highly toxic and volatile fracking by-product. In assessing climate impacts of LNG production, these unintended side effects must be considered as they impact our climate in a direct and harmfully way.
https://oilprice.com/Latest-Energy-News/World-News/LNG-Projects-Will-Help-Boost-Canadas-Ultra-Light-Oil-Production.html

1246-4 19. LCA Inputs and Assumptions - End Use
1246-5 12. LCA Inputs and Assumptions - Global Warming Potential Value

LNG does not have the same power as other fuels to transport cargo through rough weather, wind and waves. TOTE's LNG engines are dual fuel and can burn LNG or diesel. What are the estimates of extra diesel use in heavy seas? What guarantees do you have that TOTE would actually burn LNG even when market fluctuations would mean higher costs than diesel? In the end TOTE is free to burn whatever is cheapest to them, right? Or will fuel consumption be accurately tracked, and if so by whom?

I am urging PSCAA to reject the SEIS in its entirety and use actual B.C. leakage rates and 20 year GWP. Also important and reason to reject the SEIS is that the information and project description in the FEIS and the SEIS are substantially different. Throughput production, capacity, end use, peak shaving reasoning all have changed too drastically to be believable in the SEIS. The city would use FEIS not SEIS for actual construction and operating permits.
As you prepare to make decision for the community, please consider your own mission:

- Be good and wise stewards of our resources
- Defend the future
- Prevent and reduce risk by upholding and enforcing the law
- Protect us from air pollution
- Tell us what's in the air we are breathing.

Please hold true to your words and consider people and a living planet over the mighty dollar.

Dear Puget Sound Clean Air Agency,

Thank you for the supplemental study on LNG climate impacts.
Over the last several years I have been closely following this new fossil fuel facility in the Port of Tacoma. As a resident and someone who bikes, kayaks and recreates by and near the port, this project would directly affect me. I am also deeply concerned about climate chaos and unintended consequences.
Draft SEIS comments for LNG facility, Port of Tacoma

When the SEIS on greenhouse gases was drafted, it appears as though the actual Final Environmental Impact Statement was not consulted. In regards to the end uses, the FEIS and the DSEIS vary greatly. The various contradictions between the documents make both untrustworthy and call for a new, independent third-party impact analysis by entities other than the subcontractors that have produced the flawed FEIS and flawed DSEIS.

End uses:
On-road trucking.
According to the FEIS, the PSE facility would not be an LNG gas station to direct fuel trucks. To assume without LNG facility road trucks would burn diesel has several flaws. 1) trucks cannot and would not be fueled at LNG refinery. 2) there is already an LNG gas station near I-5 (not PSE operated), and trucks who have engines designed for LNG can use that station. 3) LNG road trucks cannot be fueled with diesel.
To assume without LNG diesel would be the only alternative is inherently wrong given the many trucks, busses, and vans that are already available fully electric.

Truck to ship bunkering
According to the city of Tacoma planning department staff, only two 10,000 gal LNG tanker trucks are allowed day, and only after the roads are fixed so they can handle the dangerous LNG trucks. No use for the LNG on these trucks has been identified by PSE to date. To assume diesel would replace the LNG fuel that has no customers again is pure speculation. PSE is still claiming WA ferries will use LNG, when in reality WA ferries have made clear they are going electric. Without LNG bunkering infrastructure and LNG-ready vessels, there is simply nowhere for the LNG to go. Assumptions on GHG reductions for the two LNG tankers a day cannot be made.

Bunker barges
Since the elimination of the Hylebos dock due to heavily polluted sediment, there is no barging dock anyplace for LNG barges. City of Tacoma staff Schultz has made it clear that the TOTE dock is not possible to be used for barges:

- The configuration of the fueling arm is unique to the TOTE ships, and a conventional bunker barge could not be fueled using this infrastructure.
- The TOTE site does not have moorage facilities or shoreline permit approval for construction

to accommodate a bunker barge.

Yet the SEIS claims over 120 million gallons (at 500 gal/day production numbers) for barging alone. That is blatantly false and simply not possible, unless PSCAA can claim that city information is wrong. This whole section of the SEIS must be scrapped.

It is disappointing that the DSEIS appears to be confused not only on the actual end uses of the LNG, but even the actual production numbers of LNG vary by 100%. In no other project description would such a massive discrepancy be allowable. Imagine a builder would approach a city demanding a building permit not knowing if the building would have 50 or 100 apartments, or if there would be 50 or 100 parking spots. The very basic information on this refinery is simply lacking.

Let’s remember that the facility owners would benefit from many $ millions in tax breaks each year, that it would cost rate payers well over $ 134 mil and that this facility would pollute our air and water, expose the population to dangers and be in operation long after all of us are gone. PSCAA owes it to the people of Tacoma and the people in the entire region to do due diligence when it comes to permitting a 40-year fossil fuel refinery. I do not believe best available science and due diligence were used when preparing this report.

Best

Dear Puget Sound Clean Air Agency,

Thank you for the supplemental study on LNG climate impacts.
Over the last several years I have been closely following this new fossil fuel facility in the Port of Tacoma. As a resident and someone who bikes, kayaks and recreates by and near the port, this project would directly affect me. I am also deeply concerned about climate chaos and unintended consequences.

The description of the various (potential) end uses of the LNG itself has been a constable moving target. The uses as described in the DEIS is so drastically different for the FEIS and from various PSE statements, that the actual FEIS has become a work of fiction and must be redone it its entirety.

Peak Shaving – the ever-changing thing:
At 2016 UTC hearing, PSE claimed that peak shaving was needed to supply residents with the needed gas on 2 or 3 cold days every few years. Consequently, the UTC approved that 43% of the LNG facility would have to paid for by PSE gas utility customers.

Statement from PSE spokesperson to KPLU two days AFTER the FEIS was issued:
"*It's going to primarily serve as a back-up to our natural gas distribution system. So on that coldest day in January, when we all need more gas to heat our homes and businesses, we can return some of that liquefied natural gas to our distribution system*," said Grant Ringel, a PSE spokesman.

"About 43 percent of the LNG at the facility would be used to serve PSE's Western Washington customers when their gas heating needs peak in cold weather, said Roger Garratt, director of strategic initiatives for PSE."
https://www.seattletimes.com/seattle-news/environment/puget-sound-energy-puyallup-tribe-in-showdown-over-lng-plant-on-tacoma-tideflats

Now, According to the SEIS, the peak shaving gas would be used to burn for electricity generation. DSEIS Page 136: "operation of diesel fired power generation during periods of natural gas shortages. Therefore, natural gas us ed for peak s having would enable natural gas fired power generation."
Since the announcement of the SEIS, PSE advertisement has changed to say they need peak shaving for electric power, a statement never made before the announcement of your SEIS.

It makes no sense to make gas customers to pay for gas used in electricity generation, especially rate payers in Tacoma, who have plenty green public power via Tacoma Public Utilities. I do not believe the UTC would have approved 43% of LNG costs for gas rate payers if PSE would have stated they will burn the gas for

electricity, as it would be inherently unfair to force gas customers to pay for electricity capacity.

Given the directly conflicting statements by PSE regarding peak shaving, to assume that without LNG diesel use would increase is beyond speculation and cannot be counted as GHG reduction via LNG. It also ignores innovation in electricity storage currently being used by other large scale utilities who have decided to move away from fossil fuel burning. California can no longer afford to ignore climate chaos. Can Washington afford to burn away 40 more years? The decision is up to you.
https://www.utilitydive.com/news/storage-will-replace-3-california-gas-plants-as-pge-nabs-approval-for-worl/541870/

The earlier stated peak shaving use of 2-3 days every few years suddenly ballooned to 10 days every year in the SEIS (page 132: Up to 10 days per year, the Tacoma LNG Facility is expected to operate in a holding mode while LNG is vaporized). It seems as though PSE is trying to make us believe our winters are getting rapidly colder…when all data points in the opposite direction.

Dear Puget Sound Clean Air Agency,

Thank you for the supplemental study on LNG climate impacts and the public comment opportunity. Over the last several years, I have been closely following this new fossil fuel facility in the Port of Tacoma, along with other facilities that negatively impact our air, land, water and wildlife.

The DSEIS deals with PSE's LNG climate impacts. With the following comments I'd like to diverge somewhat and comment on something crucially important to the entire project.

The location on Alexander Avenue has a badly polluted history. In the early 20th century, the LNG refinery location was productive tidelands and accustomed and usual fishing/gathering grounds of the Puyallup Nation. Such grounds are protected by the Medicine Creek Treaty of 1854, which is the Supreme Law of the Land and as strong as the U.S. Constitution itself. Such accustomed and usual fishing rights were upheld again in the 1974 Boldt Decision.

Over the years, those fishing and gathering areas were filled with toxic Asarco slag and other debris, along with Puyallup River dredgings. The Puyallup River bottom rightfully and legally also belongs to the Puyallup Tribe. The Treaty Rights of the Puyallup Nation have not been nullified by these habitat destroying actions by the port and other entities. Indeed, during several municipal court jury trials over the last two years, neither the city nor the port have been able to produce evidence that said land belongs to them or that they have the right to lease it out. The Pierce County Assessor's office is not in possession of an original warranty deed or warranty trust for the LNG parcels. Please verify who if anyone has original documents.

The Treaty Rights also include the government's responsibility to meaningfully consult with the sovereign Puyallup Nation on issues affecting the fishing and gathering grounds, such as in this case building polluting fossil fuel infrastructure on an already very toxic fill and on top of and next to a Superfund site, one of the worst in the nation. Neither port, city, nor the clean air agency have taken this responsibility serious and with proper care. When the state transferred SEPA lead agency status to the city of Tacoma, the responsibility transferred as well, and now it also rests with the Clean Air Agency.

On this eve of the Thanksgiving holiday we are reminded of the many injustices that the Puyallup People and all indigenous First Peoples of America have endured. I urge you to not continue travelling down the same road.

I am asking for the Clean Air Agency to use utmost diligence and care in regards to the location, proper ownership, the Treaty Rights and fishing rights as well as proper

consultation to be conducted before anything else.

It’s unconscionable that so many government agencies have stood idly by as the refinery has been built over the last year and a half without proper permits nor properly identifying who the rightful and legal owners are. The LNG location lies outside the actual tribal reservation but very clearly within the Treaty Right waters and tidelands – their usual and accustomed fishing and gathering grounds, where the Puyallup People have sustainably harvested and practiced their culture for millennia.

Best

Dear Puget Sound Clean Air Agency,

Thank you for the supplemental study on LNG climate impacts.
Over the last several years, I have been closely following this new fossil fuel facility in the Port of Tacoma. As a resident and someone who bikes, kayaks and recreates by and near the port, this project would directly affect me. I am also deeply concerned about climate chaos and unintended consequences.

Analysis does not incorporate diesel emissions for transporting sand/water to fracking wells:
Nearly all (98%+) of the wells in British Columbia are fracking wells and fracking requires large consumption of water and sand for its operation. The SEIS, however, does not include the GHG emissions from the diesel trucks used to transport the water and sand to the wells, nor the energy it takes to mine the sand and ship it from as far away as Asia.

Deforestation and loss of carbon retention:
DSEIS has not taken into account the amount of forest lands that are being clear-cut for gas extraction and the resulting transport and burning of the biofuel. Even without actual extraction, exploratory seismic lines take our large amounts of trees and bring degradation to the forests and harms the natural function as a carbon sink.

Material failure:
Aging of the actual facility and all the supporting pipeline infrastructure from the well to the facility as well as end-use infrastructure of LNG have been ignored by the report. Older pipes have more leak potential, as well as more explosion and devastation potential. How often do parts and pipelines in the PSE network fail, or are being damaged due to construction or accidentally bored into sever lines? All those leaks are allowing methane to escape straight into the atmosphere.

Human error:
Simple human error such as faulty work orders caused one death, two dozen injured and over 80 buildings destroyed due to massively over-pressurizing an aging system. What are the carbon footprint costs to all the gas pipelines leaking and exploding?
https://www.usatoday.com/story/news/nation/2018/10/11/ntsb-natural-gas-explosions-columbia-gas-lawrence-north-andover/1604415002/
PSE gas line to and from the LNG facility is reverse flow and pressurized. Human error and/or ageing can result in large releases of methane. The destruction of many buildings would cause GHG hg releases from disposing of debris and rebuilding. In 2016, PSE received the highest ever fine in WA due to their negligence in blowing up a Seattle neighborhood. Debris and reconstruction impacts and GHG releases of frequent leaks and accidents need to be considered.

Over the last several years I have been closely following this new fossil fuel facility in the Port of Tacoma. As a resident and someone who bikes, kayaks and recreates by and near the port, this project would directly affect me. I am also deeply concerned about climate chaos and unintended consequences.

No plan for changes in BC methane leaks or leak estimates:
The SEIS locks PSE LNG into getting fracked gas from Canada regardless of the actual methane leak rates. If later studies show that actual leaks are considerably larger, what happens? Will operations at the facility be halted until the new studies are applied?

Regulations do not equal Implementation:
The SEIS claims that we should expect to see reductions in the amount of upstream fugitive emissions given B.C.'s new, tough regulations on fugitive methane emissions. However, just because a regulation has been passed, that does not mean that it has been actually implemented in the field. The SEIS should only assume methane emission leak rates based on empirically collected data, and not on plans. We see what can happen to a government with change in leadership. Assuming EPA rules to stay in place for 40 years might have seemed possible just 2 years ago. Now the EPA is run by oil and gas interests. We cannot assume policy stability in our own country, there is no way to predict what Canada will or won't do.

Analysis assumes credit for extra maritime customers that currently do not exist:
The analysis appears to assume that Puget LNG (the for-profit arm of this venture that will be selling the LNG to maritime customers) already has additional maritime customers, and so is claiming greenhouse gas emissions reduction credit for them. They have no such customers and so cannot legitimately claim such credit.

Questionable Methane Slippage Rates for TOTE Vessels:
The SEIS appears to be using unacceptably small methane slippage rates (the amount of unburned methane that will escape into the atmosphere) for the TOTE maritime vessels that will be burning the LNG. Even in PSE's own greenhouse gas life cycle analysis (that they completed and is provided as part of this report) their external peer reviewer questioned PSE's assumption on their methane slippage rate. That same PSE report indicated that PSE should be using the higher rate, as that is considered best practice.

Cut Off Threshold
The SEIS includes a 1% cutoff threshold, such that any emissions source is excluded when the source produces less than 1% of the total GHGs for the system. We need to understand all of the sources that fall into this cut off threshold category and the

1251-5 cont'd 11. LCA Inputs and Assumptions - General
1251-6 7. SEPA Alternatives

notional percentage of GHG emissions coming from those sources. If the analysis incorporates multiple sources less than 1%, but cumulatively these add up to a significant percentage of the overall GHG emissions (say three 0.8% sources adding up to 2.4%), this would be significantly under-representing the true GHG emissions.

No alternative option for ships is a false assumption:
TOTE Maritime is the only shipping company in the Port of Tacoma that has committed to converting their vessels to run on LNG. TOTE is already compliant with the Maritime Organization (IMO) low sulfur emissions requirements, as it has been using ultra-low sulfur diesel (ULSD) since February 2017. Therefore, TOTE has no regulatory need to convert to LNG, despite the false and repeated claims by TOTE, PSE, Port and business interests. Other companies are either also using ULSD or are incorporating scrubbers into their vessels to meet the IMO requirement. TOTE converted to using electric, shore-based power when they are in port in Tacoma, cutting local emissions that would increase again due to LNG refinery. WA State Ferries considered converting to LNG, but abandoned the idea in favor of electric engines. Other maritime shippers in the port have refused to adopt LNG, even though it would the cheapest available fuel (real reason behind TOTE's conversation, as they already promised steep cuts in rates once LNG comes online). Wallenius Wilmhelmsen, now leasing the old methanol refinery site in the port, make clear that LNG does not meet their green approach.

Four-stream compliance approach

One good example of our proactive approach concerns the 2020 global sulphur cap change. It is undoubtedly good news in terms of both health and the environment, however it will also have greater impact on industry than any previous regulation.

> Wallenius Wilhelmsen believes there is no 'silver bullet' solution for compliance, which is why we have been pursuing a four-stream compliance approach.

Post January 1st, 2020 we will comply through use of three of those four streams namely: Marine Gas Oil (MGO), exhaust gas scrubbers and Ultra Low Sulphur Fuel Oil (ULSFO). The fourth stream, Liquid Natural Gas (LNG) has so far not met the requirements of Lean:Green for RoRo vessels in global operation.

Best

Subject: Draft SEIS comments for LNG facility, Port of Tacoma
Date: Wednesday, November 21, 2018 4:18:12 PM

Dear Puget Sound Clean Air Agency,

Thank you for the supplemental study on LNG climate impacts.
Over the last several years, I have been closely following this new fossil fuel facility in the Port of Tacoma. As a resident and someone who bikes, kayaks and recreates by and near the port, this project would directly affect me. I am also deeply concerned about climate chaos and unintended consequences.

The only two options analyzed in the DSEIS the are 1) building the LNG facility or 2) no action, under which it is assumed diesel would be used for the next 40 years instead of many LNG applications, some of them not even in the FEIS by City Of Tacoma. This assumption is very unrealistic given conservation, innovation and the advancement of clean technologies such as wind sails on container ships, hydrogen fuel cells, battery storage and electric propulsion, such as state ferries are investing in right now.

The DSEIS assumes that the LNG refinery would have a 40-year life span. The reason given is that “many existing plants have been running for more than 40 years” (page 64). How many other LNG facilities have you analyzed and where are they located? PSE itself claims a 30-year life span for the facility.

The DSEIS uses an outdated methane global warming potential (GWP) value:
GWP is a measure of potency for a greenhouse gas and it is measured against carbon dioxide (CO2). CO2 has a GWP value of 1. Methane has a much larger GWP value, especially over the short term. The draft SEIS uses the United Nations’ 2007 value of 25 for the 100-year number (i.e. the methane average GWP over 100 years), whereas they should be using the 2016 value of 32. This single modification in SEIS GHG model makes the LNG plant dirtier from a greenhouse gas emissions perspective than if the LNG plant were not built.

Report	20-year GWP	100-year GWP
2007 IPCC AR4	72	25
2013 IPCC AR5	84	28
2016 Scientific Study (authors include lead from 2013 study)	96	32

Methane is significantly more potent in the near-term, yet the SEIS analysis only looks at the long-term impact:
Methane is a significantly more potent greenhouse gas than carbon dioxide, especially in the short term. The DSEIS analysis is based on the 100-year GWP of methane. The IPCC report released a report on October 8th, indicating that we must change our energy fuel mix in the next 12 years or face dire consequences in 22 years. Therefore, the SEIS should use the 20-year numbers, as that is the timeframe where action is

needed. Using the most recent 20-year value of 96 makes the LNG plant 50% dirtier than the current capability.

Lack of evidence that BC fracked gas is as clean as they claim.
The draft incorrectly assumes that B.C. fracked gas would result in a significant GHG emission reduction. The reports used to justify such conclusion were models or self-reported by industry. The three B.C. based reports all require further analysis to determine if they can even be extrapolated to B.C.-wide fracking wells. One of the reports, states that the emissions examined in the report are lower than industry average due to a variety of reasons. It's would be inappropriate to extrapolate the methane leakage rate from that report to all of B.C. fracking wells. The SEIS fails to incorporate methane leakage data from recent 2017 and 2018 reports that use empirical, independent physical studies at well sites. The 2018 report found that 85 percent of active wells are directly venting methane daily, and that those leakages have been historically underreported. The same report found that methane emissions in BC are 2.5 times higher than reported.

No guarantee that all of the fracked gas would come from BC:
The DSEIS claims all of the natural gas would be coming to the facility from British Columbia. During the recent natural gas pipeline explosion in B.C. on October 10th, PSE was able to use natural gas from North Dakota. The methane leak estimates from North Dakota are noticeably higher than those reported from B.C. PSE's own 2017 10K filing with the Securities and Exchange Commission (SEC) shows that in 2017 they obtained gas from British Columbia (54.8%), Alberta (19.1%) and the United States (26.1%). How will the Air Agency hold PSE accountable to bringing in only B.C. gas?

On their own webpage, PSE stated only about 50% of their gas would be from B.C. Right after PSCAA announced the SEIS on GHG, PSE swiftly changed their page to say ALL the gas would be from B.C.

Claudia Riedener

Steve: Thank you. So, next up is Dan Riley.

Dan: Good evening. My name is Dan Riley. I'm a resident of Gig Harbor, Washington. I'm recently retired. I've spent my career in the petroleum energy sector. In 2008, the International Maritime Organization set regulations to reduce the sulfur content in marine fuel. These regulations reduced the sulfur 3.5% down to 0.5%.

[05:52:00] The regulations go into effect in 2020. At that time, marine operators have, basically, two viable choices. They can either switch their marine vessels to diesel or to natural gas. I want to speak today in favor of both the liquified natural gas facility that TOTE Maritime's extraordinary commitment to convert their Orca fleet to LNG and also for the LNG facility. As someone who analyzes these issues, TOTE's commitment to convert to LNG represents a $700 million plus investment and the cleanest next generation fuels available. To me, this is an infrastructure project.

As we watch the skylines change in our urban areas due to our robust economy and building projects, we also need to invest in energy infrastructure projects, so that we can keep pace with the rest of our area's development. This LNG facility and the TOTE commitment will build LNG infrastructure for the west coast that can power our shipping fleet as they convert to LNG in the future.

[05:53:04] Building innovation and new energy infrastructure matters. The Northwest Seaport Alliance and the Greater Puget Sound community would be irresponsible, if we didn't build for the future. People opposing the facility are living in the past ignoring the ports around the world who are building LNG facilities to service the conversion of vessels to natural gas. As a person who believes that climate change is real, it is vital, as the UN report states, that we take immediate action to address the problem. If that is true, then, why would we not embrace the project? Your agency's own lifecycle analysis documents that 13.5% reduction in greenhouse gases.

As someone who has spent my career in the petroleum sector, I can assure you that those kinds or projects that will create a 13.5% reduction don't come along very often. We need to get on with the transition to cleaner transportation fuels.

[05:54:00] If we embrace the global challenges of climate change, then, we cannot say no, not in my backyard. Area code 253, 425, and 206 need to do their part, if we truly care about climate change. Thank

you. I urge you to approve the project.

RE: Tacoma LNG Facility

My name is Dan Riley, I am a resident of Gig Harbor, Washington. I have spent my career in the energy-petroleum business.

In 2008 the International Maritime Organization set regulations to reduce the sulfur content in marine fuel, these regulations that reduce sulfur from 3.5% to 0.5% go into effect in 2020, marine operators have two choices, switch to diesel or Natural gas.

I am in favor of both the liquified natural gas facility and TOTE Maritime's extraordinary commitment to convert their Orca fleet to LNG. As someone who analyzes these issues, TOTE's commitment to convert to LNG represents a $200 million-plus investment in the cleanest next generation fuel available. To me, this is an infrastructure project. As we watch the skyline change in our urban area due to the robust economy and building projects, we also need to invest in energy infrastructure projects to keep pace with our areas development. This LNG facility and TOTE's commitment will build LNG infrastructure for the West Coast that can power our shipping fleet as they convert to LNG. Building innovative and new Energy infrastructure matters. The NW Seaport Alliance and the greater Puget Sound Community would be irresponsible if we don't build for the future. People who are opposing this LNG facility are living in the past and ignoring that Port's around the world are building LNG facilities to service the conversion of vessels to natural gas.

As a person who believes in climate change, it is vital, as the UN report states that we take immediate action to address the problem. If that is true, then why would we not embrace this project? The air agencies own lifecycle analysis documents a 13.5% reduction in greenhouse gases. Again, as someone who has spent years in the industry, I can assure you the ability to reduce greenhouse gases by a minimum of 13.5% is very rare. These opportunities simply do not exist. Conversely, if we don't approve this facility and the air agency does not issue the air permit, then you will simply have these ships powered by diesel fuel. The Air Agency and opponents simply cannot have it both ways. A decision against this project and TOTE's LNG Conversion is a decision against innovation and a decision for more more greenhouse gases.

Let's get on with the transition to cleaner transportation fuels.iIf we are to embrace the global challenges of climate change, then we cannot just say "not in my backyard." Area codes 253, 425, and 206 need to do their parts if we truly care about climate change.

1. The upstream methane emissions analysis needs to include the full number of years that PSE will use as "Useful Life" of the facility. Investors get their Return on Investment over that period and if they are required to cease operations in a shorter period of time the investors will have to be compensated for the "taking" of their asset.
2. The analysis also needs to use the actual methane historical leakage rate recently documented for both the production and transmission process.
3. The analysis also needs to assume that domestic use of the LNG locally will be consistent with current local usage including maritime usage, and that the bulk of the methane will be exported to a growing Asian market.
4. The analysis needs to assume that the facility will run at full capacity to meet export demand and that upstream pipeline expansion and leakage will need to increase over time.
5. The analysis cannot assume a significant reduction in methane leakage upstream from new technology not yet proven; it must use currently available technonogy.

Sincerely,

Phil Ritter, CPA

From: 350 Seattle
To: Public Comment
Subject: Puget Sound Energy's LNG facility
Date: Wednesday, November 21, 2018 11:54:01 PM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

Agree 1000% with this from Val Peaphon:

he Puget Sound Clean Air Agency is relying on a risky make-or-break assumption that the Tacoma LNG Project will only be supplied natural gas from British Columbia (BC). Is this based on PSE's word? How is it guaranteed/proven/enforced? I believe this assumption/expectation to be false.

Also, why do you accept the assertion that natural gas from BC is cleaner? Is this rooted in scientific evidence or based on self-reports from industry? "According to Natural Resources Canada, about 50 percent of Canadian gas was derived from fracking in 2014, and the figure is expected to increase to 80 percent by 2035." (Powell, Tarika. Is Your "Natural" Gas Actually Fracked? Sightline Institute. Web. 30 October 2017. www.sightline.org.)

Please consider PSE will say anything to get their LNG project approved.

On PSE's own website, www.tacomacleanlng.com, they have said many things on the subject. Below are excerpts from PSE materials and website content over time (see attachments):

Originally in PSE's FAQ piece they stated half of their gas comes from the United States:

Q: "Does PSE produce natural gas?"
A: "No, we purchase 100 percent of the natural gas supplies needed to serve our customers. About half the gas comes from British Columbia and Alberta and the rest comes from the Rocky Mountain states."
Q: "Do you buy gas that has been fracked?"
A: "About 50 percent of the natural gas in the US comes from hydraulic fracturing (fracking). While the debate regarding its effect on the environment will continue, we support rules and regulations that ensure safety and protection of ground water during the drilling of natural gas."

Then, as PSE started to receive pushback regarding the environmental degradation caused by fracking they revised their messaging to highlight horizontal drilling as an alternative yet they continued to say they get their gas from both Canada and the United States:

Q: "Where does PSE get the natural gas for this facility?"
A: "PSE has no natural gas wells of its own. We buy 100 percent of our natural gas, either from Canada or Rocky Mountain states. We are a local natural gas distribution company that supplies gas within the State of Washington. Fracking – hydraulic fracturing- has been employed by the natural gas industry for many years, though with the advancement of

1804-3 11. LCA Inputs and Assumptions - General
1804-4 13. LCA Inputs and Assumptions - Natural Gas Source

horizontal drilling technology, new supplies of natural gas are available for recovery."

Next, PSE starts to omit what extraction method will be used altogether but again maintains they get their gas from both Canada and the United States:

Q: "Where does PSE get the natural gas for this facility?"
A: "As a local gas distribution company, PSE provides natural gas to 800,000 customers throughout western Washington. We have no natural gas wells of our own. We buy 100 percent of our natural gas, either from Canada or the Rocky Mountain states."

Now, conveniently, PSE reports:

Q: "Does PSE produce natural gas?"
A: "No, we purchase 100 percent of the natural gas supplies needed to serve our customers. All gas for this facility will be brought from British Columbia, Canada."

The DSEIS's conclusion there will be an overall decrease in greenhouse gas (GHG) emissions relies on the sole source of natural gas coming from BC. If PSCAA were to abandon that assumption, would there still be a net reduction of GHG emissions? PSCAA should run the numbers showing other likely outcomes if something less than 100% of the gas were to come from BC. What if that number is reduced to 75%, 50%, or even 25%?

The Tacoma LNG Project should not be granted a NOC order of approval. The Puget Sound Clean Air Agency's DSEIS on the proposed Tacoma LNG project is unacceptable. If the permit is not denied outright, I am requesting you conduct a new study figuring that natural gas will come from a variety of locations. Once that is complete, please open another public comment period.

Sincerely,

LaDonna Robertson

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

First of all, I want to thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. With our climate in grave peril, as emphatically stated in the latest IPCC report, your review of the greenhouse gas impacts of the natural gas used in this project couldn't be more important. Those scientists make clear that we cannot, and must not, allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.

Puget Sound Clean Air Agency
Seattle, WA
11/21/2018, 7:29 PM

To Whom It May Concern:

These are just some of the shortcomings developed by a coalition of groups including Advocates for a Cleaner Tacoma (ACT), Sierra Club, 350 Seattle, Washington Physicians for Social Responsibility (WPSR) and 350 Tacoma. One could bring up any of these in a comment:
• The Draft SEIS is Incomplete – The current version of the draft SEIS does not contain all the information we, the public, need to fully assess the accuracy of this study and the predicted impact of the LNG facility. There are at least 10 places in the study that have “placeholder” values instead of actual data. We request that the PSCAA complete the draft SEIS, re-issue it, and then reset the public comment period so that we may better formulate our questions about this project.
• SEIS is Using Outdated Methane Global Warming Potential Value – They did not use the best available science for the Global Warming Potential (GWP) value for methane. GWP is a measure of potency for a greenhouse gas and it is measured against carbon dioxide (CO2). CO2 has a GWP value of 1. Methane, however has a much larger GWP value. They are using the 2007 value of 25 for the 100-year number (i.e. the value average over 100 years), whereas they should be using the 2016 value of 32. Everything else being equal, making this one modification in their models makes the LNG plant dirtier from a greenhouse gas emissions perspective than staying with the heavy fuel oil.
Report 20-year GWP 100-year GWP
2007 IPCC AR4 72 25
2013 IPCC AR5 86 28
2016 Scientific Study (authors include lead from 2013 study) 96 32
• Analysis is based on 100-year, not 20-year, global warming potential (GWP) values – They

base all of their analysis on the 100-year GWP of methane, whereas, given the IPCC report that was released on Monday indicating that we must change our energy fuel mix in the next 12 years or face dire consequences in 22 years, they should be using the 20-year numbers, as that is the timeframe where action is needed. Using the most recent 20-year value of 96 makes the LNG plant 150% dirtier than the current capability.

• Questionable claims that B.C. fracked gas is as clean as they claim – They indicate that the fracked gas from B.C. has a much smaller leakage rate. However they fail to incorporate 2017 and 2018 analyses showing that a large percentage of the fracked gas wells are underreporting their methane leakages.

• What assurances do we have that all of the fracked gas would come from BC? They claim that all of the natural gas will be coming to the plant from British Columbia. However, just as we saw on Wednesday with the natural gas pipeline explosion in BC, they were able to use natural gas from North Dakota. The methane leak estimates from North Dakota are noticeably higher than those reported from B.C. We have no guarantees that the gas used would come from BC. Of note, per their 2017 10K filing with the Securities and Exchange Commision (SEC), in 2017 they obtained gas from British Columbia (54.8%), Alberta (19.1%) and the United States (26.1%).

• Analysis assumes credit for extra maritime customers that currently do not exist – The analysis appears to assume that Puget LNG (the for-profit arm of this venture that will be selling the LNG to maritime customers) already has additional maritime customers, and so is claiming greenhouse gas emissions reduction credit for them. They have no such customers and so cannot legitimately claim such credit.

• Questionable Methane Slippage Rates for TOTE Vessels – It appears that they are using smaller methane slippage rates (the amount of unburned methane that will escape into the atmosphere through the exhaust system) for the TOTE maritime vessels that will be burning the LNG. In fact, even in PSE’s own greenhouse gas life cycle analysis that they completed and is provided as part of this report, their external peer reviewer questioned PSE’s assumption on their methane slippage rate indicating that they should be using the higher rate as that is considered best practice.

• Analysis does not incorporate diesel emissions for transporting sand/water to the fracked wells – Fracking requires large consumption of water and sand for its operations, however GHG emissions from these diesel trucks were not included in the analysis

Background

Puget Sound Energy is trying to build a Liquefied Natural Gas (LNG) refinery, storage and distribution facility in the Tideflats area of Tacoma. It is sited on Puyallup Tribal lands and is being built without their consent. There are many concerns about the project ranging from taxpayer and ratepayer subsidization, safety issues, and environmental impact.

The Puget Sound Clean Air Agency (PSCAA) holds the power to grant or deny a key permit for the Puget Sound Energy (PSE) Liquefied Natural Gas (LNG) project in Tacoma. Finding the initial Environmental Impact Statement (EIS) lacking, they opened up a Supplemental Environmental Impact Statement (SEIS) process to take into account the life cycle impacts of natural gas (mostly fracked these days) in terms of its role in climate change.

Sincerely,

Carole: Thank you. Margo Rolf, please?

Margo: Good afternoon. I've done a fair amount of scratching out also. My name is Margo Rolf. Two weeks ago, the IPCC, Intergovernmental Panel on Climate Change, released its findings in a report in which they said that we must keep the warming of the earth to 1.5 degrees Celsius. Unfortunately, it has already increased by 1 degree Celsius. We have until 2030 to make a significant change to lowering carbon dioxide or, by 2050, there will be catastrophic changes.

[02:04:07] Yet, the life of this LNG plant is anticipated to be 40 years taking it to 2060. At what point are we going to listen to experts whose only, or at least main interest, on the issue is the future of our planet? Deborah Roberts, co-chair of the IPCC working group said, "The next few years are probably the most important in our history." I ask that you please consider that report before the decision is made. I would also like to briefly mention some items on methane, since it's being presented as being so clean. We know, of course, that it is 86 times worse as a greenhouse gas. That it leaks along the way making it worse.

And we wonder why the pipes cannot be constructed in such a way that they don't leak.

[02:05:04] Is it even possible, in an earthquake pone area? As you may know, last night, at 12:45 a.m., there was 2.9 earthquake 2 miles north-northeast of University Place, Washington. Could it be nature's way of saying to those of us who care about policy in Tacoma, what are we thinking, what are we doing? This is the wrong project, in the wrong place, and definitely in the wrong time. Thank you.

Subject: Tacoma LNG SEIS
Date: Wednesday, November 21, 2018 3:51:24 PM

Puget Sound Clean Air,

Thank you for providing the opportunity to review and comment on the PSE Tacoma LNG SEIS.

I am an area resident and I am concerned about the negative man-made effects on our climate and the limited time that we have to act to start mitigating the damages to our environment. In the recent report by the Intergovernmental Panel on Climate Change it is reported that we must make progress by 2030 if we are to avoid catastrophic climate events by 2050. Making progress does not include adding additional fossil fuel facilities, especially when they have an up to 40 year usage span. Please consider this report (IPCC) and its latest information based on real science gathered from more that 6000 studies from around the world. We are at a unique place in the history of mankind in that we have an opportunity to better insure the safety of our planet and the life thereon. That possibility of a healthier life for this generation and future ones does not include more fossil fuel pollutants. It is time to stop adding carbon dioxide and also all the added impacts of m ethane, which has a stronger effect in the first 20 years by 86% than CO2, and this needs to be considered in your evaluation. Please consider the findings of the IPCC report as you do further study.

Thank you.

Margo Rolf

Subject: Tacoma LNG SEIS Project Comment
Date: Sunday, October 21, 2018 1:53:37 PM

Dear Responsible Official,

First... I am furious that any movement on this project has begun BEFORE a full environmental study was performed. How can that be allowed to happen?
Thankfully this project has been delayed... but I believe the study will show it must be stopped altogether if the side effects of fracking on the environment are fairly weighted in this study.
I support all efforts to prevent taking our country and any environmentally sensitive part of our country deeper into the use of fossil fuels when alternatives are definitely available!
Puget Sound Energy and Tote Marine seem to imagine that a clean energy future can be arrived at by digging the fossil fuel hole deeper. This proposed LNG project is another step toward climate chaos at a moment when the IPCC has given us a clear warning that we must urgently move away from fossil fuels.

Fracked gas is not a lesser evil. Scientists' understanding of methane's impact on the climate continues to evolve, and at every step along the way we learn that fracking allows more methane escapement than we had previously observed and that the impact of methane on the climate, particularly in the short term, is even more serious than had been previously understood.

I applaud your decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct this more rigorous analysis. Thank you.

I urge you to revise the analysis to account for the following:

1. Methane should be counted as 86 times more potent than CO2 based on the current IPCC analysis (AR5 rather than AR4) considering a 20 year timeframe (rather than the 100-year).

2. Revise the analysis of the impacts of fracking in British Columbia based on recent research(1) demonstrating that methane escapement has been dramatically under-estimated.

3. Revise the "no-action alternative" to include a clean energy alternative in which PSE provides electricity not with a different source of fracked gas, but with renewable energy and energy efficiency.

4. Revise the "no-action alternative" to include the assumption that Tote Marine will achieve a 50% GHG reduction, in line with the International Maritime Agency's established goals. This reduction might alternatively be achieved by a combination of fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion or many other alternatives besides fracked LNG.(2) For clean local emissions requirements, Tote Marine can achieve virtually all of the localized lower-particulate and lower SOx and NOx benefits claimed for LNG propulsion by opting for low-sulfur marine gas oil over heavy fuel oil, and installing selective catalytic reducers and diesel particulate filters.(3)

5. This more accurate analysis will show that the project has a significant and unmitigated impact on the global climate, which
should be seen as a sufficient basis for denial of the Notice of Construction application.

Thank you for your time and consideration of these comments.

Subject: Puget Sound Energy's LNG facility
Date: Friday, November 16, 2018 9:49:08 AM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

It's past time to start a new way, to make an economy that promotes life on this planet. We need to stop allowing any destruction. We have many non-destructive means of energy. That's where we need to create infrastructure. The world economy is leaving us behind. Our politicians are leading us in the wrong direction.

Sincerely,

Maggie Rose

Puget Sound Clean Air Agency, 1904 Third Ave, Suite 105, Seattle, WA 98101
ATTN: Public Comment on DSEIS, PSE LNG Project
Dear Puget Sound Clean Air Agency,
I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to ~~deny the permit~~ because the Draft Supplemental Environmental Impact Statement does not accurately represent the true greenhouse gas emission profile of the project. I have the following specific concerns:

The analysis used a 100 year Global Warming Potential for methane emissions. Given the crucial timeframe outlined in the most recent UN IPCC report, we have a 12 year window to avoid dire consequences by 2040. Therefore the 20 year Global Warming Potential should be used. In the first 20 years methane is 86 times more dangerous/impactful than CO_2.

(Check here to continue comments on the other side).

In addition, a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required and adequate consultation with the Puyallup Tribe and other neighbors of the project should be conducted.

Dear Puget Sound Clean Air Agency,
I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to deny the permit because the Draft Supplemental Environmental Impact Statement does not accurately represent the true greenhouse gas emission profile of the project. I have the following specific concerns:

The Supplemental Environmental Impact Study uses unacceptably small methane slippage rates, which underestimates the amount of methane that will escape into the atmosphere. Their assumptions were even questioned by their external peer reviewer. Require them to use the higher rates (Check here to continue comments on the other side). that meet ~~industry~~ best practices for environmental impact.

In addition, a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required and adequate consultation with the Puyallup Tribe and other neighbors of the project should be conducted.

Date: Monday, November 12, 2018 8:32:17 PM

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

I was at the open house you held at Rialto recently. Thanks for opportunity to hear both sides. I came into the meeting against it and after hearing the pro side, came away so much more convinced this is a BAD project.

I don't want to pay to make PSE's Australian owner even more rich, or for TOTE's greenwashing PR with this dirty gas. What' so clean about Natural gas if the source results in folks having burning flames come out of their faucets from fracked gas chemical soup getting into their groundwater?

The Maritime Industry, nor the Port of Tacoma and hence the city of Tacoma itself, does not rise or fall on this LNG project. Correction: it certainly won't rise, but could potentially lead to our fall.

Contrary to one comment I heard at Rialto, Alaskans being fed, does not rise nor fall with this LNG project. I used to live there and my company ships there all the time. This was pure drama comment.

The family man concerned about air quality if this doesn't pass was intriguing. As if this is the only way he can get clean air into his kids lungs!! Converting to green energy so they would actually HAVE A REAL FUTURE was a choice lost on him. If he is that concerned about the dirty air they are NOW CURRENTLY breathing is he having them wear gas masks outside while they play? I think not.

The other pro comments about Natural Gas being best current option is resigned, myoptic, shortsightedness at its best. A TOTAL disregard for the upstream costs of this "Clean" energy.

I have personal experience with fracked gas and it is INSIDIOUS, it poisoned my uncles well water for crying out loud! This form of gas extraction is PURE EVIL!! Why are we supporting the byproduct of this criminal activity that is protected by cigarette science?

Finally, all the pro comments seemed to have jobs as a common vested interest. These jobs do not even amount to a fraction of one percent of Tacoman jobs and to cater to their desires while IGNORING the CLEAR WILL of the PEOPLE is and would be a most unfortunate decision you will have to live with.

PLEASE STOP CHASING THE QUICK EASY AND DIRTY DOLLAR.

Tacoma has one of the most beautiful waterfronts on the west coast. Don't lose sight of this

tourist jewel we own and cultivate it accordingly.

RECEIVED
OCT 29 2018
Puget Sound
Clean Air Agency

October 25th, 2018

Dear Puget Sound Clean Air Agency,

We have reviewed the draft SEIS for greenhouse gas emissions for the PSE LNG plant in Tacoma. We appreciate your taking the environmental impacts of this project seriously and for requiring the completion of this GHG SEIS. We are writing as we have a number of technical questions concerning the project that are preventing us from completing a thorough analysis of the draft SEIS. Given the serious and extensive nature of the concerns that we have identified, and given the numerous places where data is incomplete, we respectfully request answers to these questions and then the re-issuance of a new draft SEIS, followed by another 30-45 day public comment period. We are not able to adequately analyze the SEIS in its current state.

Our questions are as follows:

Main Document

Section 2.3.5, Page 2-4:
It is stated that ship bunkering would occur for a total of 8 hours per week. Please confirm that this is for Tote Maritime only and does not include the potential future maritime customers. What are the estimates for the non-Tote maritime vessels?

Section 3.3.1, Page 3-5:

1) While we recognize that PSE currently uses diesel for peak shaving operations, please explain why is it assumed that all peak shaving would be supplied with diesel fuel. Please detail any other options that PSE has considered for meeting peak shaving demands (e.g. purchase of electricity from Tacoma Power, purchase of batteries, development of other renewables, and conservation). Please also detail any programs that PSE is part of (such as Green Energy programs) that could potentially be used for peak shavings.

2) Please explicitly state the instantaneous power, in MW, and energy, in MWh, required to meet peak shaving demands. What is the source for the estimate that 5.89 million gallons of diesel per year is required for peak shaving?

3) Later in the document (Appendix C, p. 16, Section 1.3; Appendix C, p. 24, Section 2; Appendix C, p. 35, Section 2; Appendix C, p. 60, Section 3.2.3; Appendix C, p. 70, Section 5; Appendix C, p. 74, Section 5;) it is stated that peak shaving would only occur for 10 years; is that the assumption here as well? Please confirm that this is a valid assumption.

Section 4.3.2, Page 4-7
Major clarifications are needed for Tables 4-3, 4-4 and 4-5 in order to understand the analysis. Please provide a table or figure that defines every term used, specifies what energy type it refers to (electric, diesel, LNG, or other) and clarifies which analysis method in the appendix

was used to determine the GHG emissions. Also, please use terms in Table 4-5 that are identical to terms used in Tables 4-3 and 4-4, or where that is not possible, include a footnote to the table explaining them.

Table 4-3, Page 4-8
Upstream Life-cycle
Power LNG Production. Please explain what this is. Does this refer to electricity used to run the LNG plant? Is this the electricity that will be purchased from Tacoma Power, which the models assume will "WA ave mix?" (This appears in Table 4-5 under the category "electricity").

Diesel Emergency. Please confirm if the diesel emergency would be used during a power outage from Tacoma Power in order to keep the LNG plant operating. Why it is included under the category "Peak Shaving" in Table 4-5? Given that this diesel will eventually be burned, are the GHG emissions included in end use? If so, where?

Power LNG Vaporizer – Peak Shaving: Is this electricity to be used to power the LNG vaporizer for peak shavings? If so, why is it categorized as "Trucking" in Table 4-5, instead of being included in "Electricity"? (More generally, throughout this document, does "power" refer only to electricity?)

Gig Harbor Diesel truck fuel – Please confirm that this is the diesel required for transporting LNG to the Gig Harbor LNG peak-shaving facility. Why is it categorized as "Tote Marine vessels" in Table 4-5?

Direct LNG Plant
Vaporizer – Peak Shaving: Does this refer to electricity used to operate the vaporizer for peak shaving? Or LNG emitted during peak shaving?

End use LNG
Diesel peak shaving: What does this represent, as our understanding is that diesel would be eliminated from peak shaving in both Scenarios A and B? Does this mean LNG used to offset diesel peak shaving?

TOTE Marine Vessels: Please confirm that methane slippage was represented in the emissions analysis for the TOTE vessels and if so, what slippage rate was used?

Other Marine Vessels LNG (By Bunker Barge): Please confirm that methane slippage was represented in the emissions analysis for the Non-TOTE marine vessels, and if so, what slippage rate was used?

Section 4.4, Table 4-4, Page 4-10
Total Upstream Emissions
No Peak Shaving – Diesel Dual Fuel: Please confirm that this is the upstream emission from diesel used in peak shaving. If it **is** peak shaving, why is it categorized as "**No** peak shaving?" (Note: this is included in "Peak Shaving" in Table 4-5.)

0345-3 11. LCA Inputs and Assumptions - General
0345-4 11. LCA Inputs and Assumptions - General
0345-5 19. LCA Inputs and Assumptions - End Use
0345-6 17. LCA Inputs and Assumptions - Peak Shaving
0345-7 17. LCA Inputs and Assumptions - Peak Shaving
0345-8 14. LCA Inputs and Assumptions - Leakage/Slippage
0345-9 14. LCA Inputs and Assumptions - Leakage/Slippage
0345-10 17. LCA Inputs and Assumptions - Peak Shaving

Section 4.5, Table 4-5, Page 4-12
Although this table compares the items in Tables 4-3 and 4-4, many of the category names in this table are different from those in Table 4-3 and Table 4-5. Please clearly explain linkages between this table and the previous two and use the same category names where possible.

Appendix B

Section 2.1, Cut-off criteria, Page 8
To clarify the emission categories that emit less than 1%, does "direct Tacoma LNG plus WTT and downstream emissions," mean the entire CO2e budget, as shown Tables 4-3 and 4-4? In other words, is this threshold: 1% of 727,536 tonnes/year CO2e scenario A no action, 1% of 1,443,219 scenario B no action, 1% of 687,639 scenario A proposed action, or 1% of 1,386,514 scenario B proposed action?

Given that the 1% cut-off threshold represents a major fraction of the 4% or 5% greenhouse gas reductions, please identify all the components for which the 1% criteria are used and the likely percentage values for those components.

Sections 2.2 – 2.4, Pages 9 - 11, 14 - 15, 18, 19, 21, 22, 24, 25
These pages all have incomplete/TBD data. We recognize that this is the methodology section and so it does not contain all of the final results, but it should be populated with the correct values for clarity. Please supply this incomplete data. Can you also confirm that in all of these places where there is missing data, that it has been properly populated in the results section and accordingly in the model itself?

Section 2.2.3, Page 19
Regarding footnote 16: "Methane from onboard LNG storage tanks may escape during its use. Data on methane losses has been requested." Did you receive this data from PSE? If so, what were the leakage rates and were they included in the model?

Appendix C

Section 1.5, Page 22: "Generally, all of the LCA models described here produce the same life cycle GHG results with the same input assumptions," please provide a reference for this statement.

Section 2.1, Page 27
System Boundary. Please clarify if Scope 3 emissions include rail and truck diesel emissions for sand and water used in fracking and if not, why not, as these are part of the extraction operations. We recognize that both oil and gas are derived from fracking, but that the percentage of oil wells that are currently sources to the No Action Alternatives for scenarios A and B are not all fracked wells. In particular, 40% of the diesel comes from the Alaska North

0345-11 9. LCA Methodology

0345-16 cont'd 16. LCA Inputs and Assumptions - Hydraulic Fracturing

Slope where conventional oil wells are used, whereas the B.C.-based gas is 85% - 98% derived from fracking wells.

Section 2.2, Page 30: It is stated here and several other places that a sensitivity analysis was performed with a variety of mixes for electric. Where are the results of the sensitivity analyses shown?

Section 2.2, Page 31. Power Generation and WTT Upstream Life Cycle Emissions
Please give a reference for the statement that the electricity load from the Tacoma LNG project will not result in an expansion of power generation resources.

Section 2.4.1, Page 41, Table 2.5
Is the natural gas composition an average distribution determined from the Williams pipeline?

Section 3.1, Page 54: It says here WA average mix was used for power generation for construction, for the upstream emissions. Is the WA average mix used for **all** electricity estimates?

Section 3.2.1, page 56
Please confirm that the analysis uses a methane leakage rate of 0.32% from GHGenius 4.03. What are the references for that leakage rate? Why was an outdated version of GHGenius used, which is no longer available? Why wasn't the newer version used (Version 5, available at https://ghgenius.ca/index.php/downloads), with an updated methane leakage rate?

Section 5, page 71
The SEIS states, "Note that the emissions from the LNG facility plus upstream emissions are higher than those for the no action alternative. However, the carbon content of LNG results in lower end use emissions; so the net life cycle GHG emissions are reduced under most situations." Under what conditions are the emissions not reduced and what are the values/results under those conditions?

Section A, page 88, and elsewhere where example calculations are shown
Boxed example calculations: Please replace the values here, which are "illustrative," with actual values used. What is E_NL (last equation in box)? We require example calculations that clearly link to what is shown on page 87. For example, each example calculation could refer to one term inside the brackets in Equation 5.

Direct Emissions from LNG Facility Operations, and other example calculations: Please revise example calculations so that they are accurate and comprehensible. For example, here the units do not work out to g C / mmBtu (but rather to just g). Furthermore, we do not get the same result for this example. (We assume what is shown here is the result of an operation that then has further values subtracted and then multiplied. Since this makes the math technically incorrect, we are not sure, but see no other way to interpret this). Since these errors limit our ability to perform a full review of the draft SEIS, we request corrected example calculations throughout the draft SEIS.

0345-17 16. LCA Inputs and Assumptions - Hydraulic Fracturing

0345-19 19. LCA Inputs and Assumptions - End Use
0345-20 15. LCA Inputs and Assumptions - Natural Gas Properties
0345-21 11. LCA Inputs and Assumptions - General
0345-22 9. LCA Methodology
0345-23 10. LCA Calculations
0345-24 10. LCA Calculations
0345-25 10. LCA Calculations

Section A.3, page 95, Table A.10, Inventory of Fugitive Leak Components
Please provide references for this table.

Section B.1, Page 102 and References page 122:
Please provide the reference for the number 4.65 billion cubic meters from all oil and gas operations, and total natural gas production in BC of 1,801 billion cubic feet (should the leakage be 4.65 billion cubic *feet*? Otherwise the math giving 0.26% does not work out). Please note that the reference "Province of British Columbia, 2018" is a web site and relevant information could not be found. Please provide the report referenced.

Section B.1, Page 103, Table B.3:
GHGenius 2016, BC: Please provide this reference. Is this GHGenius v. 4.03, and was that version used throughout the analysis?

BC 2017: We cannot find this reference; please provide it.

Table C.1. Page 117:
The natural gas column indicates placeholder values and data requested. Were the values received from PSE and if so, what are they?

Appendix C, Page 118: Please confirm that 2007 UN IPCC AR4 100-year GWP values were used for methane and nitrous oxide throughout the model.

The analysis needs to include the most up-to-date GWP values (AR5), and also include both the 20 and 100 year values, as well as the newer values of Etminian et al. 2016. In calculating LCA for LNG, the Department of Energy analysis includes AR5 100 year and 20 year (see Life Cycle Greenhouse Gas Perspective on Exporting Liquefied Natural Gas from the United States, May 29, 2014 DOE/NETL-2014/1649, available at https://www.energy.gov/sites/prod/files/2014/05/f16/Life%20Cycle%20GHG%20Perspective%20Report.pdf). Please provide the greenhouse gas emissions for the AR5 100 year and 20 year GWPs, as well as for the newer values of Etminian et al. 2016.

General Comments:

Uncertainty Analysis - Given that 1) fugitive methane emissions were central to this analysis, 2) BC methane emissions are highly uncertain, and 3) the greenhouse gas CO2e reduction was modest (5% and 4% for scenarios A and B), and 4) the report states that various scenarios were examined, why weren't the results of an uncertainty analysis given? The uncertainty analysis should consider sources of uncertainty such as:

- Exclusion of contributions less than 1%. Given a total difference of only 4 or 5%, a 1% threshold for ignoring a contribution to CO2e seems much too high. Please detail the combined estimated percent ignored so it can be determined how it compares to 5%.

0345-26 9. LCA Methodology
0345-27 10. LCA Calculations
0345-28 9. LCA Methodology
0345-29 9. LCA Methodology
0345-30 10. LCA Calculations
0345-31 12. LCA Inputs and Assumptions - Global Warming Potential Value
0345-32 12. LCA Inputs and Assumptions - Global Warming Potential Value
0345-33 12. LCA Inputs and Assumptions - Global Warming Potential Value

- Uncertainty due to use of an outdated value for the 100-year GWP of methane (AR4). Please provide additional analyses for the more-accurate updated value from AR5 (28) as well as the current value from Etminan et al. 2016 (32).
- Use of the 20-year GWP. Please provide additional analysis using the 20-year GWP.
- The currently-available version of GHGenius uses a methane leak rate of 0.46%. How does the analysis change using this value?

Review & Process - Finally, we have a few questions about the overall review and process as follows:

- Can you please also articulate the internal PSCAA review process for the SEIS? Does PSCAA have staff who are able to and have reviewed the SEIS for accuracy and what are the results of those reviews?
- Regarding the overall SEIS process and given the issues raised, we would like to see a fully edited and updated document that incorporates these concerns and then another public comment period to provide an additional review. The recent UN IPCC report highlighted the critical importance of our rapidly addressing our greenhouse gas emissions, so getting this report right is of the utmost importance. We hope you will agree and grant this additional comment period.

Thank you for requiring this SEIS to quantify the greenhouse gas emissions of the LNG plant, and to help keep our air clean. We appreciate and look forward to the answers to our questions.

Penny Rowe

Carole: Thank you. Penny Rowe?

Penny: Hi. I'm Dr. Penny Rowe, a Tacoma resident and a Puget Sound energy rate payer. I want to thank you for requiring the SEIS and for keeping our air clean. As a climate scientist, I conducted an independent review of the DSEIS in my free time.

[02:14:05] I'm asking you to deny a permit for this plant because the DSEIS fails to show that the plant will reduce greenhouse gases. At a minimum, the DSEIS requires major revisions, and the comment period needs to be extended to give us more time to review it. The DSEIS concludes that greenhouse gases will be reduced by four or five percent. Five percent is a small number. For two values to be considered different, scientific practice dictates that they must differ by more than their uncertainties. However, uncertainties were not given. And it is evident that uncertainties are large, particularly for the upstream methane leakage rate.

The DSEIS has additional problems. It cites references that cannot be found. It fails to use current values publishes in the scientific literature. It fails to reference relevant studies. And it fails to use the most current version of the model for the lifecycle analysis.

[02:15:00] Data is indicated as missing in numerous places, and incorrect units make mathematical calculations difficult or impossible to follow. I think that if corrected to use the best available scientific methods, data, and models, it is likely that the analysis would show that greenhouse gas emissions would increase relative to the no action alternative. I also just wanted to point out that Puget Sound Energy customers will not receive seven percent of the LNG. They will receive seven percent of the LNG for ten years. Over a 40 year lifetime of the plant, that's only 1.75%. Thank you very much for your time.

Subject: questions about DSEIS for PSE LNG
Date: Saturday, October 27, 2018 1:02:38 PM

October 27th, 2018

Dear Puget Sound Clean Air Agency,

We have reviewed the draft SEIS for greenhouse gas emissions for the PSE LNG plant in Tacoma. We appreciate your taking the environmental impacts of this project seriously and for requiring the completion of this GHG SEIS. We are writing as we have a number of technical questions concerning the project that are preventing us from completing a thorough analysis of the draft SEIS. Given the serious and extensive nature of the concerns that we have identified, and given the numerous places where data is incomplete, we respectfully request answers to these questions and then the re-issuance of a new draft SEIS, followed by another 30-45 day public comment period. We are not able to adequately analyze the SEIS in its current state.

A copy of this letter has also been sent by mail.

Our questions are as follows:

Main Document

Section 2.3.5, Page 2-4:
It is stated that ship bunkering would occur for a total of 8 hours per week. Please confirm that this is for Tote Maritime only and does not include the potential future maritime customers. What are the estimates for the non-Tote maritime vessels?

Section 3.3.1, Page 3-5:

1) While we recognize that PSE currently uses diesel for peak shaving operations, please explain why is it assumed that all peak shaving would be supplied with diesel fuel. Please detail any other options that PSE has considered for meeting peak shaving demands (e.g. purchase of electricity from Tacoma Power, purchase of batteries, development of other renewables, and conservation). Please also detail any programs that PSE is part of (such as Green Energy programs) that could potentially be used for peak shavings.

2) Please explicitly state the instantaneous power, in MW, and energy, in MWh, required to meet peak shaving demands. What is the source for the estimate that 5.89 million gallons of diesel per year is required for peak shaving?

3) Later in the document (Appendix C, p. 16, Section 1.3; Appendix C, p. 24, Section 2; Appendix C, p. 35, Section 2; Appendix C, p. 60, Section 3.2.3; Appendix C, p. 70, Section 5; Appendix C, p. 74, Section 5;) it is stated that peak shaving would only occur for 10 years; is that the assumption here as well? Please confirm that this is a valid assumption.

Section 4.3.2, Page 4-7
Major clarifications are needed for Tables 4-3, 4-4 and 4-5 in order to understand the analysis. Please provide a table or figure that defines every term used, specifies what energy type it refers to (electric, diesel, LNG, or other) and clarifies which analysis method in the appendix was used to determine the GHG emissions. Also, please use terms in Table 4-5 that are identical to terms used in Tables 4-3 and 4-4, or where that is not possible, include a footnote to the table explaining them.

Table 4-3, Page 4-8
Upstream Life-cycle
Power LNG Production. Please explain what this is. Does this refer to electricity used to run the LNG plant? Is this the electricity that will be purchased from Tacoma Power, which the models assume will "WA ave mix?" (This appears in Table 4-5 under the category "electricity").

Diesel Emergency. Please confirm if the diesel emergency would be used during a power outage from Tacoma Power in order to keep the LNG plant operating. Why it is included under the category "Peak Shaving" in Table 4-5? Given that this diesel will eventually be burned, are the GHG emissions included in end use? If so, where?

Power LNG Vaporizer – Peak Shaving: Is this electricity to be used to power the LNG vaporizer for peak shavings? If so, why is it categorized as "Trucking" in Table 4-5, instead of being included in "Electricity"? (More generally, throughout this document, does "power" refer only to electricity?)

Gig Harbor Diesel truck fuel – Please confirm that this is the diesel required for transporting LNG to the Gig Harbor LNG peak-shaving facility. Why is it categorized as "Tote Marine vessels" in Table 4-5?

Direct LNG Plant
Vaporizer – Peak Shaving: Does this refer to electricity used to operate the vaporizer for peak shaving? Or LNG emitted during peak shaving?

End use LNG
Diesel peak shaving: What does this represent, as our understanding is that diesel would be eliminated from peak shaving in both Scenarios A and B? Does this mean LNG used to offset diesel peak shaving?

TOTE Marine Vessels: Please confirm that methane slippage was represented in the emissions analysis for the TOTE vessels and if so, what slippage rate was used?

Other Marine Vessels LNG (By Bunker Barge): Please confirm that methane slippage was represented in the emissions analysis for the Non-TOTE marine vessels, and if so, what slippage rate was used?

Section 4.4, Table 4-4, Page 4-10
Total Upstream Emissions
No Peak Shaving – Diesel Dual Fuel: Please confirm that this is the upstream emission from diesel used in peak shaving. If it **is** peak shaving, why is it categorized as "**No** peak shaving?"

(Note: this is included in "Peak Shaving" in Table 4-5.)

Section 4.5, Table 4-5, Page 4-12
Although this table compares the items in Tables 4-3 and 4-4, many of the category names in this table are different from those in Table 4-3 and Table 4-5. Please clearly explain linkages between this table and the previous two and use the same category names where possible.

Appendix B

Section 2.1, Cut-off criteria, Page 8
To clarify the emission categories that emit less than 1%, does "direct Tacoma LNG plus WTT and downstream emissions," mean the entire CO2e budget, as shown Tables 4-3 and 4-4? In other words, is this threshold: 1% of 727,536 tonnes/year CO2e scenario A no action, 1% of 1,443,219 scenario B no action, 1% of 687,639 scenario A proposed action, or 1% of 1,386,514 scenario B proposed action?

Given that the 1% cut-off threshold represents a major fraction of the 4% or 5% greenhouse gas reductions, please identify all the components for which the 1% criteria are used and the likely percentage values for those components.

Sections 2.2 – 2.4, Pages 9 - 11, 14 - 15, 18, 19, 21, 22, 24, 25
These pages all have incomplete/TBD data. We recognize that this is the methodology section and so it does not contain all of the final results, but it should be populated with the correct values for clarity. Please supply this incomplete data. Can you also confirm that in all of these places where there is missing data, that it has been properly populated in the results section and accordingly in the model itself?

Section 2.2.3, Page 19
Regarding footnote 16: "Methane from onboard LNG storage tanks may escape during its use. Data on methane losses has been requested." Did you receive this data from PSE? If so, what were the leakage rates and were they included in the model?

Appendix C

Section 1.5, Page 22: "Generally, all of the LCA models described here produce the same life cycle GHG results with the same input assumptions," please provide a reference for this statement.

Section 2.1, Page 27
System Boundary. Please clarify if Scope 3 emissions include rail and truck diesel emissions for sand and water used in fracking and if not, why not, as these are part of the extraction operations. We recognize that both oil and gas are derived from fracking, but that the percentage of oil wells that are currently sources to the No Action Alternatives for scenarios A and B are not all fracked wells. In particular, 40% of the diesel comes from the Alaska North Slope where conventional oil wells are used, whereas the B.C.-based gas is 85% - 98% derived from fracking wells.

Section 2.2, Page 30: It is stated here and several other places that a sensitivity analysis was performed with a variety of mixes for electric. Where are the results of the sensitivity analyses shown?

Section 2.2, Page 31. Power Generation and WTT Upstream Life Cycle Emissions
Please give a reference for the statement that the electricity load from the Tacoma LNG project will not result in an expansion of power generation resources.

Section 2.4.1, Page 41, Table 2.5
Is the natural gas composition an average distribution determined from the Williams pipeline?

Section 3.1, Page 54: It says here WA average mix was used for power generation for construction, for the upstream emissions. Is the WA average mix used for **all** electricity estimates?

Section 3.2.1, page 56
Please confirm that the analysis uses a methane leakage rate of 0.32% from GHGenius 4.03. What are the references for that leakage rate? Why was an outdated version of GHGenius used, which is no longer available? Why wasn't the newer version used (Version 5, available at https://ghgenius.ca/index.php/downloads), with an updated methane leakage rate?

Section 5, page 71
The SEIS states, "Note that the emissions from the LNG facility plus upstream emissions are higher than those for the no action alternative. However, the carbon content of LNG results in lower end use emissions; so the net life cycle GHG emissions are reduced under most situations." Under what conditions are the emissions not reduced and what are the values/results under those conditions?

Section A, page 88, and elsewhere where example calculations are shown
Boxed example calculations: Please replace the values here, which are "illustrative," with actual values used. What is E_NL (last equation in box)? We require example calculations that clearly link to what is shown on page 87. For example, each example calculation could refer to one term inside the brackets in Equation 5.

Direct Emissions from LNG Facility Operations, and other example calculations: Please revise example calculations so that they are accurate and comprehensible. For example, here the units do not work out to g C / mmBtu (but rather to just g). Furthermore, we do not get the same result for this example. (We assume what is shown here is the result of an operation that then has further values subtracted and then multiplied. Since this makes the math technically incorrect, we are not sure, but see no other way to interpret this). Since these errors limit our ability to perform a full review of the draft SEIS, we request corrected example calculations throughout the draft SEIS.

Section A.3, page 95, Table A.10, Inventory of Fugitive Leak Components
Please provide references for this table.

Section B.1, Page 102 and References page 122:

Please provide the reference for the number 4.65 billion cubic meters from all oil and gas operations, and total natural gas production in BC of 1,801 billion cubic feet (should the leakage be 4.65 billion cubic *feet*? Otherwise the math giving 0.26% does not work out). Please note that the reference "Province of British Columbia, 2018" is a web site and relevant information could not be found. Please provide the report referenced.

Section B.1, Page 103, Table B.3:
GHGenius 2016, BC: Please provide this reference. Is this GHGenius v. 4.03, and was that version used throughout the analysis?

BC 2017: We cannot find this reference; please provide it.

Table C.1. Page 117:
The natural gas column indicates placeholder values and data requested. Were the values received from PSE and if so, what are they?

Appendix C, Page 118: Please confirm that 2007 UN IPCC AR4 100-year GWP values were used for methane and nitrous oxide throughout the model.

The analysis needs to include the most up-to-date GWP values (AR5), and also include both the 20 and 100 year values, as well as the newer values of Etminian et al. 2016. In calculating LCA for LNG, the Department of Energy analysis includes AR5 100 year and 20 year (see Life Cycle Greenhouse Gas Perspective on Exporting Liquefied Natural Gas from the United States, May 29, 2014 DOE/NETL-2014/1649, available at https://www.energy.gov/sites/prod/files/2014/05/f16/Life%20Cycle%20GHG%20Perspective%20Report.pdf). Please provide the greenhouse gas emissions for the AR5 100 year and 20 year GWPs, as well as for the newer values of Etminian et al. 2016.

General Comments:

Uncertainty Analysis - Given that 1) fugitive methane emissions were central to this analysis, 2) BC methane emissions are highly uncertain, and 3) the greenhouse gas CO2e reduction was modest (5% and 4% for scenarios A and B), and 4) the report states that various scenarios were examined, why weren't the results of an uncertainty analysis given? The uncertainty analysis should consider sources of uncertainty such as:

- Exclusion of contributions less than 1%. Given a total difference of only 4 or 5%, a 1% threshold for ignoring a contribution to CO2e seems much too high. Please detail the combined estimated percent ignored so it can be determined how it compares to 5%.

- Uncertainty due to use of an outdated value for the 100-year GWP of methane (AR4). Please provide additional analyses for the more-accurate updated value from AR5 (28) as well as the current value from Etminan et al. 2016 (32).

- Use of the 20-year GWP. Please provide additional analysis using the 20-year GWP.

- The currently-available version of GHGenius uses a methane leak rate of 0.46%. How does the analysis change using this value?

Review & Process - Finally, we have a few questions about the overall review and process as follows:

- Can you please also articulate the internal PSCAA review process for the SEIS? Does PSCAA have staff who are able to and have reviewed the SEIS for accuracy and what are the results of those reviews?

- Regarding the overall SEIS process and given the issues raised, we would like to see a fully edited and updated document that incorporates these concerns and then another public comment period to provide an additional review. The recent UN IPCC report highlighted the critical importance of our rapidly addressing our greenhouse gas emissions, so getting this report right is of the utmost importance. We hope you will agree and grant this additional comment period.

Thank you for requiring this SEIS to quantify the greenhouse gas emissions of the LNG plant, and to help keep our air clean. We appreciate and look forward to the answers to our questions.

Dr. Penny M. Rowe
Dr. Todd Hay

1540-2 14. LCA Inputs and Assumptions - Leakage/Slippage

From: Marcie Rubardt
To: Public Comment
Subject: comment on DSEIS for PSE LNG tank
Date: Tuesday, October 30, 2018 5:24:43 PM

I am writing to register my concern about the proposed PSE permit for a large LNG tank at the Port of Tacoma. I am concerned that:

1. The possibility of explosion in such proximity to large population centers is potentially a disaster. This possibility is exacerbated by the earthquake and tsunami potential in this region.
2. The potential for even minor methane leaks at every point along the distribution potentially contributing significantly to greenhouse gases. This makes natural gas potentially as damaging as energy sources, such as coal, that are more commonly considered to be “dirty”. This impact is worse with fracking - the source of most current LNG growth in supply.
3. Even though this is represented a “bridge” solution for energy, the establishment of LNG infrastructure and markets essentially approves “backing off” on the push to find alternatives. Instead, it is time to push forward with cleaner alternative energy sources and add investment in these directions.
4. PSE is a for-profit corporation owned by Canadian interests. The current CEO heads the board of the AmericanGas Association, indicating considerable potential for corruption and self interest in expanding LNG markets. In addition, PSE has already received considerable tax breaks and public subsidy, including passing of capital costs to PSE rate payers while enhancing profit.

In summary, I feel like this proposal is problematic on many fronts, the permit process has been messy an incomplete with multiple conflicts of interest at play, and it essential that the PSCAA move forward VERY cautiously, taking every opportunity to exhaustively explore cleaner and more reliable alternatives to this tank.

Thanks for your consideration.

Subject: Comment on the proposed Tacoma LNG facility
Date: Wednesday, November 21, 2018 10:34:36 PM

Dear PSCAA reviewers

I am writing today to provide comments on the SEIS for the proposed Tacoma LNG terminal.

Your agency works every day to protect our public health, improve air quality, and reduce our region's contribution to climate change. This SEIS is seriously flawed and does nothing to convince me that the proposed project will support any of your objectives- in fact, were this SEIS accurate and comprehensive, I believe it would show clearly that this proposal is not in our region's interest nor consistent with your Agency mission to protect our health and air quality. Serious issues with this SEIS include:

-This SEIS looks only at the 100 year GWP of the methane associated with this project. As methane is a far more potent near-term GHG, a 20-year timeframe for measuring impacts would show that this project has far higher GWP. And because the next few decades represent an absolutely critical window during which we must cut fossil fuel emissions sharply, this is the timeframe over which these impacts need to be considered.

-This draft incorrectly assumes that the BC gas used would reduce GHG emissions, conclusions that are based on models or self-reporting by industry. These conclusions are not verified, and therefore we cannot trust that their conclusions are robust or accurate. And there is substantial credible and recent evidence to support that methane leak rates associated with these wells are far higher than reported. Without verification, it is irresponsible to rely on this data to draw conclusions about the actual GHG emissions of this fuel source.

-This report assumes all gas will be brought in from BC; how does your Agency intend to monitor and verify that this will be the case, and how do we know that sources of gas with even higher leak rates will not be tapped?

Beyond all of these very serious concerns, there is the overriding problem that LNG is fundamentally not a fuel source that we should be developing in the face of the critical needs we have to transition from fossil fuels to mitigate climate change. The Department of Ecology for Washington State has some substantive GHG emission reduction goals, including:

- Reduce overall GHG emissions to 1990 levels by 2020 – that's ONLY 2 years away.
- Reduce overall GHG emissions to 25 percent below 1990 levels by 2035.
- And, finally to reduce emissions to 50 percent below 1990 levels by 2050.

Will this facility do anything to help us achieve these goals? Quite the opposite. Please DENY the final Order of Approval for PSE's LNG Facility in Tacoma. To truly reduce GHG emissions we need our energy companies to transition entirely off of fossil fuels. There is no other way for Washington State to meet its GHG emission reduction targets.

Sincerely,

Deborah Rudnick
Bainbridge Island, WA

1452-1 12. LCA Inputs and Assumptions - Global Warming Potential Value

From: Catherine Ruha
To: Public Comment
Subject: ATTN: Public Comment on DSEIS, PSE LNG Project
Date: Tuesday, October 30, 2018 9:38:05 PM

To Whom It May Concern,

The SEIS is Using Outdated Methane Global Warming Potential Value – The SEIS did not use the best available science for the Global Warming Potential (GWP) value for methane. GWP is a measure of potency for a greenhouse gas and it is measured against carbon dioxide (CO2). CO2 has a GWP value of 1. Methane, however has a much larger GWP value. They are using the 2007 value of 25 for the 100-year number (i.e. the value average over 100 years), whereas they should be using the 2016 value of 32. Everything else being equal, making this one modification in their models makes the LNG plant dirtier from a greenhouse gas emissions perspective than staying with the heavy fuel oil.

Puget Sound Energy should not have creating dirtier air as one of its goals. My health and the health of all in the Puget Sound region should be of primary concern. There are cleaner ways to produce energy.

Thank you,
Catherine Ruha

October 31, 2018

Dear Carole J. Cenci,

Puget Sound Energy and Tote Marine seem to imagine that a clean energy future can be arrived at by digging the fossil fuel hole deeper. This proposed LNG project is another step toward climate chaos at a moment when the IPCC has given us a clear warning that we must urgently move away from fossil fuels.

I applaud your decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct a more rigorous analysis.

Sincerely,
Dave Russell

Susanryan.nenc@gmail.com

Dear PSCAA,

Let me first say I thank you for requiring a Supplemental Environmental Impact Statement to begin with. I participated in the meetings requesting it be done. However now that it has been done I am gravely disappointed in the how the draft was reached and not what I would expect from a professional public organization that should be seeking and using the best possible data. I am confident you can do better.

On October 30th I attended the Public Hearing and stayed until 10:00pm waiting for my name to be called but I missed out. I attended this with a friend and we sat in the back of the auditorium observing the proceedings. We were impressed by your abilities to keep an even keel and patience with the long day and passionate voices crying out to be heard.

We noticed a distinct difference in the public comments. Those from industry and business groups set to personally benefit from the expansion of LNG into Tacoma and beyond. They all supported the project and your draft report. A common theme was “I’m an environmentalist and I believe in science” used in a way to make them sound informed and caring. One young man newly employed by industry referenced how nice Tacoma is now with all the gentrification. Oh my, my friend and I thought when we heard that.

A bulk of the other comments opposing the LNG facility and Draft SEIS were from persons educated in the sciences, professors, volunteers for environmental groups, tribal members and activists not looking for their own monetary interests but for the interests of all that live in breathe. I thank them for their efforts because nothing ever gets done for the better without activists leading the way trying to make a difference in a world where profit and excessive greed often trumps common sense and doing the right thing. We need to turn this train wreck around and stop expanding and extracting fossil fuels. We have weekly reminders of climate change and hardship around the globe.

While environmental activists can be louder and are willing to call out bluffs the industry group huddled around each other more quietly snickering and laughing while others were up giving testimony. Sitting in the back of the room behind them was eye opening as many appeared to be employees with their employers.

I do not claim to be an expert on science and data but I do know that what once was believed about fracking and the impact on the environment has changed. Several years ago before the LNG project came on line it was reported that data collected during the recession gave an inaccurate picture. Consumption was down at this time leading to a belief that impact was lower and that LNG was a favorable direction. We now know that was wrong.

I will let the educated individuals speak to all the finer details and flaws found in the draft SEIS. Too many holes in need of repair.

As someone that remembers collecting cans as a 10 year old near the Mississippi river in Minneapolis, for the first Earth Day, our environment has always been import to me. I'll never forget learning that plastic never goes away and there is only so much oil in the ground.

I have lived long enough to know nothing is safe, accidents happen, politicians are too easily influenced to look the other way and public agencies are under increased pressure to produce reports and make decisions that have favored the fossil fuel industry for far too long.

I never knew until last year that PSCAA only measures air particulates and not all the cumulative gases and chemicals I smell coming from the Port. I had a blind faith it must be safe. Silly me, no wonder I would get a headache when traveling back midweek from North East Tacoma down the hill to cross the Port.

The burning sensation in my nostrils was very unpleasant. Or, the smells early Sunday morning in my backyard near University of Puget Sound a location which does not get prevailing winds coming off the Port, those go towards East Tacoma and tribal land.

The Puget Sound Clean Air Agency is the only stop gap left. Tacoma has always been low hanging fruit, the recent Methanol debacle and now this LNG mistake is not a coincidence.

I have been a PSE customer for 21 years. We have never run into a situation where PSE had a shortage. I called PSE a month ago to find out if the gas coming into my home is fracked. I stayed on the line for about 20 minutes while the rep tried to find me an answer. I told him I don't want fracked gas in my home. He assured me he would call me back when he had an answer. He never did. I believe I know the answer to the question. I will be starting to look for a new heating source.

We must stop creating new fossil fuel opportunities. And those Union dudes are going to be out of jobs regardless in the near future just like the rest of us.

It is really hard to believe that this Puget Sound Energy – LNG Facility can pass permitting if strict and rigorous analysis is used.

Sincerely,
Susan Ryan

Steve: Next up is Holly Rydel Kelly.

[03:35:00]

Holly: Hi. My name is Holly, and I sat through all of the first session. And I thought about submitting a written comment. But I actually wanted to see your faces and you to see my face. Before even getting into the environmental and economic concerns, this LNG facility is being built on tribal lands without their consultation or support. I am broken hearted at the repeated and persistent breaking of already exploitive treaty agreements. I'm a seventh generation Pierce County resident. My children who are in college now are the eighth. I want nothing more than to see Tacoma thrive. I want jobs and a robust economy for now and into the future.

I am for sustainable jobs and a clean environment. But this SEIS doesn't even meet clean air standards. And the short sighted focus of immediate economic benefits does not take into account the long term economic damage of pollution and reliance on fossil fuels.

[03:36:05] The tide flats and our Asarco site are notorious for their oppressive pollution, and no amount of jobs they provide can make up for the economic depression of contaminated soil, the Tacoma aroma, and toxic waters. The waters here are not just sacred, but they're the life of our community. Since before written history, before the arrival of capitalism, our Puget Sound waterways have been the life of this region from clean drinking water, food, ritual, highways for trade. It is essential that we preserve the air, soil, and water of our community. PSE touts the LNG facility as clean energy reducing greenhouse gas emissions.

Yet, a closer look shows that it is only a four to five percent improvement in greenhouse gas emissions over a hundred years than not building it. But it is way more of a polluter, in its initial few decades, i.e., right now, and only has a life span of 40 years anyway.

[03:37:00] I'm not a scientist, so these are my layperson observations in assessing what I've read. But I beg of you to listen to the scientists who have testified prior to me. I ask for Tacoma, for you, to you to not pander to corporations' stealing of tribal lands and help us invest in real green energy effective now and into the future. As our Clean Air Agency, I beg of you to use your powers to protect the people of Puget Sound.

Subject: LNG vs crude
Date: Tuesday, October 30, 2018 10:22:57 AM

This issue is more complex that it would first seem. According to this research as presented in **The Economist**, the overall death toll is less from the effects of crude than the effects of liquid natural gas.

https://www.economist.com/business/2018/10/27/sulphur-emissions-rules-for-shipping-will-worsen-global-warming

David and Gwen Sailer, Browns Point

Steve: Thank you. Next up is Rene Cournoyer. Josh Clearman?

Josh: Thank you all. And thank you for hearing us today.

[04:58:00] And thank you to my fellow folks here. And welcome to everyone from out of town. My name is Josh Clearman. I live in Tacoma. And I've lived here for six years with my kids. And before this, I lived in Key West, Florida where I was the co-author of the Climate Action Plan. My students and I installed the first wind tide grid tide turbine in the Florida Keys. We installed a 25,000 watt solar array. And I'm coming before you to fully support the LNG project. It is natural gas, as people have said, definitely has its problems. But I want to give another number out there, and it's 365.

That's the number of days that myself and my co-workers on Hilltop and my kids breathe bunker air. As you and your authority for Puget Sound air quality, I ask you to get the bunker fuel air out of the Puget Sound. Thank you.

[04:59:00]

Steve: So, before I get to the next five, just a heads up, the group after that will be LaDonna Robertson, Joanna Shoetler, Bret Stein, Dave Gering, and Norma Ramirez. So, next up, and I'm probably not going to do this justice. Saiyare Refaei. Sorry, if you'd state your name, so we can get it right.

Saiyare: Saiyare Refaei. Thank you for the opportunity to speak. Thank you for those who sacrificed to be here today. I send gratitude to the Puyallup Tribe of Indians whose land we currently occupy as a product of colonization and genocide.

[05:00:02] They continue to lead our justice work today. I would also like to lift up the immigrant detainees in the northwest detention center in Tacoma tide flats who do not get a say or maybe even know about the LNG plant that could have overtly harmful effects, given that their current emergency protocol is to stay place. My name is Saiyare Refaei, and I work at the Diversity Center at Pacific Lutheran University as the coordinator for sustainability integration. I am also a community artist. And this year, I was appointed to the city of Tacoma's Commission on Immigrant and Refugee Affairs.

Yet, I come to you today as a concerned, exhausted but not defeated, Tacoma resident. I want to share a memory. The evening

on July 18, 2017, I joined friends in the Tacoma tide flats to stand with the Puyallup People and community members, elders, families, and children. We held space unarmed peacefully and delayed unlawful construction for three hours through marching, song, and prayer.

[05:01:03] I was also taking pictures to share with those who were unable to attend. By the third hour, I remember Puyallup Tribal member, Dakota Case, coming to the large group and telling us the police are starting to get hostile. To please not do anything disrespectful. We held space long enough today, and we can come back tomorrow. As a couple of my friends and I were returning to where we had parked, we noticed a tinted, unmarked minibus that an officer entered suited in riot gear. My friend overheard the officer say, "Not today, guys."

I, frantically, messaged a couple of friends who were still in the larger group to make sure that they knew about the militarized presence that was there and hoped that they would get home safe. In the coming days, I learned that PSE was paying Fife police to be out there. Not for the protection of concerned community members, but to protect their profits and project that they were unlawfully constructing.

[05:02:02] Every time I see a PSE logo or greenwashed LNG ad, I think of that moment when PSE chose to invest in militarized force over hearing and respecting the wishes of the community they are supposed to be serving. They could have put all of our lives at risk. And I'm grateful to be standing here in front of you today. I truly hope the supplemental environmental impact statement is redone properly before denying the LNG permit. Our community has already experienced enough trauma over the last year because of this project. Thank you.

Steve: Thank you. So, the next one is Sarai Salgado.

[06:00:03] I don't know if I'm saying this – Sardi, Sarah, I can't read the writing. I'm sorry.

Sarai: Good evening. My name is Sarai. I work in Tacoma, and I wanted to come this evening to represent some of the people in my generation that believe in science and want to see our government bodies use the best available science, when making decisions. I am here to applaud the work of the draft Environmental Impact Statement that concludes, and I quote, "The use of LNG produced by the proposed action, instead of petroleum based fuels for marine vessels, trucks, and peak shaving is predicted and results in overall decrease in GHG emissions the Puget Sound region and that beneficial impact."

The findings of SEIS conclude that we will reduce greenhouse gases by 13.5%. As someone who believes in climate change, we all have a responsibility to do what we can now, not later, to save our planet.

[06:01:00] Saying not to LNG facility is saying not to doing our part to reduce greenhouse gas emissions. Saying no to LNG is saying not to reducing sulfur oxides. Saying not to reducing particulate matter is saying not to reducing nitrogen oxides. And saying not to LNG is saying yes to more air pollution. We have a real choice to make. While LNG is not perfect, it does represent a significant step in the right direction. And it sure as heck beats the alternative. Let's not let emotion, unrealistic expectations, or politics get in the way of following science and data. As former Vice President Al Gore stated, "We have a global emergency. We don't have one more day to spare without consequences."

Approve the air permit for LNG facility and let's celebrate TOTE's environmental commitment to making our marine time industry less polluting. Thank you.

Steve: Thank you. Next up is Twylia Westling? Twylia Westling?

[06:02:00] I can tell you the next 10 on the list here. Jennifer Williams, Kelly Scott, Beverly Christie, Janine Terrdao, Steve Way, Michael Foster, Jessica Lee, Bill Crawford, Grace Green, and Ben Nelson. So, Jennifer Williams? Kelly Scott? Did we already have Kelly Scott talk?

November 20, 2018

To Whom It May Concern:

I wanted to write to you today to represent some people of my generation that believe in science and want to see our governmental bodies use the best available science when making decisions.

I write to you to applaud the work of the Draft Environmental Impact Statement that concludes, and I quote:

> *"The use of LNG produced by the proposed action, instead of petroleum-based fuels for marine vessels, trucks and peak shaving is predicted to result in an overall decrease in GHG Emissions in the Puget Sound Region a net beneficial impact."*

The findings of the SEIS conclude that we will reduce greenhouse gases by 13.5%. As someone who believes in Climate Change, we all have a responsibility to do what we can now, not later, to save our planet. Saying no to this LNG Facility is saying no to doing our part to reduce greenhouse gas emissions. Saying no to LNG, is saying no to reducing Sulphur oxides. Saying no to reducing particulate matter. It is saying no to reducing nitrogen oxides and saying no to LNG is saying yes to more air pollution.

Like it or not, we have a real choice to make. Are we going to move forward or go backwards? While LNG is not perfect, it does represent a significant step in the right direction and it beats the alternative.

Let's not let emotion, unrealistic expectations or politics get in the way of following the science and the data. As former Vice President Al Gore has stated, "we have a global emergency". We don't have one more day to spare without consequences. Approve the air permit for the LNG Facility and let's celebrate TOTE's environmental commitment to making our maritime industry less polluting by a long shot!

Sincerely,

Sarai Salgado

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Our ability to help the environment is slipping away. Act now!

0619-1 12. LCA Inputs and Assumptions - Global Warming Potential Value

Dear Port of Kalama, and Cowlitz County,
Dear Puget Sound Clean Air Agency,

I am concerned about the ~~tenth~~ percent of methane that would leak from the pipelines used to bring gas to the Kalama methanol refinery. Studies have shown pipes in the US leak between 1-4%. A low leak rate would be cleaner while a high leak rate would mean a large amount of methane being released into the atmosphere. Methane is 86 times as powerful a greenhouse gas compared to carbon dioxide in the first 20 years after release, we are already seeing the impacts of global warming such as the smoke filled summer in Washington state, please reserch the leak rate from the pipeline Kalama would use.

Please include this impact in the Final Supplemental Environmental Impact Statement.

0631-1 3. Outside of SEIS Scope

Dear Port of Kalama, and Cowlitz County,
Dear Puget Sound Clean Air Agency,

I am concerned about PSE ~~hearing~~ acting in the communities best interest They have built the LNG facility without the proper permits. Many people in tacoma are against the facility and it is on puyallup tribal land, PSE is an important and valuable provider of energy in the region, However this LNG facility has no benefit to local communities from an energy usage standpoint, Please make sure PSE will follow laws and regulations pertaining to operation of the tacoma LNG facility

Please include this impact in the Final Supplemental Environmental Impact Statement.

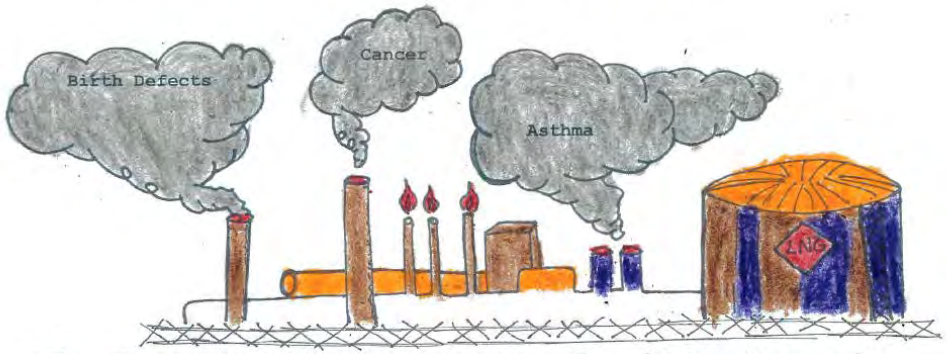
Name: Bill Sampson	Email: billrsampson.24@gmail.com
Address: 6555 51st Ave NE Seattle WA 98115	Phone: (206) 384-9682

Steve: Thank you. Bill Sampson?

Bill: Hi. Thank you for letting me speak today. My name is Bill Sampson, and I live in Seattle. I volunteer with the Sierra Club. And you've heard a lot about why natural gas is bad or why fracked gas is bad and a lot of the impacts of this project.

[05:03:00] So, I want to talk about why I'm here and why the people who are in red are here. My shirt says, "Beyond coal exports," because the first hearing I went to like this was about the scoping hearing for the draft environmental impact statement of the Cherry Point coal terminal up in Bellingham. And I've been to several, many hearings like this, since then. And I think there's a lot of common themes between all of these fossil fuel projects. The for profit proponents, they mostly care about profits. Whereas the people in the room here wearing red, they care about the health and safety and livability – the care about the people in the communities.

And they want everyone to have a safe, livable, breathable climate. In the climate movement, we have a few sayings like coal, oil, gas, none shall pass. And so, to me, that means that we want a safe, livable, breathable climate.



[05:04:02] We want renewable energy and not fossil fuels because all of the fossil fuel, it's bad energy. It's dirty energy. It's really bad. And another saying we have is people over pipelines. And so, that really applies to these fracked gas projects. We want to prioritize the health, again, of people instead of pipelines and profits. Thank you.

I have repeatedly heard LNG (Liquified Natural Gas) referred to as a "bridge fuel." I don't know where this term came from, but in my mind, any energy source which involves a 3% leakage rate of methane, as well as other concerns to air quality including arsenic, cadmium and VOCs (Volatile Organic Compounds) is NOT a "bridge", but a barrier. It is a barrier to our communities remaining healthy and prosperous. It is a barrier to correcting years of harm done by the fossil fuel industry. LNG is a barrier to progress. In these desperate times, we MUST do better. We cannot afford to settle. For the sake of clean air, please vote NO on this final permit. Let's stop living in the past. Defend the future. Thank you. Hillary 10/30/18

The DSEIS needs to be redone — it does not accurately capture outcomes of this project and is based on unrealistic timelines that do not take into account the rapidly approaching deadline for humanity to avoid climate disaster.

Methane is a significantly more potent greenhouse gas than CO_2, especially in the short term. The DSEIS is based on the 100 year GWP of methane. The recent IPCC report released indicates we must change our energy fuel mix in the next 12 years or face dire consequences in just 22 years. The SEIS should use 20 year model for methane leakage. A 2018 report found 85% of active wells are directly venting methane DAILY and that those →

leakages have been historically underreported.

2/3 of all "natural" gas in the U.S. is fracked. LNG will not arrive in Washington carbon neutral. When methane leaks directly into the atmosphere, it is 87 TIMES MORE POWERFUL at trapping heat than carbon dioxide when averaged over 20 years.

The DEIS needs to rely on accurate science and must be reissued with ample time for public comment. We cannot make educated decisions on LNG with an SEIS that doesn't reflect the reality of the crisis we are in.

I want to trust the process. I want it to be transparent. I want to see an SEIS that incorporates recommendations from the IPCC report. I want the Puyallup Tribe to be properly consulted as is required by law. Until these things are done, I cannot see how the process of LNG can move forward. It's an environmental justice issue. Its time to listen to science, not special interests and money.

Please do the smart thing — the right thing.

Thank you.

Hillary 10/30/18

Steve: Thank you. Next up is Hillary Sanders.

Hillary: Good evening. Thank you for hearing us today. My name is Hillary Sanders. I am a resident of Bothell. I wake up every morning and step out onto my back porch, and I take a deep breath.

[03:33:00] And I do not have to worry about whether or not that air is clean. And that is a privilege that I hold. I have never had to worry about air quality affecting my health, until the last few wildfire seasons. And I think a lot of us, in this room, could say the same. But for many people in our state, they do not have that privilege. And it is not because of anything that they did or did not do. It is because government entities and large corporations, oil companies, coal companies, energy companies like PSE, are deciding what is best for the people. I think it is an injustice that this LNG project has been allowed to go forward without a vital permit and without the consent of those who will be most impacted by air pollution.

The Puyallup Tribe was not properly consulted. The residents of Tacoma were not properly consulted. This is not how Puget Sound Energy should do its business. They have a responsibility to residents, as do you, to ensure that we have clean air to breathe.

[03:34:00] If this facility is approved, the community will be exposed to dangerous, volatile organic compounds that have been linked to birth defects, cancers, and nervous system problems. Furthermore, the draft SEIS insufficiently captures outcomes of this project and is based on unrealistic timelines that do not take into account the rapidly approaching deadline for us to avoid climate disaster. What I am asking you to do today is to not turn your back on the people in this room, the people who have been talking here today for hours. Don’t turn your back on them the way that PSE has. The people have spoken.

This project is not right for Tacoma, and it is not right for Washington. We can do better than LNG. Please do the right thing for the people of Tacoma. We need an accurate EIS. We need a cleaner solution than LNG. Please defend the future. Thank you.

Subject: Puget Sound Energy's LNG facility
Date: Tuesday, November 20, 2018 12:36:42 PM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

PSE's LNG project increases our greenhouse gas emissions and fuels climate change - which means more wildfires and smoke for our region. The resulting air pollution makes us sick and leads to higher rates of asthma attacks, heart problems and cancer in our communities.

The LNG facility will emit toxins such as benzene, toluene and xylene - causing cancer, asthma, birth defects & other health problems for people living and working near the facility. People detained inside the NW Immigration Detention Center & people living on the Puyallup Reservation will be impacted first and worst by this toxic air pollution.

Everyone from health professionals to educators and scientists have expressed their concern about the damage this facility will inflict on people and the environment.

From my understanding, it is the role of the PSCAA to defend those communities most impacted by air pollution, not protect the profits of big foreign energy companies like PSE.

Please do the right thing and deny the clean air permit for LNG.

Sincerely,

Hillary Sanders

1687-1 12. LCA Inputs and Assumptions - Global Warming Potential Value

From: 350 Seattle
To: Public Comment
Subject: Puget Sound Energy's LNG facility
Date: Tuesday, November 20, 2018 12:30:23 PM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

The recent Intergovernmental Panel on Climate Change report states that we have only 12 years left to radically transform our energy system if we are to have a stable climate future - and that means keeping all new fossil fuels in the ground.

The Clean Air Agency's analysis of PSE's LNG facility is based on 100-year, not 20-year, global warming potential (GWP) values. We should be using the 20-year numbers, as that is the time frame where action is needed. Using the most recent 20-year value of 96 makes LNG 150% dirtier than the bunker fuel it's supposed to replace.

This is not acceptable.

Please be heroes to our future generations. Issue an accurate DSEIS and allow for a new comment period so the community has the opportunity to review.

Sincerely,

Hillary Sanders

Steve: Kelly Scott?

Kelly: Good evening. Thank you for the opportunity to provide a public comment for the draft SEIS. My name is Kelly Scott. I live four blocks away from this theater. I also work for TOTE Services as the LNG conversion port engineer. This means that I am responsible for most aspects of the vessel's conversion to run on LNG. TOTE will be submitting formal, written, technical comments, but I thought it was important to also attend this public meeting. The conversion of TOTE's vessels to run on liquified natural gas as a maritime fuel puts TOTE in the company of a few key environmental leaders in the shipping world.

[04:49:07] As noted by various studies and reviews, the use of LNG results in a reduction of various air emissions, including NOx, SOx, and particular matter as well as reduction of greenhouse gases. TOTE's efforts to improve our environmental footprint are in keeping with the International Maritime Organization's regulations addressed to NOx and greenhouse gases. The use of LNG will virtually eliminate SOx surpassing the IMO rules regarding sulfur emissions to be limited to 0.5%.

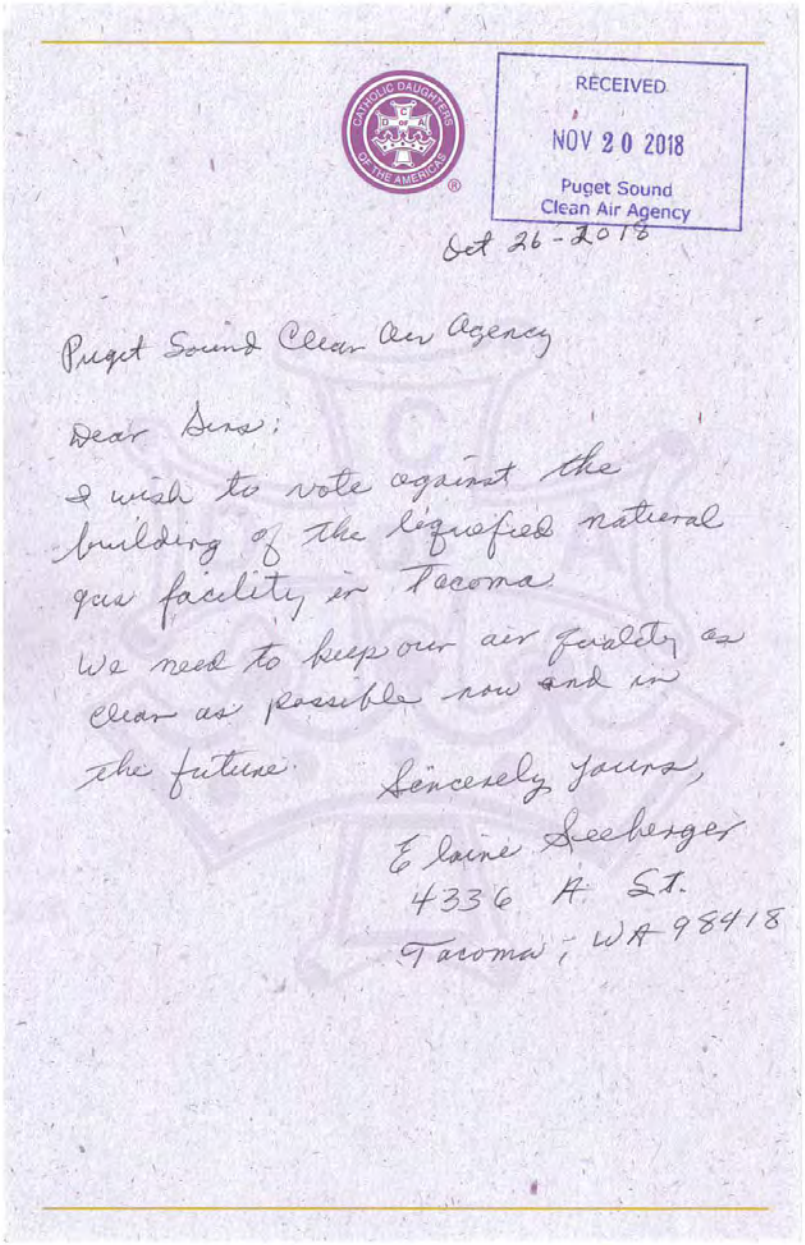
In addition, the use of LNG as a fuel, currently, the only commercial available option that put the maritime community on the path of meeting the recently set goals of reducing greenhouse gas emissions by 50% by 2050.

[04:50:05] We strive to be leaders in our industry seeking new and innovative ways to reduce our environmental impact while offering the best in class service to our customers and the communities we serve. The use of LNG as a maritime fuel does both of these things while also laying the foundation for the shift from diesel to natural gas, as a fuel of choice, for the maritime sector. A fuel that, as you noted in your report, has the ability to reduce maritime emissions by at least 13%. The maritime sector will continue to evolve and find new fuel options. LNG is the most environmentally friendly fuel available today. Thank you.

Steve: Thank you. Before I call up the next group, the next group of five, it's Saiyare Refaei, Bill Sampson, Bradley Thompson, Linda Fortune, and Stephanie Hillman.

Carole: Thank you. Andrea Scott-Murray?

Andrea: Hi. I'm a lifetime resident of Washington State. I'm a PSE rate payer. And I am also a person who has suffered with asthma my whole, entire life.



[00:59:00] I'm also qualified as a middle school science teacher. So, there are a lot of threads in my life that come to this point where I'm standing before you. I'm hearing a lot of words. There are a lot of numbers. And all of that is very important. I want to say one other thing though. There's the experience of standing in a tide flat. It can be argued that that's a big, empty space that there's nothing useful or valuable happening there. As a person who has kayaked, as a person who has sailed, as a person who has spent many hours on the beach, I will tell you it is a very valuable place.

There is a great deal of wildlife, a great deal of energy, and a great deal of chemical processes that are happening there.

[01:00:00] In my mind, even if you could agree, and I can't, if you could agree that LNG is a way forward, in terms of transitions, if you could agree to that, I do not, in any sense, think that putting a plant like this is appropriate on a tide flat. I think that is very bad siting. I'm really shocked. And my brother lives here in Tacoma. He has an old house. For him to paint his house because it has lead paint, he has to go get a $200.00 permit with the city of Tacoma. And now, I am wondering why PSE is coming before us with an incomplete report with procedures that are not being followed in terms of permitting without consulting with the Puyallup Tribe.

[01:01:10] There are rules in place. Those rules need to be followed. And, in the end, I ask you, Clean Air Agency, to ignore these economic arguments that are being put forward to you and look to your paramount issue, which is to provide us all with clean air. My life depends on that.

To: Public Comment
Subject: Tacoma LNG SEIS Project Comment
Date: Sunday, November 4, 2018 11:54:55 AM

Dear Responsible Official,

There are a number of arguments being made intended to deter Puget Sound Energy and Tote Marine from constructing a very large fracking tank near Tacoma, Washington, that have to do with the impact on nearby communities. Here, I'd like to provide another reason this project should not continue with an emphasis on the broader environment.

To express it in the simplest of terms, fracking is a bad idea. Period. It contributes to global warming - a threat with the potential to cause more harm than ISIS, MS-13, the worst-case scenario surrounding Iran, drug abuse, and the the collective impact of all plagues combined - due to the release of potent methane gases. There is evidence if not settled proof, that fracking may induce earthquakes and poison drinking water in some communities. Expanding the use of fracking is basically consenting to trading public safety and potentially the long-term future of life on Earth for electricity and profits. I contend this is not a good deal.

I'm doubtful that my comment nor 10,000 others is going to inspire anyone to consider these thoughts, let alone change a single mind. But in hopes that my doubts are unfounded, I submit this for your consideration.

Sincerely,

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

As a resident of northern Oregon, and as a citizen of a warming world, I am concerned that the draft EIS submitted is based on very flawed reasoning. The analysis is seriously flawed and unacceptable. The
Air Agency must get better data and analysis before they decide on the air permit for the facility.
The draft SEIS uses an outdated methane global warming potential (GWP) value - GWP is a measure of
potency for a greenhouse gas and it is measured against carbon dioxide (CO2). CO2 has a GWP value of 1.
Methane has a much larger GWP value, especially over the short term. The draft SEIS uses the United
Nations' 2007 value of 25 for the 100-year number (i.e. the methane average GWP over 100 years), whereas they should be using the 2016 value of 32. This single modification in SEIS GHG model makes the LNG plant dirtier from a greenhouse gas emissions perspective than if the LNG plant were not built.

Methane is significantly more potent in the near-term, yet the SEIS analysis only looks at the long
term impact . The draft SEIS analysis is based on the 100-year GWP of methane. The IPCC report released a scary report on October 8th, indicating that we must change our energy fuel mix in the next 12 years or face extremely dire consequences in 22 years. Therefore, the SEIS should use the 20-year numbers, as that is the timeframe where action is needed. Using the most recent 20-year value of 96 makes the LNG plant 50% dirtier than the current capability.

Please reject this draft EIS and demand a more meaningful and accurate one. The lives of our children, not to speak of our grandchildren, and of the animals and plants around us, deserve better consideration.

I urge PSCAA not to issue the permit for the NLG. within the Three mile blast zone of the LNG there are schools, homes, ICE detention center with no evacuation plans) To name some of what would be destroyed. The land the LNG is located on is also earthquake prone. Fracked gas (main source) contributes to global warming, contaminates water and can cause earthquakes.

Renewable energy is the future and needs to be invested in rather than fossil fuels.

Subject: LNG Tacoma
Date: Tuesday, October 16, 2018 1:19:26 PM

I urge Puget Sound Clean Air agency to not issue the permit for the Liquefied natural gas facility in the Tacoma tide flats. The explosive nature of natural gas is a concern. There have been many natural gas explosions including the Canadian pipeline explosion in early October of this year. Within the three mile blast zone of the LNG proposed plant in Tacoma there are schools, homes, the ICE detention center (with no evacuation plans) to name some of what would be completely destroyed in the event of an explosion.

The main source of gas would be from fracked gas which contributes to global warming, contaminates the water and can cause earth quakes.

Global warming is on the increase as evidenced by the increased hurricanes , , droughts, record breaking temperatures, increased floods, to name a few of the destructive results from the raise in temperature.

In addition building on this site in the port of Tacoma is a violation of the Puyallup Tribe's Medicine Creek Treaty of 1854.

From: Betty Sue Sherrod
To: Public Comment
Subject: Puget Sound Energy and Fracked Gas in Tacoma
Date: Friday, November 16, 2018 9:11:16 AM

Dear Puget Sound Clean Air Agency,

I am writing to oppose the building of the Tacoma Liquefied Natural Gas (LNG) facility.

Now retired, in 1996 to 1999 I lived and worked as a pastor for two small churches in rural western Pennsylvania. I believe it was toward the end of my service, that I began to hear stories of brown water coming from people's faucets after fracking began in the area. Their wells were being destroyed. In recent years, increased earthquake activity has been linked to areas where fracking occurred. Fracking has been connected to real damage in real people's lives. I must speak to oppose it.

I believe the scientists when they tell us that we are living very close to the edge of the full disaster of global warming and climate change. There are many factors that have contributed to the Camp and Woolsey fires in California - where I also served; but global warming and our use of petroleum, surely bear a substantial portion of the responsibility for the destruction, the 60+ deaths, and the 600+ missing persons. We need to move away from the use of petroleum, not towards it! This is not a time to allow others to make more profit on the degradation of the earth. How can we create profit on something so deadly? I must speak to oppose it.

Thank you for receiving comments.
I pray your deliberations will dig deeper than these fossil fuel deposits and look further into the future of our children, our grandchildren, and the earth itself.
Rev. Betty Sue Sherrod (retired)

This LNG facility is not a bridge – it will be used for 40 years – and by then our climate will be in catastrophic times. The fracked gas will come from the US, BC, and Alberta, and the SEIS must be rewritten to include current (not 2007) data about methane leaks from ~~extraction~~ point, through transport, to the Tacoma LNG AND the effects of 93% of it being burned as fuel.

so:
- use current data
- include all 40 years
- include upstream and downstream leaks and explosions.

0454-2 22. General Opposition
0454-2 12. LCA Inputs and Assumptions - Global Warming Potential Value

Dear Puget Sound Clean Air Agency,

The SEIS is using outdated methane emissions data – eleven years old – when much more accurate data is available. This is not good science or engineering. The SEIS must be redone ~~and~~ with current scientific info, and a new public comment period set.

Please include this in the final supplemental environmental impact statement.

Address: 6634 154th Ave NE zip 98052	Email: nshimeall@gmail.com

(PSE Ratepayer)

Carole: Thank you, Mr. Voget. Nancy Shimeall?

Nancy: Hi, I'm Nancy Shimeall. And I'm a PSE rate payer. But as such, I object to this project. I am against approval.

[00:10:00] For one thing, although the first two speakers mentioned about the benefits of using bunker fuel, what you need to take into account is that it will increase the use and extraction of fracked gas. And we know that you need to include both the upstream and the downstream pollution that occurs when it's extracted, transported, and processed, as well as burned later. So, please include that in your consideration. But I also want to talk about from the heart. It deeply concerns me that the Puyallup tribe is being disregarded, in terms of the approval of this facility and in worrying about what's happening to their treaty land.

And also, I know that, as your job as the Clean Air Agency, that it's your job to be stewards of our air and our resources.

[00:11:00] And I honestly don't know how we can still be talking about a facility like this, when we know, from the recent IPCC report that we only have 12 years to do anything about runaway climate change and the impacts. So, I ask you to think about all of that as well. And I implore you to please don't approve this. Thank you.

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

Right now we are breathing the smoke that comes from California's wildfires. The fire season is all year long now; we are paying the price here, and in 10 years, according the IPCC report, we will not be able to stop catastrophic climate change. PSE's LNG project increases our greenhouse gas emissions and fuels climate change - which means more wildfires and smoke for our region. The resulting air pollution makes us sick and leads to higher rates of asthma attacks, heart problems and cancer in our communities.

Sincerely,

Nancy Shimeall

Address: 16634 [illegible] 59th Ave NE Lake Stevens 98258	Phone: 360-708-4014

Dear Port of Kalama, and Cowlitz County,

Dear Puget Sound Clean Air Agency,

If built, both the Kalama refinery and the Tacoma LNG refinery would require a massive new pipeline, spanning our state or Canada or several other states. The SEIS must include the fact that methane leaks and use up to date projections (4% - 11% leakage) to study the impacts on our environment.

Please include this impact in the Final Supplemental Environmental Impact Statement.

Name: Nancy Shimeall	Email: nshimeall@gmail.com

2083-1 12. LCA Inputs and Assumptions - Global Warming Potential Value

Dear Port of Kalama, and Cowlitz County,

Dear Puget Sound Clean Air Agency,

I am deeply worried about the fact that methane is 86 times more powerful of a pollutant over a 20 year period than carbon. Permitting agencies must use the most up-to date potential for methane when studying the impact of any project!

Please include this impact in the Final Supplemental Environmental Impact Statement.

Name: Nancy Shimeall	**Email:** nshimeall@gmail.com

Address: 6634 159th Ave NE Redmond 98052	Phone: 360 708 4014

0459-1 22. General Opposition

Dear Puget Sound Clean Air Agency,

I am a young adult with great concerns for this LNG plant. I look forward to a future that does not rely on harmful fracked gas that puts our communities and children at risk. You have a moral responsibility to redo the SEIS to accurately reflect the emissions it will cause. Consider the very real harm this facility will do in Tacoma and our world before moving forward with this toxic project.

Please include this in the final supplemental environmental impact statement.

Name: Rachel Shinaburger	Phone: 815-905-1685
Address: [illegible] 98122	Email: rachel@earthministry.org

Rachel: Reverend Ruud could no longer be here. He had another obligation, but he asked me to speak on his behalf.

Steve: Did you sign in yourself coming in?
Rachel: I did not.

Steve: Go ahead.

Rachel: My name is Rachel Shinaberuger. And as a person of faith, I value our planet as a gift from the creator. I believe we are charged to take that gift and care for it as best we can. This includes caring for air, water, and land. In caring for our environment, we ensure that we are also caring for its people. The choice of adding more fossil fuel pollution to our atmosphere has very real consequences. Even this week, due to global warming temperatures, Super Typhoon Yutu ravaged through the Pacific breaking records as the strongest storm to touch US soil, since 1935.

[04:26:05] As someone who has lived in Central and South America, I've seen first hand the devastating effects that this change has had on both the land and the communities there. I desire climate justice and that means caring for our neighbors globally and locally. I'm asking you to listen to the voices of those most vulnerable to pollution and climate change. Especially listen to the Puyallup Tribe as they request you respect their lands and their water. The LNG plant is clearly an immoral and irresponsible choice for our future. The SEIS is in need of further review and revision and should be open to further public comment.

We all have a moral obligation to care for our home and for each other. The people of Tacoma desire a better, brighter, cleaner environment for our community. Please protect us from the harmful LNG plant, while we work together to build a better future for us all. Thank you.

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Dear Puget Sound Clean Air Agency,

Further progression of the LNG Refinery would be incredibly irresponsible both ethically and environmentally.
First and foremost, the Puyallup people are a sovereign governmental body and they have the right to decide what takes place on their land. The production of this refinery would be an act of violence to their families, resources, future, culture, etc. The native people of North America should never have suffered as they already have; how can we continue to disrespect their livelihood and their laws?
The LNG refinery will output dangerous levels of methane into our atmosphere during this pivotal and urgent time for our climate in crisis. This methane, and other volatile organic compounds, will be released into the atmosphere and most-affecting vulnerable, already oppressed, native communities. The delicate properties of LNG, in addition to all of the methane, makes for a very dangerous risk of explosion. The blast zone from this explosion is expected to be at least 3 miles. This would fatally-engulf a huge community if a fire were to happen! It also puts anyone working within the facility in grave danger - the extent of which is not even known because of lack of permits. Fires and explosions on other LNG refineries and oil trucks are not uncommon and have claimed hundreds of lives already.
Fracking uses a huge amount of water and desecrates otherwise beautiful, fertile land that could be utilized for things like sustainable crops, fisheries, oxygenation, etc.
Additionally, refineries often bring in thousands of non-native workers onto tribal land to work. The housing areas set up for these workers are referred to as “man camps”. Historically, these man camps have increased sex and drug trafficking, murder, assault, etc wherever they are established.
The environmental and social implications of the LNG refinery are violent at best.
Please hold true to the values and priorities of the PSCAA and deny the clean air permit for this facility!

Thank you,
Margaret Shiple

[05:10:07] So, next up is LaDonna Robertson. Joanna Shoetler?

Joanna: Joanna Shoetler, lifetime Washingtonian. Family member is Stewart Middle School, so we've been around for a long time, probably fifth generation Shoetler, if you really go back. And I'm in Seattle, at this point. And I really don't know what I want to say. But thank you. I want to also say I do want to acknowledge that we're on Puyallup land. And whatever they have recommended, I agree with them. And I also agree with everybody who says that the report is insufficient.

[05:11:03] And it is too bad that there aren't two people that should be here on this panel that haven't been elected for this panel, which is too bad, as well. So, I would like to talk about the orcas. I would like to talk about the tar sands. And I think I also want to talk about the immigrants, which I just read right now about that are coming up from Central America because it's all connected to everything. Mostly, we're dealing with climate change. And we're looking at different things we need to do. But we've really got to also look at the orcas. We have 74 left. When I started working on fossil fuel projects in 2012, I wrote down 89, I think it was.

And every time I review another hearing, meeting, comments, I have to take one orca off my numbers, another one and another one. So, we're dealing with salmon.

[05:12:00] We're dealing with creel, we're dealing with all of the different things that they need. But we need the water. We need the fresh water. And that's not what this project is for. LNG, it pollutes the water. It kills water. I talked to the Native Americans and the First Nations up in tar sands area. They have to pull bears out of these tar sand pits, just to think about coming across it. And what about the birds that have to fly into these tar sand pits? We've lost thousands and thousands and thousands because of that. So, now, we're going to go back to the immigrants that are coming up from Central America.

I know that it sounds crazy, but I just read it's all about climate change. It's about their farms, about the coffee and everything. And they just don't have it anymore. Well, that's going to be happening here, too, because, if this LNG goes in, the quality of life is going to go down. And I haven't heard anything, in the last couple of hours, what we really have to go to is, this week, came out with Mount Rainier, Mount Baker are the last top three volcanoes that could go.

1155

1155-2 22. General Opposition
1155-2 3. Outside of SEIS Scope

[05:13:10] We all know every day could be our last day of a wonderful place here because we know, when that mountain goes, we're screwed. And when that mountain goes, and we have that LNG plant going and we have to keep it at 200 degrees below centigrade, what's going to happen to the power? What's going to happen when that thing can't go? I hope they have generators. Have we talked about generators there? Are they going to have a generator? Because if it doesn't, that thing is going 3 to 5 miles out. And I'm sorry, but I'd be really scared about that. And I'm really scared because it will go up over that mountain in Federal Way.

I don't know, is there anyone from Federal Way here? But all the way across the Commencement Bay all the way up to the Hilltop and more.

[05:14:00] I'd be really scared about this plant, especially when they're all over the country and all over the world, they're blowing up all over the place. That's all I can say. Protect the salmon, protect the orcas, protect the treaties, and protect our way of life, before it's destroyed. Thank you.

1622-1 12. LCA Inputs and Assumptions - Global Warming Potential Value

To: Public Comment
Subject: Public Comment on DSEIS, PSE LNG Project – Deny requested permit
Date: Wednesday, November 21, 2018 4:46:44 PM

Dear Puget Sound Clean Air Agency,

While I applaud the completion of the Supplemental Environmental Impact Statement to more fully evaluate the impacts of the Puget Sound Energy Liquefied Natural Gas Project, I fear that the statement is incomplete and extremely misleading.

I am extremely concerned about a number of assumptions and base calculations utilized in the report. Most significantly, the SEIS should not be referring to the 100-year value for the Global Warming Potential of methane. As the recent IPCC report underscored, we have a finite amount of time to address the root causes of climate change, on the scale of 12 years, before the impacts become even more untenable. As such, the 20-year GWP is a much more relevant number to include in calculations.

As is, it would be inappropriate for your agency to issue an air permit for the facility. I believe that the 20-year GWP for methane, closer to 86 times that of carbon, will also help illustrate just how detrimental approving this project would be – for Tacoma, the surrounding Seattle area, the Pacific Northwest, and the world.

I hope we can count on you to make the right decision and go back to the drawing board, or simply deny the project outright.

Sincerely,

Mariah Shriner

Dear Puget Sound Clean Air Agency,

While I applaud the completion of the Supplemental Environmental Impact Statement to more fully evaluate the impacts of the Puget Sound Energy Liquefied Natural Gas Project, I fear that the statement is incomplete and extremely misleading.

Please reconsider a number of the base assumptions utilized in this report including

- The 100-year Global Warming Potential for methane (the 20-year window should be utilized instead)
- The leakage rates for methane projects
- The slippage rates calculated for fuel usage

All of these numbers have been selected through a process that blatantly disregards numbers accepted as best practice and/or elects to use numbers that present the most favorable overall emissions and climate impact of the project.

As such, the analysis is incredibly flawed and it would be inappropriate for your agency to issue an air permit for the facility based on this report. I hope we can count on you to make the right decision and go back to the drawing board. When you have done so, we request that you re-open the public comment period to allow the citizens' voices to be heard.

Sincerely,

Mariah Shriner

Subject: Puget Sound Energy LNG Project
Date: Wednesday, November 21, 2018 3:06:06 PM

Dear Puget Sound Clean Air Agency,

Thank you for providing the opportunity to review the Puget Sound Energy LNG project being built in Tacoma. We are already feeling the direct impacts of our warming planet and the science is clear -- we must act quickly to avoid catastrophic changes to the livability of our planet.

The information in the current Supplemental Environmental Impact Statement is flawed and based on inaccurate assumptions and invalid data. I am writing to request that you accurately update the SEIS and require it to be complete and credible and then re-open the public comment period so that the report can be reviewed thoroughly.

I am aware of several serious issues with the current SEIS that was issued on October 8th. These issues mislead the impact on our climate and fail to accurately reflect the risks that this project poses to the people of Tacoma, the state of Washington, and our country. The SEIS is quite flawed and any one of the issues that I am aware of would warrant a re-drafting. However, for the purposes of this comment, I will provide information on only one of the problems.

The SEIS makes several, unrealistic assumptions and mask the very real negative impacts of this project. The SEIS claims emissions benefits from customers that Puget Sound Energy simply does not have. According to PSE and the City of Tacoma, the only maritime customer is TOTE with its two vessels which have already delayed their conversion to consume LNG. Securing new customers as well as the additional permitting could take years and is not guaranteed.

The SEIS says that emissions will only be reduced if the natural gas comes from British Columbia because leakage rates are reportedly lower there than in the US. Shockingly, most leakage rates were self-reported by the fossil fuel industry based on models and recent measurements taken in the field have shown that fugitive emissions from BC wells and pipelines are much worse than reported.

Even if the leakage rates were accurate, this assumption is irrational. PSE does not limit the sourcing of its gas from BC and cannot honor this promise. Their recent filings show they relied on gas from BC, Alberta, and the US. Furthermore, with the recent pipeline explosion in BC that interrupted PSE's supply, we know it is not always available.

Thanks again for initiating this crucially important review of this facility and I hope that you will use the best available science when revising this draft SEIS.

Sincerely,

Walter Shriner, PhD

Dear Puget Sound Clean Air Agency,

Thank you for allowing the opportunity to review the Puget Sound Energy LNG project being built in Tacoma. We are already feeling the direct impacts of our warming planet and the science is clear -- we must act quickly to avoid catastrophic changes to the livability of our planet.

The information in the current Supplemental Environmental Impact Statement is flawed and based on inaccurate assumptions and invalid data. I am writing to request that you accurately update the SEIS and require it to be complete and credible and then re-open the public comment period so that the report can be reviewed thoroughly.

I am aware of several serious issues with the current SEIS that was issued on October 8th. These issues mislead the impact on our climate and fail to accurately reflect the risks that this project poses to the people of Tacoma, the state of Washington, and our country. The SEIS is quite flawed and any one of the issues that I am aware of would warrant a re-drafting.

The SEIS makes several, unrealistic assumptions and mask the very real negative impacts of this project:

<!--[if !supportLists]-->1. <!--[endif]-->The SEIS claims emissions benefits from customers that Puget Sound Energy simply does not have.

<!--[if !supportLists]-->2. <!--[endif]-->The SEIS indicates that emissions will only be reduced if the methane comes from British Columbia. This is currently untrue and promise they can't make.

<!--[if !supportLists]-->3. <!--[endif]-->The leakage data for methane sources is inaccurate and underestimated, and doesn't include important emissions sources that by themselves are "relatively small" but add up to serious greenhouse impacts.

<!--[if !supportLists]-->4. <!--[endif]-->Fugitive emissions from pipelines and pipeline explosions are not accounted for.

<!--[if !supportLists]-->5. <!--[endif]-->Slippage rates from ships using the fuel are calculated with a lower rate than is considered best practice.

Thanks again for initiating this crucially important review of this facility and I hope that you will take best available science into consideration when revising this draft SEIS.

Dear Puget Sound Clean Air Agency,
I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to deny the permit because the Draft Supplemental Environmental Impact Statement does not accurately represent the true greenhouse gas emission profile of the project. I have the following specific concerns:

The fundamental calculations of impact are based on inaccurate and inappropriate values. In particular, the DSEIS underestimates the GWP and of methane, the analysis is over too long ~~that~~ a time period (100 vs 20 year) and leakage rates.

(Check here to continue comments on the other side.)

In addition, a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required and adequate consultation with the Puyallup Tribe and other neighbors of the project should be conducted.

Name: Walter Shriner, PhD Email: wmspdx@gmail.com

Address: 2235 NE 43rd Ave, Portland, OR 97213

By completing this comment card you agree to receive updates about the project.

Steve: Okay. Next up is Terry Velasco. Before I get the next five started here, let me give you just a heads up for the next group after that. It would be Bethany Llewellyn, June Bluespruce, Abigail Castle, Lynn Fitz Hugh, and Meredith Neal.

[03:38:09] So, next up, I'm not sure if I can read this. It's Mary Morgan? Did I get that right, Morgan? Okay. Next, is Zoe Shurman.

Zoe: I'm Zoe Shurman, and I'm 12 years old. I'm a member of Plant for the Planet, a youth led organization trying to plant a trillion trees all around the world to mitigate climate change. And I'm also part of Zero Hour, another youth led organization addressing social justice and climate issues. We know that fracked gas produces less carbon emissions than coal when burned.

[03:39:00] But the problem is the extraction, the transmission, the processing, storage, and distribution of fracked gas plus the burning of it. Add it all up, it leaks large amounts of CO_2, methane, ammonia, arsenic, cadmium, hydrogen sulfide, and sulfur dioxide. When accounting for methane leaks, fracked gas has climate impacts that definitely rival those of coal. This is the opposite of the direction that we need to be going in. These chemicals, when released into the air, are horrible for human health causing and inflaming asthma, contributing to heart disease and stroke, and significantly decreasing life expectancy.

This facility would also emit volatile organic compounds like mentioned earlier or rocks, which have been linked to birth defects, have been shown to cause cancer, and have shown to just, in general, negatively affect the nervous system. Another thing is that the draft SEIS uses an outdated methane global warming potential value.

[03:40:02] Just using basic common sense, experts who study climate change as their jobs have these updated numbers. And it makes no sense not to use them. They are the only numbers relevant today. And they are the only ones that matter for my life, for my generation, and for my time. The old numbers have nothing to do with the coming years. No actuary will use them and no insurer. They have to use information that best reflects reality. The old methane numbers are only useful for accommodating the interests of the investors in this project.

If you are going to act in an accountable way to me and every child

1241-1 21. LCA Inputs and Assumptions - Additional Air Pollutants
1241-2 22. General Opposition
1241-3 12. LCA Inputs and Assumptions - Global Warming Potential Value

in this region, you have to answer truthfully whether this is going to contribute to sea level rise, whether this is going to heavily contribute to more pollution in our atmosphere, whether this is going to contribute to throwing our agricultural system into disarray, and whether you all are going to let this happen, when all of us know the answer to all of these questions. Me and my generation are relying on the adults in our world to make the right choices.

[03:41:00] And so far, this has, generally, not happened. We need you to stand with us this time. Thank you.

Steve: Thank you. Next would be Lula Pritchard.

[03:27:00] Don Golden? Mary T. Andrews Yarbrough? Mary? So, before I call the next five up, just a heads up, the next group after that is it Morgan Michael, Zoe Shurman, Jamie Margolin, Jeffrey Grinstead, and Karen Stocker. So, Benjamin Sibelman?

Benjamin: My name is Benjamin Sibelman. I am an environmental activist and also one of the caregivers for a girl who just turned 1 year old in our community house in Seattle.

[03:28:05] And, yesterday, I went to a rally held by a children led group, Plant for the Planet, because it's the children that are going to be feeling the impact of runaway climate disruption, if we allow that to happen. I honor the concerns of people in Tacoma whose children could be breathing somewhat cleaner air as a result of replacing some of the ships' fuel with LNG. And I believe in finding some way for the children to breathe cleaner air, but this is not it. The solution can't just be this illegally built plant with no permit. It's violating the treaties. It's in a terrible location. It's a lesser evil, at best, in terms of children's lungs.

And last year, you announced that this plant would emit ammonia, arsenic, cadmium, hydrogen sulfide and other things.

[03:29:06] And then, there's the children who live near the fracking sites, which fracking has been demonstrated to cause huge amounts of water pollution, air pollution, use up a lot of fresh water that's just pumped in with weird chemicals into the bedrock. And finally, this is the wrong solution because it's locking in 40 more years of using fossil fuels. We have 20 years, and do we still want this happening in 2060? That's crazy. We need a third way. We need all of the ships here to be using shore power. There are hybrid tugboats out there and electric tugboats are being developed and tested now.

Those could tow ships in and out of the port. And we also need to start converting the gas stoves in our houses, which are also causing pollution that's hurting our lungs.

[03:30:08] The answer is electricity and renewable electricity. Thank you.

Subject: Tacoma LNG SEIS Project Comment
Date: Sunday, October 21, 2018 12:37:48 PM

Dear Responsible Official,

I oppose the Puget Sound Energy and Tote Marine proposal to build a new, large LNG terminal in Tacoma.

Your decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct this more rigorous analysis is a step forward.

I urge you to revise the analysis to account for the following:

1. Methane should be counted as 86 times more potent than CO2 based on the current IPCC analysis (AR5 rather than AR4) considering a 20 year timeframe (rather than the 100-year).

2. Revise the analysis of the impacts of fracking in British Columbia based on recent research(1) demonstrating that methane escapement has been dramatically under-estimated.

3. Revise the “no-action alternative” to include a clean energy alternative in which PSE provides electricity not with a different source of fracked gas, but with renewable energy and energy efficiency.

4. Revise the “no-action alternative” to include the assumption that Tote Marine will achieve a 50% GHG reduction, in line with the International Maritime Agency’s established goals. Alternatively a combination of fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion or many other alternatives could contribute to cleaner maritime traffic.

Clean local emissions requirements can be achieved by opting for low-sulfur marine gas oil over heavy fuel oil, and installing selective catalytic reducers and diesel particulate filters.

5. This more accurate analysis will show that the project has a significant and unmitigated impact on the global climate, which
should be seen as a sufficient basis for denial of the Notice of Construction application.

Thank you for your time and consideration of my comments.

Sincerely,
Carol Sibley

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Fracking and its products are destructive of the land and waters. The process is associated with earthquakes, which have now been reported at the first fracking site in northern England. The release of methane in the Porter Ranch/Aliso Canyon incident drove over 15,000 people from their homes for four months. This is a risky, demonstrably harmful process and needs to be replaced by reliance on renewable, non-fossil fuel energy.

1177-1 23. General Support

Carole: Thank you. Lisa Simmons?

Lisa: Hello. There we go. My name is Lisa Simmons. I'm here in support of the project on two fronts. The first is I'm a long term resident here of Tacoma. I've always lived pretty central, hill top, and I live by Lincoln. And secondly as an employee of TOTE Maritime Alaska. I'm in support of this project because I do believe that it is a step forward. I'm in support of my company because I think that they're actually putting their money where their mouth is and investing in the future of this community, investing in the environment.

[01:28:03] We know that there is no renewable fuel source, for shipping, right now. There's no renewable fuel source for transportation. So, every year that we're not trying to be better, we're just keeping it as it is. It's more particulate matter in the air. It's more CO2. It's more greenhouse gases. I live here. I run. I'm trying to buy a house. We'll see how it goes. But I want something better, and I'm proud to be in an area that is willing to take this step forward. And I'm proud to work for a company that's willing to stick their necks out and try to be better. So, that's everything.

Carole: Thank you. Laura Skelton?

Laura: Thank you. My name is Laura Skelton, and I'm the executive director of Washington Physicians for Social Responsibility. Our organization is made up of hundreds of doctors, nurses, and public health professionals who work to protect the health of Washingtonians from major threats, including climate change and pollution.

[02:20:04] We have dozens of members here in Tacoma whose primary concern is the health of this community. As we have learned more about this project, we have grown more concerned. Today, I'm here to request improvements to the draft Supplemental Environmental Impact Statement and to express our support for the Puyallup Tribe's position. I also want to state our grave concerns with the entire fracked gas industry. Simply put, fracking is terrible for health. The gas for this facility would most likely come from Canada where fracking pollutes air, soil, and water.

We are not interested in trading the harms associated with bunker fuel for the harms associated with fracking and LNG. We are deeply concerned about climate change, which is widely thought to be the biggest public health challenge of this century. We believe the SEIS underestimates this project's likely contributions to climate change.

[02:21:02] Why not use the scientifically accepted, 20 year global warming potential of methane to estimate this project's contributions to climate change in its first two decades? We also encourage the agency to take another look at its methane leakage assumptions. Newer data suggests that the methane leakage rates in British Columbia are significantly higher than those reported in the SEIS. Lastly, it is our understanding that TOTE is already using ultra low sulfur diesel. The build out of this facility and associated pipelines will create demands for more gas coming through our region, which poses a risk of explosion and fire in a very busy port. Is this risk truly necessary?

Further, building this facility commits us to using more fossil fuels at a time when we urgently need to move to truly clean energy. We urge you to revise the SEIS with the best and latest science, so that the public can better understand the true costs of this project.

[02:22:00] Thank you.

PSCAA
Attn: Public Comment
1904 3rd Ave
Suite 105
Seattle, WA 98101

To Whom It May Concern:

Every day the urgency of environmental progress in our region seems to escalate. The health of local waterways that empty into Puget Sound, the fluctuating populations of iconic species like salmon and orca and the ongoing challenge to manage forest fires are high profile examples of environmental challenges we face. Residents and businesses are asked to consider what they can do to reduce their own footprint upon the environment – from recycling and composting, to using 'salmon safe' car wash services hybrid and electric vehicles., to LED lighting, remote workplaces and carpooling, among many others.

On occasion an entire industry has the opportunity to adopt greener practices, which is the case for the shipping industry in Tacoma. Traditionally powered by diesel fuel, cargo ships across the world are increasingly retrofitted to run on liquefied natural gas. This upgrade results in significant reductions in dangerous air emissions and leads to improved air quality. I believe the upgrade allows for an essential transition that has a measurable positive impact on air quality for years to come. I would hope that PSCAA and the City of Tacoma rewards TOTE for going beyond what is required to improve our overall air quality.

Let's be specific about the emissions reductions. LNG offers a cleaner alternative to diesel, which the American Lung Association says can aggravate respiratory and cardiovascular disease, cause chronic bronchitis, asthma, lung inflammation and emphysema, and lead to cancer. Switching from diesel to LNG as a shipping fuel will reduce sulfur emissions by 100%, harmful diesel particulate matter by more than 90%, nitric oxide and nitrogen dioxide emissions by 90% and carbon dioxide emissions by 20%.

While the benefit to the environment is undeniable, there is a business imperative driving the upgrade. As noted by Reuters in June 2018, "Driving the shift are new rules from the International Maritime Organization that cut the allowed sulfur content in marine fuel to 0.5 percent from 3.5 percent by January 2020. *LNG is virtually sulfur free.*"

If we are as committed to safeguarding the local environment as much as we say we are, then we must seriously consider every technological advance that enables us to incrementally withdraw from fossil fuels. We all know things just don't happen overnight. Tote converting their ships to LNG is true generational environmental progress. The Port of Tacoma has the opportunity right now to positively impact environmental air quality with an upgrade that not only benefits a well-established local company but will support residents and Port workers who are challenged by respiratory and/or cardiovascular illness.

The LNG facility proposed at the Port of Tacoma should be supported by everyone who agrees we must take steps – now – to improve our local air quality, and to put us on a steady path toward cleaner fuels needed to power our daily lives.

Your own SEIS documents a 13.5% reduction in greenhouse gases, not to mention the reduction in Sulphur Oxides – 100%, Particulate Matter by 99% and Nitrogen Oxides by 90%. While your focus is air quality, you should seriously consider the benefits to the marine environment. The reductions in carbon and particulate matter will benefit the dwindling populations of salmon and orcas.

Regards,

Subject: Tacoma LNG SEIS Project Comment
Date: Wednesday, November 21, 2018 9:16:17 PM

Dear Responsible Official,

I am writing this to tell you how I feel about having a fracked gas tank within blast zone of my home and near an earthquake zone. I also want you to know how disappointed and shocked I feel that your Council ever thought to accept this concept and to allow this great concern shown via meetings, numerous demonstrations and letters from the community, as well as the Tribe to go on for so long!

Please do not wait for an environmental study! Stop this now. It is time to consider new uses of the land on the flats. This holding out on your part seems like a wrong use of your power!!

Huge efforts have brought Tacoma area to great things by covering the blight of Asarco. The cleanup is not done, regarding wildlife, fish, environment, water. Let's continue to honor Tacoma.

****

Puget Sound Energy and Tote Marine seem to imagine that a clean energy future can be arrived at by digging the fossil fuel hole deeper. This proposed LNG project is another step toward climate chaos at a moment when the IPCC has given us a clear warning that we must urgently move away from fossil fuels.

Fracked gas is not a lesser evil. Scientists' understanding of methane's impact on the climate continues to evolve, and at every step along the way we learn that fracking allows more methane escapement than we had previously observed and that the impact of methane on the climate, particularly in the short term, is even more serious than had been previously understood.

I applaud your decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct this more rigorous analysis. Thank you.

I urge you to revise the analysis to account for the following:

1. Methane should be counted as 86 times more potent than CO2 based on the current IPCC analysis (AR5 rather than AR4) considering a 20 year timeframe (rather than the 100-year).

2. Revise the analysis of the impacts of fracking in British Columbia based on recent research(1) demonstrating that methane escapement has been dramatically under-estimated.

3. Revise the "no-action alternative" to include a clean energy alternative in which PSE provides electricity not with a different source of fracked gas, but with renewable energy and energy efficiency.

4. Revise the "no-action alternative" to include the assumption that Tote Marine will achieve a 50% GHG reduction, in line with the International Maritime Agency's established goals. This reduction might alternatively be achieved by a combination of fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion or many other alternatives besides fracked LNG.(2) For clean local emissions requirements, Tote Marine can achieve virtually all of the localized lower-particulate and lower SOx and NOx benefits claimed for LNG propulsion by opting for low-sulfur marine gas oil over heavy fuel oil, and installing selective catalytic reducers and diesel particulate filters.(3)

5. This more accurate analysis will show that the project has a significant and unmitigated impact on the global climate, which
should be seen as a sufficient basis for denial of the Notice of Construction application.

Thank you for your time and consideration of these comments.

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

Many thanks for opening up a review process! As a young American, I'm concerned about our nation's continued mistreatment of the environment. Global issues including climate change, ocean acidification, and air and water pollution threaten my future— and more importantly, the millions of citizens in developing nations without access to the technology and freedom of movement that would allow me to evade the negative effects of environmental degradation. I know you've probably received hundreds of similar messages, but I emphatically believe in the importance of transitioning to sustainable clean energy sources.

As I understand it, the public takes issue with your report on these points:

The data is incomplete. The impact estimates of the project are relevant to an innapropriately long time-span considering the length of the project. Estimates related to sourcing of gas are innacurate. The SEIS did not factor in a high-enough slippage rate.

I look forward to the submission of an updated report in line with these concerns.

Thanks again!!
Kahlo

This Pipeline Is Wrong. It invades tribal land and violates the treaties created to give autonomy to the native people. It jeopardizes the heartbeat of the Puget Sound & Salish Sea. It risks our children's futures and gambles their health away for the bottom line of a corporate budget.

Only TWO exits exist in case of an emergency. The gas is subsidized by the people of Tacoma and shipped away from them. The shipping companies receive tax breaks that the people of Tacoma have to pay for while THEIR resources are exploited, THEIR futures are risked

and their Childrens' lives are put in Danger.

This is blatant racial disparity with the inmates at the Detention Center in the blast zone, treated like expendable mucks. This is NOT right.

PSE's actions, cherry picked data, and flagrant disregard of the affect this plant will have alone should be cause to halt this pipeline.

Green energy is the future. For every 1 job in fossil fuel, green energy creates 4. This is a dying industry. We need to invest in thriving, long-term energy that doesn't require us to kill ourselves to have it.

— Sarah Smith

Steve: Okay. Lynn Dinino? Kathryn Lewandowsky? Ezekiel Smith? Oh, go ahead.

Zeke: Zeke Smith. Deny this permit. Ultimately, it is just another brick in the Trump Pence wall against Native rights, against environmental progress, against human rights, and against the planet itself.

[06:34:12] Trump's make America great again is a 21st century fascist program of manifest destiny. America first wrapped in the flag and Mike Pence's Bible taken literally, with a program of white supremacy, misogyny, and xenophobia. This regime denies truth and objective evidence. This regime denies truth and objective evidence. And yet, it has its hands on the most powerful military and nuclear arsenal in history and is preparing and threatening to use it. Millions of immigrants live in terror, fearing their loved ones will be ripped away. People's humanity is viciously denied. Women are poised to lose the right to abortion.

[06:35:00] Trump and Sessions have instructed police to take the gloves off further brutalizing people of color. LGBTQ rights recently won are under assault. Damage done to the environment by this regime in just the period of 14 months could be irreversible. Regardless of whether you voted, no matter who wins, we must be in the streets beginning the day after the midterm elections to demand and demonstrate our determination that, in the name of humanity, the Trump Pence regime must go. Protest Wednesday, November 7, 6:00 p.m., the day after the midterms at Cal Anderson Park, Seattle.

And protest Saturday, November 10 1:00 p.m.. Cal Anderson Park, Seattle. And deny this permit. Thank you.

Is video available of the recent public comments in Tacoma at the Rialto?

Testimony LNG Facility in Tacoma
November 30, 2018

Let me see if I have this right. PSE wants this facility in Tacoma to sell LNG to Asia as well as use it as resource for other purposes. Regardless of the estimated leakage rate for methane in the draft SEIS, the consensus estimate for methane leaks from fracked gas seems to be around 3%. This release of methane combined with the burning of fracked gas roughly is the GHG equivalent of burning coal to generate electricity. So what PSE really wants to do is to export coal plants to China minus the particulates.

It is my understanding that the recent UN Intergovernmental Panel on Climate Change just reported that the world is not on track to meet the goals set by the 2015 Paris Climate Accord and that we are on track to blow through our carbon budget to keep temperatures within 2°C never mind a goal of 1.5°C. In fact according to the report, we only have 10 to 15 years to make dramatic improvements in reduction of GHG to stay within our carbon budget. Many scientists think we are already too late to address these issues with just renewable energy and improved energy efficiency. They are starting to call on governments to begin huge R&D projects to figure out ways to extract massive amounts of CO^2 out of the atmosphere in order to avoid the most catastrophic impacts of climate change. Right now we have no idea how to pull CO^2 out of the atmosphere beyond planting trees and modifying soil management practices. Nor do we have any real idea how much such technology would cost although some estimates are as high as $200 per ton of CO^2.

This is utter madness! Why should we be having this conversation in 2018 with what we now know about the accelerating rate of climate change? Under no circumstances should be we be building any form of new fossil fuel infrastructure in the State of Washington. The Puget Sound Clean Air Agency should deny the air permit for this facility, a facility which PSE has begun illegally without proper permitting. Any other decision is morally and fiscally irresponsible.

0443-2 12. LCA Inputs and Assumptions - Global Warming Potential Value
0443-3 3. Outside of SEIS Scope
0443-4 8. No Action Alternative

Carole: Thank you. Ronald Snell?

Ronald: Thank you for the opportunity to speak this afternoon. My name is Ron Snell. I live in Kirkland, Washington. And I am also speaking as a grandfather. I have two granddaughters. One lives here in the Puget Sound region and the other in Colorado. Both of them are going to be negatively impacted by this project. PSE's long term plan, as I understand it, for this project, is to sell LNG to Asian markets for which there is a booming market.

[02:18:04] Unfortunately, the estimates in the SEIS are woefully inadequate, in terms of methane leakage. The consensus estimate for methane leaks around fracked gas seems to be around three percent. At this rate, release of methane, combined with the burning of fracked gas, is roughly the greenhouse gas equivalent of burning coal to generate electricity. So, what PSE is really proposing to do is to export coal plants to China minus the particulates. We know, from the recent IPCC report that a number of people have referred to that we're approaching a crisis in our climate.

It is so severe that many scientists no longer believe we can get to meet our climate goals simply with renewable energy and with energy efficiency. They are starting to call on massive government investment in CO_2 technologies to pull CO_2 out of the atmosphere.

[02:19:03] We don't know how to do that. We have no idea what it's going to cost, but some estimates are as high as $200.00 per ton. I don't understand why we're having the conversation we are today facing a climate crisis that we are. This feels like utter madness. Under no circumstances should we be building any new fossil fuel infrastructure in the state of Washington. Any other decision is morally and fiscally irresponsible. Thank you.

Subject: Comment on Tacoma LNG SEIS
Date: Saturday, October 27, 2018 8:07:22 AM

Dear Puget Sound Clean Air Agency,

As a person of faith, I believe we are called to care for both creation and communities. My values of stewardship, justice, and responsibility have compelled me to comment on this project.

The SEIS uses a dated value for the 100-year Global Warming Potential (GWP) for methane from 2007 when updated values were published 2013 and then again in 2016.

It is a false assumption that British Columbia would be the only gas source for this facility and this requirement is not enforceable. The SEIS also failed to incorporate multiple, recent independent studies showing methane pollution rates as much higher than those reported by the fossil fuel industry.

Deviating from PSE's proposal, the SEIS included bunkering more than the two TOTE vessels on the Blair Waterway. The SEIS should instead provide an analysis using only secured customers.

Use of placeholder values, incorrect units of measurement, and the stated need for more data from PSE makes the analysis incomplete and hard to follow.

The draft SEIS should be thoroughly edited and released for a new full public comment period. The Puyallup Tribe, citizens of Tacoma, and residents of the Salish Sea have a right to know the total local and global impacts of this proposal.
Thank you for conducting a supplemental environmental review of the greenhouse gas emissions for PSE's proposed LNG facility on the Tacoma Tideflats.

As a member of Earth Ministry, which has been working closely with scientists and policy experts to review the SEIS, I am concerned that the document does not fully analyze the climate impacts of this project.

Please address the following in the Tacoma LNG SEIS:

1. Methane's impact on climate – The SEIS uses a dated value for the 100-year Global Warming Potential (GWP) for methane from 2007 when updated values were published 2013 and then again in 2016. Using the best available science shows the plant would have higher greenhouse gas emissions. Additionally, given the short timeframe required to address climate change as recently noted by the United Nations, the SEIS should use the 20-year GWP for methane, which shows that the plant will be more than 50% dirtier over the next two decades.

2. Source of fracked gas – It is a false assumption that British Columbia would be the only gas source for this facility and this requirement is not enforceable. In addition, the SEIS relies upon self-reported pollution data on BC gas from the fossil fuel industry. It also failed to incorporate multiple, recent independent studies showing methane pollution rates as much higher than those reported by the fossil fuel industry.

3. Lack of alternative options – TOTE is already using ultra-low sulfur diesel (ULSD) and other companies are also using ULSD or scrubbers to meet emission requirements. The no action alternative assumes that LNG is required for TOTE to meet its emission requirement, when these alternatives already exist and are in use.

4. Alterations to the original proposal – Deviating from PSE's proposal, the SEIS included bunkering more than the two TOTE vessels on the Blair Waterway. The SEIS should instead provide an analysis using only secured customers.

5. Incomplete information – Use of placeholder values, incorrect units of measurement, and the stated need for more data from PSE makes the analysis incomplete and hard to follow. The draft SEIS should be thoroughly edited

and released for a new full public comment period.

The Puyallup Tribe, citizens of Tacoma, and residents of the Salish Sea have a right to know the total local and global impacts of this proposal. With missing data and alterations to the project, this draft SEIS does not account for full climate impacts.

I ask that the PSCAA live into its self-proclaimed commitment to be good and wise stewards of our shared resources. Please re-start this review with complete information and additional opportunity for comment.

Thank you for caring for creation and our community.

Sincerely,
Walther Soeldner

In order to properly inform the decision makers and to assure the citizens that those decisions are based on a fair and reasonable technical assessment, the DSEIS requires a significant revision. Values for the global warming potential of methane must be updated to reflect the latest scientific consensus. In addition, the DSEIS must use the 20 year GWP of methane rather than the 100y GWP. Finally, adopting the best possible information on methane leakage should be incorporated.

The PSCAA, at a minimum, must ensure a comprehensive, fair and current DSEIS. Please make the above revisions so all parties can be confident that subsequent decisions are based on the best information available.

Thank you.

Subject: Tacoma LNG Permit
Date: Wednesday, November 21, 2018 9:12:10 AM

Hello,

I wish to express my support for Puget Sound Energy's (PSE) liquefied natural gas (LNG) facility. Based on draft SEIS issued by the Puget Sound Clean Air Agency (PSCAA) on October 8, 2018, I encourage the agency to issue the necessary permits for the project to proceed.

We all need to be good stewards of environment and make responsible decisions at local, state and federal levels. All the information reviewed thus far regarding this project gives me confidence that proceeding with the project is the responsible thing to do for the community and overall environment. LNG is a cleaner fuel than Diesel so PSCAA needs to act appropriately and support PSE in making this project a success.

Sincerely,
Pooja Soni

solution. Tacoma is one of the county's Superfund sites. We need to clean it up, not add to the contaminants.

We should stop the construction solely on the grounds of those contaminants.

If it was then consider the existential threat of more green house gases in the global atmosphere there is no scientifically based argument to continue the project.

ATTN: Public Comment on DSEIS, PSE LNG Project

Dear Puget Sound Clean Air Agency,

I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to deny the permit because the Draft Supplemental Environmental Impact Statement does not accurately represent the true greenhouse gas emission profile of the project. I have the following specific concerns:

The proposed LNG plant in Tacoma will release ammonia, arsenic, cadmium, hydrogen sulfide, and sulfur dioxide and emit volatile organic compounds. All this pollution has been linked to birth defects and cancer and harm the nervous (Check here to continue comments on the other side). ✓

In addition a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required, and consultation with the Puyallup Tribe and other neighbors of the proje must be done.

To Whom It May Concern;

The Puget Sound Clean Air Agency's requirement for a "complete quantitative analysis of greenhouse emissions upstream and downstream of the LNG facility operations" in the final EIS of the PSE LNG project is just another example of the obstructionist policy and actions of our state's liberal agencies. Will this same clean air environmental review requirement be applied to other important industries operating within Washington State such as aircraft manufacturing, retail business, DOD, etc?

If not, why not? The answer is obvious. If it were so, we wouldn't be building another airplane, erecting another supermarket, or supporting another military troop for a long time - if ever again. Think about the 'upstream' energy consumption and greenhouse gasses produced to actually mine, transport, process, manufacture, and deliver all of the raw materials and items it takes to build airplanes, support our military, or supply the everyday items bought in our supermarkets. Think about the amount of energy and greenhouse gasses produced to do all that just to preserve our quality of living and maintain our freedom. Then, look at the 'downstream' greenhouse gas impacts over the life-cycle of all the flights of that one airplane, supporting and maintaining the thousands of troops and equipment at one of our local military bases, or the millions of truck and automobile trips to and from the supermarket required to supply and purchase all the items to feed and clothe our families.

The construction of the LNG plant in the Tacoma Tideflats should be allowed to proceed as planned. Washington State agencies need to stop being political tools and start being more honest and realistic. The LNG is going to produce less greenhouse gasses than burning marine diesel, unless of course the ultimate goal is to end all commerce. This project is safe, energy efficient, and environmentally better - and it should proceed. Let's put that gem of a port to work for us!

October 31, 2018

Dear Carole J. Cenci,

I am the mother of 2 children who are active with Plant for the Planet, an organization that took over the United Nations Environment Program's international tree planting program to fight climate change, and we are members of 350.org.

Every single day these kids are speaking to other kids about climate change, writing letters, giving speeches, attending rallies, writing public comments, or planting trees.

They don't stop, because they don't see most adults doing ANYTHING substantial to stop the impending challenges of climate change. They know that when our agricultural system is destabilized, and we are stealing water from other states, and we are locked in wars for resources, they will also be caring for their aging parents. This is not a scene any of us want.

We want a future where we get to learn, and love, and contribute to the betterment of society... This plant stands in the way of that dream.

They are very well aware the fossil fuel companies have known this about this problem since the 1970's, and their disbelief in our inaction is devastating to me. Because I'm one of the people who didn't act and knew. I have to make that up to them now.

The only messaging I see in support of this facility is FROM the industry. The only numbers that are positive come FROM the industry. The only people that want this are FROM the industry, in addition to some local people that they've sold on the concept that it will reduce port pollution... AT THE EXPENSE OF THE ENTIRE PLANET.

It was even more painful to be present at the hearing yesterday and to see how many people who live near the facility spoke - and how many of them had clear physical disabilities, and potentially other disabilities as well. It was outright shameful that this was dumped on the people are least able to defend themselves.

Here's what is apparent -

PSE is LYING about their expected methane leaks. Every climate scientist that I've spoken to and hear testify backs this up. The numbers that PSE gives are not just off, they are completely disingenuous given what WE KNOW about ALL other projects of this type. My kids know they are lying. At this moment, hundreds of kids across the district know. And they are learning what is being stolen from them.

I'm going to get on board with this, and request the following:

1. Methane should be counted as 86 times more potent than CO2 based on the current IPCC analysis (AR5 rather than AR4) considering a 20 year timeframe (rather than the 100-year).

2. Revise the analysis of the impacts of fracking in British Columbia based on recent research(1) demonstrating that

methane escapement has been dramatically under-estimated.

3. Revise the "no-action alternative" to include a clean energy alternative in which PSE provides electricity not with a different source of fracked gas, but with renewable energy and energy efficiency.

4. Revise the "no-action alternative" to include the assumption that Tote Marine will achieve a 50% GHG reduction, in line with the International Maritime Agency's established goals. This reduction might alternatively be achieved by a combination of fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion or many other alternatives besides fracked LNG.(2) For clean local emissions requirements, Tote Marine can achieve virtually all of the localized lower-particulate and lower SOx and NOx benefits claimed for LNG propulsion by opting for low-sulfur marine gas oil over heavy fuel oil, and installing selective catalytic reducers and diesel particulate filters.(3)

5. This more accurate analysis will show that the project has a significant and unmitigated impact on the global climate, which should be seen as a sufficient basis for denial of the Notice of Construction application.

Thank you for your time and consideration of these comments.

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

I am opposed to PSE's LNG project and will attend the hearings in Tacoma in solidarity with the diverse group standing against this reckless and short-sighted attempt that to hurt our community. I appreciate your review
of the impact of natural gas on our local environment and world climate. Scientists, our governor, world leaders and the majority of citizens of the Puget Sound region know that we cannot allow any further fossil fuel infrastructure to be built and must RAPIDLY transition to renewable energy sources.

I request that you complete the draft SIES report, reissue it, and then reset the public comment period so that we have time to review the completed report thoroughly.

Thank you for your consideration.
Sincerely,

Ann H. Steel, MD, MA, LMHC

Subject: Tacoma LNG fracked gas storage and refinery project.
Date: Saturday, November 17, 2018 4:32:17 PM

Dear Puget Sound Clean Air Agency (PSCAA),

Stop the proposed Tacoma LNG fracked gas storage and refinery project. PSCAA holds the power to approve or deny the final permit for this disastrous project.

These are just some of the shortcomings developed by a coalition of groups including Advocates for a Cleaner Tacoma (ACT), Sierra Club, 350 Seattle, Washington Physicians for Social Responsibility (WPSR) and 350 Tacoma. One could bring up any of these in a comment:

- **The Draft SEIS is Incomplete** – The current version of the draft SEIS does not contain all the information we, the public, need to fully assess the accuracy of this study and the predicted impact of the LNG facility. There are at least 10 places in the study that have "placeholder" values instead of actual data. We request that the PSCAA complete the draft SEIS, re-issue it, and then reset the public comment period so that we may better formulate our questions about this project.
- **SEIS is Using Outdated Methane Global Warming Potential Value** – They did not use the best available science for the Global Warming Potential (GWP) value for methane. GWP is a measure of potency for a greenhouse gas and it is measured against carbon dioxide (CO2). CO2 has a GWP value of 1. Methane, however has a much larger GWP value. They are using the 2007 value of 25 for the 100-year number (i.e. the value average over 100 years), whereas they should be using the 2016 value of 32. Everything else being equal, making this one modification in their models makes the LNG plant dirtier from a greenhouse gas emissions perspective than staying with the heavy fuel oil.

Report	20-year GWP	100-year GWP
2007 IPCC AR4	72	25
2013 IPCC AR5	86	28
2016 Scientific Study (authors include lead from 2013 study)	96	32

- **Analysis is based on 100-year, not 20-year, global warming potential (GWP) values** – They base all of their analysis on the 100-year GWP of methane, whereas, given the IPCC report that was released on Monday indicating that we must change our energy fuel mix in the next 12 years or face dire consequences in 22 years, they should be using the 20-year numbers, as that is the timeframe where action is needed. Using the most recent 20-year value of 96 makes the LNG plant 150% dirtier than the current capability.
- **Questionable claims that B.C. fracked gas is as clean as they claim –** They indicate that the fracked gas from B.C. has a much smaller leakage rate. However they fail to incorporate 2017 and 2018 analyses showing that a large percentage of the fracked gas wells are underreporting their methane leakages.
- **What assurances do we have that all of the fracked gas would come from BC?** They claim that all of the natural gas will be coming to the plant from British Columbia. However, just as we saw on Wednesday with the natural gas pipeline explosion in BC, they were able to use natural gas from North Dakota. The methane leak estimates from North Dakota are noticeably higher than those reported from B.C. We have no guarantees that the gas used would come from BC. Of note, per their 2017 10K filing with the Securities and Exchange Commision (SEC), in 2017 they obtained gas from British Columbia (54.8%), Alberta (19.1%) and the United States (26.1%).
- **Analysis assumes credit for extra maritime customers that currently do not exist –** The analysis appears to assume that Puget LNG (the for-profit arm of this venture that will be selling the LNG to maritime customers) already has additional maritime customers, and so is claiming greenhouse gas emissions reduction credit for them. They have no such customers and so cannot legitimately claim such credit.
- **Questionable Methane Slippage Rates for TOTE Vessels –** It appears that they are using smaller methane slippage rates (the amount of unburned methane that will escape into the atmosphere through the exhaust system) for the TOTE maritime vessels that will be burning the LNG. In fact, even in PSE's own greenhouse gas life cycle analysis that they completed and is provided as part of this report, their external peer reviewer questioned PSE's assumption on their methane slippage rate indicating that they should be using the higher rate as that is considered best practice.
- **Analysis does not incorporate diesel emissions for transporting sand/water to the fracked wells** –

1827-1 10. LCA Calculations

In August my wife and I moved to Tacoma one thing we most looked forward to was living in a State that cared for the air and environment (as compared to Utah where multiple counties routinely fail air quality limits). Imagine my disappointment when I learned of the LNG facility only a few miles away.

I urge you to revisit the SEIS using up to date science, not cutting corners, and taking at all possible Situations.

I also urge you to Respect the Puyallup tribe. Do not issue this permit people are worth more than money. Supporting the LNG facility is putting individual wealth over our fellow humans.

Subject: Tacoma LNG SEIS Project Comment
Date: Wednesday, October 24, 2018 11:55:06 PM

Dear Responsible Official,

This LNG infrastructure would constitute an ecological disaster at every step in the life-cycle of the gas, from its drilling, through transport, to combustion. The Tacoma LNG export project would frustrate the maintenance of a planet that can sustain human life, serve no other valid purpose, and must therefore be rejected. We are rapidly crossing climate thresholds of no recourse, and will ordain an indefinite increase in carbon by locking in long-term gas projects. Our survival over the coming centuries depends upon moving rapidly toward a lower-carbon economy. This mathematically requires that the large majority of methane reserves remain securely underground. If this goal is to have any meaningful policy expression, then PSCAA cannot permit this project.

Fracked gas is not a lesser evil. Scientists' understanding of methane's impact on the climate continues to evolve, and at every step along the way we learn that fracking allows more methane escapement than we had previously observed and that the impact of methane on the climate, particularly in the short term, is even more serious than had been previously understood.

I applaud your decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct this more rigorous analysis. Thank you.

I urge you to revise the analysis to account for the following:

1. Methane should be counted as 86 times more potent than CO2 based on the current IPCC analysis (AR5 rather than AR4) considering a 20 year timeframe (rather than the 100-year).

2. Revise the analysis of the impacts of fracking in British Columbia based on recent research(1) demonstrating that methane escapement has been dramatically under-estimated.

3. Revise the "no-action alternative" to include a clean energy alternative in which PSE provides electricity not with a different source of fracked gas, but with renewable energy and energy efficiency.

4. Revise the "no-action alternative" to include the assumption that Tote Marine will achieve a 50% GHG reduction, in line with the International Maritime Agency's established goals. This reduction might alternatively be achieved by a combination of fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion or many other alternatives besides fracked LNG.(2) For clean local emissions requirements, Tote Marine can achieve virtually all of the localized lower-particulate and lower SOx and NOx benefits claimed for LNG propulsion by opting for low-sulfur marine gas oil over heavy fuel oil, and installing selective catalytic reducers and diesel particulate filters.(3)

5. This more accurate analysis will show that the project has a significant and unmitigated impact on the global climate, which
should be seen as a sufficient basis for denial of the Notice of Construction application.

Thank you for your time and consideration of these comments.

Subject: Comment to Draft Supplemental Environmental Impact Statement
Date: Thursday, November 8, 2018 8:11:50 AM

Dear Puget Sound Clean Air Agency,

For over twenty years I have owned property and lived in the same (98421) zip code as the proposed LNG plant. I am familiar with the area.

In that time I have seen Tacoma clean up its aroma, its crime and start to address its lack of a downtown core. Because of these achievements I have started to believe that Tacoma's trajectory was UP

The LNG plant, as it is currently proposed, does not fit with my hopes and vision for Tacoma's future.

The Jobs often cited are not economically more productive to the local economy than building and staffing a new 7-11 store.

The environmental questions you are expert in and have heard amply addressed are real. Please review the accuracy of the science in the SEIS presented to you.

My request is that you reject this SEIS for scientific reasons, while knowing that the ordinary, informed and caring citizens of Tacoma, including me, support that decision for the future of Tacoma.

Thank You,

Rick Semple

Subject: Tacoma LNG Terminal
Date: Tuesday, October 30, 2018 6:43:00 AM

Hello,

I am writing to express my opposition to the proposed Puget Sound Energy LNG Terminal at the Port of Tacoma. We don't need an export terminal in Puget Sound for British Columbia gas. Let the Canadians figure that out for themselves.

The draft SEIS for the project is not complete and contains at least 10 “placeholder” values instead of actual data. One of these is related to the Global Warming Potential (GWP) value for methane.

The project itself is proposed to be located on disputed Puyallup Tribal lands and is being built without their consent.

I believe that the PSCAA should complete the draft SEIS and address these and other issues relating the the project's potential impact on global climate change. In particular the analysis should assess both 20 year and 100 year impacts, especially in view of the Intergovernmental Panel on Climate Change report that establishes the need for urgent action to reduce carbon emissions in the next two decades. Then the PSCAA should re-issue the SEIS, and reset the public comment period.

Sincerely,

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

As a grandparent, I could not be more worried about the drastic climate changes we are already seeing. As one small example, the fires in CA are out of control- and this is in November! The terrible consequences of climate chaos are upon us and worsening rapidly.

I want to thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. With our climate in grave peril, as emphatically stated in the latest IPCC report, your review of the greenhouse gas impacts of the natural gas used in this project couldn't be more important. We now all understand that we cannot, and must not, allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources. This needs to happen in the next decade, not in the distant future. The health and very lives of our children and grandchildren depend on making the right decisions now.

The draft SEIS does not account for the full climate impacts of fracked gas. This is unacceptable and must be corrected before you decide on a permit.

A significant concern with this draft SEIS is that it is incomplete. There are several sections that are missing data and so we can not accurately assess the quality of the report and understand how certain conclusions are reached. Because of that, I respectfully request that you complete this report, reissue it, and then reset the public comment period so that we have time to review the completed report thoroughly.

There are several issues with the current draft report you issued on October 8th. It is my belief that when these issues are given proper attention and addressed with best available science, it will show that the marginal improvements in emissions the study claims will disappear and the project will in fact be worse for the climate than doing nothing at all.

Here are some of the issues as I understand them:

- The SEIS is not using the best available science for the Global Warming Potential (GWP) of methane.
-It uses the UN 2007 value for GWP of 25 for the 100-year value, where you should be using the 2016 value of 32. This single modification in the modeling of GHG emissions makes the proposed plant dirtier to our air and climate than if the LNG plant is not built.
-Methane is much more potent in the short-run, but the SEIS analysis only looks at the long-term impact.
-It uses the 100-year GWP of methane and not the 20-year value which is much more relevant

given the urgency in addressing the climate crisis. The appropriate 20-year GWP value to use is 96.
- This facility is projected to have a 40 year lifespan, so why does the report project out to 100 years, which is 90 years beyond the time we need to have taken decisive action?
- The SEIS claims emissions benefits from customers that Puget Sound Energy simply does not have. According to PSE and the City of Tacoma, the only maritime customer is TOTE with its two vessels which have already delayed their conversion to consume LNG. Securing new customers (there are only just over 100 LNG ships in operation out of a worldwide fleet of 90,000) as well as the additional permitting could take years and is not guaranteed.
- The SEIS says that emissions will only be reduced if the natural gas comes from Canada, because leakage rates are reportedly lower there than in the US. Shockingly, most leakage rates were self-reported by the fossil fuel industry based on models and recent measurements taken in the field have shown that leakage rates are much much worse.
-If later studies show that actual leaks are much greater, what will happen? Will the facility stop operations until the data from new studies are calculated?
- How can it be guaranteed that PSE is sourcing its gas from BC anyway? Their recent filings show they relied on gas from BC, Alberta, and the US. And with the recent pipeline explosion in BC that interrupted PSE's supply, we know it's not always available.
- When ships use any fuel, a certain percentage of it escapes without combusting through the exhaust system and into the atmosphere. This is known as slippage and the SEIS uses a lower rate than is considered best practice. Even in PSE's own GHG life cycle analysis, the external peer reviewer raised the issue of inaccurate slippage assumptions. PSE should use the higher rate that is considered best practice.
-At public information meetings in 2017, the Air Agency stated that the facility would release ammonia, arsenic, cadmium, sulfur dioxide, and hydrogen sulfide. These contributions to air pollution, in any amount, degrade air quality. Furthermore, the proposed vaporizer unit would release VOCs. The health of surrounding communities will be adversely impacted. This is not acceptable.
-The proposed project is an assault on the Puyallup Tribe's rights and community health.

For all these reasons and more, I urge and implore you to consider the negative effects of this proposed plant. We need to pivot rapidly to use of safer renewable energy and widespread efforts to reduce energy use through conservation programs of all types. You have an important role to play now. Future generations depend on our wise decisions.

Thanks again for initiating this crucially important review of this facility and I hope that you will take the best available science into consideration when revising this draft SEIS.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

I have personally stood by the Pullyalup tribe on this opposition to the LNG project.
We feel the project has not utilized any channels of communication for permitting, public safety, or right to build. This build breaks laws on the land it is founded.
I object the continuation of this storage facility and request denial of Any further analysis.
Safety for surrounding Puget Sound residence is in jeopardy with this gas facility. With rising water levels that scientists are predicting, and potential meltdown of this enormous facility it's not safe.

Subject: Tacoma LNG SEIS Project Comment
Date: Tuesday, October 23, 2018 9:21:52 AM

Dear Responsible Official,

Puget Sound Energy and Tote Marine seem to imagine that a clean energy future can be arrived at by digging the fossil fuel hole deeper. This proposed LNG project is another step toward climate chaos at a moment when the IPCC has given us a clear warning that we must urgently move away from fossil fuels. It is disappointing to know that this huge structure may be built to store fracked natural gas. This is another example of what is happening to cause climate change. In addition, natural gas is dangerous in that it can
easily explode causing a wide range of damage including killing people. A safer method such as wind and solar definately should be studied more. We seem to presently be witnessing more climate change affects this year and it is concerning.

Fracked gas is not a lesser evil. Scientists' understanding of methane's impact on the climate continues to evolve, and at every step along the way we learn that fracking allows more methane escapement than we had previously observed and that the impact of methane on the climate, particularly in the short term, is even more serious than had been previously understood.

I applaud your decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct this more rigorous analysis. Thank you.

I urge you to revise the analysis to account for the following:

1. Methane should be counted as 86 times more potent than CO2 based on the current IPCC analysis (AR5 rather than AR4) considering a 20 year timeframe (rather than the 100-year).

2. Revise the analysis of the impacts of fracking in British Columbia based on recent research(1) demonstrating that methane escapement has been dramatically under-estimated.

3. Revise the "no-action alternative" to include a clean energy alternative in which PSE provides electricity not with a different source of fracked gas, but with renewable energy and energy efficiency.

4. Revise the "no-action alternative" to include the assumption that Tote Marine will achieve a 50% GHG reduction, in line with the International Maritime Agency's established goals. This reduction might alternatively be achieved by a combination of fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion or many other alternatives besides fracked LNG.(2) For clean local emissions requirements, Tote Marine can achieve virtually all of the localized lower-particulate and lower SOx and NOx benefits claimed for LNG propulsion by opting for low-sulfur marine gas oil over heavy fuel oil, and installing selective catalytic reducers and diesel particulate filters.(3)

5. This more accurate analysis will show that the project has a significant and unmitigated impact on the global climate, which
should be seen as a sufficient basis for denial of the Notice of Construction application.

Thank you for your time and consideration of these comments.

Subject: Puget Sound Energy LNG Project
Date: Monday, November 12, 2018 11:08:13 PM

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

Thank you so much for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. With our climate changing so drastically, as urgently stated in the latest IPCC report, your review of the greenhouse gas impacts of the natural gas used in this project are extremely necessary. Those scientists make clear that we cannot, and must not, allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.

My first concern with this draft SEIS is that it's incomplete. There are several sections that are missing data and so we can not accurately assess the quality of the report and understand how certain conclusions are reached. Because of that, I request that you complete this report, reissue it, and then reset the public comment period so that we have time to review the completed report thoroughly.

With that said, I am aware of several issues with the current draft report you issued on October 8th. It is my belief that if these issues are given proper attention and addressed with best available science, it will show that the marginal improvements in emissions the study claims will disappear and the project will in fact be worse for the climate than doing nothing at all.

Here are some of the issues as I understand them:

-SEIS is not using the best available science for the Global Warming Potential (GWP) of methane. It uses the 100-year GWP of methane and not the 20-year value which is much more relevant given the urgency in addressing the climate crisis. The appropriate 20-year GWP value to use is 96.

- This facility is projected to have a 40 year lifespan, so why does the report project out to 100 years, which is 90 years beyond the time we need to have taken decisive action?

- The SEIS claims emissions benefits from customers that Puget Sound Energy simply does not have. According to PSE and the City of Tacoma, the only maritime customer is TOTE with its two vessels which have already delayed their conversion to consume LNG. Securing new customers (there are only just over 100 LNG ships in operation out of a worldwide fleet of 90,000) as well as the additional permitting could take years and is not guaranteed.

- The SEIS says that emissions will only be reduced if the natural gas comes from Canada, because leakage rates are reportedly lower there than in the US. Shockingly, most leakage rates were self-reported by the fossil fuel industry based on models and recent measurements

taken in the field have shown that leakage rates are much much worse.

-What assurances do we have that all of the fracked gas would come from BC? The claim is that all of the natural gas will be coming to the plant from British Columbia. However, just as we saw on Wednesday with the natural gas pipeline explosion in BC, natural gas was used from from North Dakota. The methane leak estimates from North Dakota are noticeably higher than those reported from B.C. We have no guarantees that the gas used would come from BC. Of note, per their 2017 10K filing with the Securities and Exchange Commision (SEC), in 2017 they obtained gas from British Columbia (54.8%), Alberta (19.1%) and the United States (26.1%).

- When ships use any fuel, a certain percentage of it escapes without combusting through the exhaust system and into the atmosphere. This is known as slippage and the SEIS uses a lower rate than is considered best practice.

-There are questionable Methane Slippage Rates for TOTE Vessels – It appears that they are using smaller methane slippage rates (the amount of unburned methane that will escape into the atmosphere through the exhaust system) for the TOTE maritime vessels that will be burning the LNG. In fact, even in PSE's own greenhouse gas life cycle analysis that they completed and is provided as part of this report, their external peer reviewer questioned PSE's assumption on their methane slippage rate indicating that they should be using the higher rate as that is considered best practice.
Analysis does not incorporate diesel emissions for transporting sand/water to the fracked wells – Fracking requires large consumption of water and sand for its operations, however GHG emissions from these diesel trucks were not included in the analysis

Analysis assumes credit for extra maritime customers that currently do not exist – The analysis appears to assume that Puget LNG (the for-profit arm of this venture that will be selling the LNG to maritime customers) already has additional maritime customers, and so is claiming greenhouse gas emissions reduction credit for them. They have no such customers and so cannot legitimately claim such credit.

Thanks again for initiating this crucially important review of this facility and I hope that you will take best available science into consideration when revising this draft SEIS.

Sincerely,
Tobi

Subject: Comment on Tacoma LNG SEIS
Date: Thursday, November 1, 2018 4:20:22 PM

Dear Puget Sound Clean Air Agency,

Liquid natural gas is not a better choice than oil for the climate.
Natural gas is said to be clean, but this is misleading. When natural gas burns, it releases 55% as much carbon dioxide as burning coal and 80% as much carbon dioxide as burning gasoline. Natural gas is about 95% methane, which is much more warming than carbon dioxide. Even if leakage could be kept to 3%, the effect of natural gas use on the climate would be worse than the use of oil or coal and even worse than that, counting the additional energy needed to compress and store natural gas, Since 2006, methane emissions have been rising significantly, correlating with the increase in fracking.
With the speed of development of batteries, solar electricity and other alternative clean energy, the money invested in an LNG plant may not prove profitable. General Electric just announced a $23 billion decrease in value because of their investment in natural gas turbines which proved non-competitive against clean energy.
It is our moral responsibility to drastically cut carbon emissions . Thank you.

Thank you for conducting a supplemental environmental review of the greenhouse gas emissions for PSE's proposed LNG facility on the Tacoma Tideflats.

As a member of Earth Ministry/Washington Interfaith Power & Light, which has been working closely with scientists and policy experts to review the SEIS, I am concerned that the document does not fully analyze the climate impacts of this project.

Please address the following in the Tacoma LNG SEIS:

1. Methane's impact on climate – The SEIS uses a dated value for the 100-year Global Warming Potential (GWP) for methane from 2007 when updated values were published 2013 and then again in 2016. Using the best available science shows the plant would have higher greenhouse gas emissions. Additionally, given the short timeframe required to address climate change as recently noted by the United Nations, the SEIS should use the 20-year GWP for methane, which shows that the plant will be more than 50% dirtier over the next two decades.

2. Source of fracked gas – It is a false assumption that British Columbia would be the only gas source for this facility and this requirement is not enforceable. In addition, the SEIS relies upon self-reported pollution data on BC gas from the fossil fuel industry. It also failed to incorporate multiple, recent independent studies showing methane pollution rates as much higher than those reported by the fossil fuel industry.

3. Lack of alternative options – TOTE is already using ultra-low sulfur diesel (ULSD) and other companies are also using ULSD or scrubbers to meet emission requirements. The no action alternative assumes that LNG is required for TOTE to meet its emission requirement, when these alternatives already exist and are in use.

4. Alterations to the original proposal – Deviating from PSE's proposal, the SEIS included bunkering more than the two TOTE vessels on the Blair Waterway. The SEIS should instead provide an analysis using only secured customers.

5. Incomplete information – Use of placeholder values, incorrect units of measurement, and the stated need for more data from PSE makes the analysis incomplete and hard to follow. The draft SEIS should be thoroughly edited and released for a new full public comment period.

The Puyallup Tribe, citizens of Tacoma, and residents of the Salish Sea have a right to know the total local and global impacts of this proposal. With missing data and alterations to the project, this draft SEIS does not account for full climate impacts.

0976-1 17. LCA Inputs and Assumptions - Peak Shaving
0976-2 3. Outside of SEIS Scope
0976-3 3. Outside of SEIS Scope

Dear PSCAA Nov 21, 2018

I would like to make additional comments about the DEIS for the LNG plant being constructed by PSE in Tacoma.

After a thorough review and several other letters, I felt that several more comments were necessary.

While the DSEIS was suppose to contain information about the air emissions, PSE also included much more. Specifically, they changed the description to make the project more economically feasible for them. Additional trucking, additional barging and additional capacity were all added without review. The need for peak shaving was redefined. The original spiel told the public that the peak shaving was needed to protect the natural gas consumers from low gas pressure in the consumer's lines due to large usage during cold winters. Now the story has changed to, peak shaving is required to run gas turbines to generate more electricity on cold days. It appears the customers for the peak shaving has changed from gas customers to electric customers. If this is the case, their need for peak shaving will be invalid. They do not need extra gas capacity during the several coldest winter days, they need extra electrical capacity. Any claim that LNG was cheaper than building new pipelines should be voided because there has been no claim of a need for extra electrical lines. Until it is proven that the requirement for electrical demand can not be met with additional purchased electricity, all their claims are void. The need for the public to spend $133 million of the $310 million for plant would be improper. The need for the gas customers to spend any capital to build a plant that will support the electrical customers of PSE is probably illegal.

The equally bad side of the economics is that PSE is now trying to proposing building a 500,000 gallon plant instead of the 250,000 gallons originally proposed. I do not know if they plan on increasing the cost of the plant while doubling the capacity, but I would imagine that the percentage of the cost of the plant the public will be required to pay will not change.

While PSCAA should be looking at the air emissions, these changes in the economics can not be ignored or allowed. This DSEIS will only get your review and it will be upon you to determine if the entirety has changed sufficiently to warrant not approving it. It appears that they have tried to put in too many changes that the original FEIS is no longer valid and the new DSEIS can not be approved.

Thanks for your consideration.

Subject: Additional comments on PSE LNG DSEIS
Date: Monday, November 19, 2018 8:02:42 AM
Attachments: Dear PSCAANov 19 V2.docx

Dear PSCAA Nov 19, 2018

I would like to make some additional comments about the DSEIS performed on the proposed LNG being built by PSE in Tacoma.

I very much appreciate the efforts of PSCAA to investigate the emissions created by both the upstream and downstream sources. I submitted many requests to the City of Tacoma stating that it had been ignored and was required by law. It is obvious when these impacts are included, the emissions become much worse.

I understand that your agency is primarily involved with the air emissions and that the Supplemental EIS that you required would analyze the “air emissions”. You are put in a difficult position due to the fact that the DSEIS rewrote the definition of the project and included additional elements that were not in the original FEIS.

First, this SEIS should not allow any changes because it is only a supplemental review of the air emissions described in the FEIS. Additional capacity, additional trucking, additional barging, etc. are not part of the original FEIS.

Second, the changes/additions to the SEIS have many more implications besides the air emissions. For example, all the safety analysis was done on a 250,000 ton per day basis. If the new SEIS wants to assume a 500,000 ton per day capacity, a completely new safety analysis would be required. This was not included in the SEIS and I do not think PSCAA would be the proper agency to review it.

The same could be said for the economics section that is required in any EIS. The SEIS described a larger capacity plant that had more trucks, more barging and more customers. The SEIS makes assumptions about potential new customers that are currently non-existent. These kinds of added assumptions would be hard for any agency to evaluate. This is also something that PSCAA is not designed to deal with.

Overall, I find it easy to reject the SEIS on the increased air emissions. There are several very obvious errors that prove that the SEIS is wrong. (The misuse of the British Columbia methane leakage rate, the 100 year timeframe for greenhouse gas equivalents and many others that I submitted in my previous letter.)

Neglecting the air emission portion, the SEIS should be completely rejected due to the additions and changes to the FEIS that can not be substantiated. If these are actual changes that PSE wants to include at this late date, it would require a completely new EIS so that all the implications could be evaluated. It is unlawful to put all these new issues in the FEIS that is only being done to look at the upstream and downstream air emissions. The safety and economic areas that are being impacted should require analysis by the appropriate agencies.

It appears the only three choices that I could see being made;

-[if !supportLists]-->1. 1. <!--[endif]-->Reject the whole SEIS due to the large increases in GHG calculated by using the correct BC methane leakage rate and the 20 year GWP instead of the 100 year.

-[if !supportLists]-->2. 2. <!--[endif]-->Have the SEIS redone using only the project description approved in the FEIS and not all the additions that were made in the SEIS. It would be a clean assessment appropriate for the PSCAA request to include the upstream and downstream emissions.

-[if !supportLists]-->3. 3. <!--[endif]-->Reject the whole SEIS on the grounds that the changes in capacity,

distribution and customers were significant enough to require a complete analysis. This would include new safety studies, new economic studies and impacts on the community.

I can not see any scenario that this SEIS can be approved. The flaws, additions and the omissions are too great to make it acceptable.

Thank you for your attention to this very serious matter. I hope you agree with my analysis.

The SEIS makes assumptions about potential new customers that are currently non-existent. These kinds of added assumptions would be hard for any agency to evaluate. This is also something that PSCAA is not designed to deal with.

Overall, I find it easy to reject the SEIS on the increased air emissions. There are several very obvious errors that prove that the SEIS is wrong. (The misuse of the British Columbia methane leakage rate, the 100 year timeframe for greenhouse gas equivalents and many others that I submitted in my previous letter.)

Neglecting the air emission portion, the SEIS should be completely rejected due to the additions and changes to the FEIS that can not be substantiated. If these are actual changes that PSE wants to include at this late date, it would require a completely new EIS so that all the implications could be evaluated. It is unlawful to put all these new issues in the FEIS that is only being done to look at the upstream and downstream air emissions. The safety and economic areas that are being impacted should require analysis by the appropriate agencies.

It appears the only three choices that I could see being made;

1. Reject the whole SEIS due to the large increases in GHG calculated by using the correct BC methane leakage rate and the 20 year GWP instead of the 100 year.
2. Have the SEIS redone using only the project description approved in the FEIS and not all the additions that were made in the SEIS. It would be a clean assessment appropriate for the PSCAA request to include the upstream and downstream emissions.
3. Reject the whole SEIS on the grounds that the changes in capacity, distribution and customers were significant enough to require a complete analysis. This would include new safety studies, new economic studies and impacts on the community.

I can not see any scenario that this SEIS can be approved. The flaws, additions and the omissions are too great to make it acceptable.

Thank you for your attention to this very serious matter. I hope you agree with my analysis.

Attachments: Dear PSCAA LNG Comments Nov 15.docx

Attached are my comments about the inadequacies of the DSEIS done for the Tacoma LNG plant being proposed by PSE.

Please take them into consideration. The DSEIS is fatally flawed and should not be approved.

Thanks

Steven Storms

1097-1 13. LCA Inputs and Assumptions - Natural Gas Source
1097-2 1. Determination of SEIS Scope - Comparison to FEIS

Dear PSCAA Nov 15, 2018

I am writing in response to the recent Draft SEIS done for the LNG plant being proposed by Puget Sound Energy in Tacoma. I am a retired Chemical Engineer and PE with over 40 years experience in the energy and environmental field. I was totally dismayed at the biased DSEIS report that was just published. To me, it was intuitively obvious that an unbiased SEIS would conclude that LNG produced from fracking wells has a very detrimental impact on Greenhouse Gas emissions. This is be both locally and globally. The warped logic and the outdated assumptions make the DSEIS a total farce. It appears that the company that wrote the DSEIS tried to figure out some possible way to make assumptions that would lead to the conclusion that LNG was beneficial. I find their whole report erroneous, with the intent to mislead the public and your agency. I know this is harsh criticism, but it is my firm belief, backed by over 40 years experience.

Let me now explain my reasoning.

1. As the DSEIS states several times, the only reason they can conclude LNG can lower CO2 emissions is due to the extremely low methane fracking emissions achieved in British Columbia. If the natural gas were to be supplied from anywhere else, the emissions would be so high that it would reverse their conclusion. -- Newsflash!!! The assumption that British Columbia has lower methane leakage rates has been dispelled for several years. In fact there was a big scandal because the government withheld the information for 4 year until a journalist discovered the cover up. The new results show the BC methane leakage rate is at least 2.5 times higher than previously reported.
https://cleantechnica.com/2017/05/16/british-columbia-albertas-methane-emissions-drastically-reported/?fbclid=IwAR02CI8XEl30ChIov9W59xTgmGMSu5TMolz1tVDUnkA4nHgY5hw1zGXG4H4
https://thenarwhal.ca/unreported-emissions-natural-gas-blows-british-columbia-s-climate-action-plan-bc-s-carbon-footprint-likely-25-greater
https://thenarwhal.ca/b-c-coughs-up-fracking-report-four-years-late-only-after-leaked-journalist

Even the use of natural gas coming exclusively from British Columbia is questionable and is a new assertion that was not in the original FEIS. Originally it was reported in the FEIS as coming from Alberta, British Columbia and the Rocky Mountain States.

3.11.3.8 Natural Gas Natural gas service is provided by PSE in the vicinity of the Project. PSE is Washington State's oldest energy company and provides natural gas services to approximately 770,000 natural gas customers across six counties, including Pierce County (PSE 2014b). The City of Tacoma, City of Fife, and unincorporated Pierce County are located within PSE's Pierce County service area. PSE's natural gas supply is delivered to Washington via interstate transmission pipelines owned and operated by third parties, and the natural gas is provided by suppliers in Alberta, British Columbia, and the Rocky Mountain states. The natural gas supply conveyed through to PSE is then distributed to customers through approximately 21,000 miles of PSE-owned gas distribution mains and service lines (PSE 2015).

1097-3 12. LCA Inputs and Assumptions - Global Warming Potential Value
1097-4 12. LCA Inputs and Assumptions - Global Warming Potential Value
1097-5 12. LCA Inputs and Assumptions - Global Warming Potential Value

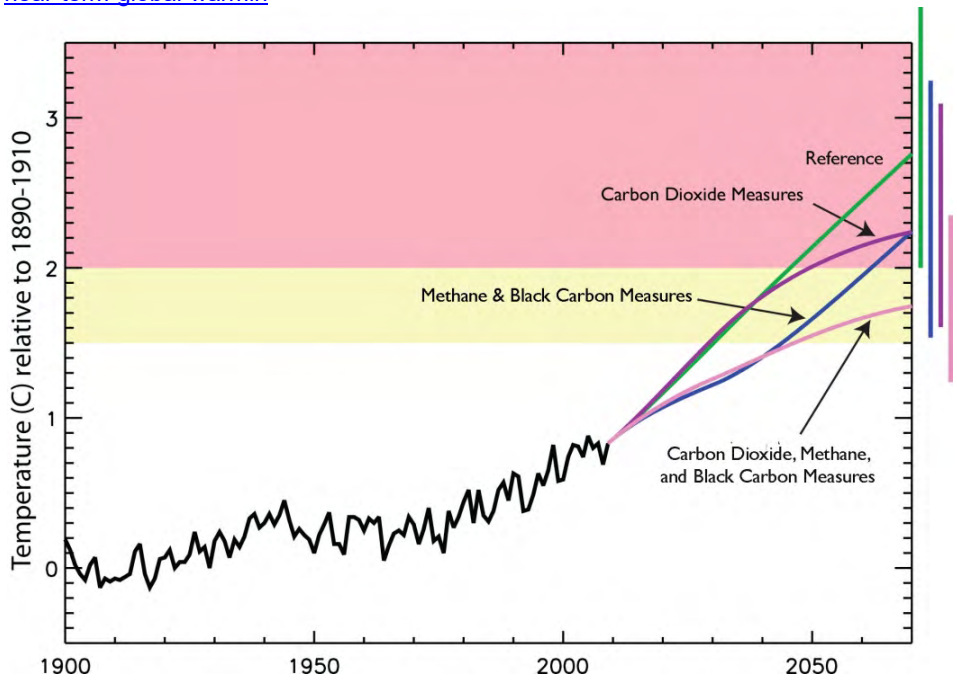
2. While the use of 100-year Global Warming Potential (GWP) is probably the most common measurement, the 20-year measurement also has a lot of merit. Even the International Panel on Climate Change (IPCC) says that there is no scientific argument for selecting 100 years compared to other choices. The choice of time horizon is a value judgement. With the new United Nations report, it is clear that drastic climate change is much closer to the 20 year time frame than the 100 year. My value judgement would lean much closer to the 20 year time frame and should be used. If the 100 year measurement is mentioned, it should only be used as a comparison.

I think Drew Shindell of NASA said it best at the Goddard Institute for Space Studies: "If you believe limiting near-term climate change is an important goal for society, then it makes sense to pay attention to the 20-yr value (105X)."

https://thinkprogress.org/how-the-epa-and-new-york-times-are-getting-methane-all-wrong-eba3397ce9e5/
The brand new IPCC report agrees that the "Planet has only until 2030 to stem catastrophic climate change". It will be well past the ability to influence climate change in 100 years.
https://edition.cnn.com/2018/10/07/world/climate-change-new-ipcc-report-wxc/index.html

3. The SEIS should show the impact of the LNG project on the environment. The project has a 25 year lease with the option for an additional 25 years. To make the correct analysis of the impact, it would seem obvious that one or both of these contract lengths should be used. While I believe that the 20 year GWP is the correct assumption, it is clear that using the 100 year assumption has no possible relevancy. Any analysis beyond the contract length of 25 or even 50 years would be pure fantasy. (A 20 - 40 year timeframe is also mentioned.)

4. If the report is going to rely on the 100-year GWP at least they should get it right by using the most current number. The Fifth Assessment from the IPCC claims a 34 GWP for methane instead of the 30 or 25 used in the SEIS. (It appears possible that the SEIS is actually using 25 as the GWP, which is about 5 years outdated.) This would be a 36% increase and this alone is sufficient to change the SEIS conclusion.
From the EPA,the GWP for methane is between 28 -36.



https://www.epa.gov/ghgemissions/understanding-global-warming-potentials

Are there alternatives to the 100-year GWP for comparing GHGs?
"The United States primarily uses the 100-year GWP as a measure of the relative impact of different GHGs. However, the scientific community has developed a number of other metrics that could be used for comparing one GHG to another. These metrics may differ based on timeframe, the climate endpoint measured, or the method of calculation.
For example, the 20-year GWP is sometimes used as an alternative to the 100-year GWP. Just like the 100-year GWP is based on the energy absorbed by a gas over 100 years, the 20-year GWP is based on the energy absorbed over 20 years. This 20-year GWP prioritizes gases with

1097-6 3. Outside of SEIS Scope
1097-7 1. Determination of SEIS Scope - Comparison to FEIS

shorter lifetimes, because it does not consider impacts that happen more than 20 years after the emissions occur. Because all GWPs are calculated relative to CO2, GWPs based on a shorter timeframe will be larger for gases with lifetimes shorter than that of CO2, and smaller for gases with lifetimes longer than CO2. For example, for CH4, which has a short lifetime, the 100-year GWP of 28–36 is much less than the 20-year GWP of 84–87."

5. In order to prevent either the 1.5 or 2.0 degree C temperature rise described in both the Paris Climate Accord and the UN study, methane plays a crucial part. In this NASA graph it shows the only way to meet the temperature targets is by reducing methane emissions. All other methods will exceed the targets. It does not take much forethought to realize that replacing one fossil fuel with another will have very little impact on CO2 emissions. http://www.climatecentral.org/news/groundbreaking-new-study-shows-how-to-reduce-near-term-global-warmin

6. While the City of Tacoma did not think a SEIS was warranted, they tried to make clarifications through the use of the "Frequently Asked Questions". This FAQ process addressed many of the concerns brought up by the public. Often the city had to go to PSE to get a firm answer. This method did not always seem appropriate to handle questions, but it was the way the City chose in order to keep from requiring a Supplemental EIS. The response from the FAQs should

1097-8 1. Determination of SEIS Scope - Comparison to FEIS
1097-9 1. Determination of SEIS Scope - Comparison to FEIS
1097-10 1. Determination of SEIS Scope - Comparison to FEIS

therefore be taken as an extension of the FEIS. That is also where the new DSEIS differs drastically from the claims made by the City in the FAQ section. Either the City is wrong or the new SEIS is drastically different than what the City approved and presented to the public.

7. When looking back at the Frequently Asked Questions (FAQ) in July listed in the City of Tacoma website, it is obvious that the scope of the LNG project has been changed in the DSEIS.

"Can the Project Change Without Additional Review?

The FEIS analyzed a defined scope of the project as proposed by Puget Sound Energy, which has been carried through to the Shoreline Substantial Development permit and other permits:

- One loading arm and platform to serve only the TOTE vessels in the Blair Waterway;
- Stormwater infrastructure and pier surface removal in the Hylebos Waterway;
- Construction of the LNG liquefaction facility;
- Extension of a natural gas pipeline to the site; and
- Distribution of product using up to two tanker trucks per day.

When Puget Sound Energy submits a building permit it will be reviewed for consistency with the proposed project in the FEIS. If anything beyond that scope is proposed or there are substantive changes to the project that are likely to have significant adverse environmental impacts, additional review will be required to determine if the changes, and the likely impacts therefrom, are significant. For example, serving additional vessels in either the Blair or the Hylebos Waterway will require additional infrastructure in the shoreline, since that part of the project, as originally proposed, has now been removed. This will require a new shoreline permit (with a public notice and review process) and concurrent environmental review."

http://www.cityoftacoma.org/cms/One.aspx?portalId=169&pageId=113653

All new mentions of additional barging, additional trucking and even the thought of increasing the capacity from 250,000 gallons of LNG per day to 500,000 gallons has been illegally added. Either the City of Tacoma did not understand what they approved or PSE misrepresented the project.

Let me point out several changes from the FEIS or misunderstandings that the City of Tacoma made.

A. Plant capacity that is being permitted.

In the FAQ section, the question was asked about the plant capacity. This was due the uncertainty raised by the range in the FEIS spanning from 250,000 gallons to 500,000 gallons. This is the reply from the City.

- "What Production Thresholds Were Used in the Air Quality Analysis?

In several places in the FEIS, the daily production capacity of the LNG plant is listed as a range of 250,000 – 500,000 gallons per day. The question has been asked about which production level was used to generate the emissions analysis in the air quality impacts section of the FEIS. PSE has confirmed that the production limit of the plant as currently designed is 250,000 gallons per day; the plant is not capable of producing more LNG daily than that.

Any increase in production would require an expansion of the plant, which would require additional permitting and applicable environmental review. A 500,000-gallon production capacity would be predicated on additional customers, which would also have additional infrastructure needs and/or trip generation with additional review and permitting."

The part about "With additional review and permitting" seems to be absent in the new DSEIS because it was added with no additional review or permitting.

B. Trucking

While the new SEIS talks about trucking to haul LNG to other customers, in the FAQ from the city, it is quite clear that is not intended.

- What About Trucking?

1097-11 1. Determination of SEIS Scope - Comparison to FEIS
1097-12 1. Determination of SEIS Scope - Comparison to FEIS

The PSE site is located on the east side of Alexander, bordering the Hylebos Waterway. The EIS analyzed the environmental impacts of the facility. This includes an LNG storage tank, the liquefaction facility (refrigerants propane, isopentane, and ethylene), the cryogenic pipeline and loading facility for TOTE, and two truck loading bays on the west side of the facility.

Under the project as proposed, up to two tanker trucks per day would arrive empty at the Tacoma LNG Facility and leave carrying LNG to market, generally to a local user. These would service the existing peak-shaving facility in Gig Harbor, as well as other users. PSE has indicated no intent to increase trucking beyond the two trips a day analyzed in the FEIS; should trucking increase, the City would analyze the proposed increase to determine whether it requires additional review."

Again, additional trucking was added in the SEIS, which is above the two tanker truck trips per day the city claimed. This was done without any additional review by the City. If PSE wants to add new elements to the project, it should not be done during a SEIS. A totally new review of the project would be required and a completely new EIS should be required.

C. Barging

The question about additional barging has been a consistent problem. Originally, the PSE plan included a barging site on the Hylebos Waterway. When this was removed, it was stated that no additional barging would be permitted to replace the Hylebos capacity. In the FAQ section from the City, this issue was addressed several times.

- "Will the excess LNG be sold to other ships via bunker barges and ships?

According to PSE, LNG production will be dependent on market demand so LNG production would be limited to what is needed to meet TOTE's needs, trucking, and storage for natural gas peaking requirements. There are no proposals at this time to sell LNG to other ships via bunker barges, which would require additional permitting and public review."

- Outline operations at the Blair Pier. Will LNG be barged in addition to TOTE bunkering?

PSE has not advised the City of any changes to the proposed operations at the Blair Terminal as described in the FEIS Section 2.2.2 TOTE Marine Vessel LNG Fueling System. Barging LNG from the proposed new dock on the Hybelos Waterway was withdrawn from the Shoreline permit, no additional barging has been proposed by PSE."

- "What About Bunkering?

There has been some confusion caused by the term "bunkering" as it has been used in multiple contexts. The term "bunkering" applies in general to ship fueling whether from land during berthing or from water by barge. The term applies in general to any ship fueling at a dock (including TOTE ships), but is also used to describe barges which would fill and then go to another site to fuel ships (as in bunkering barges).

Bunkering from land can include fuel trucks or fixed bunkering facilities such as proposed by PSE. Bunkering from water can be done by barge or in some cases bunkering ships for refueling at sea.

The proposed dock on the Hybelos to load LNG barges was not intended for bunkering barges to be used by TOTE Marine. If the dock was constructed the purpose would be to load barges intended to deliver LNG to other customers in Puget Sound. However, after the EIS process was completed, PSE stipulated to withdraw the construction of a LNG barge dock on the Hybelos from the shoreline permit. There is no proposal to relocate bunkering of LNG barges to the Blair Waterway. Such a proposal would require additional environmental analysis under SEPA.

Further, there appears to have been some confusion regarding the use of the term "bunkering" in relation to recent conveyances of easements leading to a misunderstanding about PSE's ability to move elements of the project previously proposed on the Hylebos Waterway to the Blair.

Despite the language of the easement, such a relocation is not allowed under the shoreline permit. Any relocation would involve additional shoreline permitting, environmental assessment, and public review.

The FEIS analyzed two bunkering barges calling in the Hylebos. Relocation to the Blair might benefit from analysis of impacts due to the move, or any other change in impacts from the relocation, but no such relocation is taking place.

What About Bunkering?

There has been some confusion caused by the term "bunkering" as it has been used in multiple contexts. The term "bunkering" applies in general to ship fueling whether from land during berthing or from water by barge. The term applies in general to any ship fueling at a dock (including TOTE ships), but is also used to describe barges which would fill and then go to another site to fuel ships (as in bunkering barges).

Bunkering from land can include fuel trucks or fixed bunkering facilities such as proposed by PSE. Bunkering from water can be done by barge or in some cases bunkering ships for refueling at sea.

1097-13 1. Determination of SEIS Scope - Comparison to FEIS
1097-14 1. Determination of SEIS Scope - Comparison to FEIS
1097-15 8. No Action Alternative

The proposed dock on the Hybelos to load LNG barges was not intended for bunkering barges to be used by TOTE Marine. If the dock was constructed the purpose would be to load barges intended to deliver LNG to other customers in Puget Sound. However, after the EIS process was completed, PSE stipulated to withdraw the construction of a LNG barge dock on the Hybelos from the shoreline permit. There is no proposal to relocate bunkering of LNG barges to the Blair Waterway. Such a proposal would require additional environmental analysis under SEPA.

Further, there appears to have been some confusion regarding the use of the term "bunkering" in relation to recent conveyances of easements leading to a misunderstanding about PSE's ability to move elements of the project previously proposed on the Hylebos Waterway to the Blair.

Despite the language of the easement, such a relocation is not allowed under the shoreline permit. Any relocation would involve additional shoreline permitting, environmental assessment, and public review.

The FEIS analyzed two bunkering barges calling in the Hylebos. Relocation to the Blair might benefit from analysis of impacts due to the move, or any other change in impacts from the relocation, but no such relocation is taking place.

The addition of potential new barging, bunkering and relocating elements from the Hylebos to the Blair now seems to be the intention of PSE. According to the City, none of this would be allowed. I have underlined several of the specific statements made by the City. In no uncertain terms would any of this be allowed! Even the shoreline permitting would become invalid. Further assessment and public review are required to make these changes. How the writers could include these changes could only be at the insistence of PSE. I am sure the public, the City or even PSCAA would not have tried to make these huge changes.

Despite the assurances from the City of Tacoma, the new SEIS has added all three elements (Capacity increases, trucking and barging). Under Section 1.2 and 1.2.1 of the new DSEIS, it clearly states that the 250,000 gallons per day up to 500,000 gallons is still being proposed. It also says that bunkering barges and trucks will be used to provide fuel to other customers. This appears to be a blatant attempt to expand the project in the SEIS process without going through the permitting process. It does not appear to be as stated by the City,

- "What Changes have been made to Intended LNG Distribution Methods and Volumes?

The FEIS examined distribution to TOTE via pipeline, a pipeline to new pier on the Hybelos for LNG barges, and a LNG truck loading rack. The only change occurred when, during the Shoreline Permit appeal process, PSE withdrew the proposal to construct a new pier on the Hybelos Waterway for LNG barges. The production of LNG can be scaled up or down depending on market demand so volumes may vary, but generally would be limited to what is required by TOTE, independent trucking to end users, and maintaining storage volumes."

Nowhere does it say that additional barging would be allowed or that more than two trucks of LNG would be allowed. The City gave assurances that only 250,000 gallons would be permitted. Now the DSEIS has tried to increase all of them. This is not a SEIS of the original project, but a completely new attempt to rewrite the FEIS to give PSE more capacity and expand the transportation abilities.

8. The DSEIS seems to include new information and options. For instance, both barging and trucking options were added that were not included in the original FEIS. While I thought that new options were not going to be included, but if they are, I would like to add one more. The base case has changed since the FEIS was completed. Originally, the TOTE ships were burning normal diesel fuel. Currently they are burning low sulfur fuel to meet the new shipping emission regulations. This appears to be a solution that is readily available and is already in use. There is not a drastic need for conversion to LNG to meet emission limits. This should be the new base case.

1097-16 19. LCA Inputs and Assumptions - End Use
1097-17 19. LCA Inputs and Assumptions - End Use
1097-18 16. LCA Inputs and Assumptions - Hydraulic Fracturing
1097-19 22. General Opposition

9. As a matter of curiosity, I would like to know about the dual fuel capability that the TOTE ships will maintain. They plan on converting to LNG, but will keep the ability and fuel on-board to switch back to diesel if there are problems with the LNG or they need extra power. If they think this is needed so bad as to add the extra weight and take up extra cargo space, they must plan on needing to use it on some occasions. If they do spent a portion of the time burning diesel fuel, even if it is in foreign waters outside the area required to meet the new emissions regulations, the CO2 and other emissions from the diesel should be included in the review.

10. Concerning the new options that were added to the SEIS, they should be stricken from the evaluation. Trying to take credit for new users that are not permitted in the FEIS is a slight of hand method to find reductions on CO2 emissions. In the very first draft, PSE intended to add a barging facility on the Hylebos Waterway. Due to environmental and tribal problems, this facility was deleted from the project. This left PSE with a large problem. About 40 % of the total plant production had no customers or no way of being shipped or transported. To make matters worse, the Washington State Ferry System, which had been considering conversion to LNG decided to convert to electrical engines instead. Many attempts were made to discover what PSE planned on doing with the excess capacity. At first they said they would run the plant according to demand. Further discussions with the City specified that barging from the Blair Waterway was not allowed because there was no permit and that barges could not mate up to the loading system anyway. Questions were raised about potential increases in trucking. Even though, the facility had the capacity to load nearly 100 tanker trucks a day, the FEIS stated that only two trucks would be used. Now in the SEIS, both barging and tanker trucks have been added. These new additions or imaginary additions are a big reason that they can claim reductions in CO2. PSE has never shown they have any customers for the excess LNG. Without specific customers, it is impossible to calculate the CO2 emissions. Even worse, they are now trying to add the capability to transport the excess LNG if they find customers. This capability was not included in the FEIS and was flatly denied by the City and PSE when questioned about it. This is both an expansion of the FEIS and an attempt to take credit for emission reductions from phantom users.

11. In the DSEIS, a lot of credit was taken for imaginary trucking use of LNG. There are currently no customers for this LNG, there is no permit for the loading of this fuel and the assumption of increasing the capacity to 500,000 gallons per day is not allowed. These assumptions warped the benefits of LNG. -- While all the benefits of extra LNG trucking usage in Tacoma were exaggerated, somehow the detrimental impact of trucking at the fracking well sites were omitted. Each fracking well requires massive amounts of water, chemicals and sand. Large amounts of waste must also be hauled away from each site. Most of this will be delivered by trucks burning diesel and emitting large amounts of CO2. These emissions are real and not based upon assumptions that future customers for LNG might be found that will want to convert to LNG. During the life-cycle of the LNG plant, the number or fracking wells required to supply the plant will reach into the thousands. Each well will require a fleet of trucks and many other associated pieces of equipment to provide the natural gas going to the LNG plant in Tacoma. Much of this will be trucking, but pumping, drilling and a myriad of other activities will

1097-20 22. General Opposition
1097-21 7. SEPA Alternatives

be required. These must all be included in the DSEIS. Allowing PSE to cherry-pick just the potential of future LNG users in Tacoma leads to a very erroneous conclusion. Again, they are falling back into the previous methodology of not including all the upstream impacts. This caused the SEIS to be required the first time, but they seem to want to repeat it again.
http://www.otsego2000.org/documents/FrackingShaleTrucks.pdf
http://www.bctwa.org/Frk-HowManyTankerTrucks.pdf
https://www.fractracker.org/2018/10/living-with-silica-sand-mines/?fbclid=IwAR2yeIu0KblKMHB1pKerHJNhD_7pUkRK_ycFUcuit9VncAc1U1tDzjiT_N0

Overall, this DSEIS attempt to get the LNG approved has completely failed as a legitimate document. It has used outdated assumptions, twisted logic, incomplete data and pure manipulation in order to show that the use of LNG is beneficial. It has expanded the capacity to make it possible to double the production capacity of the plant without requiring a further review or permitting. It has added additional transportation capability in order to use the extra production capacity. It failed to include upstream impacts such as the trucking and equipment required to operate the fracking wells. (Note: This is just a continuation of the problem of the previous FEIS that failed to include upstream impacts.) It then tries to justify the increased capacity as being more beneficial than the lower 250,000 gallon capacity. If the truth were known, I doubt that PSE even has the customers that are required to make that calculation. As new technology improves, PSE may find it harder to find customers, much like the ferry system that decided to convert to electricity. It is entirely possible that they may be thinking about expanding their production for export, which seems to be one of the few true legitimate customers in the future. Florida is currently experiencing this type of problem. https://www.desmogblog.com/2018/10/04/lng-by-rail-small-scale-exports-florida-edens-fortress?fbclid=IwAR3gBE-zDWqlWbr35D_MRES3GIJKXU9zRYKbvDirE6F8BckTR5JHGIXFEts

No matter what PSE plans to do with the current extra capacity at the 250,000 gallon rate or the expanded 500,000 gallon rate, it is a bad product, being built in a bad location. It can not improve the air quality in Tacoma because the ships are not even running while in Port. All the emissions from the LNG plant will be incremental, and it will run 24 hours a day every day of the year. I generally feel that expansions of any type of fossil fuel is damaging, especially when one fossil fuel is replacing another. TOTE has other options, including the one they are currently using. The TARGA plant adjacent to TOTE also has biofuel available to meet the regulations. There is not another shipping line or single ship in Tacoma or Seattle that is choosing the LNG option. Low sulfur fuel or scrubbers seem to be the preferred method of everyone else.

Please take the information that I have provide into account when you are evaluating the DSEIS. I think that you will find that the whole attempt to be a guise to permit something that is clearly wrong. It is a thinly veiled attempt to make LNG appear to be beneficial. It completely ignores the assurances made by the City of Tacoma in the FAQ section. It makes an attempt to add additional capacity and increase operating options that were not even in the FEIS. It still fails to

include all the upstream impacts. You should be able to see through the multitude of misrepresentations and reject the whole report.

Thank you for your consideration.

I wanted to make this is shared with the Puyallup Tribe. While some of the information is already known and being used, there is much that is new or described in much more detail. It also is presented in a very professional manner by a professional organization that can be quoted. It should help their understanding and their efforts with the City. Steve.

Steve: Thank you. So, next up is Seth Storset. Did I get that right?

Seth: Good evening. It's Seth Storset, it was close. Could have been my handwriting.

[04:05:00] So, I'm Seth Storset. I'm the director of safety for TOTE Maritime. I heard some comments about being paid to be here. I am paid by TOTE. But I chose to work for TOTE because of their values and what we stand for. For many of our things we've done in the past like installing the first rain gardens in the port or the first ones to do cold ironing, the only ones still, we've always been a first. And I think, when you're first, it's a little scary. It's a little hard. It's the first time. But it's worked for us, in the past. We know what we're doing is right. Also, just to tie into the port, I've been working here for 13 years.

I have many family and friends that also work here. Todd that spoke earlier, I've seen him out on the ships. He coaches my son's soccer teams. A lot of our views are the same. My dad also works for Tacoma Rail.

[04:06:00] I've lived here my entire life. I believe, and this is with TOTE believes, is that it is the best alternative fuel, at this time. Yeah, it would be great if there was wind power or Tesla batteries that could carry our ships to Alaska. That's just not the case now. So, we're doing what we believe is the best alternative, at this time. I've been out on various ships between the Port of Tacoma and the Port of Seattle. And I've come off and wiped my forehead and taken that soot off. And I don't think that that's necessary. I think everybody would agree that we want cleaner air.

Also, I'd like to add that our sister company in Jacksonville that goes to Puerto Rico has been running off of LNG for the last three years. It's been safe, and they've got clean air. And we're doing it efficiently and responsibly. We would do the same here. So, lastly, as the director of safety and that being my focus, is I want to be able to provide a clean and safe environment.

[04:07:00] And that's what we're trying to do. So, thank you, and appreciate your time.

Carole: Thank you. Dan Streiffert.

Dan: Hi. My name is Dan Streiffert, and I'm the conservation chair for Rainier Audubon, which serves South King County.

[00:38:00] And I would like to speak for the birds. For more than a century, volunteer bird watchers throughout the Americas have contributed observations to Audubon's annual bird count begun as a way to assess the health of bird populations. Data from annual censuses are now key to predicting birds' responses to climate change. The results of a study done by National Audubon showed that, of the 588 species Audubon studied, 314 are likely to find themselves in dire straits by 2080, unless we begin to reduce the severity of global warming and buy birds more time to adapt to the changes coming their way.

But it's not just about climate change. It's also about economics. Tony Seba, an economist working at Stanford University, wrote a book called *The Clean Destruction of Energy and Transportation*. And in this, he predicts that oil, nuclear, natural gas, coal, electric utilities, and conventional cars will be obsolete by 2030.

[00:39:07] This is about clean energy technologies disrupting resource based industries. The clean disruption is inevitable, when you consider the exponential cost improvements of these technologies. The more you make, the cheaper it gets. With gas and oil, the more you extract, the more expensive it gets. Electrifying the global energy system with clean energy is the only way to reach the target set by the Paris Agreement on Climate Change and avoid the catastrophic scenarios outlined by the recent IPCC report. Building a new LNG plant will be a disaster for both the city of Tacoma and PSE rate payers.

There are numerous forecasts the utilities are already overbuilding capacity needed to meet the load. Rising gas prices will, ultimately, result in stranded assets as clean technologies become more economic.

[00:40:00] When PSE ends up defaulting on this project, the rate players will be left bailing them out. There is no economic argument for this plant that makes any sense. Peter Lynch left a comment in PV magazine that sums up the situation succinctly. "The future is rapidly approaching, and for the first time in history, mankind has a clear and unequivocal choice. Move forward with renewables at World War II speed or doom mankind to a slow, painful, and

totally avoidable death." Thank you.

Carole: Thank you. So, I'm going to call up the next five. Maia Syfers, Steven Gilbert, Daniel Bean, Jan Zuckerman, and Frank Leyritz.

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

This facility is being built on Puyallup Tribal treaty land without appropriate permission from the tribe. It is also being built dangerously close to the Northwest Detention Center; if something goes wrong, detainees are incredibly vulnerable to the blast zone with very few options for evacuation.

Sincerely,

Lucinda Stroud

I am writing to urge you to reject the LNG plant in Tacoma. The SEIS used is outdated. It uses the 100 year GWP of methane instead of a 20 year value which is more relevant, especially in light of the IPCC data on climate change. We have a short window of opportunity to act to avoid catastrophic climate change. This project takes us in the wrong direction for decades. I urge you to consider the long term consequences of this plant. Thank you. Linda Studley

Re: Proposed Tacoma Liquified Natural Gas Project, Draft Supplemental Environmental Impact Statement

November 8, 2018

The following comments are submitted on the Draft Supplemental Environmental Impact Statement (DSEIS) for the proposed Tacoma Liquified Natural Gas Project. The comments focus on the Green House Gas emissions relative to the Tacoma LNG project.

The DSEIS focused on evaluation of Green House Gas (GHG) emissions and their impacts associated with the construction, operation and decommissioning of the Tacoma LNG facility and marine bunkering facility. It focuses on reduction in GHG emissions associated with the project.

Replacement of Fuel

A portion of the reduction of GHG is focused on the replacement of petroleum based fuels (marine diesel oil and diesel fuel) that fuel marine vessels and trucks with LNG in order to reduce overall GHG emissions in the Puget Sound region. This is presented as seeking cleaner fuel for maritime or other transportation users.

1314-1 cont'd 3. Outside of SEIS Scope
1314-2 11. LCA Inputs and Assumptions - General
1314-3 13. LCA Inputs and Assumptions - Natural Gas Source

The DSEIS failed to consider the extensive cost and time frame that would be required to change/retrofit the marine vessels and trucks equipment from petroleum based fuel in all the marine and transportation equipment , to use LNG as a fuel source. In addition, the time to develop and implement regulatory requirements for such changes were not included. In addition, the DSEIS failed to consider the economic impact on companies operating the petroleum based fuel equipment and the GHG emissions to be released during retrofitting of equipment that is currently being fueled by petroleum based fuels.

The proposed LNG project is estimated to take four years to construct and operate for 40 years. There was no consideration of the portion of that 44 year time period when equipment will continue to operate with petroleum based fuels and continue to release GHG emissions at the current rate. Thus the calculations of reduction of GHG emissions in the Tacoma LNG project DSEIS are flawed.

The NOC Order of Approval should not be issued based on the above flaws in the DSEIS.

Source of Natural Gas

The sole source of the natural gas to be supplied to the Tacoma LNG project is presented as being from British Columbia. If the sole source of natural gas is not from British Columbia, for the entire 40 year life of the Tacoma LNG project, the proposed action will not produce a net reduction of GHG emissions.

The difference in the Proposed Action versus No Action for a 250,000 gallons per day facility capacity is only 5.4% less GHG. For a 500,000 gallon per day facility capacity, the difference is only 3.9%.

This is not sufficient reduction in GHG to allow the permitting, construction and operation of the proposed facility, when it all depends on the use of only British Colombia natural gas to be supplied to the proposed activity.

Assuming the availability of British Columbia natural gas for the 40 year life of the Tacoma LNG facility, is too risky, no matter how strict the permit conditions are. If something happens to even a part of the British Columbia natural gas supply, the use of alternative sources of natural gas will result in greater emissions of GHG when compared to the No Action alternative.

Based on data presented in the DSEIS, the GHG emission factors for natural gas production in the United States may be as much as five times higher than for Canada natural gas. In addition, the fugitive emissions from natural gas production in the United States appears to be 60 percent higher than published fugitive emission factors. The combined difference in emission rates of GHG between Canadian and United States could be as high as eight times. Thus, if British Columbia natural gas is not available for the entire 40 years of life of the Tacoma LNG project, and United States natural gas needs to be utilized for portions of the project, the Tacoma LNG project would have an increase in GHG emissions when compared to No Action.

As a result, the Tacoma LNG project should not be granted a NOC Order of Approval.

1581-1 5. Regulatory Framework
1581-2 10. LCA Calculations
1581-3 22. General Opposition

From: Grace Sullivan
To: Public Comment
Subject: LNG in Tacoma
Date: Wednesday, November 21, 2018 4:52:54 PM

Hello,

I'm writing to provide comment on the SEIS for the LNG facility in Tacoma.

First, I'm very concerned that the treaty rights of the Puyallup Tribe were not respected in this process. I've heard directly from tribal citizens that they were not properly consulted, and this is a huge issue. Tribal treaty rights in the US have historically been trampled on for the sake of industry and economy, and this is reprehensible and must stop.

Second, I feel that the current SEIS is woefully incomplete and is sloppily missing data in places where real data is required. There are numerous tables that contain placeholder data and this is unacceptable. Please hold this report to the same high standards that are expected in any professional industry.

Third, this report does not use the most current scientific data available on greenhouse gasses. This is important because, according to the UN climate report, we have very little time to turn around the impending catastrophic climate change we are facing worldwide. Getting this report right might not feel like that big of a deal, but if everyone around the world cut corners on their own little industrial endeavors, then we would have no chance of regulating anything and making safe and informed choices regarding pollution and greenhouse gasses.

In closing, please take this task seriously and don't put the financial needs of this industry over your commitment to providing professional and unbiased oversight. This LNG project should not be escorted through the permitting processes without thoroughly and honestly assessing its risks and costs.

Subject: Grace Sullivan Comment on Tacoma LNG SEIS
Date: Tuesday, November 20, 2018 7:46:56 PM

Dear Puget Sound Clean Air Agency,

Hello,

I am a long time resident of Tacoma and a single mother of two. I am also pursuing my bachelor's degree in molecular & cellular biology at the University of Puget Sound, and I have a deep respect for science. Right now, the entire scientific community of the world has raised the alarm to warn us that we have to act NOW to prevent imminent catastrophic planetary disaster. It would be obscene to ignore this warning, and to continue developing fossil fuel infrastructure in Tacoma would help usher in an era of human suffering that is unconscionable. Please, please take this SEIS report seriously.

This process may just seem like a formality in the road towards approving the LNG facility in Tacoma, but it is clear even to me as a scientist-in-training that the preparers of this report did NOT perform scientific due diligence in their work. If I, as a student, were to turn in such an ill-formed and unfinished to one of my professors, I would not receive a passing grade. Please hold the SEIS preparers to at least as high a standard as I am held to as a student.

Thank you for conducting a supplemental environmental review of the greenhouse gas emissions for PSE's proposed LNG facility on the Tacoma Tideflats.

As a member of Earth Ministry/Washington Interfaith Power & Light, which has been working closely with scientists and policy experts to review the SEIS, I am concerned that the document does not fully analyze the climate impacts of this project.

Please address the following in the Tacoma LNG SEIS:

1. Methane's impact on climate – The SEIS uses a dated value for the 100-year Global Warming Potential (GWP) for methane from 2007 when updated values were published 2013 and then again in 2016. Using the best available science shows the plant would have higher greenhouse gas emissions. Additionally, given the short timeframe required to address climate change as recently noted by the United Nations, the SEIS should use the 20-year GWP for methane, which shows that the plant will be more than 50% dirtier over the next two decades.

2. Source of fracked gas – It is a false assumption that British Columbia would be the only gas source for this facility and this requirement is not enforceable. In addition, the SEIS relies upon self-reported pollution data on BC gas from the fossil fuel industry. It also failed to incorporate multiple, recent independent studies showing methane pollution rates as much higher than those reported by the fossil fuel industry.

3. Lack of alternative options – TOTE is already using ultra-low sulfur diesel (ULSD) and other companies are also using ULSD or scrubbers to meet emission requirements. The no action alternative assumes that LNG is required for TOTE to meet its emission requirement, when these alternatives already exist and are in use.

4. Alterations to the original proposal – Deviating from PSE's proposal, the SEIS included bunkering more than the two TOTE vessels on the Blair Waterway. The SEIS should instead provide an analysis using only secured customers.

5. Incomplete information – Use of placeholder values, incorrect units of measurement, and the stated need for more data from PSE makes the analysis incomplete and hard to follow. The draft SEIS should be thoroughly edited and released for a new full public comment period.

The Puyallup Tribe, citizens of Tacoma, and residents of the Salish Sea have a right to know the total local and global impacts of this proposal. With missing data and alterations to the project, this draft SEIS does not account for

full climate impacts.

I ask that the PSCAA live into its self-proclaimed commitment to be good and wise stewards of our shared resources. Please re-start this review with complete information and additional opportunity for comment.

Thank you for caring for creation and our community.

Sincerely,
Grace Sullivan

Subject: Puget Sound Energy's LNG facility
Date: Tuesday, November 20, 2018 7:12:13 PM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

The SEIS says that emissions will only be reduced if the natural gas comes from Canada, because leakage rates are reportedly lower there than in the US. Shockingly, most leakage rates were self-reported by the fossil fuel industry based on models - independent analyses from show that fracked gas leakage rates are much, much worse.

Sincerely,

Grace Sullivan

Tacoma LNG Facility Testimony
Puget Sound Clean Air Agency
Oct. 30, 2018

In this Supplemental Environmental Impact Statement, you are trying to ascertain the environmental dangers to our air quality that may be inherent in the operation of PSE's LNG plant in Tacoma. In assessing how much risk is involved in operating this plant, I'm sure you are not expecting a finding of no risk. Natural Gas is inherently dangerous, as a pollutant, as a highly explosive substance, and as a greenhouse gas. The question is how much risk is acceptable. In order to determine this, you will have to weigh the risks against the benefits to the community. A finding of great benefit would naturally skew the acceptable risk upwards. A finding of no benefit would make no finding of risk acceptable.

What are the benefits of locating a fourteen-story bomb in a heavily populated area? The government is investing heavily in this project because there is great concern about maintaining energy independence in a troubled world. But this facility is adding little to our energy independence. Only 7% of the energy stored at the plant will be available to the community. The other 93% will be sold for the private benefit of PSE. Other than the creation of a small number of permanent jobs, the benefits accruing to the community simply do not merit the level of risk. I'm asking you to reject this permit.

Terry Sullivan
Vashon Island resident
206 463 2812
terry.sullivan46@gmail.com

Carole: Thank you. Terry Sullivan? Before you start, I'm going to go ahead and call the next group up just to save a minute or so. So, the next group of speakers is Mark Wells, Steve Gilbert, Kevin Jones. Jori Atkins, and Todd Hay.

Terry: Hi. My name is Terry Sullivan. And I'm a Vashon Island resident and a PSE rate payer. And although I agree entirely with all of the reasons presented thus far in opposition to this project, I wanted to present one other particular aspect that I don't think has been addressed.

[01:05:03] What you're trying to do here is to ascertain the environmental dangers in our air quality that may be inherent in the operation of this project, this plant. And in assessing how much risk is involved in operating this plant, I'm sure you're not expecting to find a finding of no risk. Natural gas is inherently dangerous as a pollutant, as a highly explosive substance, and as a greenhouse gas. The question is how much risk is acceptable. In order to determine this, you'll have to weigh the risks against the benefits to this community. A finding of great benefit would, naturally, skew the acceptable risk upwards.

A finding of no benefit would make no finding of risk acceptable. What are the benefits of locating a 14 story bomb in a heavily populated area?

[01:06:00] The government is investing heavily in this project, so we're told, because there's a great concern about maintaining energy independence in a troubled world. But this facility is adding little to our energy independence. Only seven percent of the energy stored in that plant will be available to this community. The rest of it, the other 93% will be sold for private profit for PSE. Other than the creation of a small number of permanent jobs, the benefits accruing to the community, for this project, simply do not merit the level of risk. I'm asking you to reject this permit.

Dear PSCAA...

Please be a HERO for future generations!

We Need Your Help! This project would lock us into decades of more fossil fuel use.
With only a dozen years left to make drastic changes or face irreversible climate chaos,
we can't keep allowing corporations to build new infrastructure.
I hope to one day have children and grandchildren of my own.
Your agency can help keep this a possibility by denying the air permit for the proposed Tacoma LNG project.

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

I am soundly opposed to PSE's Liquefied Natural Gas project being built in Tacoma.

The science in the latest IPCC report makes it clear that all resources - public and private - are best applied to rapid expansion of renewable energy sources. It is dangerous and short sighted to proceed with this project given what we know about fossil fuel's impact on the environment.

Additionally, there are some real concerns with the information and process involved with this project. Here are some of the issues as I understand them:

- The SEIS is not using the best available science for the Global Warming Potential (GWP) of methane. It uses the 100-year GWP of methane and not the 20-year value which is much more relevant given the urgency in addressing the climate crisis. The appropriate 20-year GWP value to use is 96.
- This facility is projected to have a 40 year lifespan, so why does the report project out to 100 years, which is 90 years beyond the time we need to have taken decisive action?
- The SEIS claims emissions benefits from customers that Puget Sound Energy simply does not have. According to PSE and the City of Tacoma, the only maritime customer is TOTE with its two vessels which have already delayed their conversion to consume LNG. Securing new customers (there are only just over 100 LNG ships in operation out of a worldwide fleet of 90,000) as well as the additional permitting could take years and is not guaranteed.
- The SEIS says that emissions will only be reduced if the natural gas comes from Canada, because leakage rates are reportedly lower there than in the US. Shockingly, most leakage rates were self-reported by the fossil fuel industry based on models and recent measurements taken in the field have shown that leakage rates are much much worse.
- How can it be guaranteed that PSE is sourcing its gas from BC anyway? Their recent filings show they relied on gas from BC, Alberta, and the US. And with the recent pipeline explosion in BC that interrupted PSE's supply, we know it's not always available.
- When ships use any fuel, a certain percentage of it escapes without combusting through the exhaust system and into the atmosphere. This is known as slippage and the SEIS uses a lower rate than is considered best practice.

Thanks again for initiating this crucially important review of this facility and I hope that you will take best available science into consideration when revising this draft SEIS.

Respectfully,

Susan Sweetwater, LICSW

Subject: Please REJECT the permit for the Tacoma LNG facility
Date: Wednesday, November 21, 2018 4:14:35 PM

Hello,

I am writing to submit my comment against the LNG facility in Tacoma. The most recent SEIS did not use the most recent Global Warming Potential (GWP) value for methane. Though I have heard that the older values are currently accepted for use, given the recent IPCC report on climate change, we should be using the most recent available data any time we analyze a project. In addition to that concern that I have, I am also concerned, given the IPCC report, that the analysis has chosen to use 100 year GWP values rather than 20 year values. We need to be looking at how this project will be impacting us right now, when the next few years we have to dramatically cut greenhouse gas in order to save the planet.

Though I realize you are the Puget Sound Clean Air Agency, emissions do not stop at neatly identified bureaucratic boundaries. For this reason, I think we need to be considering that the majority of the fuel at this facility will come from fracking. I am going to assume you have general knowledge of fracking and that I do not need to explain the current devastation being experienced by communities near fracking operations, such as being able to light their tap water on fire and seeing earthquakes in areas not near fault lines. It is imperative that we do everything in our collective power to stop the increase in fracking as a process. We have no way to know that we will only be receiving gas from the one source in BC listed in the SEIS. As we saw when the most recent explosion happened, customers receiving gas from BC had to get it from North Dakota, which has higher leakage rates.

And though it is hard for me to say which reason is the most important, I will say one of the biggest issues here is that this facility is being built without the consent of the Puyallup tribe. The Tacoma Tideflats are their land, per the Medicine Creek Treaty. This is an insult to a nation that has already experienced genocide by colonizers, and now their land is being stolen again. Of note is that there is actually recent legal precedent to back this up, as a court case nearly one year ago found two protesters not guilty of trespassing on the LNG construction site. In that case, tribal elder Ramona Bennett testified explaining Puyallup rights to the land through the Medicine Creek Treaty, and the jury found that they were not able to convict protesters of trespassing, as the land did not belong to the City of Tacoma.

Finally, this facility, if it were to explode as the Plymouth LNG facility did in 2014, many lives would be lost. The LNG facility is dangerously close to the Northwest Detention Center, which has a shelter in place policy, meaning those being detained even though they have not committed crimes will be subject to breathing toxic air, or worse. There are homes, preschools, and businesses within the blast zone. These people do not deserve to have their lives threatened by this facility.

Please reject the air permit for the LNG facility.

Thank you,
Kara Sweidel
Seattle, WA

[00:41:00] And if you can keep it under three minutes that would be wonderful. A couple of minutes would be even better. But you do have the full three minutes. So, I'm sorry, Maia Syfers.

Maia: Hi, thank you. My name is Maia Syfers. I work as a nurse practitioner in Tacoma. Two-thirds of natural gas is obtained through fracking, in the US. And per the Sight Line Institute, the estimation is at least half of northwest natural gas is fracked. According to a comprehensive analysis of scientific studies by the Natural Resources Defense Council, there is a growing body of evidence linking the air pollution from hydraulic fracking to global, regional, and local community health impacts. Global effects include the associated methane gas leakage contributing to overall climate change.

[00:42:00] Regional and local affects from nitrogen oxide with multiple volatile organic compounds together forming ground level o-zone and exposure to diesel particulate matter and toxic volatile compounds, such as toluenes, xylenes, benzenes can cause multiple health complications. These include upper and lower respiratory problems, brain and nervous system effects, bone marrow and immunological compromise, reproductive effects due to endocrine disruption, and damage to fetal and child development and various cancers.

As a healthcare provider, I practice by the axiom to first do no harm. As a public agency, the PSCAA is entrusted with the responsibility to protect public health through access to clean air. Whether or not fracking is currently happening in Washington is not relevant.

[00:43:00] It is likely the percent of LNG obtained through fracking will increase to meet supply demands, in the future. Approving air pollution anywhere is not in the public health interest. And it, certainly, would be disingenuous to claim that pollution can be contained in a living ecosystem.

The PSCAA website mission statement quotes, "We work together to clean the air we breathe and protect our climate through education incentives and enforcement. Strategies include adopting and enforcing air quality regulations, sponsoring voluntary initiatives, and educating people and businesses about clean air and climate friendly choices they can make." I ask PSCAA to help Puget Sound Energy make that climate friendly choice regarding the Tacoma LNG plant by recognizing the significant air pollution

On Oct 31, 2018, at 12:16 PM, Kevin Jones <kevinjonvash@gmail.com> wrote:

Tacoma LNG Facility Testimony – Puget Sound Clean Air Agency

My name is Kevin Jones. I am a PSE ratepayer. I have 35 years of engineering project planning, implementation and risk management experience working for The Boeing Company. Now retired, I have not been paid to testify and will receive no financial benefit due to your final permit decision. I oppose issuing the permit to PSE for the Tacoma LNG facility.

Thank you for performing a Supplemental Environmental Impact Statement (SEIS) for the Tacoma LNG Facility. I was quite concerned when upstream gas emissions were dismissed by the City of Tacoma as "too remote to the project site and the City of Tacoma to be part of the EIS". Of course, these emissions pour into the only climate we have.

Unfortunately, the SEIS conclusion is based on upstream gas emissions which are not credible. Gas as a bridge fuel is now a known myth due to much higher than reported upstream methane leaks. The SEIS makes erroneous and unreasonable assumptions about these upstream gas emissions. Historically, upstream gas emissions are higher than reported. In 2016 The Economist noted that upstream gas leaks in the United States are underestimated by about 30%. The Atmospheric Chemistry and Physics group recently reported that gas leaks in British Columbia are under-reported by 43%. If this assessment is applied to the upstream gas emissions in the SEIS we find the stated greenhouse gas emission reduction of the proposed scenario A action falls from 40,000 tons to 6440 tons.

Basing permit approval on a net greenhouse gas emission reduction of less than 1% would not pass muster in a high school level engineering class. Further, a permit issued for the LNG facility, based on this erroneous SEIS, will result in a fossil fuel facility investment that locks us into an approach that provides no proven environmental benefits over a multi-decade time period during which time true environmental solutions to maritime shipping pollution could emerge.

In addition to the unreliable British Columbia fugitive gas emission data, the SEIS also assumes a reliable British Columbia delivery network over the entire life span of the

facility. The October 9 pipeline explosion, which PSE euphemistically calls an "unexpected rupture", adds significant doubt to this reliability. You heard testimony that the LNG facility can mitigate the risk of a pipeline explosion. In fact, pipeline explosions create significant risk to achieving the important (though specious) SEIS caveat that all the source gas must come from British Columbia.

The SEIS, when corrected to use reasonable upstream gas emission leak levels, indicates an unacceptable risk regarding greenhouse gas emission reductions. The conclusion that the proposed action reduces greenhouse gas emissions is based on SEIS fiction. When other system level factors are considered, like the outdated global warming potential values and using 100-year versus 20-year values, the SEIS conclusions are not credible.

Based on these factual errors in the SEIS, you must reject this permit.

To PSCAA:

My name is Maia Syfers, and I work as a nurse practitioner in Tacoma. Two thirds of natural gas is obtained through fracking in the US and the Sightline Institute estimates at least half of NW natural gas is fracked. According to a comprehensive analysis of scientific studies by the Natural Resources Defense Council, there is a growing body of evidence linking the air pollution from hydraulic fracking to global, regional and local community health impacts. Global effects include methane gas leakage contributing to overall climate change. Regional effects from nitrogen oxides and multiple volatile organic compounds forming ground level ozone can cause respiratory problems and cardiovascular problems. In local communities, exposure to diesel particulate matter and toxic volatile compounds such as toluenes, xylenes and benzenes can lead to upper and lower respiratory problems, brain and nervous system effects, bone marrow complications, immunological compromise, reproductive system effects due to endocrine disruption, damage to fetal and child development, and various cancers. According to studies evaluated by the Union of Concerned Scientists The EPA has identified more than 1,000 chemical additives that are used for hydraulic fracturing

As a health care provider I practice by the axiom “to first do no harm”. As a public agency, the PSCAA is entrusted with the responsibility to protect the public's access to clean air. The Precautionary principle implies a social responsibility to protect the public from exposure to harm when scientific investigation has found a PLAUSIBLE risk. This principle has been explicitly incorporated into various laws and regulations in the European Union and various international bodies including the UN. Whether PSCAA officially endorses this principle or not, it nonetheless IS the basic risk/benefit approach that should guide and inform decisions regarding public trust, especially when confronted with the scientific evidence being presented at this hearing. The PSCAA website mission statement quotes “We work together to clean the air we breathe and protect our climate through education, incentives and enforcement. Strategies include adopting and enforcing air quality regulations, sponsoring voluntary initiatives and educating people and businesses about clean air and climate friendly choices they can make”. I ask the PSCAA to help PSE make that climate friendly choice regarding the Tacoma LNG plant by recognizing the significant air pollution issues the project entails. Protect our air, our climate and our health and not corporate profits.

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

First of all, I want to thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. With our climate in grave peril, as emphatically stated in the latest IPCC report, your review of the greenhouse gas impacts of the natural gas used in this project couldn't be more important. Those scientists make clear that we cannot, and must not, allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.

I testified as a health care provider on October 30th along with many others. I was dismayed to see PSE and other business interests sending representatives to testify for their vested business interests. Their consistent rationales presented, including calling LNG a "bridge fuel" which burns cleaner, the number of jobs the plant might possibly create or the issue of container ship fueling, was accurately rebutted by multiple other speakers. I heard a climate scientist who had done her own analysis of the draft SEIS, a toxicologist, other scientists and environmentalists speak to the inaccurate and incomplete data leading to the draft SEIS conclusions. I also heard each of the business interest points analyzed and exposed as misrepresentations of the truth. I am not going to spell out out the scientific and data source and analysis concerns about the draft SEIS as you will have heard about these from multiple knowledgeable sources. I would like to remind PSCAA that your mission is the protection of air quality in the public domain, and that letting business interest rationalizations (using already disproven arguments) supersede that imperative is simply being party to the overall dominance of corporate power so harming our society today. Allowing any fossil fuel based project to go forward when we need to expand true renewable energy infrastructure instead is a betrayal of the public trust. I hope the public can count upon your integrity and your own concerns for the world we are leaving our children.

Thank you.

Subject: Tacoma LNG SEIS
Date: Tuesday, November 20, 2018 6:40:26 PM

Puget Sound Clean Air,

Thank you for providing the opportunity to review and comment on the PSE Tacoma LNG SEIS.

I am a Tacoma resident concerned about climate change and our contributions to global warming. Part of what makes Tacoma so special is its story of moving from a legacy of pollution to a community that can take pride in its industry and environment.

After reading the SEIS, it appears to use old information, and it's missing data. The SEIS should be using the latest IPCC numbers when determining the global warming potential of greenhouse gases. It should also use the 20-year numbers instead of the 100-year, since this plant will only be operational for 40, and we'll see big impacts from the very beginning. When the 20-year GWP from the 2013 IPCC report is used, it shows that emissions from the LNG facility are actually 30-31% worse than the No Action alternative.

The SEIS is also missing really important information, like the carbon content of the gas to be used. This data is needed for a complete study, and until it's there, this SEIS is incomplete.

How will PSCAA ensure that the methane gas comes from BC? The SEIS should also analyze the very likely scenario in which PSE will have to get its methane gas from the Unites States network.

Finally, the SEIS doesn't include smaller sources of emissions, like those from tearing the plant down. These smaller sources of emissions could add up to a big impact, and should be included in the analysis.

Because of these conclusions, I am opposed to the PSE Tacoma LNG project. Please update the SEIS, reissue it when it is complete and credible, and then re-open the comment period.

I write as a citizen of the Cherokee Nation, born & raised on Puyallup Territory. The Puyallup have been stewards & caretakers of these lands since time immemorial, and are welcoming & generous hosts despite generations of cruelty from the settlers of this region. I am referring both to historic genocide & broken treaties, but also to more recent history - within my life time for instance the City of Tacoma tried to deny the Puyallup Tribe their sovereign treaty rights claiming 'they did not exist'. Despite this incredible fiscally motivated insult, the Tribe has continued to generously consult with & work alongside the City in the years since the settlement. The fact that

again, ~~recording~~ over & over, the City of Tacoma & the Port, governmental & private ~~agencies~~ alike have continued to attempt to undermine tribal sovereignty, against the laws of their own country, in a transparently selfish land grab, is disgusting and makes me ashamed to be a resident of Tacoma & an employee of the City of Tacoma. Please do not add another injustice to this long history of violence & oppression of Indigenous rights. The data shows that climate change will impact POC ~~communities~~ & low income communities the most, and the societal impact caused by institutionalized racism & the legacy of stolen land in this country is more than apparent for example 84% of Native women are raped or assaulted in their lifetime. ~~This is not a~~ similar facts are not coincidences & the ecological industry ~~equivalent~~ owes Indigenous communities, some of the most vulnerable populations in the world, a ~~complete~~ overhaul. Please make the ethical & legal decision, respect treaty rights & tribal sovereignty, and deny the permit.

Dear Clean Air Agency,

We moved to Tacoma in 2000. We particularly appreciate the natural beauty and the civic spirit in this town. One of us works downtown at UW Tacoma, and we live just a few miles from downtown.

We urge the Puget Sound Clean Air Agency to redo the draft SEIS. The draft SEIS falls short of accounting for what the best and most recent scientific evidence tells us is the full impact of fracked gas on global warming. Without using the latest scientific evidence, the draft SEIS is flawed, and permitting based upon would be an injustice.

We recognize that fracked gas likely produces less carbon emission than coal when burned, when one account for its production, transport, processing, storage, and distribution, the net effect on climate will be worse than coal due to the release of methane at each stage.

We are quite concerned that the draft SEIS uses an outdated methane global warming potential (GWP) value. Recent values from the 2013 IPCC should be used. More importantly, the 20-year GWP value from this report should be used, rather than the 100-year GWP, given the urgency of taking action on global warming.

Finally, we believe that Puget Sound Energy's beginning their construction of the LNG plant without receiving permitting approval is a misuse of the public trust. At the same time as the general public's rights need to respected throughout the process, the Puyallup Tribe treaty rights must also be respected.

Respectfully,

Josh Tenenberg Jody Wright-Tenenberg

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Please don't subject us to future DISASTER!!

1149-1 23. General Support

[06:03:00] Beverly Christie? Janine Terrdao?

Janine: Hi, good evening. My name is Janine Terrano. I am the CEO of Topia Technology here in Tacoma. And since I moved to Tacoma in 1999, I have embraced the incredible cultural and economic rebirth of Tacoma. I have witnessed a struggling community keep its soul but take its challenges head on with bold new thinking and leadership. One of the most fundamental challenges Tacoma faced was with a dirty environmental legacy that prohibited growth. We had the aroma of Tacoma, a polluted tide flats, a polluted Thea Foss Waterway, and finally, we had one of the world's worse polluters in Asarco.

[06:04:00] But Tacoma changed. We embraced our challenges. And a new environmental stewardship emerged. The Port of Tacoma cleaned up its properties. The aroma of Tacoma is gone. Thea Foss Waterway and its uplands are clean and now home to many Tacomans. And finally, the Asarco site is now clean. And Point Ruston is home to thousands of families, shops, and restaurants. Tacoma faced its challenges with innovation and, most importantly, with leadership. Tacoma is a cleaner, more vibrant community today than it was 25 years ago.

As a person in the business of technology and innovation, I applaud our home town company, TOTE Maritime, for having the vision and the courage to convert its orca class vessels to LNG. I'm also a fly fisherman and an environmentalist and a resident of Pierce County. I thank them for going way beyond what federal, state, and local requirements are and to do the right thing for our planet.

[06:05:00] This is a company trying to do the right thing. We should celebrate this. We should applaud their extraordinary commitment. And we certainly should not punish them. Data is my business. I look at it every day. And according to the results of the study, we all know that diesel is far more polluting than LNG. This project, according to the SEIS, reduces greenhouse gases by a minimum of 13.5%. It reduces particulate matter by 99%, sulfur oxides by 100%, nitrogen oxide by 90%. We've all heard the challenges around LNG. And is it perfect? No, it's not. However, it is a transitional fuel that takes a major step away from polluting our environment.

The choices on this are crystal clear. We can either take a major positive step forward or a major step backward.

[06:06:03] I support TOTE Maritime's decision to convert to LNG, and I support this project.

Memo to: PSCAA

Regarding: Public Comment in Support of Tote Maritime Clean Air Coalition

My name is Janine Terrano and I am the CEO of Topia Technology based right here in Tacoma. Since moving to Tacoma in 1989, I have embraced the incredible cultural and economic rebirth of Tacoma. I have witnessed a struggling community keep its soul but take its challenges head-on with bold new thinking and leadership.

One of the most fundamental challenges Tacoma faced was with a dirty environmental legacy that prohibited growth. We had the aroma of Tacoma, a polluted tide flats, a polluted Thea Foss Waterway and finally we had one of the world's worst polluters, Asarco.

Tacoma changed. We embraced our challenges and a new environmental stewardship emerged. The Port of Tacoma cleaned up its properties and new shipping lines operate where polluted land once was. The aroma of Tacoma is gone. Thea Foss Waterway and its uplands are clean and now home to many Tacomans. And finally, the Asarco site is now clean, and Point Ruston is home to thousands of families, shops, and restaurants. Tacoma faced its challenges and with innovation and leadership, Tacoma is a cleaner, more vibrant community today than it was 25 years ago.

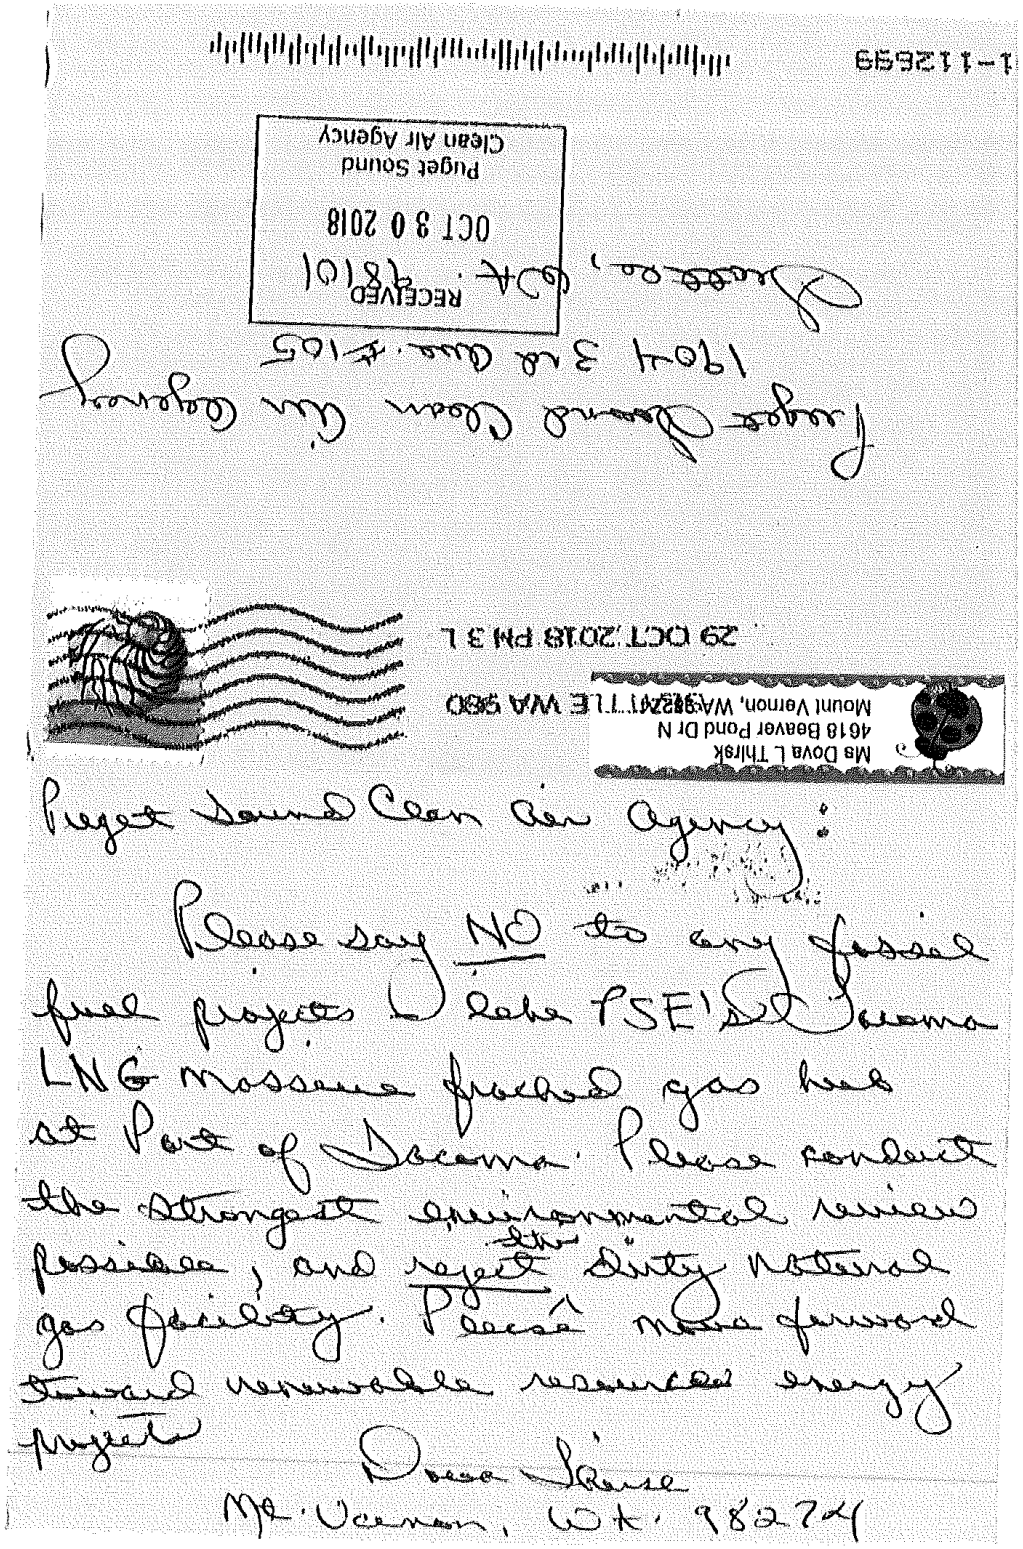
As a person in the business of technology and innovation, I applaud our hometown company TOTE maritime for having the vision and courage to convert its Orca class vessels to LNG. As a fly fisher, environmentalist, and resident of Pierce County, I thank them for going way beyond what federal, state, and local requirements are and to do the right thing for our planet. We should celebrate this extraordinary commitment, not punish it.

I look at data every day and here is the data I know to be true on this project.

- Diesel is FAR more polluting than LNG
- This project according to the SEIS reduces Greenhouse gases by a minimum of 13.5%
- It reduces particulate matter by 99%
- Sulfur Oxides by 100%
- Nitrogen oxide by 90%

Is LNG perfect? The answer is no. However, is it a transition fuel that takes a major step away from more polluting fuels? The answer is a resounding yes.

The choices on this are crystal clear. We can either take a major positive step forward or a major step backward. I support TOTE Maritime's decision to convert to LNG. Every day we wait is another day of air and water pollution we can no longer afford. As a fisher, conservationist, and as a person in the technology and innovation business- I would urge you to approve this air permit in a timely manner. Just yelling no to LNG is just old divisive politics and it does nothing to protect our environment or our planet. Saying Yes to LNG moves us closer to a greener and sustainable future. By the way, I hope the air



agency holds itself and the opponents accountable for every day TOTE is forced to use diesel with all of its pollution instead of LNG.

Sincerely,

Janine Terrano, CEO

Dear PSCAA :

The Tacoma LNG Project just makes sense. We already have made great improvement in our release of " Green House Gases " by converting the local bus lines to natural gas and removing the ugly black exhaust. The next step is to convert our shipping to the natural gas in the form of Liquid Natural Gas (LNG). Our water ways are one of our most valuable assets that must be protect to insure the wild life for future generations. PSE's Tacoma LNG Project is a great step in improving emissions from the Alaskan shipping. I approve of the project and hope for the State of Washington will lead the way for other application's of LNG in our state.

Best Regards,

Carole: Thank you. Bradley Thompson?

Bradley: Good evening. My name is Bradley Thompson. I'm a registered nurse. I'm also a volunteer with 350 Tacoma. I'd like to start by acknowledging that we're standing on ancestral territory of the Puyallup People. It is a violation of treaty rights that the tribe has not been properly or meaningfully consulted on this LNG project.

[05:05:02] And I ask for that process to begin immediately. On behalf of 350 Tacoma, we incorporate, by reference, the comments of the Puyallup Tribe and agree with their statements. I agree with many other speakers tonight that this draft SEIS is inaccurate and incomplete. And so, it feels impossible to comment on a flawed analysis that does not account for the full climate impacts of fracked gas. I'm asking you to go back to the drawing board, in order to more thoroughly complete the report, publish a revised draft, and then, hold another public comment period.

Mostly, tonight, I'd like to note that your draft SEIS was released on October 8, the same day that the UN Intergovernmental Panel on Climate Change released its urgent wake up call. This report prepared by the world's leading climate scientists says that we must cap the rising global temperature to just 1.5 degrees, and this much happen much faster than previously recognized.

[05:06:00] And doing that will require "rapid, far reaching, and unprecedented changes in all aspects of society." In order to achieve that, global emissions of carbon dioxide have to reach net zero by 2050. As you're probably aware, that's going to be almost impossibly difficult to achieve. And yet, our planet's livability depends on that. What does that mean? It means that we've got to stop building new 50 year fossil fuel infrastructures starting like 20 years ago. It means that an environmental impact statement shouldn't compare new fracked fossil gas infrastructure to a no action alternative, but rather to a do something different please alternative.

It means that we can't be locking ourselves into increased dependence on fossil fuels but rather should be investing in real, green alternatives that, contrary to what other people have said, currently exist, even in the maritime sector.

[05:07:09] It means that agencies like yours can no longer do business as usual, if we want to have a real shot at keeping this planet habitable for future generations. It means that people who have

power to deny permits and stop new fossil fuel infrastructure from being built, such as yourselves, need to take bold, brave action. My ask is that you incorporate the recommendations of the IPCC report into this SEIS to make transparent the consequences of the decision that you make. Thank you.

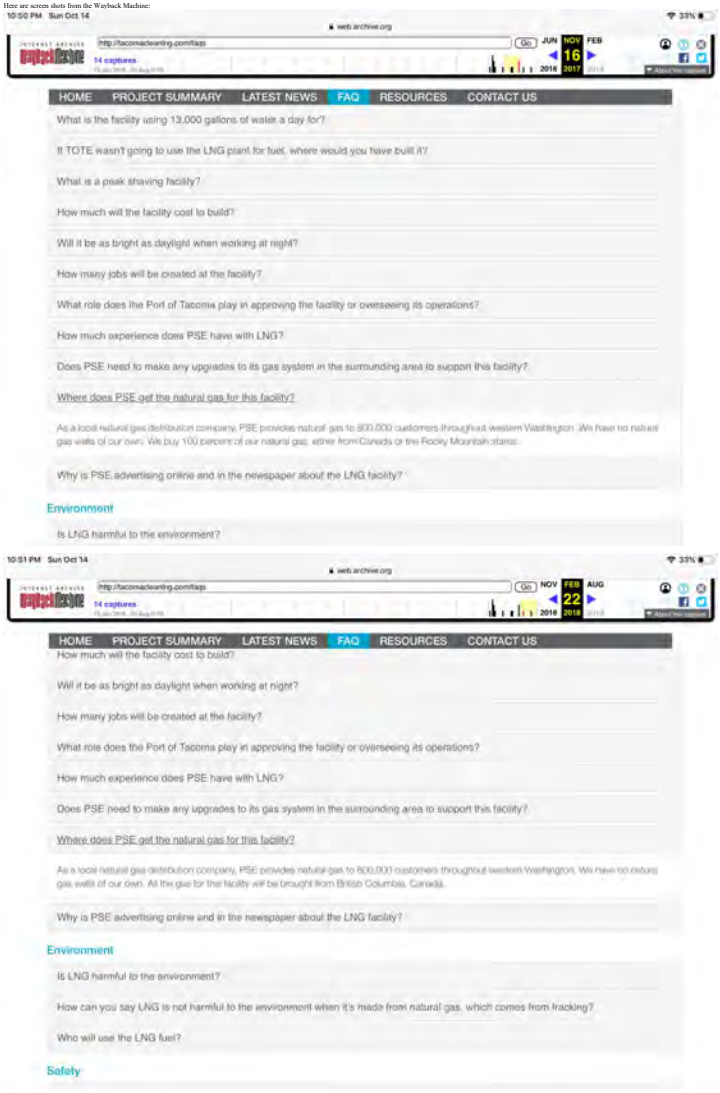
Dear Puget Sound Clean Air Agency,

In this comment, I am questioning the assurances that you have from Puget Sound Energy (PSE) that 100% of the fracked fossil gas supply for the Tacoma LNG project would come from British Columbia. There are numerous studies from Canada that question the voracity of the self-reported methane leakage rates from fracked fossil gas infrastructure in B.C. Methane leakage rates from fracking wells and natural gas transmission infrastructure in the United States are significantly higher, placing even greater doubt upon the claims made in B.C.

Interestingly enough, now the Kalama Methanol project in their SEIS makes the same claim that they will source 100% of their fracked fossil gas from B.C., thereby improving their cumulative GHG numbers.

Puget Sound Energy has long claimed that they source their natural gas supply from three areas: B.C., Alberta, and the Rocky Mountains. In fact, in their 2017 filing with the Securities and Exchange Commission (SEC), PSE reports obtaining natural gas from British Columbia (54.8%), Alberta (19.1%), and the United States (26.1%).



Interestingly, on November 5, 2017, Puget Sound Energy stated on its Tacoma Clean LNG website: "We have no natural gas wells of our own. We buy 100 percent of our natural gas, either from Canada or the Rocky Mountain states." On November 16, 2017, they made the exact same claim. But then the website was updated. By February 22, 2018, the website stated: "All the gas for this facility will be brought from British Columbia, Canada."

So...what changed between November 16, 2017 and February 22, 2018? On January 24, 2018, Puget Sound Clean Air Agency announced their Notice of Determination for a Supplemental EIS, requiring a cumulative analysis of the greenhouse gas impacts of the Tacoma LNG project. Could it be that Puget Sound Energy, and Kalama Methanol, are both cherry picking their numbers in order to provide a best-case analysis of the GHG impacts of their projects?

If Kalama Methanol and Tacoma LNG both source 100% of their natural gas from British Columbia, is there enough currently existing gas supply using currently existing transmission pipeline infrastructure. If not, then the GHG impact of any additional fracking wells or transmission infrastructure must be added to both projects' SEIS.

I ask that the SEIS analysis use Puget Sound Energy's currently existing gas supply percentages: B.C. 54.8%, Alberta 19.1%, and Rocky Mountains 26.1%. The GHG analysis must include methane leakage rates based upon those percentages from the different supply sources. Puget Sound Energy should not be able to cherry pick their numbers for the SEIS, only to change up their supply sources once the project is up and running.

Subject: Public comment on DSEIS, PSE LNG project
Date: Wednesday, November 21, 2018 11:03:03 PM

Dear Puget Sound Clean Air Agency,

I submit the following comments regarding the draft SEIS for the Puget Sound Energy Liquefied Natural Gas project:

- **The Draft SEIS is Incomplete** – The current version of the draft SEIS does not contain all the information we, the public, need to fully assess the accuracy of this study and the predicted impact of the LNG facility. There are at least 10 places in the study that have "placeholder" values instead of actual data. I request that the PSCAA complete the draft SEIS, re-issue it, and then reset the public comment period so that we may better formulate our questions about this project.
- **SEIS is Using Outdated Methane Global Warming Potential Value** – Your analysts did not use the best available science for the Global Warming Potential (GWP) value for methane. GWP is a measure of potency for a greenhouse gas and it is measured against carbon dioxide (CO2). CO2 has a GWP value of 1. Methane, however has a much larger GWP value. The DSEIS uses the 2007 value of 25 for the 100-year number (i.e. the value average over 100 years), whereas it should be using the 2016 value of 32. Everything else being equal, making this one modification in your models makes the LNG plant dirtier from a greenhouse gas emissions perspective than staying with diesel fuel.

Report	20-year GWP	100-year GWP
2007 IPCC AR4	72	25
2013 IPCC AR5	86	28
2016 Scientific Study (authors include lead from 2013 study)	96	32

- **Analysis is based on 100-year, not 20-year, global warming potential (GWP) values** – Your analysis is based on the 100-year GWP of methane, whereas, given the IPCC report that was released October 8, 2018, we must change our energy fuel mix in the next 12 years or face dire climate consequences. The SEIS analysis should use the 20-year numbers, as that is the timeframe where action is needed. Using the most recent 20-year value of 96 makes the LNG plant 150% dirtier than the current capability.
- **Questionable claims that B.C. fracked gas is as clean as they claim –** You indicate that the fracked methane gas from B.C. has a much smaller leakage rate. However you fail to incorporate 2017 and 2018 analyses showing that a large percentage of the fracked gas wells are underreporting their methane leakages.
- **What assurances do we have that all of the fracked gas would come from BC?** You claim that all of the natural gas will be coming to the plant from British Columbia. However, just as we saw with the recent natural gas pipeline explosion in BC, Puget Sound Energy was able to use natural gas from the Rocky Mountains. The methane leak estimates from the U.S. are significantly higher than those reported from B.C. We have no guarantees that the gas used would come from B.C. Of note, per Puget Sound Energy's 2017 10K filing with the Securities and Exchange Commision (SEC), in 2017 they obtained gas from British Columbia (54.8%), Alberta (19.1%) and the United States (26.1%). We ask that you use those percentages in your calculations.
- **Analysis assumes credit for extra maritime customers that currently do not exist –** The analysis appears to assume that Puget LNG (the for-profit arm of this venture that will be selling the LNG to maritime customers) already has additional maritime customers, and so is claiming greenhouse gas emissions reduction credit for them. They have no such customers and so cannot

1627-5 cont'd 6. Purpose and Need
1627-6 14. LCA Inputs and Assumptions - Leakage/Slippage
1627-7 16. LCA Inputs and Assumptions - Hydraulic Fracturing

legitimately claim such credit. They also have no ability to bunker additional ships, since lead agency City of Tacoma states that barge bunkering is prohibited at the TOTE dock and on the Hylebos waterway, and they state that fueling ships other that TOTE vessels is prohibited at the TOTE dock.

- **Questionable Methane Slippage Rates for TOTE Vessels –** It appears that you are using smaller methane slippage rates (the amount of unburned methane that will escape into the atmosphere through the exhaust system) for the TOTE maritime vessels that will be burning the LNG. In fact, even in PSE's own greenhouse gas life cycle analysis that they completed and is provided as part of this report, their external peer reviewer questioned PSE's assumption on their methane slippage rate indicating that they should be using the higher rate as that is considered best practice.
- **Analysis does not incorporate diesel emissions for transporting sand/water to the fracked wells**– Fracking requires large consumption of water and sand for its operations, however GHG emissions from these diesel trucks were not included in the analysis.

Thank you for considering these comments.

Sincerely,

Bradley Thompson

From: Bradley Thompson
To: Public Comment
Subject: Public comment on DSEIS, PSE LNG project
Date: Wednesday, November 21, 2018 10:10:17 PM

Dear Puget Sound Clean Air Agency,

In this comment, I would like to address the lack of GHG analysis or discussion of such in the DSEIS on gas liquids produced when fracking for methane.

The fracking wells in British Columbia produce a large amount of gas liquids as a by-product of fracking. Within the Montney Basin, which includes areas near Fort St. John, Dawson Creek and Chetwynd, the favored drilling sites are those containing large amounts of naturally occurring “wet” gas liquids, as opposed to “dry” conventional natural gas or methane. The most important of those liquids are pentane and condensate, which are used to dilute Albertan oilsands bitumen or heavy oil, thus allowing it to flow through pipelines.

We cannot examine the GHG impacts of fracked gas (methane) without equally analyzing the GHG impacts of gas liquids. How do we measure the GHG impact of a product that is essentially enabling the production of oilsands extraction—some of the most carbon-intensive fossil fuel extraction on the face of the planet?

Alberta’s oilsands industry is the top consumer of natural gas in Canada, accounting for one-quarter of the natural gas used. Much of that gas is burned to generate steam that is pumped below ground to “liberate” the thick oil. As oilsands operations expand, more natural gas must be consumed. It is to the industry’s benefit to see lots and lots of natural gas produced from whatever quarter, and of even greater benefit if increased gas production results in a glut of marketable gas, which keeps prices low.

Like all of that Alberta-bound natural gas, the lucrative gas liquids heading to Alberta are used to prop up the province’s heavy oil industry. They are essential in allowing thick, unrefined Alberta oil and bitumen to move through pipelines.

B.C.’s generous trade in natural gas and wet gases carries with it enormous ecological costs, almost all of which are borne by Indigenous and non-Indigenous communities located in the northeast region.

The Tacoma LNG project is lucrative because B.C. fracked fossil gas is currently dirt cheap, something made possible by the trade in gas liquids to Alberta. However, the more we create a long-term market for cheap natural gas and build new fossil fuel infrastructure to support it, the harder it will be to ever transition off of fossil fuels. With only 12 years to avert runaway climate catastrophe, if we incentivize fracked gas from B.C. we’re subsidizing the oilsands extraction industry and guaranteeing our climate’s destruction.

Please account for the cumulative climate impacts of gas liquids from the B.C. fracking wells in the SEIS.

How B.C.’s Gas Giveaway Fuels Alberta’s
Oilsands: https://thetyee.ca/Opinion/2018/08/08/BC-Gas-Giveaway-Alberta-Oilsands/

I also ask that you include the cumulative climate impacts of gas liquids extracted from the

fracked gas at the Tacoma LNG processing plant. Those gas liquids will be stored in tanks on-site, and then sold. Please account for the processing, storage, sale and use of these gas liquids in your SEIS.

Thank you for considering my comment.

Sincerely,

Bradley Thompson, 2314 S Ainsworth Ave, Tacoma, WA 98405

1628-1 cont'd 13. LCA Inputs and Assumptions - Natural Gas Source

From: Bradley Thompson
To: Public Comment
Subject: Public comment on DSEIS, PSE LNG project
Date: Wednesday, November 21, 2018 9:35:39 PM

Dear Puget Sound Clean Air Agency,

In this comment, I would like to ask that the SEIS not only compare LNG to a No Action Alternative, but also discuss other currently available alternatives that would produce significant GHG reductions much greater than LNG. Since the original project proposal in 2014, there has been a sea change both in terms of what we know is needed (e.g., IPCC report says we have 12 years to avert runaway climate catastrophe, IMO sets new maritime decarbonization standards) and what we know is possible (e.g., renewable fuels, battery storage).

First off, we know that TOTE Maritime has been using cleaner-burning Ultra-Low Sulfur Diesel (ULSD) since Feb 1, 2017. The DSEIS needs to use that as the comparison standard to LNG.
http://www.americanfast.com/news/tote-maritime-fuel-surcharge-increase/

You have no doubt received many comments that say that LNG is the only currently available cleaner-burning fuel for ships, which is patently false. With the IMO setting new decarbonization targets, there has been an exponential growth in research and development into zero carbon shipping. Currently available alternatives include: slow steaming, cold ironing (electrical shore power), engine scrubbers, wind propulsion, hydrogen fuel and hydrogen fuel cells, battery/electric, efficiency of ship design, biofuels, etc. Viking Cruises is building a ship that runs on clean zero-emission hydrogen fuel cells, Washington State ferries have rejected LNG in favor of clean battery/electric, and mostly it seems that the solution is some combination of greater efficiency, better design, and decarbonized fuels.

If TOTE continued to burn ULSD for a few more years, it is likely that a true long-term alternative to maritime use of fossil fuels will emerge. A No Action Alternative should not assume continuation of fossil fuels for 30 to 40 years, because the industry will have to transition and adapt as decarbonization targets become more stringent. There needs to be discussion and consideration of this in the SEIS.

The same is true for Puget Sound Energy and the need for peak shaving. First off, the climate is warming and so the need for peak shaving is in doubt. Second, despite population growth in this region, energy demand has remained stable due to conservation and heating efficiency.

Puget Sound Energy says that the LNG storage tank is needed for “peak shaving” when, on the 1 or 2 coldest days per year, gas demand exceeds supply to keep the Fredericksen gas-fired electrical power generating plant running.

But look what’s happening in California. Just a few weeks ago, the California Public Utilities Commission approved four energy storage projects for Pacific Gas & Electric (PG&E) to replace retiring gas generators, including two batteries that would be the largest in the world. The quickly improving economics of lithium-ion batteries are going to seal the coffin on the gas peaker plant industry. Every energy utility should now seriously look at renewable, clean energy plus power storage instead of expensive and dirty fossil fuel powered plants for energy

1629-2 8. No Action Alternative
1629-2 7. SEPA Alternatives
1629-3 18. LCA Inputs and Assumptions - Marine Diesel Oil
1629-4 7. SEPA Alternatives
1629-5 17. LCA Inputs and Assumptions - Peak Shaving

reliability needs.

The SEIS should not compare LNG peak shaving to a No Action Alternative, but needs to discuss the possibility that gas peaking plants are simply no longer needed.

Storage Will Replace 3 California Gas Plants as PG&E Nabs Approval For World's Largest Batteries: https://www.utilitydive.com/news/storage-will-replace-3-california-gas-plants-as-pge-nabs-approval-for-worl/541870/

Dear Puget Sound Clean Air Agency,

In this comment, I would like to address methane slippage in marine engines.

In reading the draft SEIS, I did not see enough discussion and analysis of methane slippage in marine engines. From what I have read, methane slippage can be significant in marine engines and can almost eliminate any reduction in GHG impact compared to, for example, ultra-low sulfur diesel (ULSD) which is what TOTE ships have been burning since early 2018. These escaped emissions are obviously significant, as methane has a global warming potential which is 86+ times higher over 20 years.

Methane slippage in marine engines depends upon many variables, which I am asking to be fully discussed in the DSEIS. The three most popular engines utilised by LNG-powered ships are: lean-burn, spark-ignited engines operating on the Otto cycle; diesel dual-fuel (DDF) compression-ignited engines, operating like a lean-burn engine on the Otto cycle, but with Diesel cycle injection to ignite the methane/air mixture; and diesel-injected, compression-ignited engines operating with natural gas on the Diesel cycle.

Therefore, there needs to be discussion in the DSEIS about these variables:
* type of ship engine (TOTE Maritime ships, but also the projected, unidentified ships converting to LNG which are currently included in your GHG analysis)
* speed of travel (methane slippage can depend upon speed of vessel and how hard the engine is working, since methane as a fuel is less efficient than diesel)
* route (dual-fuel ships may simply not choose to burn LNG outside of the 200 mile ECA, or may choose to burn diesel in heavy seas)
* in dual-fuel engines, how much diesel is being burned and how often? Some average of this needs to be accounted for in the cumulative GHG analysis.

I ask that you compare and discuss your findings in comparison to the results determined in this recent EU study by Transport & Environment, titled “CNG and LNG for Vehicles and Ships—The Facts”: https://www.transportenvironment.org/sites/te/files/publications/2018_10_TE_CNG_and_LNG_for_vehicles_and_ships_the_facts_EN.pdf

1631-1 1. Determination of SEIS Scope - Comparison to FEIS

From: Bradley Thompson
To: Public Comment
Subject: Public comment on DSEIS, PSE LNG project
Date: Wednesday, November 21, 2018 6:11:44 PM

Dear Puget Sound Clean Air Agency,

In this comment, I would like to address project scope discrepancies between the original Tacoma LNG FEIS, clarifications posted online and via email by the lead SEPA agency City of Tacoma, and the draft SEIS which you released. These discrepancies need to be resolved in order to ensure an accurate and thorough analysis of all impacts of this project, and the best way to resolve the discrepancies would be to begin the SEPA process over again in order to address the significant changes that have occurred from the time that the project was first proposed in 2014 through now November 2018.

Some of these discrepancies include:
* The original FEIS is based upon barges being filled with LNG in the Hylebos waterway, which was later scrapped due to shoreline issues. City of Tacoma has stated numerous times, and it is still stated on their website in no uncertain terms, that filling barges with LNG is not permitted at the TOTE dock or at any other dock in Tacoma. And yet, your draft SEIS analysis presumes that barge bunkering of other ships besides TOTE ships will take place. How are these barges being filled up with LNG if there are no docks available to them?
* Your draft SEIS presumes that other ships besides TOTE ships will convert from fuel oil to LNG, and will be fueled by the Tacoma LNG project. To my knowledge, there are no other current marine customers besides TOTE who have indicated that they will convert their ship's engines to LNG. City of Tacoma, again on their current website, clearly states that NO OTHER SHIPS besides TOTE are permitted to fuel up with LNG at the TOTE dock. The FEIS and the City of Tacoma clearly state that only TWO TANKER TRUCKS PER DAY will be filled at the Tacoma LNG site and travel Taylor Way. So in the absence of bunkering barges, and with only 20,000 gallons of LNG permitted to travel Taylor Way per day, how are other ships going to be fueled, and at what location is this taking place? It is presumption and aspiration that other ships will convert to LNG and be fueled by the Tacoma LNG plant, however, accurate GHG analysis needs to be based upon currently known and stated facts.
* Puget Sound Energy's original project proposal includes fueling of trucks and rail cars, and transport of LNG via tanker trucks, barges, and rail tanker cars. The original FEIS only includes some of these impacts, and excludes transport of LNG via rail tanker cars even though it is now likely that this will be permitted by the Department of Transportation as early as May 2019. If the draft SEIS analysis is going to be based on aspirational business models—such as LNG barge bunkering and truck-to-ship LNG bunkering—then I ask that you also include the GHG impacts of potential sales, slippage, and combustion of LNG transported via rail tanker cars in the U.S. The SEIS must also include GHG impacts of potential sales, slippage, and combustion of rail cars using LNG as fuel.

Date: Wednesday, November 21, 2018 4:02:19 PM

Dear Puget Sound Clean Air Agency,

In this comment, I would like to address the Enbridge natural gas pipeline system that delivers natural gas from Northeastern BC to the Washington State border, and the Williams natural gas pipeline system that delivers natural gas from the Washington State border to the Tacoma LNG plant.

In light of the October 9, 2018, natural gas pipeline explosion near Prince George, BC, I request that the Tacoma LNG SEIS address the following questions:

* How old is the Enbridge and Williams gas pipeline infrastructure?
* What is the current condition of the gas pipeline infrastructure?
* What is the current leakage rate of methane throughout the Enbridge gas pipeline and Williams gas pipeline transmission systems (including compressor stations and other pipeline infrastructure)? Has that been calculated into the overall leakage rate of methane resulting from the Tacoma LNG project?
* How have methane leakage rates from Enbridge/Williams transmission pipeline and infrastructure been determined and who validates the accuracy of those figures?
* The British Columbia Assembly of First Nations (BCAFN) Is now calling for a thorough review of all aging pipeline infrastructure in B.C. What is the status of this request, when is this review expected to be completed, and how could the outcomes of this review impact the consistent supply of B.C. gas to the Tacoma LNG project?

http://bcafn.ca/recent-natural-gas-pipeline-rupture-is-a-wake-up-call/

1633-1 3. Outside of SEIS Scope

From: Bradley Thompson
To: Public Comment
Subject: Public comment on DSEIS, PSE LNG project
Date: Wednesday, November 21, 2018 3:35:42 PM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process on Puget Sound Energy's Liquefied Natural Gas (LNG) project being built in Tacoma. As stated in the latest IPCC report, your review of the greenhouse gas impacts of the gas used in this project couldn't be more important. Scientists make clear that, to limit global warming to 1.5C and avert runaway climate catastrophe, we cannot allow any new fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.

Please include in your analysis the conclusions arrived at in a recent study carried out by UMAS consultancy that looked at European shipping industry and LNG as a marine fuel. Their analysis concluded that transition to LNG would deliver a maximum 6% reduction in ship greenhouse gas emissions by 2050 compared to the replaced diesel. At that rate, the study calls LNG an "expensive distraction" for shipping with little impact on decarbonization efforts.

Investing in LNG, and building the infrastructure in ports to support it, will simply make it harder to achieve the IMO's shipping climate goals. "Europe should back future-proof technologies that would deliver the much greater emissions reductions that will be needed, including port-side charging or liquid hydrogen infrastructure. This means the EU needs to stop mandating LNG infrastructure in European ports."

https://www.transportenvironment.org/publications/lng-marine-fuel-eu

Flaws in the Tacoma LNG draft SEIS underestimate the greenhouse gas potential of the LNG project, and those flaws have been addressed in other public comments. But, even as currently calculated, it assumes at best an approximate 6% GHG reduction as compared to a "do nothing alternative." Building new 40 or 50 year fossil fuel infrastructure to achieve minimal improvements in GHG emissions simply locks us into an incremental path where we will surely miss the window to transition to a decarbonized future and a stable climate.

Thank you for considering my comments.

1635-1 3. Outside of SEIS Scope

From: Bradley Thompson
To: Public Comment
Subject: Public comment on DSEIS, PSE LNG project
Date: Wednesday, November 21, 2018 11:58:52 PM

Dear Puget Sound Clean Air Agency,

I submit the following comments regarding the draft SEIS for the Puget Sound Energy Liquefied Natural Gas project.

As a Registered Nurse, I am acutely aware of the air quality in our city and how that exacerbates respiratory problems for my patients. Recent wildfires, and the fire at the metal scrap yard in the Port, made clear to me that our city and public health department are sorely unprepared to deal with unhealthy air advisories that threaten long-term health of vulnerable adults and especially children. Even though PM2.5 pollution was at seriously unhealthy levels this summer, there were no N95 masks distributed, there were no emergency shelters opened for the homeless, and there were few advisories issued to keep people indoors. Smoke from wildfires and the scrap metal fire came in through the air intake ducts at the hospital that I work at, causing acute respiratory flare ups, nausea, eye and skin irritation, and headaches.

I moved to Tacoma in 2008 and previously experienced no respiratory problems in my life. But not long after I moved here, I started to experience throat irritation, changes in my voice, watery eyes, and eventually non-allergenic rhinitis that continues to this day. After numerous visits to Ear/Nose/Throat specialists, and after numerous diagnostic tests and studies, I am on daily medication and my symptoms are controlled. However, I wonder about the impact on my long term health as a result of choosing to stay here in Tacoma.

Air quality this past week has returned to Unhealthy for Sensitive Groups levels, and yet people are unaware of this. There are no announcements, and I only know this because now I check PM2.5 levels on a daily basis. As a nurse, I know that PM2.5 is about more than just respiratory complications. It is implicated in heart disease, stroke, and even dementia. Like lead, there is no safe level of exposure to PM2.5, but again people are unaware of these facts in Tacoma.

I state this, because you are a Clean Air Agency, and I know that you will receive many comments touting the “clean air” properties of LNG. That would be true if TOTE Maritime was burning diesel while at berth in the Port of Tacoma, but they are not. They are the only two ships in the Port of Tacoma that currently plug into 97% clean electric shore power from TPU. On the other hand, the LNG processing/refining/storage plant will be operating 24/7 in the middle of a busy urban port surrounded by workers and residential neighborhoods. Your agency is well aware of the local pollution emissions anticipated from the LNG project. Air quality will worsen in the areas surrounding the Port of Tacoma as a result of this project.

I beg you not to approve the air permit for Puget Sound Energy’s LNG project. Enough is enough. I am an environmental site steward for a salt marsh in the industrial Port of Tacoma where I organize work parties once per month. I have volunteers who can no longer work there due to problems breathing, respiratory problems, throat burning, skin and eye irritation. I suspect it is because of leaks from the oil refinery next door.

Please don’t exacerbate Tacoma’s air quality problems. Deny the permit to the LNG plant.

Thank you for considering my comments.

Sincerely,

Bradley Thompson

Subject: Tacoma LNG SEIS
Date: Friday, November 16, 2018 4:52:32 PM

Puget Sound Clean Air,

Thank you for providing the opportunity to review and comment on the PSE Tacoma LNG SEIS.

I am a conscious elder and a Tacoma activist concerned about climate change and our contributions to global warming. Part of what makes Tacoma so special is its story of moving from a legacy of pollution to a community that can take pride in its industry and environment.

After reading the SEIS, it appears to use old information, and it's missing data. The SEIS should be using the latest IPCC numbers when determining the global warming potential of greenhouse gases. It should also use the 20-year numbers instead of the 100-year, since this plant will only be operational for 40, and we'll see big impacts from the very beginning. When the 20-year GWP from the 2013 IPCC report is used, it shows that emissions from the LNG facility are actually 30-31% worse than the No Action alternative.

The SEIS is also missing really important information, like the carbon content of the gas to be used. This data is needed for a complete study, and until it's there, this SEIS is incomplete.

How will PSCAA ensure that the methane gas comes from BC? The SEIS should also analyze the very likely scenario in which PSE will have to get its methane gas from the Unites States network.

Finally, the SEIS doesn't include smaller sources of emissions, like those from tearing the plant down. These smaller sources of emissions could add up to a big impact, and should be included in the analysis.

Do the right thing. We do not know how much damage we have done to the environment. Because of these conclusions, I am opposed to the PSE Tacoma LNG project. Please update the SEIS, reissue it when it is complete and credible, and then re-open the comment period.

Subject: Puget Sound Energy LNG Project
Date: Saturday, October 27, 2018 9:27:41 PM

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

First of all, I want to thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. With our climate in grave peril, as emphatically stated in the latest IPCC report, your review of the greenhouse gas impacts of the natural gas used in this project couldn't be more important. Those scientists make clear that we cannot, and must not, allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.

My first concern with this draft SEIS is that it's not complete. There are several sections that are missing data and so we can not accurately assess the quality of the report and understand how certain conclusions are reached. Because of that, I request that you complete this report, reissue it, and then reset the public comment period so that we have time to review the completed report thoroughly.

With that said, I am aware of several issues with the current draft report you issued on October 8th. It is my belief that if these issues are given proper attention and addressed with best available science, it will show that the marginal improvements in emissions the study claims will disappear and the project will in fact be worse for the climate than doing nothing at all.

Here are some of the issues as I understand them:

- The SEIS is NOT using the best available science for the Global Warming Potential (GWP) of methane. It uses the 100-year GWP of methane and not the 20-year value which is much more relevant given the urgency in addressing the climate crisis. The appropriate 20-year GWP value to use is 96.
- This facility is projected to have a 40 year lifespan, so why does the report project out to 100 years, which is 90 years beyond the time we need to have taken decisive action?
- The SEIS claims emissions benefits from customers that Puget Sound Energy simply does not have. According to PSE and the City of Tacoma, the only maritime customer is TOTE with its two vessels which have already delayed their conversion to consume LNG. Securing new customers (there are only just over 100 LNG ships in operation out of a worldwide fleet of 90,000) as well as the additional permitting could take years and is not guaranteed.
- The SEIS says that emissions will only be reduced if the natural gas comes from Canada, because leakage rates are reportedly lower there than in the US. Shockingly, most leakage rates were self-reported by the fossil fuel industry based on models and recent measurements taken in the field have shown that leakage rates are much much worse.
- How can it be guaranteed that PSE is sourcing its gas from BC anyway? Their recent filings

show they relied on gas from BC, Alberta, and the US. And with the recent pipeline explosion in BC that interrupted PSE's supply, we know it's not always available.
- When ships use any fuel, a certain percentage of it escapes without combusting through the exhaust system and into the atmosphere. This is known as slippage and the SEIS uses a lower rate than is considered best practice.

In addition, increased marine traffic will negatively impact efforts to improve the condition of our Salish Sea, the home of the orca and many species of sealife.

Thanks again for initiating this crucially important review of this facility and I hope that you will take best available science into consideration when revising this draft SEIS.

Subject: Comments on Draft SEIS for the PSE Tacoma LNG Facility
Date: Tuesday, November 20, 2018 9:31:59 PM

Dear PSCAA –

I urge you to consider use of the most recent science as you examine the impacts of the PSE Tacoma LNG Facility in your SEIS on GHG Emissions Life Cycle Analysis. These would be data reported in the 2013 UN IPCC Assessment Report 5 (AR5) that include two sets of values, one with climate carbon feedbacks and one without. I believe the feedback climate carbon feedback data will provide a more complete picture of the true impacts of methane emissions likely to be produced by the PSE LNG facility.

Additionally, given the need to drastically reduce our GHG emissions within the next twelve years if we are to have any hope of reversing the impacts we've caused, I urge you to replace the 100-year methane GWP values with a 20-year methane GWP value.

On behalf of my children and my grandchildren, thank you for doing what you can to generate the most complete and accurate picture of the future with and without this LNG facility.

Best,

Nancy Tosta

Re: PSE - LNG Facility Tacoma -- Draft Supplemental Environmental Impact Statement Public Comment

Dear Colleagues:

Thank you for the opportunity to comment on this important matter.

I am outraged at the gall of our elected officials and their handlers as they move us backward in our struggle for cleaner air and water while watching our environment die.

All of the reasons for rejecting claims of a cleaner fuel, more jobs, a boost in our economy and/or cheap transportation costs have been documented precisely at length, and in detail. Fossil fuels are killers from the point of extraction to the end uses to which it is put. Period.

That said, this letter is about my own private hell. When I moved to Tacoma in 2002, the first place I wanted to go was the Mountain. I wasn't disappointed. Glaciers and snow all around Paradise, wildflowers blooming through the snow. We were in coats against the cold. This year, glaciers are in small patches, snow only at the crest, no wildflowers and women running around in halter tops.

I have a "view" apartment, a ring-side seat at a public murder. The Mountain is obscured by a thick, yellow-gray haze seven days a week. The Tideflats are an expanse of belching factories in a basin not equipped to handle the burden. This whole area is dying and our leaders, our "protectors" are making sure it happens fast and final. It's apocalyptic.

I'm demanding that they stop it! Stop the investment in regression. The only way forward is with an investment in renewable sources of energy. (11/21/2018) 8:04 p.m.

SEPA Reviewer-

I am deeply troubled by the inadequacy of PSEs LNG DSEIS. I ask that you reject the document as not having utilized best science in study of the impacts of this facility. I dont believe it begins to even pass the straight face test when addressing green house gas emissions, lifespan, and impacts to the earth/climate/environment.

Please require an evaluation utilizing best science practices of a 20 year life span so we can actually evaluate the true PJT. impacts!

Dear Carole J. Cenci,

If we are to have any hope of halting climate change we must immediately stop extracting fossil fuels. Fracking is an environmental nightmare on every front, there is not one good thing to say about it. The enormous mix of chemicals used to break apart underground rock structures pollutes water supplies, the soil, the air, while the fracturing of bedrock causes earth subsidence and earthquakes. Huge quantities of good water are used in fracking, water that we can't afford to throw away on a monstrously polluting industry. Areas where fracking is taking place are suffering appalling damage from the industries' activities: local rivers and streams which once were pristine are now toxic waste sewers, people have lost their drinking water, soils are contaminated by the movement and seepage of heavily polluted water pumped up from the fracking process and can no longer be used to grow food, air quality is awful, and many people are suffering severe health problems from living near fracking sites. Also, the high levels of methane released into the atmosphere by the fracking process ensures that the possibility of reigning in climate chaos becomes virtually impossible.

The fracking and fossil fuel industries spend huge sums of money on PR in order to make it seem as though everything they are doing and want to do is utterly benign, which is a criminal lie, and they know it, but they don't care because they are infinitely greedy for money and power. Our planet cannot survive behavior like this. If we are to have a planet on which we, our children and grandchildren and their descendants can live healthy lives in a healthy environment, fracking and the extraction of fossil fuels must stop immediately.

Puget Sound Energy and Tote Marine seem to imagine that a clean energy future can be arrived at by digging the fossil fuel hole deeper. This proposed LNG project is another step toward climate chaos at a moment when the IPCC has given us a clear warning that we must urgently move away from fossil fuels.

Fracked gas is not a lesser evil. Scientists' understanding of methane's impact on the climate continues to evolve, and at every step along the way we learn that fracking allows more methane escapement than we had previously observed and that the impact of methane on the climate, particularly in the short term, is even more serious than had been previously understood.

I applaud your decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct this more rigorous analysis. Thank you.

I urge you to revise the analysis to account for the following:

1. Methane should be counted as 86 times more potent than CO2 based on the current IPCC analysis (AR5 rather than AR4) considering a 20 year timeframe (rather than the 100-year).

2. Revise the analysis of the impacts of fracking in British Columbia based on recent research(1) demonstrating that methane escapement has been dramatically under-estimated.

3. Revise the "no-action alternative" to include a clean energy alternative in which PSE provides electricity not with a different source of fracked gas, but with renewable energy and energy efficiency.

2552-6 7. SEPA Alternatives

4. Revise the "no-action alternative" to include the assumption that Tote Marine will achieve a 50% GHG reduction, in line with the International Maritime Agency's established goals. This reduction might alternatively be achieved by a combination of fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion or many other alternatives besides fracked LNG.(2) For clean local emissions requirements, Tote Marine can achieve virtually all of the localized lower-particulate and lower SOx and NOx benefits claimed for LNG propulsion by opting for low-sulfur marine gas oil over heavy fuel oil, and installing selective catalytic reducers and diesel particulate filters.(3)

5. This more accurate analysis will show that the project has a significant and unmitigated impact on the global climate, which
should be seen as a sufficient basis for denial of the Notice of Construction application.

Thank you for your time and consideration of these comments.

Dear PSCAA...

Fracked Gas Fuels Climate Chaos!

Deny the air quality permit for the Tacoma LNG project.
When accounting for methane leaks during extraction, transport & storage, "natural" gas is potentially as bad for the climate as coal.

Name Olivia Tucker Age 9

Unknown: **[Inaudible] [06:43:47]**.

Steve: Okay. One more.

[06:44:00]

Unknown: **[Inaudible]**.

Steve: Yes. We have records of all of that, yeah.

Alma: Alma Tuckiupay. Hello, relatives. It's nice to see each and every one of you here today. I just wanted to say that I stand here with my brothers and sisters from our Puyallup Tribe, our **[Native language]**. I know Carolyn went home earlier. And I was hoping that there would be a Puyallup tribal member that would come up here because I'm not Puyallup, but I am enrolled over in Black River Falls, Wisconsin. And we have these fights, these stand ins, these stand ups all over Turtle Island.

And I speak on behalf of all of the indigenous people that cannot be here tonight and for those that cannot speak for themselves. And I'm talking about the Sam, and I'm talking about the two-legged, the four-legged, the winged.

[06:45:01] Everything that we know that we know is life today, as we know it. It's really important, as an indigenous woman, to stand here also for our missing and murdered indigenous women. As you know, in the draft agenda here, you were saying that you're going to bring in fracked gas from BC. But that fracked gas comes at a cost to our indigenous women. And that's why I wear this hat because I'm standing here and saying no more stolen sisters because the fracked gas facilities brings in man camps. And these man camps prey on our women, on our indigenous women. And I just want to stand here on behalf and say no means no.

Honor life, the life that we've been given. And to deny this permit for PSE because it's not natural.

[06:46:03] It's fossil fuel. It comes from the ground. It's old stuff. It's dirty. It's death upon our people. **[Native language]** all of my relations.

Steve: Okay. Thank you. So, I'd like to remind everybody that the comment period on the draft SEIS is open through November 21. So, any comment, even if you've already submitted comments, or you heard something else at the hearing, and you want to submit

1102-1 3. Outside of SEIS Scope

more comments, that's fine. Please submit them to us by the 21st. And the hearing is closed. Thank you.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

The Supplemental Environmental Impact Statement (SEIS) submitted for the Tacoma LNG export facility is so severely flawed, in so many different ways, that it would be a serious violation of public responsibilities to accept it as it is.

As it stands, the SEIS does not account for the full climate impacts of the facility, as it is required to do, because of several glaring misapplications of current scientific consensus on data points and appropriate comparisons:
1) It uses Global Warming Potential (GWP) estimates based on 2007 values, not 2016 values - using the more recent numbers would be the appropriate scientific approach and would increase the global warming impact estimate of the project significantly.
2) It looks at long-term (100 year) not near-term (20 year) impacts, which also serves to underestimate the impact, since methane's warming impacts are comparatively more severe over the short-term. Given the latest scientific consensus from the IPCC that the next 12 years will be absolutely critical in determining our ability to avert catastrophic climate impacts, the near-term impacts are the ones to prioritize when evaluating this facility.
3) There are a number of unreasonably favorable assumptions made towards the project in terms of the methane leakage rates during production, none of which are actually justified by current practices or guaranteed to be reflected in the future methane sourcing from fracked gas for this project. The SEIS consistently uses lowest possible estimates of methane leakage based on sourcing from specific sites, but there is no guarantee or even reasonable grounds to assume this will be the case in reality.
4) Throughout, inappropriate and unrealistic comparisons are put forward to make the proposed facility look as if it has a net beneficial impact from displacing more polluting projects. There is no reason to assume this is more likely than that the project would displace more rapid adoption of clean energy alternatives, but including these scenarios as comparisons would make the project look much worse in terms of its impacts. This is obvious cherry-picking of favorable comparison models.

These are only the most glaring scientific reasons the SEIS is unacceptable, but there are broader reasons to deny the project's permissions outright. Equally important objections to the project include the violation of the rights of the Puyallup Tribe, which has consistently opposed this project and whose treaty rights, assured in the highest law of this country, are being violated by this project. The Puyallup people, in opposing this project, are also expressing serious and legitimate concerns about the environmental and health risks that will be foisted upon communities living close to this air and water polluting facility. LNG facilities

have been consistently documented to degrade air quality and emit volatile organic compounds linked to birth defects, cancers, and nervous system damage.

There are many more detailed and obvious reasons to object to accepting this SEIS, but ultimately, even with improved calculations, locking our economy into a project dependent on fracked gas extraction for decades to come cannot be justified at this moment in history when we must urgently transition away from the use of all fossil fuels. The reasonable and most responsible response is to refuse to allow any more time and effort go into the pursuit of this dangerous and dangerously misguided facility.

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

The Puget Sound Clean Air Agency should go back to the drawing board

The draft SEIS does not account for the full climate impacts of fracked gas. The analysis is incredibly flawed and unacceptable, and we need the Air Agency to do better before they decide on the air permit for the facility. The draft SEIS uses an outdated methane global warming potential (GWP) value.

GWP is a measure of potency for a greenhouse gas and it is measured against carbon dioxide (CO2). CO2 has a GWP value of 1. Methane has a much larger GWP value, especially over the short term. The draft SE IS uses the United Nations' 2007 value of 25 for the 100 year number (i.e. the methane average GWP over 100 years), whereas they should be using the 2016 value of 32. This single modification in SEIS GHG model makes the LNG plant much dirtier from a greenhouse gas emissions perspective.

Methane is significantly more potent in the near term, yet the SEIS analysis only looks at the long
term impact. Methane is a significantly more potent greenhouse gas than carbon dioxide, especially in the short term. The draft SEIS analysis is based on the 100 year GWP of methane. The IPCC report released a report on October 8th, indicating that we must change our energy fuel mix in the next 12 years or face dire consequences in 22 years. Therefore, the SEIS should use the 20
-year numbers, as that is the timeframe where action is needed. It is ridiculous to look out to 100 years, considering that the planet will already have dire problems in 22 years.

The draft SEIS incorrectly assumes that B.C. fracked gas would result in a significant GHG emission reduction. The reports used to justify such conclusion were models or self reported by industry. The three B.C. based reports all require further analysis to determine if they can even be extrapolated to B.C.

Additionally, the SEIS fails to incorporate methane leakage data from recent 2017 and 2018 reports
that use empirical, independent physical studies at well sites. The 2018 report found that 85 percent of active wells are directly venting methane daily, and that those leakages have been historically underreported. The same report found that methane emissions in BC are 2.5 times higher than reported.

The draft claims that all of the natural gas will be coming to the facility from British Columbia.
During the recent natural gas pipeline explosion in B.C. on October 10th, it is our understanding that PSE was able to use natural gas from North Dakota. The methane leak estimates from North Dakota are noticeably higher than those reported from B.C. PSE's own 2017 10K filing with the Securities and Exchange Commission (SEC) shows that in 2017 they obtained gas from British Columbia (54.8%), Alberta (19.1%) and the United States (26.1%). How will the Air Agency hold PSE
accountable to bringing in only B.C. gas?

Turn down The Tacoma fracked LNG plant in the tideflats of Tacoma. There are too many problems in the claims reported in the SEIS. The earth cannot tolerate more fossil fuel infrastructure and more fossil fuel production, particularly when the SEIS is using faulty data.

The Puget Sound Clean Air Agency should act as its name suggests, and work for sound clean air policies, and work against the Tacoma fracked LNG plant.

Sincerely,
Dena Turner

Washington's Puget Sound Orca population is seriously endangered by noise on the waterways, decreasing fish stocks, pollution, and acidified water. The DSEIS needs to account for how the proposed LNG facility emissions, noise, and extra traffic be considered neutral or helpful to the Puget Sound ecosystem?

Submitted by Caryl Utigard 2447 SW 170th St. Burien, Wa. 98166 206 439 9747

Caryl Utigard

PSE has mixed the emission data of fracked and non-fracked gas. Since already our gas is 2/3 fracked and increasing, I want the emission figures updated to show both the present and future percent fracked gas figures for the life of the plant used in figuring the emission data. Caryl Utigard

I don't see any report in the DSEIS of how much water will be used at the proposed LNG site nor where the water will be drawn or expelled. Thus, I request that PSE report on the water use and disposal that will be required on site and upstream at the fracking site. Further, the emissions resulting from hauling the water, chemicals and other site materials to and from the site must be added into the emission total. Caryl Utigard

Submitted by Caryl Utigard 2447 SW 170th St. Burien, Wa. 98166 206 439 9747

If PSE plans to use BC gas, which is 100% fracked, then the procedures they used to obtain lower emissions than using US gas are suspect. I am asking an independent PSCAA chosen firm to monitor the emissions. How can PSE guarantee that for the life of the proposed Tacoma LNG plant all the gas will come from the sources tested for purposes of this DSEIS?

Submitted by Caryl Utigard 2247 SW 170th St. Burien, Wa. 98166 206 439 9747

The DSEIS does not compare the economic damage to the Puget Sound area of investing millions of dollars in a globally detrimental old nonrenewable energy source just when the technology of the future to produce renewable energy is available and increasingly not only lower in cost, but not environmentally dangerous or destructive. I am requesting that the Puget Sound Clean Air Agency look at the basic health (air particulates, water pollution) of Puget Sound under the scenarios of LNG vs no LNG . Caryl Utigard

The DSEIS submitted by PSE is lacking accurate estimates of the hazards of building, using and maintaining the pipes and site and distribution of product. Thus, I am requesting that PSE submit a list and description of all of their explosions, leaks, unintentional emissions and the area this covers for the past 20 years as a way to estimate part of the future problems this proposed LNG plant may experience. To this data must then be added the hazard of the new mix of fracked gas, the new size of the storage facility, the new acreage of pipes proposed, the new noxious chemicals to be added at site, the site stability difference and elevation and geological fault situation. These data in total should form the estimate of air and water hazard from the LNG proposed facility vs not building the facility. Caryl Utigard

The DSEIS submitted by PSE is lacking accurate estimates of the GHG emissions .

PSE used outdated (2007) instead of (2016) and latter emission figures. As the years pass and the measurements of GHG emissions improve in accuracy the data show substantially more leakage from upstream through downstream and end use. Thus, I request that the leakage data submitted be updated using the 2016, the most recent UN data, or more recent published scientific data.

Caryl Utigard

Chuck: Chuck Valdez, yeah, that's my tax number name. My Native name is **[Speaking native language]**. I'm Apache, and I'm Northern European. I'm also a citizen here in Tacoma, a new arrival. I came from the LA Riverside area in Southern California. The air was unbreathable down there. I have asthma. I dealt with it all of my life. I don't want to see this community become like LA or Ferguson or any of the other fossil fuel polluted communities across our whole nation. And I heard TOTE and the executives and the people that work for them about emissions and sulfur and the need for LNG.

They're already meeting their requirement. They just don't want to pay. This is about greed. They don't want to pay for ultra-low sulfur diesel.

[05:22:03] LNG is unneeded. They already meet requirements. And air, water, it's all connected. And water is what this LNG facility sits on. It's an estuary. The Asarco's smelter dump is what created the land there. The Puyallup People, which I'm a guest of and everyone in this room is a guest of, they're our hosting tribe. Thank you for letting us be people here in their community. But back to the point, that's built on water. Highly explosive facility built on top of water, on top of a toxic waste dump. Nobody has the deed to that land because it's not land. It's a Asarco smelter dump.

[05:23:00] That's what it sits on. On top of water and pollution. If that thing goes up, it's going to liquify. And everything around it is going to explode, too. Fourteen or is it seventeen, I don't know how many people are going to be in charge of this plant. They're in charge of thousands of lives, 14 to 17 people in charge of the Hilltop, the Puyallup Reservation, the whole blast zone area. They're pretty much, literally, in charge of all of those lives, 17 people for greed. And I've gone past my time. Thank you for hearing my voice.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Whoever is thinking of fracking in WA or OR has no idea of the risk of this horrible idea. The Cascadia Subduction Zone is a 600-mile fault that runs from northern California up to British Columbia and is about 70-100 miles off the Pacific coast shoreline. ... The last earthquake that occurred in this fault was on January 26, 1700, with an estimated 9.0 magnitude. This could cause so much damage to these states that would cost FEMA enormous amounts of money. This idea is foolish, reckless and should be stopped immediately!

Subject: Tacoma LNG SEIS
Date: Saturday, November 17, 2018 7:50:02 AM

Puget Sound Clean Air,

Thank you for providing the opportunity to review and comment on the PSE Tacoma LNG SEIS.

I am a Fox Island resident concerned about climate change and our contributions to global warming. What happens in Tacoma doesn't stay in Tacoma: Fox Island has soil contamination from the Aramco Lead Smelter.

After reading the SEIS, it appears to use old information, and it's missing data. The SEIS should be using the latest IPCC numbers when determining the global warming potential of greenhouse gases. It should also use the 20-year numbers instead of the 100-year, since this plant will only be operational for 40, and we'll see big impacts from the very beginning. When the 20-year GWP from the 2013 IPCC report is used, it shows that emissions from the LNG facility are actually 30-31% worse than the No Action alternative.

The SEIS is also missing really important information, like the carbon content of the gas to be used. This data is needed for a complete study, and until it's there, this SEIS is incomplete.

How will PSCAA ensure that the methane gas comes from BC? The SEIS should also analyze the very likely scenario in which PSE will have to get its methane gas from the Unites States network.

Finally, the SEIS doesn't include smaller sources of emissions, like those from tearing the plant down. These smaller sources of emissions could add up to a big impact, and should be included in the analysis.

Because of these conclusions, I am opposed to the PSE Tacoma LNG project. Please update the SEIS, reissue it when it is complete and credible, and then re-open the comment period.

Hello. My name is Terry Velasco.

It is important for you to hear from someone like myself, who not only has lived in the NE Tacoma neighborhood (actually 6 minutes from the LNG facility) for over 36 years, but also has worked at TOTE Maritime for more than 21 years.

As you are aware, TOTE plans to switch from burning diesel bunker to using LNG to fuel our vessels. This is yet another opportunity my company is taking to improve our environment. Years ago, we installed Rain Gardens in our Terminal to filter the contaminates out of the storm water before it ran into Commencement Bay. We also were the first, and still the only, large shipping company in the Port to install Shorepower capability, which allows our vessels to sail into port and turn off our engines by plugging into power at the dock. For those 8+ hours, our ships emit nearly 0 emissions. That's at least 8 hours twice a week, 52 weeks a year we are reducing the release of pollutants into the air.
It stands to reason that now TOTE is taking even more steps to further reduce emissions.

My family and I greatly appreciate this and all TOTE is doing to provide a cleaner environment for our future.
Many, if not all of us, living in this area use gas in our daily lives. We need LNG to reduce our dependency on dirty diesel fuel.
Please approve this permit.
Thank you for listening.
Sincerely,
Terry Velasco

Subject: Draft SEIS on PSE LNG
Date: Tuesday, November 20, 2018 10:21:34 PM

Dear Puget Sound Clean Air Agency,

I am concerned about the peak-shaving aspect of the Puget Sound Energy LNG project. I read in the final EIS that it was supposed to be additional gas for home heating in the area on the coldest days of the year. According to PSE, this was only "for a few days that may only occur once every few winters." [01. UG-151663 PSE_PUBLIC Garratt direct (R) PSE 2015.08.11 page 10 of 51]. But now in this draft SEIS the gas from the LNG facility is supposedly going to be used on the Frederickson gas-fired power plant. It seems to me that they decided to "cherry-pick" this facility to say the gas would be used to displace the use of diesel and therefore afford greater alleged greenhouse gas reductions (at least under these rosy assumptions) rather than just being used in homes as usual.

Why is the LNG for use in peak shaving suddenly supposed to be used in Frederickson?

This seems suspicious to me and matches the pattern of PSE telling different stories to different audiences I have seen since following this project for the last two years.

How much diesel does the Frederickson power plant actually use? I would like to see data showing how much diesel the Frederickson power plant has used over its years of operation.

Furthermore, I would like to know why the PSE LNG facility will only be used for peak-shaving for 10 years? Where does this 10-year timespan come from?

Thank you for doing this review in the first place and considering my comments.

For a better tomorrow,

Subject: Draft SEIS on PSE LNG Refinery
Date: Tuesday, November 20, 2018 10:23:23 PM

Dear Puget Sound Clean Air Agency,

When I first started looking into Puget Sound Energy's Liquefied Natural Gas project, PSE always claimed they had no control over where there gas comes from or if it was from fracking. Their go-to response was "we buy our gas on the open market". Finally we saw from their Securities and Exchange filings that they get their gas from British Columbia, Alberta and the US (some 26%). As soon as the PSCAA SEIS was announced, the information on their website suddenly changed to say they get all their gas from BC. My understanding is that these gas supplies are in multi-year contracts.

I would like to see the current gas-supply contracts that PSE has and until what year they endure.

If PSE fails to maintain a purely BC gas supply, will they then be operating outside of their permit? What will be the consequences?

What happens when the leakage rates in BC are found to be higher than currently modeled?

Thank you for reviewing this unnecessary refinery.

For a better tomorrow,

Daniel Villa

Subject: Draft SEIS on PSE LNG Refinery
Date: Tuesday, November 20, 2018 10:30:10 PM

Dear Puget Sound Clean Air Agency,

I hear all these claims about the Puget Sound Energy Liquefied Natural Gas project cleaning our air here in Tacoma. I would really like to see that backed up by data since the two TOTE ships are the only ones that actually plug into shore power when they dock.

Could you show me a side-by-side comparison of the yearly emissions emitted by:

-the two TOTE ships coming and going in to port (say within 3 miles of the dock?) once a week each and plugging in to shore power

-the LNG facility running non-stop and emitting various chemicals into the city of Tacoma plus the two TOTE ships burning whatever combination of diesel and LNG to get in and out once a week each after being on shore power (using a 3 mile distance again).

I think this would be an interesting comparison.

For a better tomorrow,

Dan

Subject: Draft SEIS on PSE LNG Refinery
Date: Tuesday, November 20, 2018 11:05:21 PM

Dear Puget Sound Clean Air Agency,

As I write this email my IQAir phone application tells me that the Air Quality Index (AQI) of Tacoma is currently 98. It was at a similar level around 11am when I biked downtown and felt I had to hold my breath. When I later emerged on Pacific Avenue it reeked of port emissions. Our air quality has been horrible lately and I don't believe the Puget Sound Energy Liquefied Natural Gas refinery will help that.

The stated greenhouse gas benefits, using the old scientific potency value of methane over 100 years, are a meager 3.9-5.5%. In Europe they came to similar numbers, not even taking into account upstream methane emissions, and discounted LNG completely as being a viable shipping alternative to current fuels.

In the draft SEIS there are many places where some contributions to greenhouse gas emissions are considered to be 0% because they are less than 1%. Given the slim margin of alleged improvement, I don't think these sources should be so easily dismissed – obviously several small numbers can combine to a more significant figure.

Therefore, I would like all quantities assigned a 0% contribution in the draft SEIS assigned an actual value using best available science and the sum of those values added into the overall figures.

Also, why has the CO2 emission figure for the refinery jumped from 21,000 tons per year to 52,000 tons per year (at 250,000 gallons/day production)?

Thank for your taking into consideration my comments and I look forward to seeing them answered.

Subject: Draft SEIS on PSE LNG Refinery
Date: Tuesday, November 20, 2018 11:10:17 PM

Dear Puget Sound Clean Air Agency,

Since Puget Sound Energy claims they will be getting all of their methane from British Columbia now, I think there are some other carbon sources that are not taken into account:

- The fracking wells in BC are considered quite "wet" in that large quantities of liquid hydrocarbons come out with the "natural" gas. **These wet hydrocarbons should be figured into the greenhouse gas impacts as well. How many tons of liquid hydrocarbons are collected from the wells in BC per year? What is their GHG effect?**
- In British Columbia the gas industry cuts so-called "seismic lines" through the forests. Once they find a viable location they then feel more trees. **All the trees cut down by the natural gas industry need to be accounted for in this study. How many trees are cleared by the natural gas industry annually and what is the overall trend?**

Thank you for reviewing this project.

1274-1 1. Determination of SEIS Scope - Comparison to FEIS

From: darovi2003@yahoo.com
To: Public Comment
Subject: Draft SEIS on PSE LNG
Date: Tuesday, November 20, 2018 11:22:55 PM

Dear Puget Sound Clean Air Agency,

I noticed that the scope of services that PSE claims to provide in this draft SEIS is wider than those outlined in their final EIS for the project. For example, in your draft SEIS, PSE claims to have additional maritime customers for their LNG. The City of Tacoma, as the lead SEPA agency, has categorically denied that PSE plans to or will be allowed to any ships aside from the two TOTE vessels. They have even said that the refueling connections are unique to those ships alone and therefore can't be used by other ships (not that there are many – only 120 or so of the 100,000 cargo vessels in the world are built, or being built, to burn LNG).

How can PSE claim emissions credits for customers it does not and allegedly cannot have? Any references or calculations involving supplying non-TOTE vessels with LNG should be struck from the study.

If PSE has misled the City of Tacoma and in fact does wish to supply other maritime customers, how long would it take them to secure the additional permits they need to then start bunkering other ships?

I look forward to reading a correction and clarification on this matter.

From: darovi2003@yahoo.com
To: Public Comment
Subject: Draft SEIS on PSE LNG
Date: Tuesday, November 20, 2018 11:30:36 PM

Dear Puget Sound Clean Air Agency,

After seeing the draft SEIS you presented to us, the public, I am deeply confused about your role in this review process.

Could you please explain it to me?

What led to my confusion was the fact that this draft SEIS was so not complete. How can we comment on something that is not complete? Do you have experts of your own that reviewed the draft SEIS and asked for clarifications from Environment and Ecology, the firm that wrote it? That doesn't appear to be the case.

And what about all the questions that we ask? My understanding is that you compile them and then present them to the SEIS preparer, Environment and Ecology. But what happens when those answers come back? Do you evaluate them for completeness and scientific soundness? This is the part that worries me deeply.

I look forward to your response.

To: Public Comment
Subject: Draft SEIS on PSE LNG Refinery
Date: Tuesday, November 20, 2018 11:44:37 PM

Dear Puget Sound Clean Air Agency,

In the draft SEIS I read that “many existing [LNG] plants have been running for more than 40 years.”

I would like to see an itemized list of these facilities including their names, location, years in operation, storage capacity, production capacity and type of facility (refinery, traditional peak-shaver, maritime fueling station, etc.).

So what this report is saying is that it’s not really planned to be a so-called “bridge fuel” to renewables, but a decades long commitment to continuing to burn fossil fuels in the face of the recent Intergovernmental Panel on Climate Change.

Thanks for considering my comments.

Subject: Draft SEIS on PSE LNG Refinery
Date: Tuesday, November 20, 2018 11:59:26 PM

Dear Puget Sound Clean Air Agency,

In your draft SEIS you compare LNG to a no-action alternative. But that seems like a false choice.

What if that money had instead been invested in shore power for ships in the Port of Tacoma? How many tons of CO2 would be eliminated per year through that action? That would also have reduced local air pollution without adding a refinery which only spews more toxins into our environment.

Instead of comparing the peak shaving function of the facility to burning diesel at the Frederickson gas-fired power plant (how likely is that anyway?), why not compare it to the green alternative of lithium ion battery bank storage such as is being built in California and already deployed in Australia?

Please consider all the negative aspects of the PSE LNG project! It imports fracked gas via a pipeline and stores it in a tank. Fracked gas is ecologically unsustainable, it pollutes. Pipelines leak, explode and pollute. Tanks leak and can explode. We need clean air and water. Please recommend that the project be stopped! Our future depends on it. Thank you, Pat Villa

Subject: Puget Sound Energy LNG Project
Date: Tuesday, November 20, 2018 6:15:57 PM

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

Thank you for reviewing the Puget Sound Energy LNG storage facility being developed in the Port of Tacoma.

I am a opposed to this project for the simple reason that I believe we should not be building large fossil-fuel based projects of of any kind in Tacoma or elsewhere. The United Nations IPCC has been clear that without drastic action to curtail C02 emissions of all kinds, including from the use of natural gas, our planet will start to experience catastrophic weather and natural events due to climate change. In fact if one considers the recent wildfires in California and hurricane events around the world, this future is already on our doorstep. Review of claims by PSE already reveal that this project will not deliver the reductions in emissions promised. Please take a step for future generations, and do not permit this project to go forward.

Thanks

Subject: Deny the PSE LNG project
Date: Tuesday, November 13, 2018 2:29:32 PM

I attended your public hearing on October 30th at the Rialto Theater in Tacoma. After listening to all the arguments for and against, here is my summation:

Air quality coming from ships will be greatly improved by switching from bunker fuel to liquefied natural gas (LNG). If you just focus on switching from a dirty fuel to a fuel with no particulates, then it would be an easy decision to approve the project. But the issue of poor air quality from ships is currently being addressed. Scrubbers are available that can remove more than 99% of the sulfur from the exhaust gas. The European and North American emissions control areas (ECAs) already have a .10% sulfur cap on marine fuel that will be lowered in 2020. Alternative cleaner fuels such as hydrogen fuel cells and biodiesel are currently available. Electric engines for ships will be available eventually.

You are charged with protecting the air quality from pollution from all sources, not just ships. Refining and liquefying natural gas to make LNG produces tons of pollutants. Literally tons! Here are annual pollution estimates from the Environmental Impact Statement (EIS) that were submitted to the City of Tacoma

NOX 13.8 tons per year

CO 20.1 tons per year

SO2 5.5 tons per year

PM10 1.03 tons per year

PM2.5 1.03 tons per year

Sulphuric Acid 0.27 tons per year

Greenhouse Gases 20,751 tons per year

VOCs 85.7 tons per year Those Volatile Organic Compounds have even more serious impacts at high levels of exposure. Short-term effects include eye, nose & throat irritation, headaches, nausea/vomiting, and dizziness. Long- term, high-level exposure can cause liver and kidney damage, central nervous system damage, and cancer.

The greatest threat coming from the PSE LNG facility is from the potent climate warming greenhouse gas, methane that will be leaking from the well head to its final combustion. Both the quantity and climate warming potency need to be considered. Our civilization needs to start quickly reducing its use of fossil fuels if we are to have a healthy climate for future generations. My greatest concern is that, if approved, the PSE LNG facility would be operational for 40 years to directly contribute to climate change.

Locking us into 40 years of preventable greenhouse gas emissions in order to eliminate particulate emissions from shipping is a poor choice when there are other ways to accomplish that without endangering the climate. Maybe it will be up to 10 years before those other ways

are completely available. That is a small price to pay instead of locking us into 40 years of preventable greenhouse gas emissions. It is just that shipping companies don't want to spend the money to invest in other clean alternatives when cheap LNG is available. Making society pay for the damages and deaths caused by climate change so shipping companies can save money today is an immoral choice. Please deny Puget Sound Energy from operating the Tacoma LNG facility.

Sincerely,

Richard Voget

Carole: Thank you, Mr. Johnson. Rich Voget?

Rich: This is the wrong facility in the wrong place. It's wrong geologically to build an LNG refinery whose tank holds the equivalent of 166 kilotons of TNT in an earthquake and tsunami zone just above sea level on unstable fill next to two superfund sites. Gee, what could go wrong? It's in the wrong place for the Port of Tacoma's business to have LNG bunkering at their busy port because other ships pose an ignition risk to LNG bunkering.

[00:08:00] During ship to ship bunkering, both the supply vessel and receiving vessel pose an ignition risk. To control the risk presented by other marine traffic, bunkering operations require a geographic safety perimeter that excludes other vessels and limits the speed and possibly the size of passing ships. Precautionary safety restrictions would most likely limit ship traffic to and from other businesses on two port waterways and could likely impair normal operations of unrelated port business activity. The LNG facility is in the wrong place, from an air pollution standpoint.

The residents of Tacoma will get to breathe a potpourri of nitrous oxides, sulfuric acid, and fine particulates and experience adverse health impacts ranging from asthma to emphasema.

[00:09:00] It's estimated that 85.7 tons per year of volatile organic compounds will be emitted from the facility. Short term effects of volatile organic compounds include eye, nose, and throat irritation, headaches, nausea, vomiting, dizziness. Long term, high level exposure can cause liver and kidney damage, central nervous system damage, and cancer. What are the health implications, when a freak weather pattern causes air to stagnate for a prolonged period of time? I was in France during the heat wave of 2003. There was no breeze. Thank you.

Steve: Thank you. Next up is Carlo Voli.

[04:33:00]

Carlo: Hi. I'm Carlo Voli. I live in Edmunds. And my family on my mother's side has been here in Puget Sound Salish Sea area, since the 1870s. And I strongly support the Puyallup Tribe's stands who are opposed to this project. And also, requesting that the draft SEIS be redrawn with accurate and current data, which it obviously isn't, as a lot of other folks have pointed out. Something that hasn't been mentioned here is that not only is the scientific data you've been using incorrect, but this is also an environmental justice and Tribal Nations issue.

And it is kind of interesting that the Puget Sound Clean Air Agency and its advisory council, the two seats that are vacant are exactly those two.

[04:34:00] The Environmental Justice seat and the Tribal Nation seat, in the advisory council for your agency. So, that, to me, is quite concerning because this is, obviously, from an environmental justice issue, not just the impacted communities in Tacoma, with the air quality. But I've heard directly from First Nations up in BC where, supposedly, some of this fracked gas is going to come from, how those Treaty 8 First Nations are being directly impacted with their air and water quality and lack of ability to carry their traditional lifestyles. Plus, in all of the communities in the fracking areas, not just the air and water quality, but also the gender and sexual violence that's involved in all of this.

And I'm not sure if you're taking into account all of the increase in truck traffic in the fracking areas, which also adds a lot of air quality issues.

[04:35:05] So, please, deny this permit. And before doing that, do a proper SEIS evaluation. Thank you.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Dear Puget Sound Clean Air Agency,

Thank you for opening up public review of the Puget Sound Liquefied Natural Gas project in Tacoma Washington. Our climate is in grave peril and we need to stop building fossil fuel infra structure and transition to renewable energy as quickly as possible. Fracked gas is as harmful as coal in causing global warming, methane leaks happen from mining, to piping and burning. We can no longer give in to individuals who want to make a buck regardless of what harm they inflict on the environment and on everyone and everything that lives on earth.

Sincerely,
Sherry Wade

Steve: Thank you. Paul Wagner?

Paul: Good evening. **[Speaking native language]**. I am Shiocton. Come from house leader, spiritual, intellectual, chieftain, family **[Speaking native language]**. And we're here to let you know that this place, where you live, where your children live has been loved and cared for in a way that is almost incomprehensible by people who have not been here that long.

[04:36:02] We've been here, by current science, 16,000 years and made sacred promises to every living being. So, when you decide that you're going to build a monstrosity that is going to end the wellness for the **[Speaking native language]**, the orcas, the salmon, the **[Speaking native language]**, the human children, it's going to end their wellness. It's going to end their future and a possibility of a good future because our poles are melting. If you did not know, real science says that the Arctic is 40 degrees above average temperature this year recorded. Real science. And 600 fires in British Columbia.

We breathe smoke here in Seattle for weeks equal to smoking seven cigarettes a day.

[04:37:00] And that's if you're standing still. If you're a child running, how many cigarettes is that? A pack? We cannot afford this kind of foolishness any longer. It's an impossibility because, in 160 years, the colonialism has had rule here. It has brought death to most life. And that's the truth. If you want to know where you have come from, you have to look back and take a look at it. And then, you'll know where you're going because, in those 164 years, it has been annihilation for the ancient forests, the natural animals, and indigenous people at 95% annihilation rate.

And if you do not know where you have come from, you will not know where you're going.

[04:38:02] That's our proverb. So, you need to know that what you're doing right now, if you sign off on this deal, you're signing off on the death of the future, your children. You're signing off on that. With incorrect science, your 100 year model, it's a lie. We need to have the truth here. The children deserve the truth. Current science. Take a look at what's going on with the climate. It's collapsing right now, in front of our eyes. The climate systems are collapsing. The poles are melting. And 40 degrees above average temperature higher than normal. And 600 fires in British Columbia.

[04:39:00] We need to end this now. In absolute terms, we need to end this madness right now for the sake of all of our children, every single one of them and their future. That's what we're looking at. We're looking at their future or no future. And if you can't see that, then you are blind. You're blind with colonial insanity. And you need to open your eyes. I pray for you to open your eyes and make the right decision because our elders allowed us to learn what is the right thing for the future generation. And this monstrosity, Puget Sound Energy's bomb, is not the right future for the children or any child, plant, animal, or human living on Mother Earth.

So, please, deny the permit.

[04:40:03] Please use current science. We're begging of you for everyone's children, including yours. I don't know how we can put it in more simple terms. All I can do is pray for you. Thank you.

Subject: Puget Sound Energy's LNG facility
Date: Tuesday, November 13, 2018 8:41:52 AM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

PSE's fracked gas LNG facility is being built on Puyallup land without their consent. Honor the Treaties, and reject the Clean Air Permit for this dirty project!

Sincerely,

Jessica Walalch

RE: Comments for the draft SEIS for THE PSE LNG facility

To Puget Sound Clean Air Agency,

I'm a Puget Sound Energy (PSE) employee, and I'm also a mother to two young children. I support environmental projects, policies and technological advancements that will help protect our earth for future generations.

I believe the proposed PSE facility represents a significant benefit to the environmental health of the Puget Sound region. The draft SEIS, prepared by Ecology and Environment, Inc. and released by PSCAA on October 8, 2018, stated "When evaluating direct, upstream, and end use GHG emissions, replacing a diesel propulsion engine with a pure LNG propulsion engine results in reduced life-cycle GHG emissions."

As the draft SEIS points out, LNG is a cleaner alternative to conventional fuels such as diesel. LNG, when used as marine fuel, reduces greenhouse gas emissions by nearly 15% and eliminates visible particulate emissions produced by ships by more than 85%.

I hope PSCAA will move forward and approve the air quality permit(s) necessary for the facility's completion now that the agency has independently verified, through its own SEPA review, the project's environmental benefits and overall reduction in greenhouse gas emissions.

Thank you for your consideration.

Sincerely,

Lindsey Walimaki

0470-1 16. LCA Inputs and Assumptions - Hydraulic Fracturing
0470-2 14. LCA Inputs and Assumptions - Leakage/Slippage

Dear Puget Sound Clean Air Agency,

I am an educator in Tacoma & I value the health and livlihoods of the poorest people in our community & around the world. The impacts of climate change disproportionately impact the poorest people who cannot relocate due to fires, flooding, storms, lack of water & pollution that we caused by climate change. I am concerned that this SEIS ~~is not accurately~~ using unacceptably low Methane slippage rates, not incorporating diesel emissions for transporting fuel/workers to fracking wells, assuming credit for maritime customers that don't exist yet, & does not plan for or take into account all BC methane leaks or local climates. This Air permit should not be granted given these holes in this EIS there is insufficient data for faulty science.

Please include this in the final supplemental environmental impact statement.

0480-1 12. LCA Inputs and Assumptions - Global Warming Potential Value

Dear Puget Sound Clean Air Agency,

I am a professional mariner and recreational sailor. I value wildlife in Puget Sound like killer whales + nudibranchs. I also value the ability to eat + harvest fish + shellfish from the Pacific Northwest. I am concerned that impacts of ocean acidification + climate change will hinder mine + my children's ability to enjoy wildlife + seafood in our region over the next 20 years. I am concerned that this SEIS does not uses the GWP for 100 years rather than 20 years. Climate + OA impacts are already affecting + will affect marine wildlife over the next 20 years. Please use the 20 year GWP in the final SEIS. Also please use the GWP from the most recent available science.

Please include this in the final supplemental environmental impact statement.

0560-1 5. Regulatory Framework

Dear Puget Sound Clean Air Agency,

I am an educator living in Tacoma. I value tribal sovereignty for the Puyallup Tribe. The proposed facility puts treaty rights & the community at risk. The Medicine Creek Treaty has been violated throughout the process of this facility. I stand with the Puyallup in opposition to the LNG facility. Puget Sound Clean Air Agency & all agencys involved in this facility still need to consult with the Puyallup Tribe before proceeding

Please include this in the final supplemental environmental impact statement.

Name: Lindsay Walker	Phone:
Address: 511 S G Street Tacoma, WA 98405	Email: Walker.Lindsay3@gmail.com

Dear Port of Kalama, and Cowlitz County,

Dear Puget Sound Clean Air Agency,

The tremendous impact of these proposed projects on global warming should be considered in their entirety. Leaks of gas in all of the stages of extraction, transport, conversion to LNG, and then the end usage of the LNG in the user country (probably China) all contribute to an exasperation of global warming. The science is clear – to minimize the damaging effects of global warming is vital – otherwise coastal cities and lands will be flooded by rising sea level, there will be more fires, hurricanes will be more powerful, oceans will be more acidic, and many species will become extinct.

Please include this impact in the Final Supplemental Environmental Impact Statement.

Dear Port of Kalama, and Cowlitz County,
Dear Puget Sound Clean Air Agency,

2026

2026-1 3. Outside of SEIS Scope

I don't feel that the negative effects of the many miles of pipelines have been adequately addressed. The pipelines would cross many rivers and streams, with many possibilities for leaks and explosions. This could cause inordinate damage, including the possibility of human deaths as well as environmental damage. Leaked methane can also cause health effects as well as contributing to global warming.

Please include this impact in the Final Supplemental Environmental Impact Statement.

Name: Janet Wall	Email: janet227wall@gmail.com

Dear Port of Kalama, and Cowlitz County,

Dear Puget Sound Clean Air Agency,

2044-1 3. Outside of SEIS Scope

As a fishery biologist, I am concerned with the environmental effects of the proposed Kalama methanol refinery. The refinery would take 5 million gallons of water per day out of the Columbia River. Tankers of methanol could spill, causing impacts to the salmon population. Decreasin salmon population is already causing the southern resident Orca whales to starve for lack of food. The liquified gas could also spill during loading or transport, which should also be analyzed as another potential impact on marine life.

Please include this impact in the Final Supplemental Environmental Impact Statement.

I AM writing Today To Ask You To STOP LNG

OUT DATED SCIENCE WAS USED
OUT DATED SCIENCE CONTINUES TO BE USED.
PERMITS WERE NOT ISSUED TO BUILD PROPERLY

THE LOCATION OF THE LNG PLANT SITS ON UNCEDED TRIBAL LAND.
- NO MEAUNGFUL CONSULTATION WAS MADE W/ PUYALLUP TRIBE.

PLEASE REJECT & START OVER WITH A NEW INDEPENDANT ENVIROMENTAL STUDY!

THANK You. C. WALLACE

Steve: Thank you. Next up is Jessica Wallach.

Jessica: Hello. Thanks for being here today to hear our concerns. My name is Jess Wallach. I'm an organizer with 350 Seattle. I'm a person who breathes. And before I begin, I just want to say that I stand here with Puyallup. I recognize that the Tacoma LNG facility has been building without all of their permits in place and in violation of a sovereign nation's rejection of the facility on their land.

[04:46:05] And I stand here and ask you to incorporate, by reference, the tribe's comments in my own. So, I worked for many years as a gardener. And in the summers, when we have smoke, I have to choose between paying my rent, going go work, or being healthy. I wasn't the only person making that choice. People chose to stay inside during the smoky air. And then, they would be really tied up the next month. Or we would be outside and working and then, sick for the whole next month because we'd been breathing in the smoke from the wildfires that were exacerbated by climate change.

And in my family, I had that choice. Not everyone did. A lot of my family members have asthma, and they weren't able to go outside. And those smoky skies, driven by wildfires, driven by climate change, that's increasingly our new normal. Talk about a climate change future.

[04:47:00] Clean air is not something that we can count on. It's not something that will be there for us. And it's, certainly, not something that we can live without. So, when we talk to you today about this facility and about making choices for clean air, I'm asking you to think about what it looks like when people have to choose between going outside or paying their rent, or when they have to choose between going outside and getting food, like some of my family members did.

I'm asking you to take a look at your analysis and think about what opportunity you have to holistically consider the climate impacts of this project. I'm asking you to look at the best available science, the real 20 year numbers for methane leakage and do the right thing. You can change course here and actually consider the climate impacts of this project and actually make sure that we have clean air for the future. Thank you.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Dear Puget Sound Clean Air Agency,

The recent Special Report 15 of the Intergovernmental Panel on Climate Change tells us that we have only twelve short years in which to make deep, dramatic and rapid reductions in our CO2 emissions in order to avert irreversible changes in our climate with catastrophic impacts on the current system of life on Earth.

Building infrastructure such as that proposed for the Puget Sound Energy Liquefied Natural Gas Project being proposed for Tacoma will lock us into another 40 years of production of LNG. We don't have 40 years. The climate crisis is already well upon us. Everything that the climate scientists have predicted has come to pass with one significant exception—it is happening faster than foreseen.

We must stop all construction of new fossil fuel infrastructure if we are to have any chance at curbing climate change.

Please don't allow this project go forward. You will increase our risk of an Earthquake in the PNW. No more fracking!!!
Thank you

Steve: Okay. Next is Nickie Walters.

Nickie: Hello. I'd like to acknowledge we are currently here in Tacoma on stolen Puyallup ancestral land. And I ask you to find a moment of your time for personal reflection of what that means to you and them, as the historical original caretakers of this land.

[04:10:04] I hear it talked about by many tribal people and elders. It wasn't that long ago, about 160 years ago, when it all changed. These lands used to be so plentiful and abundant with wildlife and natural resources that no one that stepped foot into their territory ever went without. Nobody. I could talk to you about everything you know about polluting industry not measured accumulatively here, cancer rates and mysterious illnesses on the east side that run rampant, TOTE already being in compliance with their fuel requirements, the 100 year versus 20 year plan, how in 12 years we will enter climate chaos.

But I'll send those comments to you in an email plus more. I want to talk to you about my experience with going solar and PSE removing my gas lines and someone I know who actually laid those LNG pipelines in Fife to the port.

[04:11:04] So, I had an opportunity to talk to somebody who laid those pipes. And they were deathly afraid for what they were putting in that ground knowing that that gas was going to be in there. Those were sewer pipelines. They had a sewer pipeline permit. This is not okay. This is going to leak. When I had PSE come and remove my gas out of my home a few weeks ago, I was talking to some of the workers out front about LNG being dirty because they had that going green with LNG truck in my front yard. And they are the ones that pointed out that the backs of the trucks are covered in black soot. And he showed me. He wiped the soot off and showed me the white shining through the soot.

[04:12:00] This isn't as clean as they're making it out to be. Yeah, it might be cleaner, at the burn point, but it's going to leak all over the place from the fracking point. And we have no control over that fracking point. That's in a whole other country, if it comes from that country. Everything changes all of the time with what they're saying. I'm going to send you guys everything in emails. Thank you.

Steve: Thank you. Elizsabeth Parker? Before I call the next speaker, the next group getting ready after that would be Sally Perkins, Desiree

Douglass, Kathy Hewitt, Carlo Voli, and Paul Wagner.

Steve: Thank you.

[04:48:00] Next is Nikie Walters.

Nikie: I already went. I don't know why my name is in there twice. I just want to point out, too, a Seattle city councilman came here, and our own city council is not here today.

Subject: The Truth
Date: Sunday, November 18, 2018 3:38:30 PM

"Why are the people of Seattle more important than the people of Tacoma?"
-Craig Kenworthy, Exec. Director of the PSCAA questioning Port of Tacoma Commissioners about the out of control particulate matter and their undesire to gain control of it by sticking to a timeline to clean it up like Seattle has during a Seaport Alliance Meeting at the Port of Tacoma, Nov. 2017.

I know the PSCAA has never denied a permit. I know the PSCAA feels like your hands are tied to policy. I know you don't have the Native or Environmental representation positions filled at the PSCAA. This can change. all this can be changed.Together we can all change this. We can move forward and passed these hard times. We need and deserve protections in our community. When I was at that Seaport Alliance meeting a year ago and listened to Mr. Kenworthy explain his concerns, it was an emotional moment of realization that told me that the PSCAA understands so much that is wrong which we live bound to in our community in and around Tacoma that we love. I told you at the 1st comment period I spoke at you attended at Bates and I tell you again, Thank you Mr. Kenworthy for sticking up for the people of Tacoma. Please continue to advocate and help us. We are important too. All life is important and we need the PSCAA because no one else seems to understand that with all these shotty reports being forced down our throats. We will never accept whats happening to us just like we would never accept it anywhere else either.
Please at the very least, re due that study and report and begin the comment period all over again. If that study was adequate, the PSCAA would clearly see how bad LNG really is. We only have less than 12 years and we have the science, data, technology and ability to get off this forced dependency to fossil fuels and implement a wonderful butterfly effect of possibilities for the good of the future,. We can do this if we all do this together.

Thank you, Nikie Walters

Subject: Discrepancies in report that pose unacceptable risk to our community
Date: Sunday, November 18, 2018 1:45:59 PM

The US Coast Guard uses an analysis reported by Sandia National Laboratories. They have noted that buffers of .3, 1.0 and 2.2 miles with varying degrees of severity depending on the case of the accident. However, since this LNG refinery and 8 million gallon storage is located in a residential area, we have populations of people and homes within 1 mile. According to the analysis being used by the US Coast Guard, PSE is putting a large population of people and their homes at an unacceptable risk and if the Puget Sound Clean Air Agency decides to approve the air permit, then PSCAA is also allowing these populations of people and their homes to exist at extreme risk against the Coast Guards warnings. Either re due the report and begin all over again with a new comment period after the report is redone, or deny the permit and lets explore alternatives that the already highly polluted community of Tacoma would accept.

Thank you,
Nikie Walters

Subject: Environment
Date: Sunday, November 18, 2018 1:06:42 PM

Natural gas, AKA methane, is a more potent greenhouse gas than CO2 and is proven to be dirtier than coal and oil because of all the leaks via fracking/drilling wells, cheap pipelines, poorly constructed pipelines, poorly maintained pipelines, pipeline ruptures and explosions, refining/processing, human error at refineries and storage facilities, flair malfunction, every time it's transferred, increased volume of polluting trucks on our roads and community, trucking accidents on roads, not to mention what goes unreported until/if they are caught and the dissemination chain that nullify claimed greenhouse-gas benefits of LNG.
I also want to mention and acknowledge the fact that tar sands are used in the fracking process and tar sands are the dirtiest most toxic form of oil on the planet. And when they cannot reuse the tar sands anymore, they discard it wherever the state or country they are fracking the gas at allows them to. That means it can be stored in barrels and who knows what they do with it from there. Many sites have fracking ponds that they are able to just discard the tar sands into. These super toxified makeshift ponds are right on the ground next to the fracking wells allowing seepage back into the earth and into water tables which are further polluting them. We cannot control our weather. Weather also plays a part in the toxification of our air and water once fossil fuels are pulled out of the earth. We in The USA cannot regulate what other countries choose to do but we are supporting whatever they are doing. Knowing this and that Canada has the largest most toxic and destructive Tar Sands pits on the planet, is extremely concerning and unacceptable to me that we are supporting Canada in these type of endeavors, let alone bringing it via pipeline into our country. That pipeline explosion last month in Canada which effected our gas supplies in multiple States exemplifies just that and tells us that we need to be investing more in solar and wind as alternatives to bringing gas into our homes and businesses. Solar and wind does not explode such as gas does nor does it release uncontrolled amounts of raw and burning methane deposits into our air furthering causing havoc and contributing to the detriment of our environment.
We have better ways to achieve and meet our energy needs without having to build any new fossil fuel infrastructure. Look at how far humanity has come. We don't need to rely on these old outdated ways for anything. It's possible to live without fossil fuels anymore without having to inconvenience our culture if we just do it. Tesla showed us that many many years ago yet Edison's ideas were implemented instead. We know now this was a huge mistake and it must be righted by changing things before its too late. Less than 12 years are left to fix this. Deny the permit and lets serve the people and planet for a change. The good, right and moral change.

Thank You
Nikie Walters

Subject: Fracking
Date: Wednesday, November 21, 2018 10:59:56 PM

There are 1.7 existing fracking wells in the US today that have already polluted.

Using an average of 4.5 billion gallons (22,727 tons) of water + 5,000 gallons (~19 tons) of 700+ highly toxic chemicals + more than 4,300 tons of sand = the average of ~27,000 tons of fracking fluid per well × 1.7 million fracked wells= the average of 7.65 trillion gallons of water with deadly toxic polluting chemicals and 46 billion tons of fracked fluid that have already been injected into the Earth just in the U.S.

Step 1. Hydrolic fracking
Step 2. Directional drilling
Step 3. Well stimulation
Step 4. Flowback- store for reuse or dispose of in evaporation ponds which, A. Release toxic gases, B. Are not fenced, C. Spills over with heavy rainfall D. Leaks into soil and groundwater. Nearby you will fibd storage tanks with release valves releasing toxic xhemicals into our air.
Disposal on or off site-
Injection wells: Flowback forcefully pumped into underground formations such as salt caverns! These injection wells and seismic testing for fracking sites are causing earthquakes all over including in States that have never been known to ever have earthquakes till recent years.
25-50% of thoes 46 billion tons of used fracked fluid flows back out. Now mix with gas/oil/radon/radiation-some us reused.
But mostly, the volume of toxic flowback is more than the industry can handle.

Pathways for fugitive emissions to excape from wells-
Volatile chemicals in fracking fluid raise carrying radon, radiation, methane, benzene, heavy metals, and many other deadly pollutants.
Toxins from fracking oil and natural gas migrate 1. Into drinking water, aquifers, all soil layers and plant life 2. From the pressurized fracking process itself 3. Through unavoidable cracks and leaks in the cement, conduit, pipelines and storage tanks 4. Into the air we breathe

"Examining the entire fracking process used to produce natural gas, it is worse than coal" - Cornell University

In most states, there is no requirement for fracking companies to disclose the chemicals they use.
Chemicals used in fracking fluid and released by the fracking process effect:
Skin, eyes kidneys, ammune system, respiratory system, cardiovascular system, nervous system, gastrointestinal system, endocrine system, hormones are affected by exposure by the parts per billion, are known to cause cancer, birth defects and death.

These fracking ponds can be found uncleaned and abandoned across the US including on Indian Reservations such as the Blackfeet Nation.

DENY THIS PERMIT OR AT LEAST REDUE YOUR REPORT. WE CANNOT CONTINUE ON THIS DESTRUCTIVE PATH WHEN WE HAVE SO MANY OTHER CHOICES AND OPTIONS.
Thank you.

Subject: Health assessment, or lack there of in existance concernig the PROPOSED LNG Refinery and storage
Date: Sunday, November 18, 2018 3:53:14 PM

Oh Lord Creator, give me strength and don't get me started on the fact that The Tacoma Pierce County Health Department isn't required to complete a health assessment on this LNG project even though its consistently being referred to as “proposed”, it is being allowed to be grandfathered into old policy making a health assessment obsolete in this case. PSCAA this is all you. I know you know about the cancer rates and mysterious illnesses occurring on the Eastside of Tacoma down by the Port and in Northend. I know you know of the dangers of dredging the waters of Commencement Bay and that the toxins can only be measured out so far and that the toxins surpass that point. I know you know that the polluting businesses at the Port of Tacoma are spewing toxins into our air and nothing is being measured cumulatively. I know you know our air quality monitoring is minimal and we are well overdue for a good air quality report that tests for everything, but because of the cost of the one we need, it leaves us left out and unimportant as permit after permit gets approved. And as scientists, I know you know a whole lot more than me about all this stuff but we both can understand what goes up, must come down and that we have toxins going into our air are also not being monitored on our water quality reports at all. PSCAA please help us. We need you to protect us. If not for us, then think about the future generations and what we are leaving to them. Please. Please deny this permit and lets begin to do things right for the protection for the people and all living things in the waters and air all around us. we cant keep doing this when there's only 12 years to completely change our culture, privileges and conveniences that come with our forced dependency to fossil fuels. we don't need to be victims to this any more. we have the ability to move passed it if we just do it. Please.

Thank you,
Nikie Walters

Subject: Materials breach senario ignored in report
Date: Sunday, November 18, 2018 2:05:32 PM

We all know too well about the nightmarish terrorist attacks in New York and Virginia on 9/11 when planes were hijacked and crashed into the World Trade Center and The Pentagon. Just a couple months ago, a man was able to go undetected and steal an airplane from our local highly surveilled and secured Boeing field and ended up crashing it not too far from the Port of Tacoma. However, Puget Sound Energy's Safety modeling completed for the LNG site DID NOT include a materials breach scenario such as a terrorist attack.

PSE and their LNG supporters claim that a terrorist attack is not likely or warranted and instead points their fingers at the surrounding refineries as a greater risk. this is unacceptable as LNG poses many very explosive risks which are completely being ignored. Moreover, PSE has been sued twice in a Court Of Law, which they lost both cases including a resident representing himself, over the prevention of releasing safety modeling results claiming any potential of a terrorist attack. This concerns me greatly considering the raising frequency of terrorist attacks in this country, the risks imposed in the mixing of jet fuel and LNG in such of an attack going completely ignored, our location on the West Coast on the most dangerous fault line in the world and on a liquefaction zone in consideration to how such an event could trigger the fault line, within a residential area and within proximity to other refineries, its location to businesses, marinas, residential neighborhoods, schools and other populated areas, its location on the water and the fact that water does not extinguish an LNG fire but ignites it more and the fact that fire retardant foam which would in effect heavily pollute and devastate our waters and everything in it if required to extinguish a fire, the impact that such an event would have on our air and create unacceptable and unrecoverable health and safety risk to any life within proximity. And not to mention that this over $300 million project only was required to get an LLC with insurance coverage up to $50 million which is not even enough money to recover PSE's loss let alone what would devastate the surrounding area. This is in fact the same exact issue that California is currently being plagued with from the devastating fires that completely destroyed entire cities and neighborhoods as PG&E is currently being investigated as the cause of the Camp Fire. We don't need these issues in Tacoma or the State of Washington and this must change for the protection of the people, all life and the planet.

What I explain is many unacceptable risks and if PSCAA approves this permit they too would be ignoring the fact that the inevitable can happen even though we have watched such attacks happen in the USA and considering terrorist attacks are indeed on the raise on our Country. Deny the permit or start all over with a new report that addresses all the people of the city's concerns along with a new comment period. Lets consider and explore other ways of meeting the needs of shipping industry while companies like TOTE are operating within regulations on low sulphur diesel.

Subject: Not to mention....
Date: Sunday, November 18, 2018 5:03:12 PM

I want to stress to the PSCAA that I support all comments submitted in person, written, faxed and phoned in, in opposition to this PROPOSED LNG refinery and storage. Especailly the comments submitted by the scientists and professionals who's language I may not always understand,` to the most common, marginalized, disabled and at risk people of our communities who end up suffering the most from being a product of our environment. We all are important
I also want to stress that I fully support the Puyallup tribe in opposition and in pursing that their Treaty Rights be honored by all arms of Government, agencies, Corporations, businesses and people of the USA and abroad. The Puyallup Tribe is a Sovereign Nation, which is a Nation within a Nation and they should be treated with the same dignity and respect as all other countries and leaders around the world are. This goes for all Tribes. We must not forget to acknowledge who's territory was stolen and developed against their will by various and any means necessary as we live our lives out among these lands and abroad. We can all coexist in harmony as all Tribes used to before colonization intruded it heavy brutal hand on all the peaceful people of all these lands as long as respect, which is due, is honored. I say this in regards to all tribes of all these lands, not forgetting to include the genocide still being committed around the world for lands and resources that are still being stolen and ravaged by polluting and destructive industries to this day. We as moral people must stop financially supporting the destruction of our planet and the dehumanization of people who's culture connects humanity to the earth.
Together we can and will accomplish many wonderful things, but we must work together towards the common ultimate goal with moral and respect for all.

Thank you,
Nikie Walters

P.S.
While TOTE maybe doing it, ships are not plugging in at port. This is where that black crap that the long shore men complain about is coming from. We need to begin to cover all the roofs at our port in Solar and electrify what we can. This solar power at the ports will also take a burden off of the grid from TPU as the sun powers the port and vehicles needed to operate at the port.

100 year plan vs 20 year plan. This is not ok that a 100 year plan model is being used in the reports especially when the life of LNG is 25 years and the port is expected to be under water by 2030. The port being expected to be under water by 2030 is another factor of this

horrible idea we call Tacoma LNG.

I-1631 failed and that's why we need agencies to protect us. Record amounts of money was poured into the No I-1631 campaign. However, the people didn't vote against our environment, they voted against what the fossil fuel industry turned it into, a regressive tax system because even the No campaign consistently advocated for and challenged Government and environmental agencies for bolder action on climate change. This must start now my denying the permit for the PROPOSED Tacoma LNG. It is dirtier than coal if the facts and data are ran and reported on correctly. So, I urge you to fix the report by running the numbers correctly, restart another comment period, or deny the permit. Thank you.

1613-1 12. LCA Inputs and Assumptions - Global Warming Potential Value

From: nikie walters
To: Public Comment
Subject: Please redue and give us a realistic study
Date: Sunday, November 18, 2018 12:40:57 PM

The Clean Air Agency's analysis is based on 100-year, not 20-year, global warming potential (GWP) values. Given the IPCC report that was released last month indicating that we have 12 years to avoid climate catastrophe, the Clean Air Agency should be using the 20-year numbers, as that is the time frame where action is needed. Using the most recent 20-year value of 96 makes LNG 150% dirtier than the "dirty fuel" it's supposed to replace.

This is unacceptable that numbers are being used in this study and analysis that are meant to serve and fit the mold of polluting industry's needs instead of putting the health and safety needs of the people who would be living in and suffering the repercussions of polluting projects in and around our residential communities. Although I would prefer that the PSCAA denies the permit, please give us a realistic study that we can trust or deny the permit all together.

Thank you,
Nikie Walters

Subject: safety
Date: Sunday, November 18, 2018 3:18:46 PM

As a former City Employee from out of State, I have been well versed over the years in City Disaster Response, so I have very good reason for my extreme concern about the Emergency Response Plan with the LNG refinery, or lack of thereof in existence as its being allowed to be built without permits. According to an engineering consultant report obtained through a Public Disclosure Request, The Tacoma Fire Department will not complete an Emergency Disaster Response Plan until after the project is operational. Now, please understand my perspective here as I explain my concern with this. This is completely unacceptable due to the fact that there are LNG refineries which are known and exposed through a simple google search to have had operations problems on day 1 including reports of covered up and hidden emergencies, issues and problems.

I and every single living person and thing in the community deserve to have a safety plan that should have been drafted, accepted and included as part of the EIS, FEIS and SEIS reports. As a matter of fact, I questioned a Fire Battalion Chief at a meeting once about what exactly is the plan if an emergency occurs involving the LNG site at the port. The best response I got was if anything big happens, the Federal Government will step in. My response back was, oh wow so there is no plan ok, and our conversation stopped there. Now, with that, we have all seen the increasingly strong natural disasters occurring around the world let alone in our Country.

On that note, we saw the Federal response to the hurricanes in places like Louisiana, Texas and Puerto Rico. We saw people fighting for survival by lawlessly looting on an 'every man for himself' mentality, we saw a chemical plant owned by Asarco (same company as the toxic Tacoma Asarco plant) blow up after days of waiting for federal response and we saw our President show extreme disrespect towards the people when an entire island was destroyed and now has defended the EPA. Are we really going to set ourselves up to ensure the largest disaster possible is achieved on the Tacoma Tide Flats and then simply say the Federal Government will save us? We would have no choice but to depend on ourselves and that's the reality so that's why we must mitigate the degree of severity that will be inflicted upon us. What help we do get will leave us all marginalized IF we survive and will be picking up the pieces for years.

According to the earthquake professionals in Washington we already know that we are expected to survive on our own for anywhere between 2 weeks and 2 months until the Federal Government can get to us. This is due to the fact in a disaster to this magnitude, we would be completely isolated and cut off from all directions of anyone getting to us including by way of water. Zero supplies for the living will be obtainable and like in Louisiana, Texas and Puerto Rico, people will be left to lawlessly fend for themselves for survival.

We are subject to liquefaction in an earthquake of 7.4 and above. The port and that LNG

refinery is in the direct path of a lahar zone and there's only 2 ways in and out of that Port. And that's just speaking on natural disasters and the fact that we are well overdue for a big earthquake on the most dangerous fault line in the world, not to mention our fault line up here is connected to the San Andres fault of California and a big enough earthquake on either fault line can set the other off. The truth of the matter is we cannot control or compete with Natural Law even if we tried and no amount of money or science will ever change that. Additionally, the reality is we also have the quickly growing risk of terrorist attacks to worry about everywhere we go anymore and people saying how wonderful this project is don't even consider terrorism as a threat and seems to think the LNG tank is completely unreachable. We must also consider any type of emergency scenario that will in effect throw Superfund soil up into our air. I don't hear a lot about that factor being talked about and this is a serious hazardous risk considering the cancer rates and mysterious illness rates already existing and surrounding the port of Tacoma. All of this as I explain, in many types of emergencies will effect our air.

We are setting ourselves up in a bad way by not already having an Emergency Response Plan drafted and included in all the planning and reports and this will all definitely have a profound negative effect on our air quality. Climate change as the United Nations describes that we only have 12 years left. This means we must stop building new fossil fuel infrastructure now and explore, implement and rely on better choices and options. We must start now since we haven't begun already

Deny the permit or do an adequate study that the people of this city can accept and lets redue the comment period.

Thank you,
Nikie Walters

Subject: Unacceptable public risks not being addressed in the reports
Date: Sunday, November 18, 2018 1:36:25 PM

City of Tacoma and Puget Sound Energy have stated that any dangers posed by the LNG project does not exceed the fence line to the Tacoma LNG property. I am extremely concerned about PSE going around to our neighborhood council meetings and telling residents that they will contain any type of emergency within the fence line when in some cases this is not humanly possible. I also learned at one of these meetings by listening to the residents responses that the community is not falling for it one bit. Steve Storms who is a well respected resident of our community and chemical engineer along with other very intelligent and professional members of our community describe calculations for a blast zone of more like 3 and a half miles. This discrepancy not being addressed by reporting agencies is unacceptable by any standard of our community members.

Additionally, 1 day after the SEIS was completed Tacoma Fire Department safety modeling showed us that there's a 1 mile impact zone. Since this refinery and 8 million gallon storage is in a residential area, it would affect things like anyone on marine view drive, anyone on the water, people taking daily walks in their neighborhoods, the people's homes, businesses, schools, other oil refineries, metal scrap yards, the Puyallup Tribe’s treaty protected reservation lands such as marina and riverboat casino properties, many pipelines carrying gas underground to the LNG refinery, hundreds if not thousands of longshoremen, on very dangerous active fault line and on a liquefaction zone. In the even of an emergency, all these factors will be at great risk and in effect, our air will suffer unacceptable and unintended consequences as so will the raise of GHG on the permitting and reporting agencies account. This is unacceptable by any means.

With the TFD as a reporting agency on safety concerns as well as the professional calculations made by our experts of our community, these statements made by our City officials and PSE are proven to be shortsighted, misguided, flawed and puts public health safety at an unacceptable great risk.

If the Puget Sound Clean Air Agency decides to approve the air permit for the Tacoma LNG refinery, then PSCAA will also be going against the study and warnings completed by TFD by putting a large population of people, businesses and homes at great unacceptable risk. Please deny the permit and lets explore other means of serving local residents and businesses as well as TOTE since they are already operating within regulations by using low sulphur diesel.

Thank You,
Nikie Walters

Steve: Thank you. Next up is Andy Wappler.

[06:19:00]

Andy: Thank you. I'm Andy Wappler. I'm vice president of corporate operations and communications at Puget Sound Energy. And I don't want to reiterate what my colleague David Mills said earlier in the evening. I affirm what he said, in terms of the DEIS. I just want to thank you for today, your fortitude, your endurance today, and for making it possible for the community to come out and make their voices be heard. I know this process, the public involvement with the agency began about a year ago, October of last year, as you had your first opportunities for people to come and speak.

And your process in permitting PSE began even before that. So, thank you to you and to the staff, your colleagues, and Director Ken Worthy, and to the folks who came out here tonight and spent their time. We hope to be able to move forward with what we think will be a very good step for Tacoma and air quality locally. Thank you.

From: bessbree@nventure.com
To: Public Comment
Subject: need a new draft environmental impact statement for LNG plant
Date: Monday, October 29, 2018 3:32:06 PM

The Puget Sound Clean Air Agency has decided that the City's draft EIS for Tacoma's LNG project was incomplete. We need to pause this process and thoroughly address the environmental problem of methane release.

Since fracking began, the natural gas industry in the U.S. as well as Canada has touted how environmentally clean the fuel is compared to other fossil fuels. The elephant in the room, revealed by various studies in both countries (TNT 10-27-18), is the underreporting of the amount of methane being released daily due to constant venting and leakage during the life cycle of bringing the gas from the ground to consumers.

Because methane is much more potent and long-lasting in the atmosphere than CO2, the last thing Tacoma should do is sign a years-long contract that provides an outlet for natural gas without addressing what the industry has not wanted us to know for years. Until cities and citizens stand up for the tightest regulation of methane release, the natural gas industry will turn a blind eye and continue to save money by emitting far more methane than necessary, exponentially contributing to global warming.

Climate change is real. It's staring us in the face daily around the world. Before the LNG project is fully approved, I urge the city to support a much more comprehensive study of the severe, long-lasting effects of overall natural gas production, specifically fugitive methane release.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Dear Puget Sound Clean Air Agency,
Thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. I am one of a growing number of concerned citizens that see this project as dangerous and damaging to our environment. We must reduce use of fossil fuels and utilize renewable energy sources to address climate impacts.

The SEIS does not show due diligence by relying on outdated formulas and understating the full effect of fracking. I refer to a recent report from The Pembina Institute.

CItation: Kniewasser, Maximilian and Brianne Riehl. Risks to Water and Public Health from Unconventional Gas in B.C. Pembina Institute, 2018.

Address: 13129 SW 248th Vashon, WA 98070	Email: Scuby450@gmail.com

0479-1 22. General Opposition

Dear Puget Sound Clean Air Agency,

I have children + grandchildren who live in the Tacoma area. Your job is to protect them, both short term and long term. Please insist on a proper SEIS, based on a complete review of current research an data.

Please include this in the final supplemental environmental impact statement.

Name: Steve Way	Phone: 253-363-2056
Address: 13129 SW 248th Vashon, WA 98070	Email: scway45@gmail.com

0559-2 22. General Opposition
0559-2 8. No Action Alternative

Dear Puget Sound Clean Air Agency,

I hope this is old news for you but....
The state's SEPA document explicitly states that poor planning is not a reason to go ahead and grant a permit. So the fact that PSE has continued to build without required permits is a non-factor in your decisions

Please include this in the final supplemental environmental impact statement.

Name: Steve Uday	Phone: 253-363-2056
Address: 13129 SW 248th Vashon, WA 98070	Email: scway45@gmail.com

Steve: Thank you. So, next is Steve Way.

Steve: Before I start, I'd just like to clear out a personal note. There's a lot of strong feelings in the room here tonight. That includes me. I've been arrested, gone to jail, gone to trial over the Puyallup Nation land rights and the LNG facility. But we need to treat each other with respect here tonight. We've got enough rancor in this country going on. And in this forum here tonight, I would just urge us all to treat each other with respect. That's it. I see your responsibility here as being to follow the proper procedures as outlined by the state regs. And being a government agency, to represent the people.

[06:07:03] The second point, the SEPA document specifically says that poor planning is not a reason to grant permit. So, the fact that PSE has continued to build is not a factor here. Moving on. The process here. It was pointed out, during the EIS public hearings repeatedly that the Puyallup Tribe has a stake here. And that was ignored totally. The Puyallup Tribe is a nation. Some of the state regs, when it talks about local entities that should be consulted, talks about local entities that should be consulted, specifically uses the word tribes.

A couple hundred yards over here, Tacoma City Council Hall, the flag of Puyallup Nation stands there with the flag of the state of Washington and so for. They're stakeholders here. And the fact that you guys ignored them the first time around doesn't change that.

[06:08:00] And, hopefully, it just means that we have to go around again because they are, obviously, significant stakeholders in this thing, and they were ignored. My time is running out. So, I would just say that common sense, on this thing, this smell test, look around the country. There was bad air, I'm talking about the Lower Mississippi, I'm taking about around Houston and all of there, those communities are dying. Sometimes, literally, with people, a lot of disease. And you can look all of this stuff up. And so, I would just – I'm running out of time.

So, I would say your job is not to represent shareholders of a for profit company. Your job is to represent the people in the Puget Sound area. That's what you're here for. And you haven't done it, on this EIS. You haven't done it on the SEIS. There's accurate data. We all talk about our data. You can compare the data.

[06:09:00] I'll stand with the folks that are with me. And you just need to do your job and go around on this thing again. We're all tired of it. But go around again and get an accurate, following the procedures, following the data, SEIS. Thank you.

Subject: Tacoma LNG SEIS
Date: Wednesday, November 21, 2018 3:31:37 PM

Puget Sound Clean Air,

Thank you for providing the opportunity to review and comment on the PSE Tacoma LNG SEIS. I am a high school senior and I am really worried about my future. I hope you will take the concerns of my generation seriously.

The Tacoma LNG plant would be harmful to local fish and wildlife, the community of Puget Sound, and our climate.
Liquified natural gas is treated as a clean alternative to other fossil fuels. However, nothing could be further from the truth. Methane, a potent greenhouse gas, leaks into the atmosphere during production, transportation, and liquification of natural gas. Methane traps heat more than 30 times more efficiently than CO2, making these leaks exceedingly dangerous for our planet's health. All this means that while LNG burns cleaner than many other fossil fuels, it's overall effect on the climate is just as, if not more detrimental than its competitors.
What's more, LNG plants have an ugly track record of disaster — leaks and spills aren't just probable, they're inevitable. With the diverse array of local wildlife, as well as neighborhoods just a couple miles of shoreline away from the proposed plant, the Tacoma LNG project isn't a risk worth taking.
The Puget Sound area, our planet, and my generation deserve a healthy future. We're counting on you to deny dirty LNG projects like the Tacoma plant, so that future can become a reality.

RE: Comments on the Draft SEIS (DSEIS) for PSEs LNG facility

Dear Puget Sound Clean Air Agency,

After careful consideration and contemplation, I would ask that you please consider my questions and concerns noted below:

1. It appears that the SEIS does not address the trucks needed to move fracked gas, including the water and sand used in the fracking process. Leaving this unmeasured and unaccounted for in the SEIS is a serious deficit to understanding the full impact of upstream GHG impacts.
2. Has PSCAA ever denied a Notice of Construction? An Air Operating Permit? If not, how can the public be assured that the agency is actually holding industry accountable to
3. As PSCAA is aware, the IPCC October report is clear in the recommendation that if communities don't start reducing GHG production now, we will be in dire climate chaos by 2040. Realistically, we have LESS THAN 12 years to halt the climate chaos predicted by IPCC. That means we must start now. Scientists report that methane "...is a major force in short-term global warming because it has 80 times the heat trapping potential of carbon dioxide in the first 20 years..." (Gardner, 2018) (https://www.reuters.com/article/us-usa-methane/u-s-energy-industrys-methane-gas-emissions-underestimated-by-epa-study-idUSKBN1JH2TP) after entering the atmosphere. The trees won't survive the next 12 years, human life won't survive the next 12 years, if the methane that is released within the first 20 years is more potent. These emissions must be measured in this framework of 20 years, and not 100 years.
4. It is very concerning that the SEIS used the 2007 WAC measurement instead of the most recent studies which show the more serious impacts of methane on the environment, specifically the values associated with the 2013 IPC AR5 and the values available through a scientific study published in 2016. Additionally, the SEIS did not even refer to at least 2 recent studies that document how methane emissions in Canada, where the fracked gas will supposedly come from, are under-reported.
    a. https://davidsuzuki.org/wp-content/uploads/2018/01/investigating-fugitive-emissions-abandoned-suspended-active-oil-gas-wells-montney-basin-northeastern-british-columbia.pdf
    b. https://davidsuzuki.org/wp-content/uploads/2018/07/mobile-measurement-methane-emissions-natural-gas-developments-northeastern-british-columbia-canada.pdf
5. What precedent, if any, is used to enforce PSE sourcing and burning gas ONLY from British Columbia? What are the administrative and legislative mechanisms for ensuring that they adhere to this criterion? Please note that if they use gas from anywhere besides British Columbia, the results of their total emissions burden would be worse than if they did nothing at all. There were no measurements or evaluations for fracked gas from sites not located in British Columbia.
6. The analysis was done assuming that there is a market beyond the two TOTE ships and they are claiming GHG credit for these ships, which are not confirmed at this point in

1320-6 cont'd 19. LCA Inputs and Assumptions - End Use
1320-7 10. LCA Calculations
1320-8 5. Regulatory Framework

time. What happens if it takes them two years to obtain additional customers beyond TOTE? Additionally, please consider that all ships are reportedly going to be dual fuel capable, meaning that they will still be able to burn bunker fuel. What guarantees do we have that these unconfirmed shipping customers are going to only use LNG, in order for that credit to be realistic? If the guarantee can not be made, the credit should be reduced.

7. I think it has to be noted that the draft SEIS should be viewed in context of who PSE is as an entity in the State of Washington. PSE has a history of not being responsible with regard to the assets and infrastructure that they are supposed to be managing. They have also been found, on at least two occasions, to have taken advantage of rate payers to their benefit. Their report is frighteningly incomplete – there are at least 10 places in the study that have "placeholder" values instead of actual data. Knowing this history, and in the context of all the issues I have pointed out in this letter, why would we trust PSEs report?
8. I also want to acknowledge that I stand in support of the Puyallup Tribe of Indians and affirm their opposition to this plant.

I request that the Clean Air Agency complete the draft SEIS, re-issue it, and then reset the public comment period so that these questions can be assesses and addressed in a transparent and responsible way.

Sincerely,

Twylia Westling, MPA

Testimony at Puget Sound Clean Air Agency Hearing - Tacoma October 30, 2018

Hello, I'm Bill Westre, a retired aerospace engineer and a Sierra Club volunteer. I wish to testify against the introduction of new LNG infrastructure.

I would like to comment on the impact of GHG's in the atmosphere. As an engineer I have studied and practiced Thermodynamics - the science of how heat is transferred.

The earth is heated (as everyone knows) by the radiant heat of the sun. But what prevents the earth from overheating? It is the cooling from thermal radiation to deep space that we experience most dramatically on a cold clear night. The 1st Law of Thermodynamics informs us that **when the heat coming to earth is greater than its cooling to space, the temperature of the earth has to increase**. That is our current condition.

Since we can have little effect on the heat coming to the planet, we need to focus on how it is cooled. What controls the cooling rate?

The presence of GHGs in the atmosphere reduces its emissivity – a thermodynamic factor that determines the effectiveness of a body to radiate heat.

Since the Industrial Revolution the concentration of GHGs has increased nearly 50%, which has dramatically reduced the emissivity and the ability of the earth to cool itself.

Further thermodynamic analysis demonstrates this clear reality - **until the GHG concentration already in the atmosphere returns to near the pre-industrial level, the earth's heating rate will be greater than its cooling rate, causing temperatures to continue to increase and climate change to continue to accelerate for centuries.**

This is why scientists are now telling us to reduce all fossil fuel emissions to near zero by 2040.

It should be obvious that building new fossil fuel infrastructure is the exact opposite of what we need to do for future generations to survive. We need to be shutting down all that existing infrastructure now.

Together we can do this!

Willard (Bill) Westre
15704 SE 44th St

1237-1 22. General Opposition

Carole: Thank you. Nancy Farrell? Willard Westre?

Willard: Hello. I'm Bill Westre, a retired aerospace engineer. And I'm a Sierra Club volunteer. I wish to testify against the introduction of the new LNG infrastructure. I would like to comment on the impact of greenhouse gases in the atmosphere. As an engineer, I studied and practiced thermodynamics, the science of how heat is transferred.

[02:31:07] The earth is heated, as everyone knows, by the radiant heat of the sun. But what prevents the earth from overheating? It is the cooling from thermal radiation to deep space that we experience most dramatically on a cold, clear night. The first law of thermodynamics informs us that when the heat coming to the earth is greater than its cooling to space, the temperature of the earth has to increase. And this is our current condition. Since we can have little effect on the heat coming to the planet, we need to focus on how it is cooled. What controls the cooling rate?

The presence of greenhouse gases in the atmosphere reduces its emissivity, a thermodynamic factor that determines the effectiveness of a body to radiate heat.

[02:32:02] Since the Industrial Revolution, the concentration of greenhouse gases has increased nearly 50% and has dramatically reduced the emissivity and the ability of the earth to cool itself. Further thermodynamic analysis demonstrates this clear reality that, until the greenhouse gas concentration already in the atmosphere returns to the near pre-industrial level, the earth's heating rate will be greater than its cooling rate causing temperatures to continue to increase and climate change to continue to accelerate for centuries.

This is why scientists are now telling us to reduce all fossil fuel emissions to near 0 by 2040. It should be obvious that building fossil fuel infrastructure is the exact opposite of what we need to do for future generations to survive.

[02:33:08] We need to be shutting down all of that existing infrastructure now. Together, we can do this.

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

The LNG is a ticking time bomb. It's not safe, not clean energy. It's also being built against Federal Law. I stand with the Tribe. This is against the treaty.

Sincerely,

Kathi White

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

PSE's LNG project increases our greenhouse gas emissions and fuels climate change - which means more wildfires and smoke for our region. The resulting air pollution makes us sick and leads to higher rates of asthma attacks, heart problems and cancer in our communities.

Sincerely,

Lael White

Subject: Comment on Tacoma LNG SEIS
Date: Saturday, October 27, 2018 11:35:36 AM

Dear Puget Sound Clean Air Agency,

As a person of faith, I believe we are called to care for both creation and communities. My values of stewardship, justice, and responsibility have compelled me to comment on this project. I have a five generation connection to the city of Tacoma and surrounding communities. The early industrial growth around our Commencement Bay and tide flats region contributed to the contamination and poisoning of the regions air, water and soil over the years. Before EPA regulations these industries were pretty much unchecked when it came to safe and conscientious waste disposal and emission control. The chemical plants, the gas and oil companies, the log yards, the copper smelter, the paint manufacturers, and the paper mills all created high levels of pollution that are still being cleaned up today. The Aroma of Tacoma was not a joke it was deadly. The safety of this LNG plant is just as worrisome as any of these, and the explosive nature of the product is catastrophic. Tacoma should not accept this hazardous industry. I have a grandchild living in OldTown and another growing up in U.P. I don't want them, or anyone else exposed to the dangerous consequences of another volatile industry. Janet Wicks
Thank you for conducting a supplemental environmental review of the greenhouse gas emissions for PSE's proposed LNG facility on the Tacoma Tideflats.

As a member of Earth Ministry, which has been working closely with scientists and policy experts to review the SEIS, I am concerned that the document does not fully analyze the climate impacts of this project.

Please address the following in the Tacoma LNG SEIS:

1. Methane's impact on climate – The SEIS uses a dated value for the 100-year Global Warming Potential (GWP) for methane from 2007 when updated values were published 2013 and then again in 2016. Using the best available science shows the plant would have higher greenhouse gas emissions. Additionally, given the short timeframe required to address climate change as recently noted by the United Nations, the SEIS should use the 20-year GWP for methane, which shows that the plant will be more than 50% dirtier over the next two decades.

2. Source of fracked gas – It is a false assumption that British Columbia would be the only gas source for this facility and this requirement is not enforceable. In addition, the SEIS relies upon self-reported pollution data on BC gas from the fossil fuel industry. It also failed to incorporate multiple, recent independent studies showing methane pollution rates as much higher than those reported by the fossil fuel industry.

3. Lack of alternative options – TOTE is already using ultra-low sulfur diesel (ULSD) and other companies are also using ULSD or scrubbers to meet emission requirements. The no action alternative assumes that LNG is required for TOTE to meet its emission requirement, when these alternatives already exist and are in use.

4. Alterations to the original proposal – Deviating from PSE's proposal, the SEIS included bunkering more than the two TOTE vessels on the Blair Waterway. The SEIS should instead provide an analysis using only secured customers.

5. Incomplete information – Use of placeholder values, incorrect units of measurement, and the stated need for more data from PSE makes the analysis incomplete and hard to follow. The draft SEIS should be thoroughly edited and released for a new full public comment period.

The Puyallup Tribe, citizens of Tacoma, and residents of the Salish Sea have a right to know the total local and global impacts of this proposal. With missing data and alterations to the project, this draft SEIS does not account for full climate impacts.

I ask that the PSCAA live into its self-proclaimed commitment to be good and wise stewards of our shared resources. Please re-start this review with complete information and additional opportunity for comment.

Thank you for caring for creation and our community.

Sincerely,
Janet Wicks

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

No fracked gas in Tacoma!!

Carole: Thank you. Tracy Wiegman?

Tracy: Hello. I am a Tacoma resident. A member of the International Longshore and Warehouse Union, and I have worked in the Port of Tacoma for 33 years. The port that sits on the Puyallup estuary and the ancestral homelands the Puyallup Tribe.

[01:49:02] I value good working class union jobs as well as a healthy ecosystem in which to raise a healthy family. I believe these two are possible together, when great care is taken to keep the next generations to come in the forefront of all decisions. I am extremely concerned about the narrow focus of the exclusive no action alternative versus the proposed action analysis. There are other alternatives that are viable and necessary, if we are going to turn around the destruction and heating up of our planet.

In an article by 350 Seattle, they say there is significant evidence that the boom in fracking has played a major role in suppressing the development of renewable energy as cheap gas has flooded the market competing against and pushing out clean energy sources like solar and wind. The TOTE ships plug into shore power when docked in to Tacoma, the only ones that do, eliminating the need to run their diesel engines for power. Yet, the loading of the TOTE vessels and all of the ships coming to the port are done with diesel powered terminal semis and other diesel equipment.

[01:50:03] The port and the city of Tacoma, along with the Pierce County and the state of Washington, could be investing in shore power plug in capability for all of the terminals and electric equipment and their charging stations powered with solar and/or wind. The Port of Tacoma just approved a 30 year lease with Wallenius Wilhelmsen Logistics who way that to comply with the 2020 global sulfur cap regulations has been pursuing a four stream approach and have concluded the fourth stream, which is LNG, has not met the requirements for lean green enough for their vessels.

Considering the recent IPCC report stating urgent and unprecedented changes are needed, we must step up bravely with radical and fast change now. You say, in your draft SEIS that the climate change impacts would occur under both alternatives. Well, the low margin of benefit that you claim of the proposed action compared to the no action is not good enough.

[01:51:05] We don’t have the time to waste. We don’t have the time to be building any new fossil fuel infrastructure at all. Thank you.

1268-1 7. SEPA Alternatives
1268-2 3. Outside of SEIS Scope

RECEIVED
NOV 21 2018
Puget Sound
Clean Air Agency

Dear PSCAA,

Hello, I am a resident of Tacoma Washington and I work in the Port of Tacoma, which sits on the Puyallup Estuary and the Ancestral homelands of the Puyallup Tribe. I have been a member of the International Longshore and Warehouse Union for 33 years. I value good working class union jobs that can take care of a family and contribute to the economic well being of the local community. I also value a healthy ecosystem in which to live and thrive and raise a healthy family. I believe these two are possible together when great care is taken to understand where we are, where we have been and where we need to be heading to achieve these goals and especially keeping the next generations to come in the forefront of all decisions. I have a list of concerns about the Draft Supplemental Environmental Impact Statement that your agency just released and how this can negatively affect who I am, my values, the health of my family, friends and co-workers, my community, future generations and this beloved land, water and air that we all depend on.

#1) The exclusive *No Action Alternative* vs the *Proposed Action analysis on the life-cycle GHG emissions.*

I am extremely concerned about this narrow focus which excludes other alternatives that are viable and, at this point in history, necessary if we are going to have any possibility of turning around the destruction of our climate and world. "There is significant evidence that the boom in fracking has played a major role in **suppressing the development of renewable energy**, as cheap gas has flooded the market, competing against and pushing out clean energy sources like solar and wind." (Gas: The Most Dangerous Fossil Fuel of All? by 350 Seattle, Oct. 7th, 2018)

The primary customer for this LNG refinery, storage and bunkering facility, at this point, is TOTE. When the TOTE ship docks in Tacoma they plug into shore power, eliminating the need to run their diesel engines for power. Yet the unloading and loading of the TOTE vessel is done with diesel powered terminal semis. Investing in electric terminal semis and the infrastructure to support them, including solar and/or wind powered electrical charging stations, would have gone much farther in cleaning up air quality around TOTE and within the Puyallup Estuary.

1268-2 cont'd 3. Outside of SEIS Scope
1268-3 4. Language
1268-4 3. Outside of SEIS Scope

The Port of Tacoma, along with the City of Tacoma, Pierce County and even the State of Washington, could be investing in shore power plug in capability for vessels at all the terminals in the port and the infrastructure to support electric terminal semis. They could be providing incentives to these companies that do business at the Port of Tacoma to help them with investing in shore power capability for their ships and in electric terminal semis.

There was a very interesting report that came out February 6th, of this year by Roger Strevens, Vice President, Global Head of Environment at Wallenius Wilhelmsen Logistics where he says, "We are passing a 'green point of no return' as the new age of environmental impact begins." and "….in keeping with our new environmental strategy, seeks out 'Lean:Green' solutions - those that are both economically and environmentally sustainable." He goes on to say that WWL has been pursuing a four-stream compliance approach to meet the coming 2020 global sulphur cap regulations. "Post January 1st, 2020 we will comply through use of three of those four streams, namely: Marine Gas Oil (MGO), exhaust gas scrubbers and Ultra Low Sulphur Fuel Oil (ULSFO). The Fourth stream, Liquid Natural Gas (LNG) has so far not met the requirements of Lean:Green for RoRo vessels in global operations." Earlier this year the Port of Tacoma approved a 30-year lease with Wallenius Wilhelmsen Logistics to develop an auto processing facility on the former Kaiser Aluminum site allowing WWL to expand their marine cargo business.

PSE also is claiming the need for this LNG to provide energy to it's customers during peak demand times of the year. I feel this is also an unnecessary reason to build an 8 million gallon facility that **may** only narrowly be better for GHGs, **IF** the source of the gas comes from BC, especially comparing it to doing nothing! To provide more back up energy resources during peak demand times, PSE could be investing in a battery storage system along with continued investments in solar, wind and energy efficiency. The City of Tacoma, Pierce County and the State of Washington could also be investing more into these alternatives, especially energy efficiency and including investments into electric vehicle infrastructure and incentives for buying electric vehicles and incentives for home owners to invest in solar for their homes.

1268-5 12. LCA Inputs and Assumptions - Global Warming Potential Value

#2). The use of LNG produced by the Proposed Action, instead of petroleum-based fuels for marine vessels, trucks, and peak shaving is predicted to result in an overall decrease in GHG emissions in the Puget Sound region, a net beneficial impact compared to the No Action Alternative.

First of all I am concerned about the language of this statement where it says, "in the Puget Sound region". I am concerned because my understanding is this study of GHGs is suppose to cover the life cycle of GHG effects from source extraction to the burning of this fracked gas product not just within the Puget Sound region.

Second, I am concerned about the low margin of so called benefit of the Proposed Action compared to the No Action. I feel it is a horrendous and irresponsible conclusion to consider this low margin acceptable in saying it will some how benefit us, especially when you couple it with the fact that we could be investing in so many other alternatives that will give is a much larger margin of benefit! And also especially when one considers the very real extreme risk of locating this dangerous facility in such a populated location! Then adding in there the source of the fracked gas needs to solely come from British Columbia to reach these figures. I know there will be commenting on this aspect and the faulty science and numbers concerning this conclusion so I will just say that from what I've learned I feel there needs to be far more investigation Into these conclusions.

Third, considering the recent report put out by the UN Intergovernmental Panel on Climate Change stating, "urgent and unprecedented changes are needed", and that we have only 12 years to "limit climate change catastrophe", we must take heed and step up bravely with radical and fast change now! You say right here in this draft SEIS report that, **"climate change impacts would occur under both alternatives."** So, again, those low margins are not enough to warrant this LNG facility being granted permission to keep us on the road of fossil fuel burning and the continued contribution to the warming of the Earth's atmosphere! All new fossil fuel infrastructure needs to stop right now!

In conclusion:

I am asking you, the Puget Sound Clean Air Agency, as an agency who I look to for the protection of the air we breath for not only myself, my family and my community but for all life that depends on clean air, to go back and do a more thorough, complete SEIS, using current, up to date, best science available, adding in other alternatives we could be doing instead of only the No Action alternative. And when you are done to come back and start a brand new, full public comment period.

In addition, as you do this, I ask that you keep foremost in your hearts and minds that we are living in a whole new world of urgency that calls for far more than the usual status-quo-business-as-usual mentality! We need to be looking ahead at what we, as adults and elders, are creating and leaving for our children, grandchildren, great grandchildren etc.....

My question to you is what are you willing to do for your children?

I will be praying for all of you and all of us and All Life, Water, Air and Earth.....

Many Bright and Beautiful Blessings to You All.....as you work on this most important decision.....

Thank you for your time and your consideration of all I have said here, coming from so many hours upon hours upon hours of research, direct experience and deep contemplation of this situation.....

Tracy Wiegman

My question to you is what are you willing to do for your children?

I will be praying for all of you and all of us and All Life, Water, Air and Earth……..

Many Bright and Beautiful Blessings to You All…….as you work on this most important decision…….

Thank you for your time and your consideration of all I have said here, coming from so many hours upon hours upon hours of research, direct experience and deep contemplation of this situation……

Tracy Wiegman

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Dear Puget Sound Clean Air Agency,

I write today in opposition to Puget Sound Energy's LNG Project. I am opposed to this project for several reasons:

1) I am concerned about the integrity and promises of the company since they began construction of the project without a critical permit, then announced a fiat accompli to the community. PSE does not seem to be a good neighbor interested in the concerns and health of the community.

2) Various studies have shown that the upstream greenhouse gas emissions from natural gas produced by fracking are significant and belie the idea of natural gas as "clean" or a "bridge fuel." In the case of PSE Energy, the numbers shown for British Columbian gas (if indeed PSE can be held to just use that source) are questionable for methane leak rates. These leaking hydrocarbons and fugitive emissions mean that natural gas can be as dirty as coal and offers no "clean" pathway--- not today, and certainly not 40 years in the future when we need to have moved decisively away from carbon-based energy sources. We must consider the TOTAL IMPACT of a project like this.

3) Constructing this facility will lock in decades of dirty emissions. Large projects like PSE are sunk investments that demand long time lines. By approving this project, the Clean Air Agency is giving its approval for DECADES of harmful emissions to the community.

4) This project does not have the consent of local First Nations.

Thank you for your time and in the interests of public health please reject this dirty project.

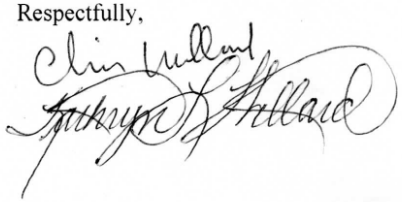
Statement Against Expansion of Facilities, including an LNG Plant, in Tide-flats without Adequate Review and Without Complete Subarea Plan

Dear Board Members

I am writing this letter to request that you maintain the current interim regulations regarding development of industry in the tide-flats with the following retraction: Do not allow a 10% expansion of existing facilities as is currently allowed in the interim regulations. **As a member/attender at Tacoma Friends Meeting (Quakers) with a deep concern for others and for the Earth, I urge you to maintain interim regulations and to force companies to wait and comply with Subarea Planning Process, as this process allows time needed for public review and consensus on issues that are very important to the health and well-being of our community.**



My concerns regarding the fast-tracking of the LNG plant and other development in our community include:

- Inadequate environmental review.
- Harmful effects of further industrial development to local water, air, animals and people.
- Environmental waste from prior industrial use at the Port of Tacoma still has not been removed.
- Potential for catastrophe in event of earthquake or volcanic eruption.
- Impact of catastrophe near densely populated area.
- The safety of detainees at the nearby detention center.
- Companies that promise jobs are not held accountable for : number of jobs created, who gets these jobs, and the cost to public health (air and water quality, diseases) of these jobs

In addition, I advise against any fast-track development of fossil fuel industry, given the recent dire warnings of United Nations International Panel on Climate Change and given all indicators that climate change: increasing forest fires, mass extinction, increasing climate-related hurricanes and storms.

I urge you to consider the long-term impact of our choices on all members of our community and on the planet as a whole. Friends testify to the sanctity of all life and are committed to social justice. Please consider all viewpoints and develop consensus when making critical decisions. I urge you also to hold companies that may cause public harm accountable for their actions and accountable to our community.

Respectfully,

1349-1 22. General Opposition

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project for Tacoma. As indicated in the IPCC report, climate change disaster is approaching with ever increasing speed. We cannot afford to devote more resources to old fossil fuel technology and must develop renewable energy sources ASAP!

We are well aware now of how much damage fracked gas is causing through leaks along the production and supply chain. It seems your analysis does not properly account for leaking gas over the short term and only uses a long term analysis. Our time is SHORT for addressing climate change!

The proposed project is a direct affront to the Puyallup Tribe, putting their treaty rights and community at risk first and worst. Their treaty rights need to be a primary consideration.

There is also concern that the whole facility will be treatened by rising sea levels resulting from climate change. That would be an ironic end to the project!

Please do not build this facility!
Thank You,
Bob Williams

Subject: Puget Sound Clean Air Agency ATTN: Public Comment on DSEIS, PSE LNG Project
Date: Wednesday, November 21, 2018 4:18:25 PM

Talking Points

These are just some of the shortcomings developed by a coalition of groups including Advocates for a Cleaner Tacoma (ACT), Sierra Club, 350 Seattle, Washington Physicians for Social Responsibility (WPSR) and 350 Tacoma. One could bring up any of these in a comment:

- **The Draft SEIS is Incomplete** – The current version of the draft SEIS does not contain all the information we, the public, need to fully assess the accuracy of this study and the predicted impact of the LNG facility. There are at least 10 places in the study that have "placeholder" values instead of actual data. We request that the PSCAA complete the draft SEIS, re-issue it, and then reset the public comment period so that we may better formulate our questions about this project.
- **SEIS is Using Outdated Methane Global Warming Potential Value** – They did not use the best available science for the Global Warming Potential (GWP) value for methane. GWP is a measure of potency for a greenhouse gas and it is measured against carbon dioxide (CO_2). CO_2 has a GWP value of 1. Methane, however has a much larger GWP value. They are using the 2007 value of 25 for the 100-year number (i.e. the value average over 100 years), whereas they should be using the 2016 value of 32. Everything else being equal, making this one modification in their models makes the LNG plant dirtier from a greenhouse gas emissions perspective than staying with the heavy fuel oil.

Report	20-year GWP	100-year GWP
2007 IPCC AR4	72	25
2013 IPCC AR5	86	28
2016 Scientific Study (authors include lead from 2013 study)	96	32

- **Analysis is based on 100-year, not 20-year, global warming potential (GWP) values** – They base all of their analysis on the 100-year GWP of methane, whereas, given the IPCC report that was released on Monday indicating that we must change our energy fuel mix in the next 12 years or face dire consequences in 22 years, they should be using the 20-year numbers, as that is the timeframe where action is needed. Using the most recent 20-year value of 96 makes the LNG plant 150% dirtier than the current capability.
- **Questionable claims that B.C. fracked gas is as clean as they claim –** They indicate that the fracked gas from B.C. has a much smaller leakage rate. However they fail to incorporate 2017 and 2018 analyses showing that a large percentage of the fracked gas wells are underreporting their methane leakages.
- **What assurances do we have that all of the fracked gas would come from BC?** They claim that all of the natural gas will be coming to the plant from British Columbia. However, just as we saw on Wednesday with the natural gas pipeline explosion in BC, they were able to use natural gas from North Dakota. The methane leak estimates from North Dakota are noticeably higher than those reported from B.C. We have no guarantees that the gas used would come from BC. Of note, per their 2017 10K filing with the Securities and Exchange Commision (SEC), in 2017 they obtained gas from British Columbia (54.8%), Alberta (19.1%) and the United States (26.1%).
- **Analysis assumes credit for extra maritime customers that currently do not exist –** The analysis appears to assume that Puget LNG (the for-profit arm of this venture that will be selling the LNG to maritime customers) already has additional maritime customers, and so is claiming greenhouse gas emissions reduction credit for them. They have no such customers and so cannot legitimately claim such credit.
- **Questionable Methane Slippage Rates for TOTE Vessels –** It appears that they are using smaller methane slippage rates (the amount of unburned methane that will escape into the atmosphere through the exhaust system) for the TOTE maritime vessels that will be burning the LNG. In fact, even in PSE's own greenhouse gas life cycle analysis that they completed and is provided as part of this report, their external peer reviewer questioned PSE's assumption on their methane slippage rate indicating that they should be using the higher rate as that is considered best practice.
- **Analysis does not incorporate diesel emissions for transporting sand/water to the fracked wells** – Fracking requires large consumption of water and sand for its operations, however GHG emissions from these diesel trucks were not included in the analysis

Subject: Comment on Tacoma LNG SEIS
Date: Tuesday, November 13, 2018 8:49:42 PM

Dear Puget Sound Clean Air Agency,

I am writing both as a member of Earth Ministry and as someone who believes our climate is at a dangerous tipping point. As a Seattle-ite I am writing because your decision will impact the course of similar decisions in this state. After looking at some of the findings of the SEIS, I have the following concerns:

1. It is inaccurate to use a 2007 value for methane's impact on climate when new data has been published as recently as 2 years ago. Then we have the recent United Nations report which underscores the urgency of addressing climate change. If you use the more appropriate 20-year Global Warming Potential benchmark, I understand that the plant then scores as 50% dirtier than currently scored.
2. There is no way to ensure that BC is the only methane source. And not surprisingly, independent studies report a much higher pollution rate than do the fossil fuel industry studies.
3. Port users like TOTE have already switched to alternative fuels and do not require LNG.
4. The SEIS itself states it needed more information from PSE. That alone should trigger a need for revision and another comment period, as it doesn't account for the full impact of climate change. Please be an effective steward for us.
Thank you for conducting a supplemental environmental review of the greenhouse gas emissions for PSE's proposed LNG facility on the Tacoma Tideflats.

As a member of Earth Ministry/Washington Interfaith Power & Light, which has been working closely with scientists and policy experts to review the SEIS, I am concerned that the document does not fully analyze the climate impacts of this project.

Please address the following in the Tacoma LNG SEIS:

1. Methane's impact on climate – The SEIS uses a dated value for the 100-year Global Warming Potential (GWP) for methane from 2007 when updated values were published 2013 and then again in 2016. Using the best available science shows the plant would have higher greenhouse gas emissions. Additionally, given the short timeframe required to address climate change as recently noted by the United Nations, the SEIS should use the 20-year GWP for methane, which shows that the plant will be more than 50% dirtier over the next two decades.

2. Source of fracked gas – It is a false assumption that British Columbia would be the only gas source for this facility and this requirement is not enforceable. In addition, the SEIS relies upon self-reported pollution data on BC gas from the fossil fuel industry. It also failed to incorporate multiple, recent independent studies showing methane pollution rates as much higher than those reported by the fossil fuel industry.

3. Lack of alternative options – TOTE is already using ultra-low sulfur diesel (ULSD) and other companies are also using ULSD or scrubbers to meet emission requirements. The no action alternative assumes that LNG is required for TOTE to meet its emission requirement, when these alternatives already exist and are in use.

4. Alterations to the original proposal – Deviating from PSE's proposal, the SEIS included bunkering more than the two TOTE vessels on the Blair Waterway. The SEIS should instead provide an analysis using only secured customers.

5. Incomplete information – Use of placeholder values, incorrect units of measurement, and the stated need for more data from PSE makes the analysis incomplete and hard to follow. The draft SEIS should be thoroughly edited and released for a new full public comment period.

The Puyallup Tribe, citizens of Tacoma, and residents of the Salish Sea have a right to know the total local and global impacts of this proposal. With missing data and alterations to the project, this draft SEIS does not account for

2568-7 cont'd 5. Regulatory Framework

full climate impacts.

I ask that the PSCAA live into its self-proclaimed commitment to be good and wise stewards of our shared resources. Please re-start this review with complete information and additional opportunity for comment.

Thank you for caring for creation and our community.

Sincerely,
Kathy Wilmering

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

No more fracking and greenhouse gases.

Steve: Next up is John Winkler.

John: Hi. I'm amazed you guys can still be up here without any beverages or anything like that. So, I commend you for that. My name is John Winkler. And I am a lifelong resident of this fine county. And I appreciate very much, especially at this late hour, you folks being here listening to all of us. Throughout much of my life, I have participated and witnessed what I consider to be the rebirth of Tacoma and much of Pierce County.

[05:58:08] Since I was a child, I remember very distinctly a Asarco and all of the rest of it. And I am very proud to say now that, through the efforts of many, many wonderful people, we've transitioned from a community with serious environmental challenges into a community that has cleaned up its polluted sites and created new, spectacular communities, on those sites, like Point Ruston and Thea Foss. I personally believe that, having observed this for as long as I have, TOTE's transition to the LNG is indeed in that same light. The Port of Tacoma has played a very important role in this process as well.

However, my purpose today is to stand up as a lifelong resident, a person who cares very, very deeply about the environment just as many, many other people in this room do, and as a lifelong Democrat, and to urge you to complete and issue the air quality permit for the LNG facility.

[05:59:06] All the scientific data says that this is what we should do for Pierce County. Climate change is a reality, and waiting is no longer an option. This project will help Tacoma and the region once again reach its transition to a cleaner and less polluting future. I believe very strongly that we must reward TOTE's incredible environmental leadership in the maritime industry and move forward with truly a generational shift to the cleanest fuel available. Finally, I would just say that I believe this is a very clear choice between the future and the past. And I hope that we can move forward. Thank you very much.

November 20, 2018

To Whom It May Concern:

As a lifelong Pierce County resident, I have been able to witness and participate, to an extent, in Tacoma's rebirth. Tacoma has transitioned from a community with serious environmental challenges, to a community that cleaned up its polluted sites and created new spectacular communities on those sites like Point Ruston and Thea Foss Waterway. I see TOTE's transition to LNG in the same light.

The Port of Tacoma has played an important role in that process as well. However, my purpose as a lifelong resident, a person who cares deeply about the environment and as a lifelong Democrat is to urge the completion of the SEIS and issue the Air Quality permit for the LNG Facility. Why? Because **all** the data and science say to do so. Climate Change is a reality and waiting is no longer an option. This project will help Tacoma and the region once again in its transition to a cleaner and less polluting future.

What does the SEIS say? It says, this facility and TOTE's conversion to LNG will reduce greenhouse gases by 13.5%. Additional data says there will be reduction of:
Sulphur oxides by 100%
Particulate matter by 99%
Nitrogen Oxide by 90%

TOTE should be rewarded for their incredible environmental leadership in the maritime industry and we should move forward with truly a generational shift to the cleanest fuel available.

In conclusion, this is a choice between the future and the past. This project has been delayed long enough. Let me be clear, any rejection of this air permit takes our community backwards and will result in us using a much more polluting fuel source. Approval of this Air Permit moves us forward with the cleanest fuel source available.

Don't follow the politics. Go with the overwhelming amount of data and science and let's get on with building a less polluting maritime fleet powered by LNG. In many aspects, TOTE's conversion to LNG is about doing our part right here in area code 253 to protect the planet.

Sincerely,

John Winkler

1124-1 22. General Opposition

Christopher: Thank you. For the record, my name is Christopher Winters. I'm a resident of Tacoma as of 1992, after spending just under 10 years in the United States Army.

[01:21:00] I was born on the Osage Reservation in Oklahoma. I'm an enrolled member of the Creek Nation and a proud resident of Tacoma, which I do call my home. And I do respect the Puyallup Tribe's position as a sovereign nation and a lot of the people here talking about jobs and our environment, in an open public forum. I'm not one to kick the can down the road and continue to talk about clean energy. When I go down to the bay, and I watch the ships that have come in and out and in and out and belching fossil fuels into the air, I grew up on the reservation. I worked in the oil industry growing up.

I know exactly what happens. I went home to Oklahoma in February to bury my mother, and I saw what the environment has turned into, when you don't consider cleaner energy solutions. I went back in September. And that was to lay another family member to rest, my little brother that served in the US Navy that's trying to convert its ships to a cleaner source of energy.

[01:22:03] That leads me to a story of this Puget Sound region. I am in the construction trades. I was assisting a local employer who, a good number of years ago, right down on the tide flats, was introducing a hybrid vessel to meet the Navy's requirement to 50% reduction in its reliance on foreign fossil fuels. If you want to see where that employer is sitting today that shipyard isn't there. That is the most expensive weather vane in the city of Tacoma. It just swings free in the air. The banner that hung on the side of the building talking about that vessel is peeling away like the leaves on the trees.

If we continue to kick the can down the road and talk about clean energy, we're going to end up with what I saw, when I went home, which is nothing. The environment and the jobs both are suffering. So, I think we need to not only work together to, if we have to revise the SEIS, then, we revise it.

[01:23:06] But we have to work together to actually become less reliant on foreign fossil fuel and less reliant on our fossil fuel. Like I said, I grew up in the oil industry. I joined the military, not out of a sense of patriotism, which was a part of my family, but when it went from $33.00 a barrel to $9.00, and people were hanging themselves. I traveled the globe. I've been to third world countries where they don't even address climate change. They don't address

clean energy. And I see what their environments are like. I lived in the sands of Iraq during the burning of the oil wells. And I sat in that every night.

And I woke up to it every day. So, if we continue to kick the can down the road, we're going to end up with what we have got, which is nothing. So, let's move forward.

[01:24:00]

Carole: Thank you. So, the next group of five is Kat Wood, Penny Rowe, Vincent O'Halloran, Ronald Snell, and Laura Skelton. So, Kat Wood is first.

Kat: Hello. My name is Kat Wood, and I'm a healthcare professional here today in solidarity with Washington Physicians for Social Responsibility. Thank you for taking the time to hear from us. In order for your agency to promote clean air, proper evaluation of possible pollution must be fairly and accurately assessed through rigorous scientific means and methods.

[02:12:05] The SEIS provided uses outdated standards to assess the global warming potential of methane and nitrous oxide, which then affects the conclusions in its analysis. The SEI draft only gives us information on methane emissions on the 100 year time table. We have a little over 30 years to stop all greenhouse gas emissions, according to the recent report from the United Nations. Methane emissions, over the short term, must be assessed, in regards to the rapidly advancing global climate shift. Methane emissions are 86 times more potent than carbon dioxide as a greenhouse gas.

And two-thirds of methane is extracted using an environmentally hazardous process known as fracking. We are at a tipping point and should be working to lessen greenhouse gas emissions not giving a green light to a project that would release hundreds of thousands of tons of greenhouse gas.

[02:13:01] I oppose the LNG facility because our greenhouse gas emissions will be worse than if we didn't have the facility at all. The SEIS given is outdated and misleading and ignores cumulative emissions that may have a large greenhouse gas impact. The SEIS inaccurately assumes that there are no alternatives to the proposed LNG plant, when there are other options available to meet emission standards that should be considered. Residents of Tacoma deserve an accurate, complete, and scientifically accurate SEIS and then, given time to comment, based on the information necessary to make such decisions for our futures. Thank you.

Puget Sound Clean Air,

Thank you for providing the opportunity to review and comment on the PSE Tacoma LNG SEIS.

I am a Tacoma resident concerned about climate change and our contributions to global warming. Part of what makes Tacoma so special is its story of moving from a legacy of pollution to a community that can take pride in its industry and environment. Unfortunately, I am personally impacted daily by the rising accumulation of toxins in my neighborhood from the Port of Tacoma. I can visually see the plumes from businesses and also have an air monitor in my neighborhood. You can look on Purple Air and look at the Pointe Woodworth neighborhood. If you type in PWW on the map link it will show you real time air quality.

After reading the SEIS, it appears to use old information, and it's missing data. The SEIS should be using the latest IPCC numbers when determining the global warming potential of greenhouse gases. It should also use the 20-year numbers instead of the 100-year, since this plant will only be operational for 40, and we'll see big impacts from the very beginning. When the 20-year GWP from the 2013 IPCC report is used, it shows that emissions from the LNG facility are actually 30-31% worse than the No Action alternative.

The SEIS is also missing really important information, like the carbon content of the gas to be used. This data is needed for a complete study, and until it's there, this SEIS is incomplete.

How will PSCAA ensure that the methane gas comes from BC? The SEIS should also analyze the very likely scenario in which PSE will have to get its methane gas from the Unites States network.

Finally, the SEIS doesn't include smaller sources of emissions, like those from tearing the plant down. These smaller sources of emissions could add up to a big impact, and should be included in the analysis.

Because of these conclusions, I am opposed to the PSE Tacoma LNG project. Please update the SEIS, reissue it when it is complete and credible, and then re-open the comment period.

PUBLIC SOUND ENERGY – LNG FACILITY TACOMA

Draft Supplemental Environmental Impact Statement

ATTN: Public Comment on DSEIS, PSE LNG Project

Gretta Woodlock 1015 N Sheridan Ave Tacoma, WA 98403

grettaw3@gmail.com

RECEIVED
NOV 13 2018
Puget Sound
Clean Air Agency

Thank you for the opportunity to share my thoughts on the construction of PSE LNG facility in the Tacoma tide flats.

Fracked gas is now the big climate fight in Washington State and especially in Tacoma currently. Two-thirds of all gas produced in the US is fracked, therefore there is nothing "natural" about gas anymore. The introduction of fracking has transformed the industry and made fracked gas into one of the largest threats to our climate. It may produce less carbon emissions when burned, however, **the production, processing, storage, transmission, and distribution of fracked gas leaks into the atmosphere immense amount of methane, which is a much more destructive pollutant for our climate than carbon dioxide. When methane is leaked directly into the atmosphere, it is 36 times more powerful at trapping heat than carbon dioxide when its impact is averaged over a 100 year period. Over a 20-year period, methane's heat-trapping impact is 87 times more powerful than that of carbon dioxide!!**
In overseeing the PSE LNG project, your track record lags. Yes, the Agency issued a Notice of Violation to PSE when it started construction **without** following protocol and process required by your agency. Civil penalties do not match the severity of the implications of the applicant's disregard for proper process. This violation should be considered in evaluating the applicant when determining if they should receive the air permit. This entire time, PSE has built a massive facility ***without a major permit***. Can they be trusted to uphold any conditions that come with an issuance of the air permit? PSE's blatant disregard for public process is undeniable. Do not let them bully their way into operating this facility.

Puget Sound Clean Air Agency has promised these following commitments on their website:

- Be good and wise stewards of the resources you give us
- Defend the future
- Prevent and reduce risk to citizens by upholding and enforcing the law
- Protect citizens from air pollution
- Tell citizens what is in the air they are breathing

There is no way for Puget Sound Clean Air Agency to uphold these commitments unless they deny the air permit for the LNG facility.
The danger of having PSE LNG facility in the city of Tacoma where thousands of citizens are within 1-3 mile radius (danger zone) is unconscionable.

Seriously, please consider putting monies and human energy into further developing solar energy, our power in the hopefully not too far future. ***Solar energy is the healthy way to ensure clean air now and into the future.***
Thank you.

Puget Sound Clean Air,

Thank you for providing the opportunity to review and comment on the PSE Tacoma LNG SEIS.

As a resident living near the shores of Puget Sound and adjacent to the Port of Tacoma, I am highly interested in how the waters and environment are continuing to be cleaned up and made even cleaner based on decisions by responsible companies in the Port, and enlightened, visionary City and Port officials. To ensure the environment remains in a state of constant improvement is all of our responsibilities and ought to elevated to an even higher priority on City, Port and company officials daily agendas.

After reading the SEIS, it appears to use old information, and it's missing data. The SEIS should be using the latest IPCC numbers when determining the global warming potential of greenhouse gases. It should also use the 20-year numbers instead of the 100-year, since this plant will only be operational for 40, and we'll see big impacts from the very beginning. When the 20-year GWP from the 2013 IPCC report is used, it shows that emissions from the LNG facility are actually 30-31% worse than the No Action alternative.

The SEIS is also missing really important information, like the carbon content of the gas to be used. This data is needed for a complete study, and until it's there, this SEIS is incomplete.

How will PSCAA ensure that the methane gas comes from BC? The SEIS should also analyze the very likely scenario in which PSE will have to get its methane gas from the Unites States network.

Finally, the SEIS doesn't include smaller sources of emissions, like those from tearing the plant down. These smaller sources of emissions could add up to a big impact, and should be included in the analysis.

Because of these conclusions, I am adamantly opposed to the PSE Tacoma LNG project. Please update the SEIS, reissue it when it is complete and credible, and then re-open the comment period.

Dear Responsible Official,

Puget Sound Energy and Tote Marine seem to imagine that a clean energy future can be arrived at by digging the fossil fuel hole deeper. This proposed LNG project is another step toward climate chaos at a moment when the IPCC has given us a clear warning that we must urgently move away from fossil fuels.

My reading and following of the issues around methane release and its relationship to fracked gas has led me to the same conclusions that follow in detail in this letter. Therefore I URGE you not to approve this climate threatening project, which also harms the nearby Puyallup Tribe.

Fracked gas is not a lesser evil. Scientists' understanding of methane's impact on the climate continues to evolve, and at every step along the way we learn that fracking allows more methane escapement than we had previously observed and that the impact of methane on the climate, particularly in the short term, is even more serious than had been previously understood.

I applaud your decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct this more rigorous analysis. Thank you.

I urge you to revise the analysis to account for the following:

1. Methane should be counted as 86 times more potent than CO2 based on the current IPCC analysis (AR5 rather than AR4) considering a 20 year timeframe (rather than the 100-year).

2. Revise the analysis of the impacts of fracking in British Columbia based on recent research(1) demonstrating that methane escapement has been dramatically under-estimated.

3. Revise the "no-action alternative" to include a clean energy alternative in which PSE provides electricity not with a different source of fracked gas, but with renewable energy and energy efficiency.

4. Revise the "no-action alternative" to include the assumption that Tote Marine will achieve a 50% GHG reduction, in line with the International Maritime Agency's established goals. This reduction might alternatively be achieved by a combination of fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion or many other alternatives besides fracked LNG.(2) For clean local emissions requirements, Tote Marine can achieve virtually all of the localized lower-particulate and lower SOx and NOx benefits claimed for LNG propulsion by opting for low-sulfur marine gas oil over heavy fuel oil, and installing selective catalytic reducers and diesel particulate filters.(3)

5. This more accurate analysis will show that the project has a significant and unmitigated impact on the global climate, which
should be seen as a sufficient basis for denial of the Notice of Construction application.

Thank you for your time and consideration of these comments.

- I rode the transit buses up here today, because I know the critical importance of stopping PUGET SOUND ENERGY's fatally short-sighted pro-LNG (ie- Fracked Gas) facility/project. It is SHAMEFUL that this (primarily foreign-owned) corporation has completely ignored the historical Native Treaty Rights & has stubbornly bull-dozed over all of our rights by proceeding w/ this Danger-filled project. =>

Geologically-speaking, we are known to live in earthquake-prone region. This is NOT the wisest place to site an explosive 'bomb', in such a densely populated area.

- We, as a species, need to immediately evolve away from relying heavily upon the use of dirty fossil fuels (incl. L.N.G.) & embrace the wisdom of (now existant) cleaner & greener energy alternatives!

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

I'm too busy to make substantive comments specific to this particular LNG project.

However, as a member of SAVE RGV from LNG sine May 2014, I've sliced and diced LNG issues six ways from Sunday and strongly suggest you slice and dice it into oblivion bye bye gone for good.

In May 2014 we learned LNG export operations were targeting our local Port of Brownsville TX, next door to South Padre TX and the Laguna Atascosa National Wildlife Refuge. We were told LNG was good, all good, no bad. Looking into it, we decided different. Then we were told it was a done deal, all the elected officials lined up behind it, big money pushing it forward, just the way things have always been done in our small impoverished backwater part of the world.

Then in 2015, four local communities passed resolutions opposing LNG: Port Isabel, Laguna Vista, South Padre Island, and Long Island Village. A number of local groups as well. Nothing like that had ever happened here before.

Rio Grande LNG (joined at the hip with Rio Grande Pipeline), Annova LNG, and Texas LNG were all supposed to be FERC approved and good to go in 2017.

But the local opposition pushed possible approvals back to 2019. For example, we forced a March 2018 Texas Commission for Environmental Quality Public Meeting here regarding Rio Grande LNG's TCEQ air quality permit request. 185 people attended the meeting. 42 of those attending made oral statements on the permit request, overwhelmingly opposing the permit. 2,003 written comments were submitted and requests for Contested Hearings on the permit were submitted by Port Isabel, Laguna Vista, Vecinos Para el Bienestar de la Comunidad Costera, Shrimpers and Fishermen of the RGV, and SAVE RGV.

Also in March 2018, SAVE RGV from LNG, Lower Rio Grande Valley Group of the Sierra Club, Friends of the Wildlife Corridor, the Laguna Madre Foundation, and Frotera Audubon submitted a letter to the Corps opposing the Lower Texas Coastal Mitigation LLC project (SWG-2018-00235) that proposed to do business with the LNG companies needing wetlands mitigation for their proposed projects at the Port of Brownsville.

I'm too busy to say much more because our US Army Corps of Engineers filing deadline for opposing Rio Grande LNG's Section 404 permit request was 11-19-2018. My 77th birthday is 11-23-2018. Our deadline for filing comments against FERC's Rio Grande LNG Draft Environmental Impact Statement is 12-03-2018. Our deadline for filling comments against

Texas LNG's Section 404 permit request is also 12-03-2018. Our deadline for filing comments on FERC's Texas LNG Draft EIS is 12-17-2018. And FERC's scheduled to issue its Annova LNG Draft EIS this December.

For more information about how many of us are fighting LNG so hard and why, check our website at www.savergvfromlng.com/ and our Facebook page at https://www.facebook.com/saveRGVfromLNG/.

They say LNG stands for Liquified Natural Gas. We say it stands for Lies 'N' Greed.

Don't let the LNG folks get a single foot wedged in your door. They're like boll weevils, worse than lice in you hair. They'll take what you give them and then be back again and again for more and more of your small piece of the world and more and more regulatory slack allowing them to cloud your sky and damage your lungs.

Take care,

Carole J. Cenci, SEPA Responsible Official
Puget Sound Clean Air Agency
ATTN: Public Comment on DSEIS, PSE LNG Project
1904 Third Ave, Suite 105
Seattle, WA 98101

Dear Ms, Cenci,
Thank you for the opportunity to comment on your DSEIS: Tacoma Liquefied Natural Gas Project (including TOTE Marine Vessel LNG Fueling System) proposed for E 11th Street in Tacoma. I am providing these written comments for both your October 30th Public Hearing and my comment on your draft.

Your draft states (page 2-1 and 4-10) that burning natural gas releases less green house gas than burning deasil or other fossil fuels by ships and that Canada in 2020 will upgrade pipelines to reduce fugitive leaks. However, it seems it would also increase amounts of natural gas piped and stored and there would be cumulative leaks and potential for catastrophic releases as well as increasing fracking in Canada with this project.

Your draft was issued the same day of UN Climate Scientists IPCC Report pointing out the seriousness of greenhouse gas emissions and need to cut those emissions almost in half in 11 years (2030) and entirely within 30 years (2050) to avoid catastrophic consequences. This shows us that fossil fuel best management practices are not going to be sufficient. Your draft came out a day before the Embridge Ink pipeline leak and explosion near Prince George, British Columbia forcing about 100 Lneida First Nations people from their homes. That is the existing BC pipeline that supplies two thirds of PSE's Natural Gas. It seems that 145 mile natural gas pipeline in areas that are seismically active contains potential risks not analyzed in the Draft. Also not analyzed for geologic risk was the location on the Tacoma tideflats where there could be increased risks of both earthquake and Mt. Rainier lahar. https://www.usgs.gov/media/images/mt-rainier-lahar-hazard-map. Hopefully your final will address these issues.

Another impact not analyzed was impact upon Puyallup Nation and their Treaty Rights. Tribal opposition of this project has been clear and consistent. Cultural impacts need to be addressed in your final.

Thank you for the opportunity to comment.

I wish to express my support for Puget Sound Energy's (PSE) liquefied natural gas (LNG) facility. This specifically includes my concurrence with the conclusion about the environmental benefit of replacing transportation diesel fuel with clean burning LNG contained in the October 8, 2018 Draft SEIS issued by the Puget Sound Clean Air Agency (PSCAA) and my support for the agency in issuing the necessary permit(s) for the project to proceed.

The Washington Department of Ecology's State Environmental Policy Act (SEPA) regulations recognize that air quality is a part of the environment. It's hard to ignore the significant environmental and air quality benefits of replacing diesel or bunker fuel currently used by the maritime industry with LNG fuel. Switching from diesel to LNG reduces greenhouse gas emissions by nearly 15%, sulfur dioxide (SOx) emissions by over 99% percent, and nitrogen oxide (NOx) emissions by nearly 85% while eliminating visible particulate matter (PM) produced by ships by more than 85%. It is these particulate emissions that are extremely harmful to the lung health of anyone breathing them in.

It is also important to note that LNG powered ships will substantially exceed the North American Emission Control Area requirements established by the International Marine Organization's (IMO). The IMO regulations have required a reduction in the fuel sulfur content from 3.5 percent to 0.5 percent. Both US EPA and the Coast Guard are enforcing these fuel regulations which have been estimated by EPA to reduce mortality by as much as 30,000 people per year. TOTE has made the commitment to use LNG fuel, which provides substantially greater benefits than even the IMO regulations mandate.

Another important environmental advantage of LNG as fuel is that in the unlikely event of a spill, LNG turns into vapor and dissipates with no lasting effects on water or marine life.

The LNG facility will also generate important economic benefits for all South Sound residents. In addition to helping local employers like TOTE remain competitive, it will create at least 250 construction jobs and over 300 indirect jobs due to the construction. After the construction, the economic activity from the project will create another 125 permanent jobs.

The draft SEIS, prepared by Ecology and Environment, Inc. and released by PSCAA on October 8, 2018, stated "When evaluating direct, upstream, and end use GHG emissions, replacing a diesel propulsion engine with a pure LNG propulsion engine results in reduced life-cycle GHG emissions."

Since the draft SEIS independently prepared for and published by PSCAA has confirmed the

environmental benefits and overall reduction in GHG emissions from use of LNG as a replacement for diesel, I fully support PSCAA promptly finalizing its October 8, 2018 draft SEIS and granting the necessary permit(s) so the LNG facility can be completed as soon as possible.

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

This terminal is a HUGE mistake. We are trying not to go extinct. Any new project devoted to fossil fuel infrastructure is a step backwards. Please consider the planet and stop this travesty!

Steve: Next up is Jessica Zimmerle.

[04:23:00]

Jessica: Hi. My name is Jessica Zimmerle. I am the program and outreach director of Earth Ministry and Washington Interfaith Power and Light. We're a statewide organization that engages people of faith on environmental issues. And recently, Earth Ministry was honored to stand behind the Puyallup Tribe in opposition to this dirty and dangerous project. Over 90 clergy in our network signed a letter of support for the Puyallup and 14 other tribes who had called for a stop work order on the plant earlier this year. That letter was delivered in person by a rabbi and a pastor to the governor's office.

I bring it up today to share an excellent quote from a local faith leader from Tacoma who signed on. He wrote that, "My faith teaches me to be trustworthy. And so, I believe we just honor the Puyallup Tribe's treaty rights. My faith teaches me to love neighbors. And so, I believe we must protect the health of all people who live in the Tacoma area."

[04:24:00] "My faith teaches me to care for creation. And so, I believe we must find alternatives to dirty fossil fuels." This quote sums up our main concerns about this project. And it's what I keep hearing over and over from members of the faith community I work with. We must respect the treaty rights of the Puyallup. We must protect the health and wellbeing of our neighbors. And we must be good stewards of God's creation. The draft does not provide reassurance that this project does any of the above. We're concerned the study does not use best available science, nor the near term 20 year timeline for evaluating global warming potential.

We're dubious of the assumption that fracked gas would only be sourced from Canada. We know methane leaks at higher rates than used. And that the no action alternative doesn't have to be the status quo. There are other options. It would be unethical to move forward with this permit, if the draft remains in its current state. Please thoroughly edit the draft and release it for full public comment.

[04:25:03] Thank you.

Steve: Thank you. Jan Ruud?

October 31, 2018

Dear Puget Sound Clean Air Agency,

I appreciate the opportunity for my comments to be heard in-regards to the LNG Facility in Tacoma. My name is Stuart Zimmerman, Regional Sales Manager for TOTE Maritime Alaska. My career with TOTE Maritime Alaska started in 2011 in Fairbanks, Alaska. I have had the proud opportunity for the past five years to call the Greater Puget Sound Region home.

One of the strongest reasons I continue to embrace working for a company as TOTE Maritime Alaska is due to their Environmental Stewardship and Community Minded Focus that is exemplified. TOTE Maritime Alaska support the communities we live and serve through donations, volunteerism and offering a reliable service offering that Alaskans have come to depend on. TOTE Maritime Alaska has made significant investments in the environment by building the cleanest most environmentally friendly vessel in the trade that offer a life-line to Alaskans on a weekly basis serving as the gateway between Puget Sound region and Alaska. Rain Gardens have been installed on our terminal in Tacoma to help mitigate pollution and water conservation. Shore side power is offered at our Tacoma facility allowing our vessels to run off shoreside power while in port offering reduction in emissions while in port.

The embarkment of our LNG Conversion project in 2012 was and has been focus doing the "right thing" for our environment. LNG is a much cleaner fuel than bunker fuel which is current source of fuel for majority of Maritime companies worldwide, LNG lowers greenhouse gas emissions: Reducing sulfur emissions by 100% and diesel particulate matter by more than 90%. The environmental benefits of switching to LNG are real and they underscore the unfortunate reality that remains leaving diesel as the only option as status quo.

It's essential we keep the Puget Sound sector competitive with ports around the world that are already embarking on building LNG Facilities and offering LNG as a viable fuel source for Maritime companies.

This project is very important for Tacoma, Puget Sound and the Maritime Industry. It's important that we mitigate any further delay in granting the air permit for the Tacoma LNG. Let's embark on a path forward together that supports benefits across our Puget Sound region, Tacoma and Maritime Industry.

I'm extremely proud to work for a company such as TOTE Maritime Alaska that supports environmental focus and the best interest of the communities we live and serve. I'm even more proud of how TOTE Maritime Alaska has embraced my family in my career and a company I hope my two children can work for some day.

Sincerely,

Stuart Zimmerman

TOTE Maritime Alaska | 32001 32nd Avenue S., Suite 200, Federal Way, WA 98001 | P: 253.449.8100 | F: 253.449.8225 | www.totemaritime.com

Dear Port of Kalama, and Cowlitz County,
Dear Puget Sound Clean Air Agency,

I am concerned about expansion of methanol + LNG. Right now we are experiencing the devastating loss of salmon runs + starvation of orcas. Both these iconic animals are what we think of and love here in the Pacific NW.

The impacts of a methanol spill, additional tankers, along w/ already warming waters will denegrade + endanger the entire ecosystem. Please include the full impact of these projects on our water + wildlife depends on our rivers.

Please include this impact in the Final Supplemental Environmental Impact Statement.

Name: Jan Zuckerman	Email: ses_janze@yahoo.com
Address: 2914 NE 18th Ave. Ptld, OR 97212	Phone: 503-481-7033

Carole: Thank you. David Bean? Do we have David Bean? Jan Zuckerman?

Jan: Thank you for the opportunity to speak today. My name is Jan Zuckerman. I'm a retired teacher and a youth mentor. Yesterday morning, I attended a youth led rally for the climate.

[00:47:05] The words of the students drove me to be here today. Naomi, a 10-year-old student, spoke of the dangers of fracked gas. She said, "Though it seems like a good idea in the short term, fracking creates lots of jobs, but it can cause health problems such as coughing and wheezing and shortness of breath for people who live near fracked wells. And it keeps us dependent on fossil fuels, which leads for more climate change. Sometimes," she says, "adults in big industries like fracking don't think about the next generation. And that can be a huge problem that causes lots and lots of pollution in the air and water. And this pollution leads to climate change, which will largely affect our generation."

Catalina, an eighth grader, spoke about the need to co-exist and shared her concern that our obsession over money and extraction of coal, oil, and gas is poisoning us.

[00:48:00] She says that we have to change our perspective by not seeing the earth merely as a natural resource but as our nurturing mother that we must care for and love. Solomon, a 17-year-old, said, "Climate change isn't scary. Climate change is terrifying. It is so blood curdling horrifying that the world would rather ignore it than face it head on." Solomon wanted me to ask you will you ignore it. Will you allow Puget Sound Energy to put people's lives at risk, disregarding science and the human right to a clean atmosphere without volatile organic compounds poisoning their bodies?

Will you allow Puget Sound Energy to pretend that LNG is cleaner than coal, when the scientific fact is that, when methane leaks into the atmosphere, it is 86 times more powerful at trapping heat than CO_2 in a 20 year period.

[00:49:02] If we do not stabilize our climate now, we will be faced with an ecosystem collapse, in our lifetime. This means we cannot afford to invest in any new fossil fuel infrastructure. This coral that I hold before you, right now, today, cannot speak nor can it compete with the fossil fuel industry. Its fate and the fate of one-quarter of all of the ocean fish species who depend on coral is in your hands. And what about the animals that depend on these fish species? What

1147-2 22. General Opposition
1147-2 12. LCA Inputs and Assumptions - Global Warming Potential Value

about Naomi, Catalina, and Solomon and the children who are yet to be born?

Are we okay with telling them that we are willing to face disaster the likes of which humanity has never seen, so that Puget Sound Energy can make money? I implore your agency to say no.

Dear Port of Kalama, and Cowlitz County,

Dear Puget Sound Clean Air Agency,

I am concerned about expansion of methanol + LNG. Right now we are experiencing the devastating loss of salmon runs + starvation of orcas. Both these iconic animals are what we think of and love here in the Pacific NW.

The impacts of a methanol spill; additional tankers, along w/ already warming waters will denegrade + endanger the entire ecosystem. Please include the full impact of these projects on our water + wildlife depends on our rivers.

Please include this impact in the Final Supplemental Environmental Impact Statement.

Subject: Tacoma LNG SEIS Project Comment
Date: Wednesday, November 21, 2018 8:24:39 PM

Dear Responsible Official,

Puget Sound Energy and Tote Marine seem to imagine that a clean energy future can be arrived at by digging the fossil fuel hole deeper. This proposed LNG project is another step toward climate chaos at a moment when the IPCC has given us a clear warning that we must urgently move away from fossil fuels.

Fracked gas is not a lesser evil. Scientists' understanding of methane's impact on the climate continues to evolve, and at every step along the way we learn that fracking allows more methane escapement than we had previously observed and that the impact of methane on the climate, particularly in the short term, is even more serious than had been previously understood.

I applaud your decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct this more rigorous analysis. Thank you.

I urge you to revise the analysis to account for the following:

1. Methane should be counted as 86 times more potent than CO2 based on the current IPCC analysis (AR5 rather than AR4) considering a 20 year timeframe (rather than the 100-year).

2. Revise the analysis of the impacts of fracking in British Columbia based on recent research(1) demonstrating that methane escapement has been dramatically under-estimated.

3. Revise the "no-action alternative" to include a clean energy alternative in which PSE provides electricity not with a different source of fracked gas, but with renewable energy and energy efficiency.

4. Revise the "no-action alternative" to include the assumption that Tote Marine will achieve a 50% GHG reduction, in line with the International Maritime Agency's established goals. This reduction might alternatively be achieved by a combination of fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion or many other alternatives besides fracked LNG.(2) For clean local emissions requirements, Tote Marine can achieve virtually all of the localized lower-particulate and lower SOx and NOx benefits claimed for LNG propulsion by opting for low-sulfur marine gas oil over heavy fuel oil, and installing selective catalytic reducers and diesel particulate filters.(3)

5. This more accurate analysis will show that the project has a significant and unmitigated impact on the global climate, which
should be seen as a sufficient basis for denial of the Notice of Construction application.

Thank you for your time and consideration of these comments.

Subject: Puget Sound Energy LNG Project
Date: Wednesday, November 21, 2018 11:11:25 PM

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

First of all, I want to thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. With our climate in grave peril, as emphatically stated in the latest IPCC report, your review of the greenhouse gas impacts of the natural gas used in this project couldn't be more important. Those scientists make clear that we cannot, and must not, allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.

My first concern with this draft SEIS is that it's not complete. There are several sections that are missing data and so we can not accurately assess the quality of the report and understand how certain conclusions are reached. Because of that, I request that you complete this report, reissue it, and then reset the public comment period so that we have time to review the completed report thoroughly.

With that said, I am aware of several issues with the current draft report you issued on October 8th. It is my belief that if these issues are given proper attention and addressed with best available science, it will show that the marginal improvements in emissions the study claims will disappear and the project will in fact be worse for the climate than doing nothing at all.

Here are some of the issues as I understand them:

- The SEIS is not using the best available science for the Global Warming Potential (GWP) of methane. It uses the 100-year GWP of methane and not the 20-year value which is much more relevant given the urgency in addressing the climate crisis. The appropriate 20-year GWP value to use is 96.
- This facility is projected to have a 40 year lifespan, so why does the report project out to 100 years, which is 90 years beyond the time we need to have taken decisive action?
- The SEIS claims emissions benefits from customers that Puget Sound Energy simply does not have. According to PSE and the City of Tacoma, the only maritime customer is TOTE with its two vessels which have already delayed their conversion to consume LNG. Securing new customers (there are only just over 100 LNG ships in operation out of a worldwide fleet of 90,000) as well as the additional permitting could take years and is not guaranteed.
- The SEIS says that emissions will only be reduced if the natural gas comes from Canada, because leakage rates are reportedly lower there than in the US. Shockingly, most leakage rates were self-reported by the fossil fuel industry based on models and recent measurements taken in the field have shown that leakage rates are much much worse.
- How can it be guaranteed that PSE is sourcing its gas from BC anyway? Their recent filings

show they relied on gas from BC, Alberta, and the US. And with the recent pipeline explosion in BC that interrupted PSE's supply, we know it's not always available.
- When ships use any fuel, a certain percentage of it escapes without combusting through the exhaust system and into the atmosphere. This is known as slippage and the SEIS uses a lower rate than is considered best practice.

Thanks again for initiating this crucially important review of this facility and I hope that you will take best available science into consideration when revising this draft SEIS.

Subject: Comment on Tacoma LNG SEIS
Date: Friday, October 26, 2018 5:56:54 PM

Dear Puget Sound Clean Air Agency,

As a person of faith, I believe we are called to care for both creation and communities. My values of stewardship, justice, and responsibility have compelled me to comment on this project.
Thank you for conducting a supplemental environmental review of the greenhouse gas emissions for PSE's proposed LNG facility on the Tacoma Tideflats.

As a member of Earth Ministry, which has been working closely with scientists and policy experts to review the SEIS, I am concerned that the document does not fully analyze the climate impacts of this project.

Please address the following in the Tacoma LNG SEIS:

1. Methane's impact on climate – The SEIS uses a dated value for the 100-year Global Warming Potential (GWP) for methane from 2007 when updated values were published 2013 and then again in 2016. Using the best available science shows the plant would have higher greenhouse gas emissions. Additionally, given the short timeframe required to address climate change as recently noted by the United Nations, the SEIS should use the 20-year GWP for methane, which shows that the plant will be more than 50% dirtier over the next two decades.

2. Source of fracked gas – It is a false assumption that British Columbia would be the only gas source for this facility and this requirement is not enforceable. In addition, the SEIS relies upon self-reported pollution data on BC gas from the fossil fuel industry. It also failed to incorporate multiple, recent independent studies showing methane pollution rates as much higher than those reported by the fossil fuel industry.

3. Lack of alternative options – TOTE is already using ultra-low sulfur diesel (ULSD) and other companies are also using ULSD or scrubbers to meet emission requirements. The no action alternative assumes that LNG is required for TOTE to meet its emission requirement, when these alternatives already exist and are in use.

4. Alterations to the original proposal – Deviating from PSE's proposal, the SEIS included bunkering more than the two TOTE vessels on the Blair Waterway. The SEIS should instead provide an analysis using only secured customers.

5. Incomplete information – Use of placeholder values, incorrect units of measurement, and the stated need for more data from PSE makes the analysis incomplete and hard to follow. The draft SEIS should be thoroughly edited and released for a new full public comment period.

The Puyallup Tribe, citizens of Tacoma, and residents of the Salish Sea have a right to know the total local and global impacts of this proposal. With missing data and alterations to the project, this draft SEIS does not account for full climate impacts.

I ask that the PSCAA live into its self-proclaimed commitment to be good and wise stewards of our shared resources. Please re-start this review with complete information and additional opportunity for comment.

Thank you for caring for creation and our community.

Sincerely,
Ms Shary B
1950 Alaskan Way Seattle, WA 98101-1075

2621-2 General Opposition
2621-2 Outside of SEIS Scope
2621-3 LCA Inputs and Assumptions - Natural Gas Source
2621-4 LCA Inputs and Assumptions - Global Warming Potential Value

Dear Puget Sound Clean Air Agency,

Puget Sound Energy is willing to sacrifice community health and safety, ratepayer money, and Puyallup Tribal land for a liquefied natural gas (LNG) facility that we do not need.

We know that two thirds of "natural" " gas is fracked, and that fracking is a dirty and environmentally hazardous extraction process that emits a pollutant called methane. When properly accounting for methane leaks, fracked gas has climate impacts that rival those of coal.

The analysis of life cycle emissions associated with natural gas must assume a 3 percent overall leakage rate of methane from the time gas is fracked to when it reaches its destination. And the climate-disrupting impact of methane must be calculated at 87 times greater than that of carbon dioxide.

Thank you for realizing the original environmental impact statement was inadequate and for conducting this further analysis to help protect public health and safety. Please produce an accurate environmental review that reflects the true hazards fracked gas has on our air and climate.

2623-1 General Opposition

Dear Puget Sound Clean Air Agency,

Puget Sound Energy's proposed LNG facility flies in the face of the Air Agency's responsibility to protect public health & to reduce our region's contribution to climate change. Please produce an accurate environmental review that reflects the hazards of fracked gas and methane on our air & climate.

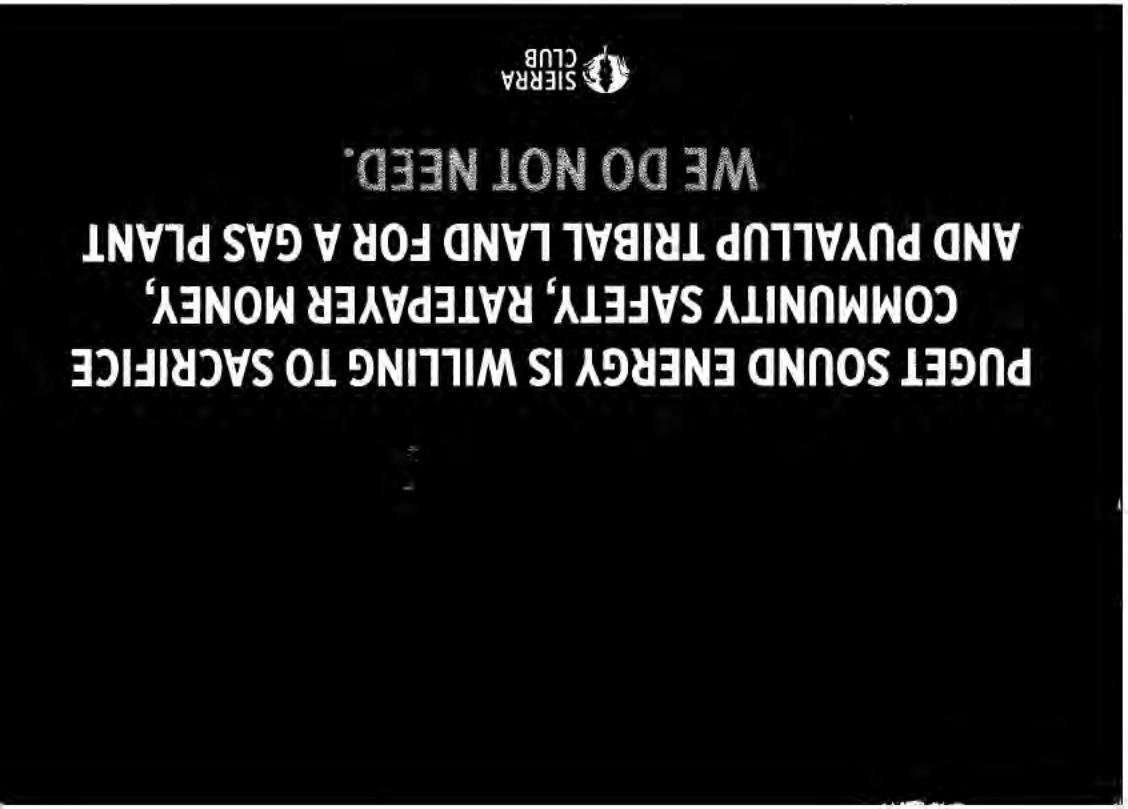
Dear Puget Sound Clean Air Agency,

Puget Sound Energy is willing to sacrifice community health and safety, ratepayer money, and Puyallup Tribal land for a liquefied natural gas (LNG) facility that we do not need.

Two thirds of "natural" gas is fracked, and fracking is a dirty and environmentally hazardous extraction process that emits a pollutant called methane. When properly accounting for methane leaks, fracked gas has climate impacts that rival those of coal.

The analysis of life cycle emissions associated with natural gas must assume a 3 percent overall leakage rate of methane from the time gas is fracked to when it reaches its destination. The climate-disrupting impact of methane must be calculated at 87 times greater than that of carbon dioxide.



Please produce an accurate environmental review that reflects the true hazards fracked gas has on our air and climate.

Sincerely,

[redacted]

PLACE STAMP HERE

2625-1 Regulatory Framework
2625-2 LCA Calculations
2625-3 General Opposition
2625-4 SEPA Alternatives

As a supporter of the Puyallup Tribe, there is **nothing more important than safeguarding Treaty-protected homelands.** Our homelands are in jeopardy if Puget Sound Energy's Liquified Natural Gas plant is allowed to operate.

We urge the PSCAA to withhold permits and redo the SEIS because:

- PSCAA has authority and obligation to consult with the Tribe and has failed to formally do so.
- This draft SEIS analysis is incomplete. This lack of complete information makes this analysis unacceptable.
- The SEIS fails to use the best available science for estimating global warming impacts. Using the best available science to analyze global warming impacts will show that the LNG plant will be harmful to our community.
- The no action alternative will actually keep our families safer and protect our Treaty-protected homelands and natural resources.

On behalf of all Tribal members and the citizens of Tacoma, **we urge PSCAA to redo the SEIS.**

Please respond to my concerns.

Subject: Tacoma LNG SEIS Project Comment
Date: Wednesday, November 21, 2018 8:24:39 PM

Dear Responsible Official,

Puget Sound Energy and Tote Marine seem to imagine that a clean energy future can be arrived at by digging the fossil fuel hole deeper This proposed LNG project is another step toward climate chaos at a moment when the IPCC has given us a clear warning that we must urgently move away from fossil fuels

Fracked gas is not a lesser evil Scientists' understanding of methane's impact on the climate continues to evolve, and at every step along the way we learn that fracking allows more methane escapement than we had previously observed and that the impact of methane on the climate, particularly in the short term, is even more serious than had been previously understood

I applaud your decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct this more rigorous analysis Thank you

I urge you to revise the analysis to account for the following:

1 Methane should be counted as 86 times more potent than CO2 based on the current IPCC analysis (AR5 rather than AR4) considering a 20 year timeframe (rather than the 100-year)

2 Revise the analysis of the impacts of fracking in British Columbia based on recent research(1) demonstrating that methane escapement has been dramatically under-estimated

3 Revise the "no-action alternative" to include a clean energy alternative in which PSE provides electricity not with a different source of fracked gas, but with renewable energy and energy efficiency

4 Revise the "no-action alternative" to include the assumption that Tote Marine will achieve a 50% GHG reduction, in line with the International Maritime Agency's established goals This reduction might alternatively be achieved by a combination of fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion or many other alternatives besides fracked LNG (2) For clean local emissions requirements, Tote Marine can achieve virtually all of the localized lower-particulate and lower SOx and NOx benefits claimed for LNG propulsion by opting for low-sulfur marine gas oil over heavy fuel oil, and installing selective catalytic reducers and diesel particulate filters (3)

5 This more accurate analysis will show that the project has a significant and unmitigated impact on the global climate, which
should be seen as a sufficient basis for denial of the Notice of Construction application

Thank you for your time and consideration of these comments

To: Public Comment
Subject: Puget Sound Energy LNG Project
Date: Wednesday, November 21, 2018 11:11:25 PM

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

First of all, I want to thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. With our climate in grave peril, as emphatically stated in the latest IPCC report, your review of the greenhouse gas impacts of the natural gas used in this project couldn't be more important. Those scientists make clear that we cannot, and must not, allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.

My first concern with this draft SEIS is that it's not complete. There are several sections that are missing data and so we can not accurately assess the quality of the report and understand how certain conclusions are reached. Because of that, I request that you complete this report, reissue it, and then reset the public comment period so that we have time to review the completed report thoroughly.

With that said, I am aware of several issues with the current draft report you issued on October 8th. It is my belief that if these issues are given proper attention and addressed with best available science, it will show that the marginal improvements in emissions the study claims will disappear and the project will in fact be worse for the climate than doing nothing at all.

Here are some of the issues as I understand them:

- The SEIS is not using the best available science for the Global Warming Potential (GWP) of methane. It uses the 100-year GWP of methane and not the 20-year value which is much more relevant given the urgency in addressing the climate crisis. The appropriate 20-year GWP value to use is 96.
- This facility is projected to have a 40 year lifespan, so why does the report project out to 100 years, which is 90 years beyond the time we need to have taken decisive action?
- The SEIS claims emissions benefits from customers that Puget Sound Energy simply does not have. According to PSE and the City of Tacoma, the only maritime customer is TOTE with its two vessels which have already delayed their conversion to consume LNG. Securing new customers (there are only just over 100 LNG ships in operation out of a worldwide fleet of 90,000) as well as the additional permitting could take years and is not guaranteed.
- The SEIS says that emissions will only be reduced if the natural gas comes from Canada, because leakage rates are reportedly lower there than in the US. Shockingly, most leakage rates were self-reported by the fossil fuel industry based on models and recent measurements taken in the field have shown that leakage rates are much much worse.
- How can it be guaranteed that PSE is sourcing its gas from BC anyway? Their recent filings

2533-1 LCA Calculations
2533-2 LCA Inputs and Assumptions - Global Warming Potential Value
2533-3 LCA Inputs and Assumptions - Global Warming Potential Value
2533-4 Purpose and Need
2533-5 LCA Inputs and Assumptions - Natural Gas Source

2533-6 LCA Inputs and Assumptions - Natural Gas Source
2533-7 LCA Inputs and Assumptions - Leakage/Slippage

show they relied on gas from BC, A berta, and the US. And with the recent pipeline explosion in BC that interrupted PSE's supply, we know it's not always available.
- When ships use any fuel, a certain percentage of it escapes without combusting through the exhaust system and into the atmosphere. This is known as slippage and the SEIS uses a lower rate than is considered best practice.

Thanks again for initiating this crucially important review of this facility and I hope that you will take best available science into consideration when revising this draft SEIS.

Subject: Comment on Tacoma LNG SEIS
Date: Friday, October 26, 2018 5:56:54 PM

Dear Puget Sound Clean Air Agency,

As a person of faith, I believe we are called to care for both creation and communities My values of stewardship, justice, and responsibility have compelled me to comment on this project
Thank you for conducting a supplemental environmental review of the greenhouse gas emissions for PSE's proposed LNG facility on the Tacoma Tideflats

As a member of Earth Ministry, which has been working closely with scientists and policy experts to review the SEIS, I am concerned that the document does not fully analyze the climate impacts of this project

Please address the following in the Tacoma LNG SEIS:

1 Methane's impact on climate – The SEIS uses a dated value for the 100-year Global Warming Potential (GWP) for methane from 2007 when updated values were published 2013 and then again in 2016 Using the best available science shows the plant would have higher greenhouse gas emissions Additionally, given the short timeframe required to address climate change as recently noted by the United Nations, the SEIS should use the 20-year GWP for methane, which shows that the plant will be more than 50% dirtier over the next two decades

2 Source of fracked gas – It is a false assumption that British Columbia would be the only gas source for this facility and this requirement is not enforceable In addition, the SEIS relies upon self-reported pollution data on BC gas from the fossil fuel industry It also failed to incorporate multiple, recent independent studies showing methane pollution rates as much higher than those reported by the fossil fuel industry

3 Lack of alternative options – TOTE is already using ultra-low sulfur diesel (ULSD) and other companies are also using ULSD or scrubbers to meet emission requirements The no action alternative assumes that LNG is required for TOTE to meet its emission requirement, when these alternatives already exist and are in use

4 Alterations to the original proposal – Deviating from PSE's proposal, the SEIS included bunkering more than the two TOTE vessels on the Blair Waterway The SEIS should instead provide an analysis using only secured customers

5 Incomplete information – Use of placeholder values, incorrect units of measurement, and the stated need for more data from PSE makes the analysis incomplete and hard to follow The draft SEIS should be thoroughly edited and released for a new full public comment period

The Puyallup Tribe, citizens of Tacoma, and residents of the Salish Sea have a right to know the total local and global impacts of this proposal With missing data and alterations to the project, this draft SEIS does not account for full climate impacts

I ask that the PSCAA live into its self-proclaimed commitment to be good and wise stewards of our shared resources Please re-start this review with complete information and additional opportunity for comment

Thank you for caring for creation and our community

Sincerely,
[redacted]
