Appendix C.4 Comment Database

Part I - Comments

[00:14:00] Councilmember Annette Bryan?

Annette: **[Speaking native American]**, good day. My name is Annette Bryan, and I'm here from the Puyallup Tribal Council with Vice Chairman David Bean and Councilwoman Anna Bean and Tribal Member Dakota Case. We are here on behalf of the Puyallup Tribal Council and the Puyallup Tribal membership. The city of Tacoma and Puget Sound Clean Air Agency have failed to consult with the Puyallup Tribe. They have allowed PSE to construct the liquified natural gas plant without the proper permits.

Consultation with the Puyallup Tribe means you don't build, unless you consult and come to an agreement with the tribe. Consultation is required by federal law to properly carry out the federal trust responsibility intended to secure our treaty protected land and resources. Thus the failure to properly consult with the tribe is a violation of federal law. It's important here because the authority was delegated to your agency. The federal trust responsibility that goes with that delegation is a part of that.

[00:15:00] These offenses are compounded by the fact we're now reviewing a draft SEIS that completely fails to examine the true impacts on our tribal numbers, members, homelands, treaty protected land and water, and all of the surrounding communities thereby putting not only our people and environment at great risk but the surrounding communities as well. Moreover, the scope of this project has changed, and the study fails to address that change. PSE does not answer to a constituency. PSE is a foreign company made up of a foreign group of investors trampling on our homelands, our community, and our rights with money leveraged from taxpayers.

The Port of Tacoma cannot responsibly subsidize a corporate venture with taxpayer dollars that ultimately harms those same taxpayers. This current science on LNG is not reflected in the study. We understand that many elected officials were misled into believing LNG is a transitional fuel and a cleaner for the environment.

[00:16:00] But we all know better now. Rejecting this study and this project is more likely to preserve our environment and keep our families safe. You talk about jobs. The Puyallup Tribe of Indian employs over 3,200 jobs, full time employment, plus hundreds and hundreds of economic development jobs. Economy is the protecting jobs, and we can do more than 18 that this facility originally talked about. How you fuel the ships does not affect how

1106-1 5. Regulatory Framework
1106-2 5. Regulatory Framework
1106-3 5. Regulatory Framework
1106-4 3. Outside of SEIS Scope

many jobs there are. This is why the region's most respected environmental champions have chosen to stand against this project and this study and, instead, stand with the Puyallup Nation.

The Puget Sound Clean Air Study is nothing more than a false promise to the Puyallup Tribe of Indians and the citizens of Tacoma. It must be rejected and, at a minimum, redone. The tribe will be submitting formal written comments and respond to the SEIS, in addition to today's remarks.

[00:17:00] We also have a letter that we are working on getting signed by our chairman requesting a government to government consultation. Thank you.

Seattle, WA 98101

Re: Request for Government to Government Consultation

The Puyallup Tribe of Indians hereby requests consultation between the Puget Sound Clean Air Agency and the Tribe prior to the publication of the Final Supplemental Environmental Impact Statement for the above referenced project. This request is in addition to any other comments provided by the Tribe's representatives at the Public Hearing and in addition to written comments that will be provided by November 21, 2018.

While the Tribe appreciates the Puget Sound Clean Air Agency's ("the Agency") work on the draft SEIS, the Tribe has significant concerns with the analysis in the draft. The project identified in the Draft SEIS is very different that the project presented to and analyzed by the City of Tacoma in its final EIS. In addition to the concerns with the draft SEIS, the Tribe remains gravely concerned that the applicants are continuing to construct this facility without the necessary Notice of Construction permit in violation of Washington's Clean Air Act and the Agency's Notice of Violation.

The Draft SEIS demonstrates that this project will have wide range impacts on the environment and Tribal Resources. The Agency is acting through delegated authority that is traced not only to the State of Washington but also to the Federal Clean Air Act and the United States Environmental Protection Agency. Under the Federal Clean Air Act the EPA has a trust responsibility to the Tribe and must consult on matters that impact the Tribe. The State of Washington has parallel authorities to consult with the Tribe. The obligations of both the Federal Government and the State of Washington to consult with the Tribe do not vanish into thin air with delegation to the Agency. Therefore, the Tribe requests that formal government to government consultation, with the full quorum of Tribal Council as required, be scheduled without further delay.

Please contact our legal counsel, Lisa A. Anderson at (253) 573-7852, to schedule the government to government consultation. The Tribe reserves its rights to present additional comments throughout the comment period.

Sincerely,

Bill Sterud

Re: Proposed Tacoma Liquefied Natural Gas Plant
Comments on Draft Supplemental Environmental Impact Statement

The Puyallup Tribe of Indians hereby submits the attached comments to the Draft Supplemental Environmental Impact Statement that was released for public comment on October 8, 2018. The attached comments are addition to any other comments provided by the Tribe's representatives at the Public Hearing and in addition to other materials provided to the agency in January of 2018, and again in June of 2018.

The Puyallup Tribe is a federally recognized Indian Tribe with its reservation located in Tacoma and surrounding communities in the State of Washington. The Tacoma LNG Plant and its associated pipelines are proposed to be constructed within and adjacent to the 1873 Survey Boundary for the Puyallup Tribe's Reservation. In addition to other lands, the Tribe owns land directly across the waterway from the proposed Tacoma LNG Plant site. The lands owned by the Tribe directly across the waterway are used as restoration sites providing critical and essential fish habitat, as cultural sites, and as marinas for both recreational and commercial boat traffic.

The Tribe, through the Medicine Creek Treaty of 1854, has a treaty right to fish in the waters surrounding the LNG Plant site and waters that will be impacted by the development and use at the proposed project site. The impacts to the waters, shorelines, habitat, and surrounding shoreline properties and uses go to the heart of the Tribe's culture and livelihood with potential impacts to fish, other wildlife, and natural resources, as well as impacts to the health and welfare of Tribal members. As is secured in Article VI, cl. 2 of the U.S. Constitution, the Treaty "shall be the supreme Law of the Land." As affirmed by *U.S. v. Washington,* the rights arising from the Medicine Creek Treaty cannot be diminished or interfered with absent authority from Congress.

While the Tribe appreciates the Puget Sound Clean Air Agency's ("the Agency") work on the DSEIS, the Tribe has significant concerns with the analysis in the draft. The project identified in the DSEIS is very different than the project presented to, and analyzed by, the City of Tacoma in its final EIS. Elements of the project relied upon for the DSEIS conclusions, such as bunkering out of the Blair Waterway, have not had any environmental review by the lead agency, the City of Tacoma, and were not considered by the City in its Shorelines Substantial Development Permit or by the Army Corps of Engineers in its NEPA review, Section 404 Permit, or the Corps issued Section 10 Permit under the Rivers and Harbors Act.

The DSEIS also contains several assumptions, in reaching its conclusion, that are either invalid or lack any reasonable support. The DSEIS fails to contain best available science in its analysis, rendering its conclusions

0865-1 5. Regulatory Framework

invalid. The DSEIS also is incomplete, with key data missing, which renders meaningful review by the public impossible.

In addition to the concerns with the DSEIS, the Tribe remains gravely concerned that the applicants are continuing to construct this facility without the necessary Notice of Construction permit in violation of Washington's Clean Air Act and the Agency's Notice of Violation. The Agency must, as it continues to review the impacts of this project, insist on the applicant's compliance and issue an order to force the applicants to cease the premature and illegal construction activity.

Finally, as the Tribe has previously notified the Agency, the Agency has failed to formally consult, on a government to government basis, with the Tribe. The DSEIS demonstrates that this project will have wide range impacts on the environment and Tribal Resources. The Agency is acting through delegated authority that is traced not only to the State of Washington but also to the Federal Clean Air Act and the United States Environmental Protection Agency. Under the Federal Clean Air Act the EPA has a trust responsibility to the Tribe and must consult on matters that impact the Tribe. The State of Washington has parallel authorities to consult with the Tribe. The obligations of both the Federal Government and the State of Washington to consult with the Tribe do not vanish as a result of delegation to the Agency. Furthermore, the Tribe is a neighboring jurisdiction with authority, under the Clean Air Act, to regulate air quality. Therefore, the Tribe requests that formal government to government consultation, with the full quorum of Tribal Council as required, be scheduled without further delay. The Tribe is prepared to have its consulting expert, Dr. Ranajit Sahu (PH.D, QEP, CEM), available for the government to government consultation.

Please contact our legal counsel, Lisa A. Anderson at (253) 573-7852, to schedule the government to government consultation. The Tribe reserves its rights to present additional comments throughout the review process.

Sincerely,

Bill Sterud

PUYALLUP TRIBE OF INDIANS

Comments on the Draft Supplemental Environmental Impact Statement

For the

Proposed Liquefied Natural Gas Project

Issued for Public Comment October 8, 2018

I. INTRODUCTION

The Puyallup Tribe of Indians ("Tribe") is a federally recognized Indian Tribe with its Reservation located in the State of Washington and includes Tacoma and surrounding communities. The Tacoma LNG Plant and its associated pipelines are proposed to be constructed within and adjacent to the 1873 Survey Boundary for the Puyallup Tribe's Reservation. In addition to other lands, the Tribe owns land directly across the waterway from the proposed Tacoma LNG Plant site. The lands owned by the Tribe directly across the waterway are used as restoration sites providing critical and essential fish habitat, as cultural sites, and as marinas for both recreational and commercial boat traffic.

The Tribe, through the Medicine Creek Treaty of 1854, has a treaty right to fish in the waters surrounding the LNG Plant site – waters that will be impacted by the development and use at the proposed project site. Impacts to the waters, shorelines, habitat, and surrounding shoreline properties and uses go to the heart of the Tribe's culture and livelihood, and carry potential impacts to fish, other wildlife and natural resources. Such impacts also pose very real threats to the health and welfare of Tribal members. As is secured in Article VI, cl. 2 of the U.S. Constitution, the Treaty "shall be the supreme Law of the Land." As affirmed by *U.S. v. Washington,* the rights arising from the Medicine Creek Treaty cannot be diminished or interfered with absent authority from Congress.

The Tribe submits the comments set out in this document to the Draft Supplemental Environmental Impact Statement ("DSEIS") pertaining to the proposed Tacoma Liquefied Natural Gas facility (the "Project").[1] From reviewing the DSEIS, it is clear that the document presents a simplistic, unrealistic, and biased analytical framework designed to reach a pre-determined outcome – namely, that the proposed LNG facility will result in a net reduction of greenhouse gas ("GHG") emissions. While any analysis of the future (in this case 40 years out) must rely on assumptions to some extent, the DSEIS is completely dependent on a foundation of factually and technically unsupported and/or unrealistic and self-serving assumptions. So much so, that its conclusions are neither reasonable nor accurate. As detailed herein, it is the Tribe's position, as

[1] PSCAA's Notice of Construction Application Number for the Project is: 11386.

set out in the Resolution of the Tribal Council attached as Appendix A, that the DSEIS is invalid and must be revised to address fundamental deficiencies that prevent the DSEIS from presenting the "reasonably thorough discussion" of environmental impacts related to the Project's GHG emissions that SEPA requires. *Residents Opposed to Kittitas Turbines v. State Energy Facility Site Evaluation Council,* 165 Wn.2d 275, 312, 197 P.3d 1153 (2008).

Revising the DSEIS to correct its fatal flaws will require the Puget Sound Clean Air Agency ("PSCAA")[2] to fully vet and re-evaluate the DSEIS' conclusion. It is evident that this Project has the potential to cause significant adverse (though as of yet unanalyzed) impacts to the environment. The DSEIS fails to adequately account for these impacts, rendering it entirely inadequate. *See Columbia Riverkeeper et al. v. Cowlitz County et al.*, SHB No. 17-010c at *18 (Sept. 15, 2018) ("[B]ecause it failed to fully analyze the impacts of greenhouse gas emissions from the Project and to consider whether additional mitigation is required, the Final EIS is remanded to Cowlitz County and the Port for further SEPA analysis consistent with this opinion."). PSCAA should use and apply SEPA's substantive authority as well as other PSCAA authority to properly evaluate the Project's validity.

The remainder of the Tribe's comments are organized as follows: Section II provides an overview of SEPA and its application to the Supplemental Environmental Impact Statement required by PSCAA; Section III provides the Tribe's general comments concerning the DSEIS; Section IV provides the Tribe's technical comments concerning the DSEIS; and Section V provides the Tribe's concluding remarks concerning the DSEIS and this SEPA review more generally. Portions of Section IV were developed in consultation with Dr. Ranajit Sahu (PH.D, QEP, CEM). Dr. Sahu – who has approximately thirty years of experience in the fields of environmental – mechanical and chemical engineering, is a consulting expert who assisted the Tribe in its review of the DSEIS. A copy of Dr. Sahu's *curriculum vitae* is attached **Appendix B**. The Tribe will make Dr. Sahu available to discuss the points raised in Section IV of these comments as part of the formal consultation process.

II. SEPA COMPLIANCE

The State Environmental Policy Act ("SEPA") is the State of Washington's core environmental policy and review statute. Like its federal counterpart, the National Environmental Policy Act ("NEPA"), SEPA broadly serves two important purposes: (1) to ensure that government decision-makers are fully apprised of the environmental consequences of their proposed actions; and (2) to encourage public participation in the consideration of environmental impacts. *See Norway Hill Preservation and Prot. Ass'n v. King Co.*, 87 Wn.2d 267, 279, 552 P.2d 674 (1976).

In adopting SEPA, the Washington legislature declared the protection of the environment to be a core state priority. *See* RCW 43.21C.010. SEPA declares that "[t]he legislature recognizes that each person has a fundamental and inalienable right to a healthful environment and that each person has a responsibility to contribute to the preservation and enhancement of the environment." RCW 43.21C.020(3). This policy statement "indicates in the strongest possible terms the basic

[2] And the City of Tacoma.

importance of environmental concerns to the people of the state." *Leschi v. Highway Comm'n*, 84 Wn.2d 271, 279-80 (1974).

SEPA is more than a purely "procedural" statute that encourages informed and politically accountable decision-making. Rather, in enacting SEPA, the Washington legislature gave decision-makers the affirmative authority to deny projects where environmental impacts are significant, cannot be mitigated, and/or violate local rules or policies. Indeed, SEPA provides substantive authority to condition or even deny proposed actions based on their environmental impacts, even where they meet all other requirements of the law. RCW 43.21C.060; *see also Columbia Riverkeeper et al. v. Cowlitz County et al.*, SHB No. 17-010c at *17 (Sept. 15, 2018) (acknowledging authority to impose conditions or deny a project based on greenhouse gas emissions).[3]

III. GENERAL COMMENTS

1. The Tacoma LNG Project will disproportionately expose the Puyallup Tribe to hazards, including the impacts of climate change.

The health impacts occasioned by climate change are numerous and increasing. In recent years, world leaders, medical, public health, and scientific bodies have expressed deep concerns about climate change as a threat to human health and well-being. Physicians for Social Responsibility,[4] the American Public Health Association,[5] and the Union of Concerned scientists (to name a few) have expressed the urgency for attention to the health threats of climate change and are speaking out about these threats with increasing urgency.

Likewise, the recently-released National Climate and Health Assessment describes how human health is already being affected by climate change: "Climate change is a significant threat to the health of the American people. The impacts of human-induced climate change are increasing nationwide. Rising greenhouse gas concentrations result in increases in temperature, changes in precipitation, increases in the frequency and intensity of some extreme weather events, and rising sea levels. These climate change impacts endanger our health by affecting our food and water sources, the air we breathe, the weather we experience, and our interactions with the built and

[3] As one SEPA treatise points out, when this premise was challenged by project proponents shortly after SEPA's enactment, "the courts consistently and emphatically responded that even if the action previously had been ministerial, it became ***environmentally discretionary*** with the enactment of SEPA." Richard Settle, SEPA: A Legal and Policy Analysis, § 18.01[2] (2014) (emphasis added). Decision-makers have also denied permits under this authority in a number of contexts, including those similar to the instant Project. *See, e.g., W. Main Associates v. City of Bellevue*, 49 Wn. App. 513, 521-23, 742 P.2d 1266 (1987) (upholding denial of permits based on historic and cultural impacts, view impacts, shadow impacts, traffic impacts, and air impacts); *State v. Lake Lawrence Pub. Lands Prot. Ass'n*, 92 Wn.2d 656, 659, 601 P.2d 494 (1979) (upholding denial of development of 14-acre parcel because of effects on bald eagles).

[5] American Public Health Association, Policy on Climate and Health (2015) (online at: http:www.apha.org/policies-and-advocacy/public-health-policy-statements/policy-database/2015/12/03/15/34/public-health-opportunities-to-address-the-health-effects-of-climate-change).

0865-4 1. Determination of SEIS Scope - Comparison to FEIS
0865-5 11. LCA Inputs and Assumptions - General

natural environments. As the climate continues to change, the risks to human health continue to grow. Every American is vulnerable to the health impacts associated with climate change."[6]

The Puyallup Tribe and its members are entitled to the quiet enjoyment of their homeland as provided for by the Treaty of Medicine Creek and as confirmed by the Puyallup Tribe of Indians Settlement Act of 1989. Puyallup Tribe of Indians Settlement Act of 1989, Pub. L. 101-41, 103 Stat. 83 (June 21, 1989). These rights and entitlement would be threatened and violated by the proposed Project. The Tribe will be disproportionately impacted by the Project's emissions of air pollution (including toxic air pollutants) due to the fact that the Tribe's entire homeland shares an airshed with the proposed LNG facility, which will emit harmful pollutants in significant amounts.

Further, because the Tribe's entire homeland is located near and, in places, adjacent to the coast (where sea levels are rising and extreme weather events are becoming more frequent because of climate change), the Tribe is uniquely sensitive to and disproportionately impacted by the consequences of climate change. Thus, the Tribe will be disproportionately affected if the Project results in a net increase in GHG emissions to the earth's atmosphere.

2. The reported GHG emissions in the FEIS differ markedly from those reported in the DSEIS.

The DSEIS states, "that the direct onsite GHG emissions for the LNG plant are now estimated to be between 52,272 and 108,998 metric tons of CO_2e per year." [DSEIS, p. 4-13]. The Tribe notes with concern (and Ecology and Environment, Inc. ("E&E") itself acknowledges) that the FEIS forecasted the facility's greenhouse gas emissions to be 20,751 metric tons CO_2e per year. [DSEIS, p. 4-12]. In other words, PSCAA's consultant, E&E, itself states that the FEIS it authored underestimates the facility's direct onsite GHG emissions by a factor of approximately 2.5 to 5.

That E&E's analysis in the FEIS was so off-the-mark calls into question whether E&E is capable of performing an analysis upon which PSCAA can justifiably rely in making its permitting decision. To have assurance in E&E's work, a satisfactory explanation as to why the FEIS so profoundly underestimated the Project's greenhouse gas emissions is necessary and appropriate.

3. The DSEIS should analyze and possibly recommend BACT for GHGs as a permit condition.

The DSEIS does not suggest or analyze the use of Best Available Control Technology ("BACT") for GHG emissions. The reason for this omission appears to be the notion that the facility is not otherwise subject to Prevention of Significant Deterioration ("PSD") review and/or requirements. Accordingly, although BACT could be utilized to reduce the Project's GHG emissions, its use is neither analyzed nor recommended as a means of addressing the significant GHG concerns the Project triggers (potentially over 100,000 tonnes per year by the DSEIS' estimation).

[6] U.S. Global Climate Change Research Program, *The Impacts of Climate Change on Human Health in the United States: A Scientific Assessment* (2016) (online at: https://health2016.globalchange.gov).

The technical comments in Section IV below identify a number of crucial flaws in the DSEIS and its analysis. Performing a flawed analysis appears to be the only way the DSEIS is able to conclude that the Project does not result in a net increase in GHG emissions. Additionally, there are very real concerns regarding the legitimacy and enforceability of the DSEIS' recommendation that all natural gas "supplied to the facility" come from British Columbia, Canada. [DSEIS, p. 4-13]. Because, under an appropriate analysis, there is a high likelihood that the Project will result in a substantial net increase of GHGs emitted into the atmosphere, BACT for GHGs should be considered and/or recommended as an additional permit condition.

4. To date, PSCAA has not formally consulted with the Tribe concerning this Project.

The Tribe appreciates the efforts of PSCAA to meet with Tribal Council to discuss its permitting authorities prior to PSCAA's decision to require a SEIS. However, as was discussed in that meeting, the Tribe strongly disagrees with PSCAA's position that it is not required to, and lacks authority to, participate in government-to-government consultation with the Tribe. PSCAA, which has delegated authority to implement the Clean Air Act and Washington's Clean Air Act, not only has the authority to consult with the Tribe and avoid destruction of the Tribe's well-established treaty rights held under the Medicine Creek Treaty, but also the obligation to do so.

Furthermore, PSCAA holds a responsibility to make an informed decision under SEPA. The Tribe exclusively holds information relevant to the analysis that PSCAA must perform to determine environmental impacts to the Tribe's members, who are among the most disproportionately impacted by the proposed Project, and to the Tribe's treaty-protected resources. Failure to consult with the Tribe cripples PSCAA's ability to perform a fully-informed analysis as required by law.

IV. TECHNICAL COMMENTS

According to the Intergovernmental Panel on Climate Change's (IPCC) October 8, 2018 report, the world needs to curb its carbon emissions by at least 45% of 2010 levels by 2030 and then achieve carbon neutrality by 2050, in order to avoid the worst effects of climate change. The report warns there is only a dozen years for global warming to be kept to a maximum of 1.5°C above historical baseline, beyond which even half a degree will significantly worsen the risks of drought, floods, extreme heat and poverty for hundreds of millions of people. Avoiding the most serious damage requires transforming the world economy away from fossil fuels within just a few years, said the authors.[7]

Therefore, from a climate change perspective, the next few years are likely the most important in human history. As such, the DSEIS' analysis needs to be correct and reliable. Unfortunately, the DSEIS' greenhouse gas analysis is fundamentally flawed and inaccurate.

Comparing two scenarios (dubbed Scenarios A and B) against a No Action Alternative, the DSEIS finds a net reduction in annual GHG emissions for Scenario A (a reduction of 39,897 tonnes

[7] The report further indicates that we are already seeing the consequences of 1°C of global warming through more extreme weather, rising sea levels, and diminishing Arctic sea ice.

per year) and Scenario B (a reduction of 56,705 tonnes per year). *See* DSEIS Table 4-5. The findings for both Scenarios A and B are not truly supported and, thus, neither is valid nor credible.

Based on the values shown in Table 4-5 of the DSEIS, the reported Scenario A benefit is 5.48% of the No Action Alternative's annual GHG emissions, and the reported Scenario B benefit is 3.93%. Both scenarios are based on hundreds of assumptions (see, for example, the various worksheets in the workpapers provided for each scenario). Accordingly, the DSEIS' conclusion that the Project will always provide a GHG reduction under either scenario (and is, therefore, beneficial from a GHG reduction standpoint) is highly specious. If certain assumptions made by the DSEIS turn out to be incorrect for both the No Action Alternative and the Project Alternative, then estimated GHG reductions (*i.e.*, benefits) in the DSEIS reverse and become GHG increases when erroneous assumptions are corrected.

Of course, in making projections into the future, certain assumptions may be warranted or even necessary. As a general proposition, the making of assumptions is not the issue. Rather, the issue here is that many of the assumptions made in the DSEIS are problematic because they are not plausible, not reasonable, not supported, and/or simply not valid. Perhaps most importantly, the problematic assumptions the DSEIS makes are biased in favor of the Project in that they skew towards exaggerating the Project's benefits and minimizing (or ignoring) the GHG harms the Project presents.

The analysis presented in the DSEIS is also problematic because it does not furnish needed bases for the key assumptions it makes,[8] and because it does not conduct reasonable sensitivity analyses in the event its assumptions are incorrect. Simply put, the analysis presented in the DSEIS reduces the inherent uncertainties in future outcomes (multiple decades into the future) to just four story-lines: two no-project story lines and two corresponding project scenario story-lines. The DSEIS then proceeds to provide simplistic and self-serving comparisons between the respective no-project and project outcomes to ultimately find the small benefits that the DSEIS presents in Table 4-5 [DSEIS, p. 4-12] discusses.[9] This simplistic analysis lacks sufficient basis and is neither informative nor reliable.

Crucially, it appears that making equally-plausible alternate assumptions and/or simply correcting the problems in the DSEIS reveals **that the Project's impact would be a net increase**

---

[8] One notable exception is that according to the DSEIS, the Project will result in a net increase of GHG released to the atmosphere if the natural gas is not sourced from British Columbia, Canada. As discussed below, the notion that sourcing natural gas from British Columbia will sufficiently reduce the Project's GHG impacts is questionable for multiple reasons, including very real questions concerning the legal and practical enforceability of the "sole source" requirement the DSEIS proposes.

[9] As a basic measure of the DSEIS analysis' simplistic and implausible nature, it is important to note the precision of the greenhouse gas emissions estimates in the no-project and project alternatives: 727,536 tonnes/year for the no-project in Scenario A; 687,639 tonnes/year for the project in Scenario A, etc. *See* DSEIS Table 4-5. Given the uncertainties in any one variable or assumption that underlies these estimates, not to mention all of them, this level of precision in the estimate borders on the absurd. Given the large +/- uncertainties in each of the no-project and project estimates (likely well over 50%), there is no statistical significance of the 5.48% "benefit" in Scenario A or of the even smaller 3.93% "benefit" in Scenario B.

in GHGs emissions (and likely more robustly so) at a time when the planet simply cannot afford such an increase.

1. SEPA Standards for Evaluating Greenhouse Gas Emissions.

SEPA and its implementing regulations explicitly require consideration of direct and indirect climate impacts. *See* RCW 43.21C.030(f) (directing agencies to "recognize the world-wide and long-range character of environmental problems"); WAC 197-11-444 (listing "climate" among elements of the environment that must be considered in SEPA review). Agencies are required to assess both the direct and indirect impacts of each proposed project.

In 2008, a working group appointed by the Governor provided a list of recommendations for ensuring that climate change would be considered in meeting SEPA's directives.[10] Those recommendations identified the following categories of GHG emissions to be considered under SEPA: 1) off-site mining of materials purchased for the project; 2) transportation of raw materials to the project, and transport of the final product offsite; 3); use of products sold by the Project proponent(s) to consumers or industry, including emissions generated from combustion of fuels manufactured or distributed by the facility.

The Washington State Department of Ecology has issued SEPA guidance for its own consideration of GHG emissions.[11] That guidance makes clear that SEPA requires climate change to be considered in an environmental analysis. Ecology's guidance provides that SEPA documents are to consider whether a proposed Project will significantly contribute to GHG concentrations.

Under SEPA, an "agency cannot close its eyes to the ultimate probable environmental consequences of its current action." *Cheney v. City of Mountlake Terrace*, 87 Wn.2d 338, 344, 552 P.2d 184 (1976). In fact, the SEPA regulations specifically direct that an "agency shall not limit its consideration of a proposal's impacts only to those aspects within its jurisdiction, including local or state boundaries." WAC 197-11-060(4)(b).[12] SEPA also constitutes an affirmation of Washington's connectedness to the rest of the planet; it explicitly calls on responsible agencies to "[r]ecognize the ***world-wide*** and ***long-range*** character of environmental problems" and take steps to cooperate in "anticipating and preventing a decline in the quality of the ***world*** environment." RCW 43.21C.030(f) (emphasis added); *see also Eastlake Comm. Coun. v. Roanoke Assoc.*, 82 Wn.2d 475, 487, 513 P.2d 36 (1973) (observing "unusually vigorous statement of legislature purpose ... to consider the ***total*** environmental and ecological factors ***to their fullest*** in deciding major matters") (emphasis added).

SEPA's regulations recognize that environmental impacts do not end at the state's borders; the SEPA regulations explicitly require that the lead agency consider the impacts of proposed projects beyond the state's geographic jurisdiction. *See* WAC 197-11-060(4)(c); *Cathcart-*

0865-7 7. SEPA Alternatives
0865-8 8. No Action Alternative

Maltby-Clearview Comm. Council v. Snohomish Cty., 96 Wn.2d 201, 209 (1981) (SEPA "also mandates that extra-jurisdictional effects be addressed and mitigated, when possible.").

Recently, the Washington Shorelines Hearings Board held that that failure to adequately analyze the full scope of a proposed project's greenhouse gas impacts constitutes grounds for invalidating issued permits. *See Columbia Riverkeeper et al. v. Cowlitz County et al.*, SHB No. 17-010c at *18 (Sept. 15, 2018) (invalidating permits because EIS failed to adequately analyze the Project's greenhouse gas impacts). Moreover, indirect impacts of fossil fuel transportation projects must be considered in the SEPA process. For example, the Washington Shorelines Hearings Board recently invalidated a SEPA document for two proposed crude oil terminals for failing to adequately consider the cumulative and indirect impacts of rail and vessel traffic. *Quinault Indian Nation v. City of Hoquiam et al.*, SHB No. 13-021c, 2013 WL 6062377 (Nov. 12, 2013).[13]

2. The DSEIS' alternatives analysis is fatally flawed.

SEPA requires that an EIS contain a detailed discussion of alternatives to the proposed action. RCW 43.21C.030(c)(iii). The discussion of alternatives in an EIS must present sufficient information for a reasoned choice among alternatives. *E.g., Toandos Peninsula Ass'n v. Jefferson Cty.*, 32 Wn. App. 473, 483, 648 P.2d 448 (1982). Thus far, the DSEIS has not explored and objectively evaluated reasonable alternatives.

The DSEIS' alternatives analysis is fatally flawed because its baseline / no-action alternative analysis is fatally flawed. This is due to the fact that its analysis: (1) assumes a static or close-to-static view of the future for the assumed life of the project (in other words, the DSEIS assumes that circumstances, technology, etc. will remain unchanged for the next 40 years); and (2) makes simplistic assumptions about the future in the absence of the project (for example, the DSEIS assumes the no-action alternative will remain unchanged over the life of the Project). The no-action alternative analysis does not account for market-driven or regulatory-driven changes such as increasing penetration of renewables or electric vehicles or even natural gas over the next 40 years, which is not a credible approach to assessing the Project's planning horizon.

The DSEIS' no action alternative analysis assumes the same mix of marine fuels (that the DSEIS believes erroneously are currently used in the TOTE and non-TOTE vessels) will remain the same for the next 40 years. Based on this assumption, the DSEIS holds GHG emissions from all vessels burning marine fuels constant for the next forty years – for example, the emission factors for the various fuels in the main engines of the vessels for CO_2, CH_4, and N_2O[14] are not adjusted

[13] Notably, here, the DSEIS indicates the following fossil fuel transportation component of the Project: that fuel bunkering will take place on the Blair Waterway (even though this was neither included nor analyzed in the FEIS, and the DSEIS likewise fails to analyze the full suite of impacts presented by such activities taking place in the Blair Waterway).

[14] As an example, for the Scenario A worksheet, these emission factors (in g/kW-hr) for various fuels are shown in a Tab called "EF Marine Vessels spec. TOTE" in cells O8-S17. No references are provided for the source(s) of these data. We further note that, in the form presented (i.e., g/kW-hr) these emission factors include many built-in assumptions on engine-specific fuel consumption (i.e., mass of fuel burned per unit of kW-hr work), engine efficiency, and the like – all of which are implicitly held constant into the future.

0865-9 1. Determination of SEIS Scope - Comparison to FEIS
0865-10 1. Determination of SEIS Scope - Comparison to FEIS

into the future. If one assumes no improvement in air quality for the no action alternative, then the benefits of the Project will be exaggerated – and unjustifiably so because it is not reasonable to assume static conditions over the next forty years.

Collectively, by speculatively and implausibly minimizing future GHG reductions in the no action alternative, the DSEIS inaccurately exaggerates the benefits the of the proposed Project. In a proper analysis, a set of plausible no action alternatives would embrace a realistic view of the next forty years, with varying levels of penetration of renewable marine fuels such as greenhouse gas-friendly biodiesels and improvements in engine efficiency (which would have lower greenhouse gas emissions).

Comparing futures involving penetration of renewables into the market (i.e., a non-static no-action alternative) with the Scenario in which the LNG project is operational is more plausible than the DSEIS' current approach. Thus, here, the DSEIS' no action alternative analysis needs to acknowledge the use of lower-GHG emitting fuel in the future for marine vessels, including TOTE vessels, and account for the resulting lower GHG emissions from vessel engines over the next 40 years. The SEIS then needs to articulate how this correction impacts its analysis.

Further, the DSEIS does not make clear what energy efficiency reductions will result if, in connection with the assumed bunkering, LNG is used in the already-existing engines of the vessels that the DSEIS assumes. The DSEIS should indicate how accounting for these reductions in efficiency impacts the "benefits" (3.93% in Scenario B and 5.48% in Scenario A) it postulates.

Due to these significant shortcomings, the DSEIS fails to properly frame the alternatives that PSCAA is to consider in making its permitting decision. Consequently, the DSEIS fails in its basic function of providing the decisionmaker with the information needed to make an informed choice. Such failure is fatal to an EIS. *See, e.g., Blair v. City of Monroe*, GMHB No. 14-3-0006c (Sept. 19, 2014) 2014 WL 5309146, at *16 ("Without a properly-framed set of alternatives, the City's nonproject environmental review simply ***fails to provide decision makers with the information to make an informed choice*** about the land use designation for the East Monroe Property") (emphasis added).

3. The scope of the proposed Project in the DSEIS is not consistent with the scope of the proposed Project in the FEIS – related incorrect assumptions further undermine the DSEIS' no action alternative analysis.

The scope of the project in the DSEIS is not consistent with the FEIS in two material respects. As a result of these discrepancies and the DSEIS' related incorrect assumptions, the DSEIS improperly and self-servingly exaggerates the Project's GHG benefits.

First, the DSEIS includes bunkering of LNG in the Blair Waterway to an unidentified population of assumed marine customers. [DSEIS, p. I (SEPA Fact Sheet, first bullet)]. The DSEIS relies upon use of LNG in ships other than TOTE vessels – which assumed vessels will obtain the LNG from the Project in the Blair Waterway – to support its analysis that the Project results in reduced GHG emissions.

Bunkering barges in the Blair Waterway is an aspect of the Project that was not included in prior Project determinations. The intensified vessel traffic on the Blair Waterway, which is an unavoidable consequence of the bunkering activities envisioned by the DSEIS, has not been analyzed in any environmental impact statement.

Further, discussion and assumptions in the DSEIS concerning bunkering barges assumes that there will be a market for LNG as vessel fuel in this region and that vessels will be calling on the Tacoma LNG facility for that purpose. However, the DSEIS provides no support for this key foundational underpinning of its analysis. Further, in assuming the existence of a market, the DSEIS fails to account for the fact that the expected market for LNG as a vessel fuel for compliance with the North American Emission Control Area has not materialized as expected. Thus, contrary to taking a "hard look," the DSEIS' has ignored important information which has resulted in an over-estimation of GHG emissions reductions from bunkering. The SEIS needs to consider a scenario in which there is no market for LNG as a vessel fuel in this region.[15]

Further, the Blair Waterway bunkering assumption is also belied by what project proponent Puget Sound Energy ("PSE") has communicated to the City of Tacoma. As shown in the correspondence **attached to these comments as Appendix C** from PSE to the City in July of 2016, Puget Sound Energy expressly denied that the proposed Project would load bunker barges in the Blair Waterway.[16]

Therefore, the stated scope of the Project (which has been publicly confirmed by PSE's representations to the City of Tacoma) contradicts the current SEPA review to the extent the DSEIS' analysis includes vessel bunkering in the Blair Waterway. Accordingly, to make the DSEIS consistent with impacts analyzed under SEPA and PSE's public representations concerning activities in the Blair Waterway, the DSEIS needs to be revised by removing the "Other" marine vessel bunkering possibility included in Table 4-5 of the DSEIS. Notably, without non-TOTE vessels using LNG, it appears the Project presents a significant increase in GHG emissions when compared to the respective no action alternatives in either Scenario A or B. In Table 4-5 of the DSEIS, combining the lines pertaining to the "Other Marine Vessels" under Upstream Life Cycle and End Use, the benefit from these "Other Marine Vessels" alone is 94,561 tonnes/year in Scenario A and 275,415 tonnes/year in Scenario B. Eliminating these two lines in Table 4-5 yields the following result: **the Project represents a net increase in GHG emissions** of 54,665 tonnes/year for Scenario A and 218,710 tonnes/year for Scenario B.

---

[15] Such a scenario is not already considered by the DSEIS' No Action Alternative analysis because that analysis assumes vessels that would otherwise receive fuel from LNG bunkering operations will run on bunker fuel and/or marine diesel fuel for the next forty years. As discussed throughout this document, that is not a valid or reasonable view for the DSEIS to take.

[16] As shown in **Appendices E and F**, PSE also made such representations to Washington's Shorelines Hearings Board. Appendix E contains briefing submitted by PSE to the Shorelines Hearings Board had no future plans to expand activities in the Blair Waterway beyond the single LNG fueling facility on the Blair Waterway that would operate eight hours a week and was designed to fuel a single type of vessel, the two ships operated by TOTE. *See* Appendix E, p. 3 – 5. Specifically, PSE states in its briefing "there is not, and has never been, a proposal for a barge loading and bunkering facility on the Blair Waterway." *Id.* at p. 5, lines 20-21. Appendix F contains hearing testimony from PSE's own witnesses to the Shorelines Hearings Board stating that loading of bunkering barges or other ships would not be possible from the Blair Waterway absent changes to the facility.

0865-11 1. Determination of SEIS Scope - Comparison to FEIS
0865-12 13. LCA Inputs and Assumptions - Natural Gas Source
0865-13 13. LCA Inputs and Assumptions - Natural Gas Source

Second, the DSEIS analyzes an increased overall daily throughput of LNG (*i.e.*, the scenario of 500,000 gallons per day) from the facility in Scenario B. This constitutes a significant departure from what was previously analyzed,[17] and this departure is highly improper. As Table 4-5 makes clear, the purpose of this self-serving scenario is to exaggerate the benefit of the proposed Project in Scenario B by allowing for additional bunkering of non-TOTE vessels in the Blair Waterway. It is also improper to include this scenario because its many additional environmental impacts (including emissions of non-greenhouse gases, criteria pollutants, air toxics – and potential increased safety hazards such as flammability and toxicity etc.) have not been analyzed in any prior project environmental analyses.

4. The DSEIS understates the upstream GHG impacts of gas sourced from British Columbia and fails to demonstrate that the proposed condition of requiring natural gas from British Columbia is enforceable.

In order to ensure that the proposed Project does not represent a net increase in GHG emissions, the DSEIS urges the following condition in the NOC Order of Approval for the LNG facility: that the facility be required to use only natural gas supplied from British Columbia. [DSEIS, p. 4-13]. Tethering the SEIS' conclusions to the assumption that all natural gas will be sourced from British Columbia for the entire assumed life of the Project (40 years) is not reasonable.

First, the DSEIS' analysis assumes (relying mainly on industry data) that the existence of provincial regulations ensures certain reduced impacts as a result of sourcing natural gas from British Columbia. That assumption, however, lacks a legitimate foundation. In fact, there exists a great deal of countervailing information indicating that natural gas from British Columbia is not likely to be as "clean" as the DSEIS' analysis indicates – this is particularly so when one considers the fact that the DSEIS relies on older, unsupported, and outdated information in the underlying GREET, GHGenius and other models. On this, the Tribe's primary concerns are: (1) the lack of accurate data on GHG impacts from natural gas extraction, processing, and transmission in British Columbia; and (2) perhaps more materially, the increasing evidence of significant methane leakage (*i.e.*, fugitive methane emissions) from such activities. We provide the following assessment.

In a recent and extensive field measurement campaign, significant methane leakage was measured from both existing and abandoned fracking wells in British Columbia:

> "...information on current emissions from Canadian unconventional developments is lacking. This study examined the incidence of methane in an area of unconventional natural gas development in northwestern Canada. In August to

[17] For example, the November 9, 2015 EIS for the project does not define or analyze these two specific scenarios. Rather, it contained vague wording that "the Tacoma LNG Facility would be constructed and produce between approximately 250,000 and 500,000 gallons of LNG per day, for use by marine customers, including TOTE, as well as regasification into the PSE natural gas distribution system for peak-shaving purposes...". [FEIS, p. II]. The only references to the 500,000 gallons appear on pages p. II, p. 1, p. 1-1, p. 1-2, p. 2-1 of the 2015 FEIS. The exact allocation of the LNG between TOTE and non-TOTE vessels was never specified (nor was it analyzed) in the FEIS or other documents.

> September 2015 we completed almost 8000 km of vehicle-based survey campaigns on public roads dissecting developments that mainly access the Montney formation in northeastern British Columbia....Roughly 47% of active wells emitted methane-rich plumes above our minimum detection limit. Abandoned and underdevelopment well sites also emitted methane-rich plumes, but the incidence rate was below that of producing wells. Multiple sites that pre-date the recent unconventional Montney development were found to be emitting, and in general we observed that older infrastructure tended to emit more often (per unit)...Extrapolating our results across the Montney development, we estimate that the emission sources we located...contribute more than 111,800 tonnes of methane annually to the atmosphere. This value exceeds reported bottom-up estimates of 78,000 tonnes for all oil and gas sector sources in British Columbia, of which the Montney represents about 55% of production."[18]

Notably, the estimate of methane emissions just from the Montney formation wells (surveyed by the authors of the report) exceeded the total BC prior estimates by over 33,800 tonnes/year (or over 43%). The Pembina Institute in Canada has recently (in 2017) opined on the state of GHG emissions, their increases, methane leakage, and the ineffectiveness of Canada's policies and regulations in decreasing these emissions from the oil and gas sector:

> "Carbon pollution associated with natural gas can increase materially if methane is leaked or vented to the atmosphere. The largest source of industrial methane emissions is the oil and gas industry, where methane can leak from wells, pipelines, and other facilities, including LNG export terminals...The production of natural gas — extraction, processing, transportation, and, for LNG, liquefaction — is energy and emissions intensive."[19]

Pembina goes on to say:

> "There are several existing and forthcoming policies in place in B.C. that are designed to reduce emissions from LNG and associated upstream development. However, these policies, summarized below, fall short of requiring projects to adopt best practices and technologies."[20]

Pembina further provides:

> "This Pembina Institute analysis using the B.C. Shale Scenario Tool includes all existing and proposed policies, including policy commitments made in B.C.'s 2016 Climate Leadership Plan on reducing methane emissions and electrifying upstream

[18] Atherton, E., et. al., Mobile measurement of methane emissions from natural gas developments in Northeastern British Columbia, Canada, Atmos. Chem. Phys. Discuss., doi:10.5194/acp-2017-109, 2017.

[19] Heerema, Dylan, et. al., Liquefied natural gas, carbon pollution, and British Columbia in 2017, Pembina Institute, 2017.

[20] *Ibid.*, p. 8

operations. It assumes almost all incremental natural gas production to supply the LNG terminals comes from the low formation CO2 Montney deposit. Upstream emissions increase with age, as older wells become less efficient and therefore more polluting."[21]

The Pembina findings are not new. Others such as the Canadian Center for Policy Alternatives have noted the same concerns, as well as the fact that GHG emissions have been increasing[22] from the oil and gas sector in Canada:

> "Trends moving in the wrong direction include emissions growth from the extraction and processing of fossil fuels. Combustion emissions from fossil fuel industries rose to 5.4 Mt (up 4.3%) and those from mining and oil and gas extraction rose to 1.7 Mt (up 24%). Fugitive emissions (non-combustion emissions from extraction, production and transportation) rose by 8.2% to 6.2 Mt (the bulk of these emissions are from oil and gas, plus some emissions from coal mining).
>
> There is some controversy over the amount of additional fugitive emissions from fracking. One widely-reported estimate put methane leakages at between 3.6% and 7.9% of life cycle production, including leakages during the well completion stage, as well as leaks from equipment, plus other fugitive emissions associated with processing, transport by pipeline and distribution. Recent fieldwork in Colorado by the US National Oceanic and Atmospheric Administration appears to validate these estimates.
>
> An important caveat is that there are no real-world data for BC (at least, not in the public domain).
>
> As noted above, leakages of methane in the extraction and processing phase of unconventional gas development could mean that, on a life-cycle basis, natural gas from unconventional sources is equivalent to or even worse than coal per unit of energy. Clearly, there is more empirical research needed to estimate actual leakages in BC shale and tight gas fields. It is estimated that if 3.2% of gas leaks, that wipes out any GHG advantage relative to coal."[23] (internal citations omitted)

In 2017, reporting from Environment Canada (EC) further confirmed concerns regarding leakage of methane from oil and gas exploration in Canada – and from British Columbia specifically – relying on airborne emissions surveys in the Horn River Basin. EC concluded that:[24]

---

[21] *Ibid.*, p. 10.

[22] That these trends continue is also confirmed by the most recent (through 2015) data available from the BC government. *See* the provincial inventory at: https://www2.gov.bc.ca/gov/content/environment/climate-change/data/provincial-inventory .

[23] Canadian Center for Policy Alternatives, BC's Legislated Greenhouse Gas Targets vs Natural Gas Development – The Good, The Bad, The Ugly, October 2012.

0865-14 13. LCA Inputs and Assumptions - Natural Gas Source
0865-15 6. Purpose and Need

(1) greenhouse gas emission sources included the methane leakage and flaring/venting; (2) there were high emissions of CO2 and CH4 from gas plants and higher emission rates for CO2 compared to company reports; and (3) emissions from continued oil and gas productions from fracked wells can be significant.

Notwithstanding these increasing GHG emissions from the oil and gas sector in British Columbia, the DSEIS analysis assumes that natural gas from British Columbia (with a CO_2e emission rate of 9,754 g/mmBtu, HHV basis) would be substantially lower-emitting than US-sourced natural gas[25] with a corresponding CO_2e emission rate of 11,499.1 g/mmBtu, HHV basis.[26] There is no reason to accept or agree with this key unsupported assumption in the DSEIS.

Second, the DSEIS makes no showing and undertakes no analysis establishing that this recommended "sole source" requirement is something that PSCAA can lawfully require and enforce. The Tribe is concerned that PSCAA does not have the authority: (1) to require that the project proponents only obtain "the natural gas supplied to the facility" from British Columbia; or (2) to enforce such a condition. Regarding enforceability, while the DSEIS suggests that the sourcing of gas from British Columbia should be made into a permit condition by PSCAA, the DSEIS does not describe how such a condition would be enforceable.

The enforceability concern is exacerbated by: (1) the fact that the natural gas pipe network enables the Project to receive gas from many geographic locations other than British Columbia; and (2) the lack of distinguishability of natural gas from different geographic locations. In short, the DSEIS fails to show that its "recommended" condition is meaningful and enforceable, rather than illusory. Even if natural gas derived from British Columbia is as clean as the DSEIS suggests (which the preceding paragraphs indicate is doubtful) – without adequately addressing whether PSCAA can actually force PSE to obtain its natural gas from British Columbia and hold it to that commitment, the DSEIS cannot begin to provide assurance that the facility's GHG impacts can or will be mitigated by the recommended "sole source" condition.

5. The DSEIS makes incorrect assumptions regarding the "need" for the Project and the GHG impacts related to those purported needs.

An EIS must "specify[] the purpose and need to which the proposal is responding …." WAC 197-11-440(4). In its analysis, the DSEIS appears to suggest the Project is needed for peak shaving and for TOTE vessels to comply with MARPOL. [DSEIS, p. 2 (Objectives, Purpose, and Need)].

(a) Peak Shaving is not shown to constitute a "need." No technical support is provided for this bedrock rationale for the Project – namely, that the LNG from the Project will displace dirtier fuels that have to be used during periods of peak electricity demand (*i.e.*, "peak shaving"). There are presently – and certainly will be in the future – myriad fuel options cleaner than LNG that will be available for peak shaving such as demand-side management, battery storage, and import of

Science and Technology Branch, Environment and Climate Change Canada, March 2017.

[25] For the entirety of the Project lifetime of 40 years.

[26] Per the GREET Model workpaper spreadsheet provided to us.

renewable-based power from the western United States (to name a few). The DSEIS does not consider these cleaner fuel sources, which is particularly problematic given that sources like renewables (solar and wind) are cleaner than natural gas. If LNG displaces the use of renewables during periods of peak demand, the project represents a harm rather than a benefit from a GHG emissions perspective. Instead of assuming static conditions for the next 40 years, which assumption is neither plausible nor reasonable, the SEIS' analysis needs to be corrected to include scenarios where peak shaving needs are met to an appreciable degree by renewable energy sources.

Further, the purported benefits the DSEIS associates with peak shaving are speculative and unjustified. Per Table 4-5, considering both the upstream and end use aspects of peak shaving, Scenario A shows a benefit of 31,021 tonnes/year (out of a total benefit of 39,896 tonnes/year) and Scenario B shows a benefit of 33,195 tonnes/year (out of a total benefit of 56,705 tonnes/year). Thus, the purported benefits from this assumed peak shaving aspect are significant. But peak shaving will still occur under the no-project alternative because of the substantial margins required by the operators of the United States' electrical grid[27] and because of the rise of renewables and storage in that grid. Accordingly, the added "peak shaving" benefit from the project is not justified as a project driver. Rather, like the 'Other" marine vessel bunkering, it appears to have been included to ensure that the project shows a small net benefit.

(b) The project is not needed for TOTE vessels (or other vessels) to comply with MARPOL. The DSEIS also appears to assume the Project is necessary for TOTE vessels to achieve compliance with MARPOL. [DSEIS, p. 2 (discussing "new fuel standards for maritime vessels in response to the North American Emission Control Area")]. The DSEIS is incorrect. On October 31, 2016, the United States Coast Guard and Environmental Protection Agency notified Totem Ocean Trailer Express (TOTE) that its MARPOL exemption was being revoked, effective November 30, 2016. *See* Oct. 31, 2016 letter from EPA to Totem Ocean Trailer Express Re: MARPOL Annex VI, Regulation Exemption Permit, which **is attached to these comments as Appendix D**. The result of that revocation is that, as of December 1, 2016, the two TOTE vessels comprising part of the DSEIS' analysis have not been allowed to run on the bunker fuel and/or marine diesel fuel that the DSEIS appears to envision in its analysis. Rather, the two TOTE vessels are now required to run on MARPOL-compliant fuel.

Thus, the DSEIS' view of this basic project driver is completely incorrect at this juncture. To the extent the DSEIS' analysis of the no action alternative assumes the TOTE vessels will run on the fuel permitted by the revoked MARPOL exemption, that portion of the DSEIS' analysis needs to be corrected / updated to reflect actual circumstances (*i.e.*, TOTE vessels running on MARPOL-compliant fuel under the no action alternative).

6. The DSEIS underestimates GHG emissions from flaring.

The DSEIS uses emission factors that do not properly account for the large quantities of nitrogen that will be present in the gases to be flared at the LNG facility. Specifically, the standard flaring emission factors were derived from hydrocarbon-rich fuels. In the Project's proposed terminal, flare gases will likely consist of significant quantities of nitrogen since it is proposed as

[27] For example, reserve margins are generally at 15% or higher throughout the western United States. *See* https://www.nerc.com/pa/RAPA/ri/Pages/PlanningReserveMargin.aspx.

0865-17 14. LCA Inputs and Assumptions - Leakage/Slippage
0865-18 12. LCA Inputs and Assumptions - Global Warming Potential Value
0865-19 15. LCA Inputs and Assumptions - Natural Gas Properties

a purge gas in many instances.[28] Combusting this nitrogen-rich flare gas will create significant quantities of N_2O, a potent greenhouse gas with approximately 300 (or more) times the global warming potential of to CO_2. In underestimating N_2O emissions from the terminal operations, it appears the DSEIS materially underestimates GHG emissions from the Project in this additional way.

7. Additional instances of technical flaws in the DSEIS.

(a) The DSEIS makes unsupported assumptions regarding fugitive emissions releases at the terminal and how they have been quantified. Proper quantification of fugitive emissions from components such as pump seals, valves, flanges, and the like requires a detail count of such components – which are subject to change up until the design of the terminal is final. Because the facility design is not yet final, assumptions regarding component counts must be regarded as preliminary or place-holders. Therefore, the estimates of fugitive emissions are also preliminary, not firm figures upon which PSCAA can rely.

(b) The DSEIS utilizes outdated global warming potential (GWP) values in its analyses. Instead of using the current, IPCC Assessment Report (AR) 5 value, it uses an earlier AR4 value for methane. At the very least, that value should be corrected to reflect the most current science. In addition, given the short half-life for CH_4, an important GHG in this analysis, the sensitivity of using the 20-year GWP for methane should have been analyzed rather than only using the 100-year GWP of methane. The 20-year GWP is also more compatible with the expected 40-year life of the project.

(c) The DSEIS makes many unsupported assumptions (especially for the next 40 years) relating to the GHG impacts of non-LNG fuels, such as the current petroleum-based fuels used in transportation and electricity generation. This includes assumptions regarding: (1) the source of the crude oil that is used to derive transportation fuels and (2) the fuel-mix for electricity generation.

(d) The DSEIS uses outdated assumptions regarding the mix of shale and non-shale gas contributions to the overall natural gas supply in the United States. For example, Table B.2 shows that the natural gas supply from shale was 51.5% in 2016, and is projected to rise to 55.2% in 2040, per the underlying GREET1_2017 model used in the analysis. [Appendix C to DSEIS, p. 101] However, a simple check of the EIA website reveals that this assumption cannot be correct. The EIA notes: "[T]he U.S. Energy Information Administration (EIA) estimates that in 2017, about 16.86 trillion cubic feet (Tcf) of dry natural gas was produced from shale resources in the United States. This was about 62% of total U.S. dry natural gas production in 2017."[29] Thus, the assumption in Table B.2 that the shale contribution to natural gas supply would top out at 55.2% in 2040 is simply wrong because it is already at 62% in 2017. This demonstrates the lack of reliability in the GREET model in this instance and, therefore, in its output in the DSEIS.

8. The Draft SEIS is so inadequate that redoing it would be consistent with (if not compelled by) SEPA.

[28] Braemar, Tacoma LNG Fire and Safety Review, July 2, 2018.
[29] https://www.eia.gov/tools/faqs/faq.php?id=907&t=8

0865-20 10. LCA Calculations
0865-21 2. Determination of the SEIS Scope

The DSEIS is incomplete, inaccurate, and unreliable. There are numerous places in which the DSEIS contains incomplete information or states that more data is needed from PSE. *See, e.g.*, DSEIS Tables 2.3 and C.1. Other instances of the DSEIS' incompleteness include coding errors and cryptic comments in the spreadsheet workpapers.

PSCAA should also note that the Tribe and its consultant, Dr. Sahu, were unable to verify many aspects of the spreadsheets provided by PSCAA in connection with this review because: (1) the provided spreadsheets were "protected" and, thus, not interactive; and (2) in many instances, formulas underlying figures depicted in the spreadsheets were not provided, which precluded the ability to trace-back and/or verify the underlying calculations.

The public should not be expected or required to comment on incomplete information. PSCAA similarly should not act on incomplete information.

The Tribe respectfully urges PSCAA to pause the SEPA process and reissue **a complete draft SEIS** for the public to review and comment upon, along with all of the work papers in a format that can be meaningfully analyzed by the public. PSCAA Reg. 1, Art. 2 § 2.08 ("Before the Agency issues an EIS, the responsible official shall be satisfied that it complies with this regulation and chapter 197-11 WAC").

V. CONCLUSION

The DSEIS fails to meet SEPA's requirements as described above. The Tribe respectfully requests that PSCAA begin this process anew and conduct a credible analysis upon which the public can then comment. In doing so, PSCAA should: (1) consult with the Tribe prior to moving forward with the public comment period; (2) start from a consistent project scope; (3) solicit expert opinion on critical assumptions underlying the analysis; (4) use stochastic methods where the future is inherently uncertain; (5) present results as a range of outcomes (as opposed to single-point estimates); (6) identify the most sensitive inputs that drive the conclusions; and (7) conduct sensitivity analyses for those inputs/assumptions as well as their resultant impact on the SEIS' conclusions. Only then will the SEIS have any regulatory meaning and value for the purpose of informed decision-making.

To date, a credible SEPA analysis has not been performed. As a result of the issues, flaws and shortcomings discussed above, the DSEIS is a misleading document that presents a biased, pro-Project view that compromises PSCAA's ability to discharge its delegated decision-making responsibilities because the document does not make PSCAA fully aware of the GHG consequences of the proposed action.

APPENDIX A

PUYALLUP TRIBE OF INDIANS

PUYALLUP TRIBAL COUNCIL
RESOLUTION NO. 14 11 18-A

WHEREAS, the Puyallup Tribe has existed since creation as the aboriginal people who are the owners and guardians of their lands and waters; and

WHEREAS, the Puyallup Tribe is an independent sovereign nation, having historically negotiated with several foreign nations including the United States in the Medicine Creek Treaty; and

WHEREAS, the Puyallup Tribal Council is the governing body of the Puyallup Tribe in accordance with the authority of its sovereign rights as the aboriginal owners and guardians of their lands and waters, reaffirmed in the Medicine Creek Treaty, and their Constitution and Bylaws, as amended and approved by the Tribe and the Assistant Secretary of the Interior; and

WHEREAS, the Puyallup Tribe has a primary interest in protecting and preserving its environment and natural resources, which are integral components of the Tribe's economic, social, cultural and spiritual life, and the Tribal Council is aware that activities both on and near the Puyallup Reservation ("Reservation") may adversely affect these resources and values, and may impair the health and welfare of the Reservation population. Off-Reservation activities may adversely affect the Tribe's Treaty fishery rights and other cultural and spiritual interests of the Tribe; and

WHEREAS, the Puyallup Tribe's land base within the Reservation is limited and, therefore, the siting of the LNG Plant with its significant risks to the Tribe's members' health and welfare, the Tribe's resources and values, and the Tribe's fishery right and other cultural and spiritual interests poses risk of significant harm to the Tribe and its members who have for time immemorial occupied these lands and cannot just move away from these lands adjacent to the LNG plant; and

WHEREAS, the Proposed LNG project presents significant risks to human life, property, cultural resources, and natural resources particularly when sited in a densely populated urban environment and the Tribal Reservation; and

WHEREAS, the Puyallup Tribe has identified to both PSCAA and the City of Tacoma significant flaws in the safety and siting analyses originally performed in the Final Environmental Impact Statement prepared by the City of Tacoma; and

WHEREAS, operations for fuel loading of vessels, whether ships or barges, other than TOTE vessels were expressly excluded from the project by PSE, the project proponent; and

WHEREAS, the LNG Plant is being constructed by PSE without all the required permits to continue with construction of the tank and related facilities; and

WHEREAS, the Puget Sound Clean Air Agency has released a Draft Supplemental Environmental Impact Statement ("DSEIS") evaluating greenhouse gas emissions impacts associated with the LNG Plant which the SEIS describes as "the construction and operation of an LNG liquefaction and marine bunkering facility within the City of Tacoma … and construction of segments of a natural gas pipeline in the City of Fife and unincorporated areas of Pierce County." According to the DSEIS, it

fulfills the need for the Puget Sound Clean Air Agency ("PSCAA") to evaluate the life-cycle greenhouse gas emissions from the LNG Plant; and

WHEREAS, the Puyallup Tribe is the only entity holding significant information regarding the impacts the LNG plant will have on Tribal treaty protected resources and the health and welfare of the Tribe's members; and

WHEREAS, the PSCAA has not formally consulted with the Tribe and has not utilized information and data exclusively held by the Tribe that is necessary to PSCAA's analysis and conclusions contained within the SEIS; and

WHEREAS, the SEIS is based on a project that has changed significantly in scope since it was first analyzed in an Environmental Impact Statement prepared by the City of Tacoma; and

WHEREAS, the DSEIS fails to use the best available science and relies on technical assumptions that are either incorrect or unsupported, or both; and

WHEREAS, there are no identified alternatives to the proposal that will reduce the risks to Tribal Members, the public as a whole, human life, and property; and

WHEREAS, the Puyallup Tribe has determined there are significant flaws in the analysis contained in the DSEIS that renders its conclusions invalid;

BE IT RESOLVED, the Tribal Council of the Puyallup Tribe of Indians hereby declares:

1. The Puyallup Tribe remains strictly opposed to the Puget Sound Energy's Proposed LNG Plant on the Tacoma Tideflats; and

2. The Puyallup Tribe is providing comments to the Puget Sound Clean Air Agency on its DSEIS and requesting the draft be rescinded and, following formal consultation with the Tribe, be replaced with a revised and corrected draft for public comment that has complete information, uses best available science, and corrects erroneous and baseless assumptions; and

3. The Puyallup Tribe respectfully but forcefully requests that PSCAA and the City of Tacoma take the time to fully analyze the safety concerns that the proposed project presents to the Tribe and the broader Tacoma community that have been identified by the Tribe's Consulting Expert and expand the environmental analysis in a new and distinct Supplemental EIS; and

4. The Puyallup Tribe resolves to request that until such items are analyzed and all permits for construction are issued, that the PSCAA and the City of Tacoma issue the necessary stop work directives to the applicants and all work on the project cease to address all deficiencies in permitting and underlying environmental impact analyses.

BE IT FINALLY RESOLVED, the Tribal Council of the Puyallup Tribe of Indians authorizes the Tribal Council Chairman (Bill Sterud), and in his absence, the Vice-Chairman (David Bean), to execute this Resolution and other implementing instruments, or amendments, required on behalf of the Tribe.

CERTIFICATION

I, Lynda Squally, Secretary of the Puyallup Tribal Council of the Puyallup Reservation do hereby certify that the above Resolution was duly adopted at a Regular Meeting of the Puyallup Tribal Council held on the Puyallup Indian Reservation on the 14th day of November 2018, a quorum being present with a vote of 4 **FOR**, 0 **AGAINST**, 0 **ABSTAINING**, and 1 **NOT VOTING** its adoption.

Lynda Squally
Secretary, Puyallup Tribal Council

ATTEST:

Bill Sterud
Bill Sterud, Chairman
Puyallup Tribal Council

APPENDIX B

RANAJIT (RON) SAHU, Ph.D, QEP, CEM (Nevada)

CONSULTANT, ENVIRONMENTAL AND ENERGY ISSUES

311 North Story Place
Alhambra, CA 91801
Phone: 702.683.5466
e-mail (preferred): sahuron@earthlink.net

EXPERIENCE SUMMARY

Dr. Sahu has over twenty eight years of experience in the fields of environmental, mechanical, and chemical engineering including: program and project management services; design and specification of pollution control equipment for a wide range of emissions sources including stationary and mobile sources; soils and groundwater remediation including landfills as remedy; combustion engineering evaluations; energy studies; multimedia environmental regulatory compliance (involving statutes and regulations such as the Federal CAA and its Amendments, Clean Water Act, TSCA, RCRA, CERCLA, SARA, OSHA, NEPA as well as various related state statutes); transportation air quality impact analysis; multimedia compliance audits; multimedia permitting (including air quality NSR/PSD permitting, Title V permitting, NPDES permitting for industrial and storm water discharges, RCRA permitting, etc.), multimedia/multi-pathway human health risk assessments for toxics; air dispersion modeling; and regulatory strategy development and support including negotiation of consent agreements and orders.

He has over twenty five years of project management experience and has successfully managed and executed numerous projects in this time period. This includes basic and applied research projects, design projects, regulatory compliance projects, permitting projects, energy studies, risk assessment projects, and projects involving the communication of environmental data and information to the public.

He has provided consulting services to numerous private sector, public sector and public interest group clients. His major clients over the past twenty five years include various trade associations as well as individual companies such as steel mills, petroleum refineries, cement manufacturers, aerospace companies, power generation facilities, lawn and garden equipment manufacturers, spa manufacturers, chemical distribution facilities, and various entities in the public sector including EPA, the US Dept. of Justice, several states, various agencies such as the California DTSC, various municipalities, etc.). Dr. Sahu has performed projects in all 50 states, numerous local jurisdictions and internationally.

In addition to consulting, Dr. Sahu has taught numerous courses in several Southern California universities including UCLA (air pollution), UC Riverside (air pollution, process hazard analysis), and Loyola Marymount University (air pollution, risk assessment, hazardous waste management) for the past seventeen years. In this time period he has also taught at Caltech, his alma mater (various engineering courses), at the University of Southern California (air pollution controls) and at California State University, Fullerton (transportation and air quality).

Dr. Sahu has and continues to provide expert witness services in a number of environmental areas discussed above in both state and Federal courts as well as before administrative bodies (please see Annex A).

EXPERIENCE RECORD

2000-present **Independent Consultant.** Providing a variety of private sector (industrial companies, land development companies, law firms, etc.) public sector (such as the US Department of Justice) and public interest group clients with project management, air quality

consulting, waste remediation and management consulting, as well as regulatory and engineering support consulting services.

1995-2000 Parsons ES, **Associate, Senior Project Manager and Department Manager for** Air Quality/Geosciences/Hazardous Waste Groups, Pasadena. Responsible for the management of a group of approximately 24 air quality and environmental professionals, 15 geoscience, and 10 hazardous waste professionals providing full-service consulting, project management, regulatory compliance and A/E design assistance in all areas.

Parsons ES, **Manager for Air Source Testing Services**. Responsible for the management of 8 individuals in the area of air source testing and air regulatory permitting projects located in Bakersfield, California.

1992-1995 Engineering-Science, Inc. **Principal Engineer and Senior Project Manager** in the air quality department. Responsibilities included multimedia regulatory compliance and permitting (including hazardous and nuclear materials), air pollution engineering (emissions from stationary and mobile sources, control of criteria and air toxics, dispersion modeling, risk assessment, visibility analysis, odor analysis), supervisory functions and project management.

1990-1992 Engineering-Science, Inc. **Principal Engineer and Project Manager** in the air quality department. Responsibilities included permitting, tracking regulatory issues, technical analysis, and supervisory functions on numerous air, water, and hazardous waste projects. Responsibilities also include client and agency interfacing, project cost and schedule control, and reporting to internal and external upper management regarding project status.

1989-1990 Kinetics Technology International, Corp. **Development Engineer.** Involved in thermal engineering R&D and project work related to low-NOx ceramic radiant burners, fired heater NOx reduction, SCR design, and fired heater retrofitting.

1988-1989 Heat Transfer Research, Inc. **Research Engineer**. Involved in the design of fired heaters, heat exchangers, air coolers, and other non-fired equipment. Also did research in the area of heat exchanger tube vibrations.

EDUCATION

1984-1988 Ph.D., Mechanical Engineering, California Institute of Technology (Caltech), Pasadena, CA.

1984 M. S., Mechanical Engineering, Caltech, Pasadena, CA.

1978-1983 B. Tech (Honors), Mechanical Engineering, Indian Institute of Technology (IIT) Kharagpur, India

TEACHING EXPERIENCE

Caltech

"Thermodynamics," Teaching Assistant, California Institute of Technology, 1983, 1987.

"Air Pollution Control," Teaching Assistant, California Institute of Technology, 1985.

"Caltech Secondary and High School Saturday Program," - taught various mathematics (algebra through calculus) and science (physics and chemistry) courses to high school students, 1983-1989.

"Heat Transfer," - taught this course in the Fall and Winter terms of 1994-1995 in the Division of Engineering and Applied Science.

"Thermodynamics and Heat Transfer," Fall and Winter Terms of 1996-1997.

U.C. Riverside, Extension

"Toxic and Hazardous Air Contaminants," University of California Extension Program, Riverside, California. Various years since 1992.

"Prevention and Management of Accidental Air Emissions," University of California Extension Program, Riverside, California. Various years since 1992.

"Air Pollution Control Systems and Strategies," University of California Extension Program, Riverside, California, Summer 1992-93, Summer 1993-1994.

"Air Pollution Calculations," University of California Extension Program, Riverside, California, Fall 1993-94, Winter 1993-94, Fall 1994-95.

"Process Safety Management," University of California Extension Program, Riverside, California. Various years since 1992-2010.

"Process Safety Management," University of California Extension Program, Riverside, California, at SCAQMD, Spring 1993-94.

"Advanced Hazard Analysis - A Special Course for LEPCs," University of California Extension Program, Riverside, California, taught at San Diego, California, Spring 1993-1994.

"Advanced Hazardous Waste Management" University of California Extension Program, Riverside, California. 2005.

Loyola Marymount University

"Fundamentals of Air Pollution - Regulations, Controls and Engineering," Loyola Marymount University, Dept. of Civil Engineering. Various years since 1993.

"Air Pollution Control," Loyola Marymount University, Dept. of Civil Engineering, Fall 1994.

"Environmental Risk Assessment," Loyola Marymount University, Dept. of Civil Engineering. Various years since 1998.

"Hazardous Waste Remediation" Loyola Marymount University, Dept. of Civil Engineering. Various years since 2006.

University of Southern California

"Air Pollution Controls," University of Southern California, Dept. of Civil Engineering, Fall 1993, Fall 1994.

"Air Pollution Fundamentals," University of Southern California, Dept. of Civil Engineering, Winter 1994.

University of California, Los Angeles

"Air Pollution Fundamentals," University of California, Los Angeles, Dept. of Civil and Environmental Engineering, Spring 1994, Spring 1999, Spring 2000, Spring 2003, Spring 2006, Spring 2007, Spring 2008, Spring 2009.

International Programs

"Environmental Planning and Management," 5 week program for visiting Chinese delegation, 1994.

"Environmental Planning and Management," 1 day program for visiting Russian delegation, 1995.

"Air Pollution Planning and Management," IEP, UCR, Spring 1996.

"Environmental Issues and Air Pollution," IEP, UCR, October 1996.

PROFESSIONAL AFFILIATIONS AND HONORS

President of India Gold Medal, IIT Kharagpur, India, 1983.

Member of the Alternatives Assessment Committee of the Grand Canyon Visibility Transport Commission, established by the Clean Air Act Amendments of 1990, 1992-present.

American Society of Mechanical Engineers: Los Angeles Section Executive Committee, Heat Transfer Division, and Fuels and Combustion Technology Division, 1987-present.

Air and Waste Management Association, West Coast Section, 1989-present.

PROFESSIONAL CERTIFICATIONS

EIT, California (#XE088305), 1993.

REA I, California (#07438), 2000.

Certified Permitting Professional, South Coast AQMD (#C8320), since 1993.

QEP, Institute of Professional Environmental Practice, since 2000.

CEM, State of Nevada (#EM-1699). Expiration 10/07/2017.

PUBLICATIONS (PARTIAL LIST)

"Physical Properties and Oxidation Rates of Chars from Bituminous Coals," with Y.A. Levendis, R.C. Flagan and G.R. Gavalas, *Fuel*, **67**, 275-283 (1988).

"From Purchase of Landmark Environmental Insurance to Remediation: Case Study in Henderson, Nevada," with Robin E. Bain and Jill Quillin, presented at the AQMA Annual Meeting, Florida, 2001.

"The Jones Act Contribution to Global Warming, Acid Rain and Toxic Air Contaminants," with Charles W. Botsford, presented at the AQMA Annual Meeting, Florida, 2001.

PRESENTATIONS (PARTIAL LIST)

"Pore Structure and Combustion Kinetics - Interpretation of Single Particle Temperature-Time Histories," with P.S. Northrop, R.C. Flagan and G.R. Gavalas, presented at the AIChE Annual Meeting, New York (1987).

"Measurement of Temperature-Time Histories of Burning Single Coal Char Particles," with R.C. Flagan, presented at the American Flame Research Committee Fall International Symposium, Pittsburgh, (1988).

"Physical Characterization of a Cenospheric Coal Char Burned at High Temperatures," with R.C. Flagan and G.R. Gavalas, presented at the Fall Meeting of the Western States Section of the Combustion Institute, Laguna Beach, California (1988).

"Control of Nitrogen Oxide Emissions in Gas Fired Heaters - The Retrofit Experience," with G. P. Croce and R. Patel, presented at the International Conference on Environmental Control of Combustion Processes (Jointly sponsored by the American Flame Research Committee and the Japan Flame Research Committee), Honolulu, Hawaii (1991).

"Air Toxics - Past, Present and the Future," presented at the Joint AIChE/AAEE Breakfast Meeting at the AIChE 1991 Annual Meeting, Los Angeles, California, November 17-22 (1991).

"Air Toxics Emissions and Risk Impacts from Automobiles Using Reformulated Gasolines," presented at the Third Annual Current Issues in Air Toxics Conference, Sacramento, California, November 9-10 (1992).

"Air Toxics from Mobile Sources," presented at the Environmental Health Sciences (ESE) Seminar Series, UCLA, Los Angeles, California, November 12, (1992).

"Kilns, Ovens, and Dryers - Present and Future," presented at the Gas Company Air Quality Permit Assistance Seminar, Industry Hills Sheraton, California, November 20, (1992).

"The Design and Implementation of Vehicle Scrapping Programs," presented at the 86th Annual Meeting of the Air and Waste Management Association, Denver, Colorado, June 12, 1993.

"Air Quality Planning and Control in Beijing, China," presented at the 87th Annual Meeting of the Air and Waste Management Association, Cincinnati, Ohio, June 19-24, 1994.

Annex A

Expert Litigation Support

A. Occasions where Dr. Sahu has provided Written or Oral testimony before Congress:

1. In July 2012, provided expert written and oral testimony to the House Subcommittee on Energy and the Environment, Committee on Science, Space, and Technology at a Hearing entitled "Hitting the Ethanol Blend Wall – Examining the Science on E15."

B. Matters for which Dr. Sahu has provided affidavits and expert reports include:

2. Affidavit for Rocky Mountain Steel Mills, Inc. located in Pueblo Colorado – dealing with the technical uncertainties associated with night-time opacity measurements in general and at this steel mini-mill.
3. Expert reports and depositions (2/28/2002 and 3/1/2002; 12/2/2003 and 12/3/2003; 5/24/2004) on behalf of the United States in connection with the Ohio Edison NSR Cases. *United States, et al. v. Ohio Edison Co., et al.*, C2-99-1181 (Southern District of Ohio).
4. Expert reports and depositions (5/23/2002 and 5/24/2002) on behalf of the United States in connection with the Illinois Power NSR Case. *United States v. Illinois Power Co., et al.*, 99-833-MJR (Southern District of Illinois).
5. Expert reports and depositions (11/25/2002 and 11/26/2002) on behalf of the United States in connection with the Duke Power NSR Case. *United States, et al. v. Duke Energy Corp.*, 1:00-CV-1262 (Middle District of North Carolina).
6. Expert reports and depositions (10/6/2004 and 10/7/2004; 7/10/2006) on behalf of the United States in connection with the American Electric Power NSR Cases. *United States, et al. v. American Electric Power Service Corp., et al.*, C2-99-1182, C2-99-1250 (Southern District of Ohio).
7. Affidavit (March 2005) on behalf of the Minnesota Center for Environmental Advocacy and others in the matter of the Application of Heron Lake BioEnergy LLC to construct and operate an ethanol production facility – submitted to the Minnesota Pollution Control Agency.
8. Expert Report and Deposition (10/31/2005 and 11/1/2005) on behalf of the United States in connection with the East Kentucky Power Cooperative NSR Case. *United States v. East Kentucky Power Cooperative, Inc.*, 5:04-cv-00034-KSF (Eastern District of Kentucky).
9. Affidavits and deposition on behalf of Basic Management Inc. (BMI) Companies in connection with the BMI vs. USA remediation cost recovery Case.
10. Expert Report on behalf of Penn Future and others in the Cambria Coke plant permit challenge in Pennsylvania.

11. Expert Report on behalf of the Appalachian Center for the Economy and the Environment and others in the Western Greenbrier permit challenge in West Virginia.

12. Expert Report, deposition (via telephone on January 26, 2007) on behalf of various Montana petitioners (Citizens Awareness Network (CAN), Women's Voices for the Earth (WVE) and the Clark Fork Coalition (CFC)) in the Thompson River Cogeneration LLC Permit No. 3175-04 challenge.

13. Expert Report and deposition (2/2/07) on behalf of the Texas Clean Air Cities Coalition at the Texas State Office of Administrative Hearings (SOAH) in the matter of the permit challenges to TXU Project Apollo's eight new proposed PRB-fired PC boilers located at seven TX sites.

14. Expert Testimony (July 2007) on behalf of the Izaak Walton League of America and others in connection with the acquisition of power by Xcel Energy from the proposed Gascoyne Power Plant – at the State of Minnesota, Office of Administrative Hearings for the Minnesota PUC (MPUC No. E002/CN-06-1518; OAH No. 12-2500-17857-2).

15. Affidavit (July 2007) Comments on the Big Cajun I Draft Permit on behalf of the Sierra Club – submitted to the Louisiana DEQ.

16. Expert Report and Deposition (12/13/2007) on behalf of Commonwealth of Pennsylvania – Dept. of Environmental Protection, State of Connecticut, State of New York, and State of New Jersey (Plaintiffs) in connection with the Allegheny Energy NSR Case. *Plaintiffs v. Allegheny Energy Inc., et al.,* 2:05cv0885 (Western District of Pennsylvania).

17. Expert Reports and Pre-filed Testimony before the Utah Air Quality Board on behalf of Sierra Club in the Sevier Power Plant permit challenge.

18. Expert Report and Deposition (October 2007) on behalf of MTD Products Inc., in connection with *General Power Products, LLC v MTD Products Inc.*, 1:06 CVA 0143 (Southern District of Ohio, Western Division) .

19. Expert Report and Deposition (June 2008) on behalf of Sierra Club and others in the matter of permit challenges (Title V: 28.0801-29 and PSD: 28.0803-PSD) for the Big Stone II unit, proposed to be located near Milbank, South Dakota.

20. Expert Reports, Affidavit, and Deposition (August 15, 2008) on behalf of Earthjustice in the matter of air permit challenge (CT-4631) for the Basin Electric Dry Fork station, under construction near Gillette, Wyoming before the Environmental Quality Council of the State of Wyoming.

21. Affidavits (May 2010/June 2010 in the Office of Administrative Hearings))/Declaration and Expert Report (November 2009 in the Office of Administrative Hearings) on behalf of NRDC and the Southern Environmental Law Center in the matter of the air permit challenge for Duke Cliffside Unit 6. Office of Administrative Hearing Matters 08 EHR 0771, 0835 and 0836 and 09 HER 3102, 3174, and 3176 (consolidated).

22. Declaration (August 2008), Expert Report (January 2009), and Declaration (May 2009) on behalf of Southern Alliance for Clean Energy in the matter of the air permit challenge for Duke Cliffside Unit 6. *Southern Alliance for Clean Energy et al., v. Duke Energy Carolinas, LLC*, Case No. 1:08-cv-00318-LHT-DLH (Western District of North Carolina, Asheville Division).

23. Declaration (August 2008) on behalf of the Sierra Club in the matter of Dominion Wise County plant MACT.us

24. Expert Report (June 2008) on behalf of Sierra Club for the Green Energy Resource Recovery Project, MACT Analysis.

25. Expert Report (February 2009) on behalf of Sierra Club and the Environmental Integrity Project in the matter of the air permit challenge for NRG Limestone's proposed Unit 3 in Texas.

26. Expert Report (June 2009) on behalf of MTD Products, Inc., in the matter of *Alice Holmes and Vernon Holmes v. Home Depot USA, Inc., et al.*

27. Expert Report (August 2009) on behalf of Sierra Club and the Southern Environmental Law Center in the matter of the air permit challenge for Santee Cooper's proposed Pee Dee plant in South Carolina).

28. Statements (May 2008 and September 2009) on behalf of the Minnesota Center for Environmental Advocacy to the Minnesota Pollution Control Agency in the matter of the Minnesota Haze State Implementation Plans.

29. Expert Report (August 2009) on behalf of Environmental Defense, in the matter of permit challenges to the proposed Las Brisas coal fired power plant project at the Texas State Office of Administrative Hearings (SOAH).

30. Expert Report and Rebuttal Report (September 2009) on behalf of the Sierra Club, in the matter of challenges to the proposed Medicine Bow Fuel and Power IGL plant in Cheyenne, Wyoming.

31. Expert Report (December 2009) and Rebuttal reports (May 2010 and June 2010) on behalf of the United States in connection with the Alabama Power Company NSR Case. *United States v. Alabama Power Company*, CV-01-HS-152-S (Northern District of Alabama, Southern Division).

32. Pre-filed Testimony (October 2009) on behalf of Environmental Defense and others, in the matter of challenges to the proposed White Stallion Energy Center coal fired power plant project at the Texas State Office of Administrative Hearings (SOAH).

33. Pre-filed Testimony (July 2010) and Written Rebuttal Testimony (August 2010) on behalf of the State of New Mexico Environment Department in the matter of Proposed Regulation 20.2.350 NMAC – *Greenhouse Gas Cap and Trade Provisions,* No. EIB 10-04 (R), to the State of New Mexico, Environmental Improvement Board.

34. Expert Report (August 2010) and Rebuttal Expert Report (October 2010) on behalf of the United States in connection with the Louisiana Generating NSR

Case. *United States v. Louisiana Generating, LLC*, 09-CV100-RET-CN (Middle District of Louisiana) – Liability Phase.

35. Declaration (August 2010), Reply Declaration (November 2010), Expert Report (April 2011), Supplemental and Rebuttal Expert Report (July 2011) on behalf of the United States in the matter of DTE Energy Company and Detroit Edison Company (Monroe Unit 2). *United States of America v. DTE Energy Company and Detroit Edison Company*, Civil Action No. 2:10-cv-13101-BAF-RSW (Eastern District of Michigan).

36. Expert Report and Deposition (August 2010) as well as Affidavit (September 2010) on behalf of Kentucky Waterways Alliance, Sierra Club, and Valley Watch in the matter of challenges to the NPDES permit issued for the Trimble County power plant by the Kentucky Energy and Environment Cabinet to Louisville Gas and Electric, File No. DOW-41106-047.

37. Expert Report (August 2010), Rebuttal Expert Report (September 2010), Supplemental Expert Report (September 2011), and Declaration (November 2011) on behalf of Wild Earth Guardians in the matter of opacity exceedances and monitor downtime at the Public Service Company of Colorado (Xcel)'s Cherokee power plant. No. 09-cv-1862 (District of Colorado).

38. Written Direct Expert Testimony (August 2010) and Affidavit (February 2012) on behalf of Fall-Line Alliance for a Clean Environment and others in the matter of the PSD Air Permit for Plant Washington issued by Georgia DNR at the Office of State Administrative Hearing, State of Georgia (OSAH-BNR-AQ-1031707-98-WALKER).

39. Deposition (August 2010) on behalf of Environmental Defense, in the matter of the remanded permit challenge to the proposed Las Brisas coal fired power plant project at the Texas State Office of Administrative Hearings (SOAH).

40. Expert Report, Supplemental/Rebuttal Expert Report, and Declarations (October 2010, November 2010, September 2012) on behalf of New Mexico Environment Department (Plaintiff-Intervenor), Grand Canyon Trust and Sierra Club (Plaintiffs) in the matter of *Plaintiffs v. Public Service Company of New Mexico* (PNM), Civil No. 1:02-CV-0552 BB/ATC (ACE) (District of New Mexico).

41. Expert Report (October 2010) and Rebuttal Expert Report (November 2010) (BART Determinations for PSCo Hayden and CSU Martin Drake units) to the Colorado Air Quality Commission on behalf of Coalition of Environmental Organizations.

42. Expert Report (November 2010) (BART Determinations for TriState Craig Units, CSU Nixon Unit, and PRPA Rawhide Unit) to the Colorado Air Quality Commission on behalf of Coalition of Environmental Organizations.

43. Declaration (November 2010) on behalf of the Sierra Club in connection with the Martin Lake Station Units 1, 2, and 3. *Sierra Club v. Energy Future Holdings Corporation and Luminant Generation Company LLC*, Case No. 5:10-cv-00156-DF-CMC (Eastern District of Texas, Texarkana Division).

44. Pre-Filed Testimony (January 2011) and Declaration (February 2011) to the Georgia Office of State Administrative Hearings (OSAH) in the matter of Minor Source HAPs status for the proposed Longleaf Energy Associates power plant (OSAH-BNR-AQ-1115157-60-HOWELLS) on behalf of the Friends of the Chattahoochee and the Sierra Club).

45. Declaration (February 2011) in the matter of the Draft Title V Permit for RRI Energy MidAtlantic Power Holdings LLC Shawville Generating Station (Pennsylvania), ID No. 17-00001 on behalf of the Sierra Club.

46. Expert Report (March 2011), Rebuttal Expert Report (June 2011) on behalf of the United States in *United States of America v. Cemex, Inc.*, Civil Action No. 09-cv-00019-MSK-MEH (District of Colorado).

47. Declaration (April 2011) and Expert Report (July 16, 2012) in the matter of the Lower Colorado River Authority (LCRA)'s Fayette (Sam Seymour) Power Plant on behalf of the Texas Campaign for the Environment. *Texas Campaign for the Environment v. Lower Colorado River Authority,* Civil Action No. 4:11-cv-00791 (Southern District of Texas, Houston Division).

48. Declaration (June 2011) on behalf of the Plaintiffs MYTAPN in the matter of Microsoft-Yes, Toxic Air Pollution-No (MYTAPN) v. State of Washington, Department of Ecology and Microsoft Corporation Columbia Data Center to the Pollution Control Hearings Board, State of Washington, Matter No. PCHB No. 10-162.

49. Expert Report (June 2011) on behalf of the New Hampshire Sierra Club at the State of New Hampshire Public Utilities Commission, Docket No. 10-261 – the 2010 Least Cost Integrated Resource Plan (LCIRP) submitted by the Public Service Company of New Hampshire (re. Merrimack Station Units 1 and 2).

50. Declaration (August 2011) in the matter of the Sandy Creek Energy Associates L.P. Sandy Creek Power Plant on behalf of Sierra Club and Public Citizen. *Sierra Club, Inc. and Public Citizen, Inc. v. Sandy Creek Energy Associates, L.P.,* Civil Action No. A-08-CA-648-LY (Western District of Texas, Austin Division).

51. Expert Report (October 2011) on behalf of the Defendants in the matter of *John Quiles and Jeanette Quiles et al. v. Bradford-White Corporation, MTD Products, Inc., Kohler Co., et al.,* Case No. 3:10-cv-747 (TJM/DEP) (Northern District of New York).

52. Declaration (October 2011) on behalf of the Plaintiffs in the matter of *American Nurses Association et. al. (Plaintiffs), v. US EPA (Defendant)*, Case No. 1:08-cv-02198-RMC (US District Court for the District of Columbia).

53. Declaration (February 2012) and Second Declaration (February 2012) in the matter of *Washington Environmental Council and Sierra Club Washington State Chapter v. Washington State Department of Ecology and Western States Petroleum Association,* Case No. 11-417-MJP (Western District of Washington).

54. Expert Report (March 2012) and Supplemental Expert Report (November 2013) in the matter of *Environment Texas Citizen Lobby, Inc and Sierra Club v.*

ExxonMobil Corporation et al., Civil Action No. 4:10-cv-4969 (Southern District of Texas, Houston Division).

55. Declaration (March 2012) in the matter of *Center for Biological Diversity, et al. v. United States Environmental Protection Agency,* Case No. 11-1101 (consolidated with 11-1285, 11-1328 and 11-1336) (US Court of Appeals for the District of Columbia Circuit).

56. Declaration (March 2012) in the matter of *Sierra Club v. The Kansas Department of Health and Environment*, Case No. 11-105,493-AS (Holcomb power plant) (Supreme Court of the State of Kansas).

57. Declaration (March 2012) in the matter of the Las Brisas Energy Center *Environmental Defense Fund et al., v. Texas Commission on Environmental Quality,* Cause No. D-1-GN-11-001364 (District Court of Travis County, Texas, 261st Judicial District).

58. Expert Report (April 2012), Supplemental and Rebuttal Expert Report (July 2012), and Supplemental Rebuttal Expert Report (August 2012) on behalf of the states of New Jersey and Connecticut in the matter of the Portland Power plant *State of New Jersey and State of Connecticut (Intervenor-Plaintiff) v. RRI Energy Mid-Atlantic Power Holdings et al.,* Civil Action No. 07-CV-5298 (JKG) (Eastern District of Pennsylvania).

59. Declaration (April 2012) in the matter of the EPA's EGU MATS Rule, on behalf of the Environmental Integrity Project.

60. Expert Report (August 2012) on behalf of the United States in connection with the Louisiana Generating NSR Case. *United States v. Louisiana Generating, LLC*, 09-CV100-RET-CN (Middle District of Louisiana) – Harm Phase.

61. Declaration (September 2012) in the Matter of the Application of *Energy Answers Incinerator, Inc.* for a Certificate of Public Convenience and Necessity to Construct a 120 MW Generating Facility in Baltimore City, Maryland, before the Public Service Commission of Maryland, Case No. 9199.

62. Expert Report (October 2012) on behalf of the Appellants (Robert Concilus and Leah Humes) in the matter of Robert Concilus and Leah Humes v. Commonwealth of Pennsylvania Department of Environmental Protection and Crawford Renewable Energy, before the Commonwealth of Pennsylvania Environmental Hearing Board, Docket No. 2011-167-R.

63. Expert Report (October 2012), Supplemental Expert Report (January 2013), and Affidavit (June 2013) in the matter of various Environmental Petitioners v. North Carolina DENR/DAQ and Carolinas Cement Company, before the Office of Administrative Hearings, State of North Carolina.

64. Pre-filed Testimony (October 2012) on behalf of No-Sag in the matter of the North Springfield Sustainable Energy Project before the State of Vermont, Public Service Board.

65. Pre-filed Testimony (November 2012) on behalf of Clean Wisconsin in the matter of Application of Wisconsin Public Service Corporation for Authority to

Construct and Place in Operation a New Multi-Pollutant Control Technology System (ReACT) for Unit 3 of the Weston Generating Station, before the Public Service Commission of Wisconsin, Docket No. 6690-CE-197.

66. Expert Report (February 2013) on behalf of Petitioners in the matter of Credence Crematory, Cause No. 12-A-J-4538 before the Indiana Office of Environmental Adjudication.

67. Expert Report (April 2013), Rebuttal report (July 2013), and Declarations (October 2013, November 2013) on behalf of the Sierra Club in connection with the Luminant Big Brown Case. *Sierra Club v. Energy Future Holdings Corporation and Luminant Generation Company LLC*, Civil Action No. 6:12-cv-00108-WSS (Western District of Texas, Waco Division).

68. Declaration (April 2013) on behalf of Petitioners in the matter of *Sierra Club, et al., (Petitioners) v Environmental Protection Agency et al. (Resppondents),* Case No., 13-1112, (Court of Appeals, District of Columbia Circuit).

69. Expert Report (May 2013) and Rebuttal Expert Report (July 2013) on behalf of the Sierra Club in connection with the Luminant Martin Lake Case. *Sierra Club v. Energy Future Holdings Corporation and Luminant Generation Company LLC*, Civil Action No. 5:10-cv-0156-MHS-CMC (Eastern District of Texas, Texarkana Division).

70. Declaration (August 2013) on behalf of A. J. Acosta Company, Inc., in the matter of *A. J. Acosta Company, Inc., v. County of San Bernardino*, Case No. CIVSS803651.

71. Comments (October 2013) on behalf of the Washington Environmental Council and the Sierra Club in the matter of the Washington State Oil Refinery RACT (for Greenhouse Gases), submitted to the Washington State Department of Ecology, the Northwest Clean Air Agency, and the Puget Sound Clean Air Agency.

72. Statement (November 2013) on behalf of various Environmental Organizations in the matter of the Boswell Energy Center (BEC) Unit 4 Environmental Retrofit Project, to the Minnesota Public Utilities Commission, Docket No. E-015/M-12-920.

73. Expert Report (December 2013) on behalf of the United States in *United States of America v. Ameren Missouri*, Civil Action No. 4:11-cv-00077-RWS (Eastern District of Missouri, Eastern Division).

74. Expert Testimony (December 2013) on behalf of the Sierra Club in the matter of Public Service Company of New Hampshire Merrimack Station Scrubber Project and Cost Recovery, Docket No. DE 11-250, to the State of New Hampshire Public Utilities Commission.

75. Expert Report (January 2014) on behalf of Baja, Inc., in *Baja, Inc., v. Automotive Testing and Development Services, Inc. et. al*, Civil Action No. 8:13-CV-02057-GRA (District of South Carolina, Anderson/Greenwood Division).

76. Declaration (March 2014) on behalf of the Center for International Environmental Law, Chesapeake Climate Action Network, Friends of the Earth, Pacific

Environment, and the Sierra Club (Plaintiffs) in the matter of *Plaintiffs v. the Export-Import Bank (Ex-Im Bank) of the United States*, Civil Action No. 13-1820 RC (District Court for the District of Columbia).

77. Declaration (April 2014) on behalf of Respondent-Intervenors in the matter of *Mexichem Specialty Resins Inc., et al., (Petitioners) v Environmental Protection Agency et al.,* Case No., 12-1260 (and Consolidated Case Nos. 12-1263, 12-1265, 12-1266, and 12-1267), (Court of Appeals, District of Columbia Circuit).

78. Direct Prefiled Testimony (June 2014) on behalf of the Michigan Environmental Council and the Sierra Club in the matter of the Application of DTE Electric Company for Authority to Implement a Power Supply Cost Recovery (PSCR) Plan in its Rate Schedules for 2014 Metered Jurisdictional Sales of Electricity, Case No. U-17319 (Michigan Public Service Commission).

79. Expert Report (June 2014) on behalf of ECM Biofilms in the matter of the US Federal Trade Commission (FTC) v. ECM Biofilms (FTC Docket #9358).

80. Direct Prefiled Testimony (August 2014) on behalf of the Michigan Environmental Council and the Sierra Club in the matter of the Application of Consumers Energy Company for Authority to Implement a Power Supply Cost Recovery (PSCR) Plan in its Rate Schedules for 2014 Metered Jurisdictional Sales of Electricity, Case No. U-17317 (Michigan Public Service Commission).

81. Declaration (July 2014) on behalf of Public Health Intervenors in the matter of *EME Homer City Generation v. US EPA* (Case No. 11-1302 and consolidated cases) relating to the lifting of the stay entered by the Court on December 30, 2011 (US Court of Appeals for the District of Columbia).

82. Expert Report (September 2014), Rebuttal Expert Report (December 2014) and Supplemental Expert Report (March 2015) on behalf of Plaintiffs in the matter of *Sierra Club and Montana Environmental Information Center (Plaintiffs) v. PPL Montana LLC, Avista Corporation, Puget Sound Energy, Portland General Electric Company, Northwestern Corporation, and Pacificorp (Defendants)*, Civil Action No. CV 13-32-BLG-DLC-JCL (US District Court for the District of Montana, Billings Division).

83. Expert Report (November 2014) on behalf of Niagara County, the Town of Lewiston, and the Villages of Lewiston and Youngstown in the matter of CWM Chemical Services, LLC New York State Department of Environmental Conservation (NYSDEC) Permit Application Nos.: 9-2934-00022/00225, 9-2934-00022/00231, 9-2934-00022/00232, and 9-2934-00022/00249 (pending).

84. *Declaration (January 2015) relating to Startup/Shutdown in the MATS Rule (EPA Docket ID No. EPA-HQ-OAR-2009-0234) on behalf of the Environmental Integrity Project.*

85. Pre-filed Direct Testimony (March 2015), Supplemental Testimony (May 2015), and Surrebuttal Testimony (December 2015) on behalf of Friends of the Columbia Gorge in the matter of the Application for a Site Certificate for the Troutdale Energy Center before the Oregon Energy Facility Siting Council.

86. Brief of Amici Curiae Experts in Air Pollution Control and Air Quality Regulation in Support of the Respondents, On Writs of Certiorari to the US Court of Appeals for the District of Columbia, No. 14-46, 47, 48. *Michigan et. al., (Petitioners) v. EPA et. al., Utility Air Regulatory Group (Petitioners) v. EPA et. al., National Mining Association et. al., (Petitioner) v. EPA et. al.,* (Supreme Court of the United States).

87. Expert Report (March 2015) and Rebuttal Expert Report (January 2016) on behalf of Plaintiffs in the matter of *Conservation Law Foundation v. Broadrock Gas Services LLC, Rhode Island LFG GENCO LLC, and Rhode Island Resource Recovery Corporation (Defendants)*, Civil Action No. 1:13-cv-00777-M-PAS (US District Court for the District of Rhode Island).

88. Declaration (April 2015) relating to various Technical Corrections for the MATS Rule (EPA Docket ID No. EPA-HQ-OAR-2009-0234) on behalf of the Environmental Integrity Project.

89. Direct Prefiled Testimony (May 2015) on behalf of the Michigan Environmental Council, the Natural Resources Defense Council, and the Sierra Club in the matter of the Application of DTE Electric Company for Authority to Increase its Rates, Amend its Rate Schedules and Rules Governing the Distribution and Supply of Electric Energy and for Miscellaneous Accounting Authority, Case No. U-17767 (Michigan Public Service Commission).

90. Expert Report (July 2015) and Rebuttal Expert Report (July 2015) on behalf of Plaintiffs in the matter of *Northwest Environmental Defense Center et. al., v. Cascade Kelly Holdings LLC, d/b/a Columbia Pacific Bio-Refinery, and Global Partners LP (Defendants)*, Civil Action No. 3:14-cv-01059-SI (US District Court for the District of Oregon, Portland Division).

91. Declaration (August 2015, Docket No. 1570376) in support of "Opposition of Respondent-Intervenors American Lung Association, et. al., to Tri-State Generation's Emergency Motion;" Declaration (September 2015, Docket No. 1574820) in support of "Joint Motion of the State, Local Government, and Public Health Respondent-Intervenors for Remand Without Vacatur;" Declaration (October 2015) in support of "Joint Motion of the State, Local Government, and Public Health Respondent-Intervenors to State and Certain Industry Petitioners' Motion to Govern, *White Stallion Energy Center, LLC v. US EPA*, Case No. 12-1100 (US Court of Appeals for the District of Columbia).

92. Declaration (September 2015) in support of the Draft Title V Permit for Dickerson Generating Station (Proposed Permit No 24-031-0019) on behalf of the Environmental Integrity Project.

93. Expert Report (Liability Phase) (December 2015) and Rebuttal Expert Report (February 2016) on behalf of Plaintiffs in the matter of *Natural Resources Defense Council, Inc., Sierra Club, Inc., Environmental Law and Policy Center, and Respiratory Health Association v. Illinois Power Resources LLC, and Illinois Power Resources Generating LLC (Defendants)*, Civil Action No. 1:13-cv-01181 (US District Court for the Central District of Illinois, Peoria Division).

94. Declaration (December 2015) in support of the Petition to Object to the Title V Permit for Morgantown Generating Station (Proposed Permit No 24-017-0014) on behalf of the Environmental Integrity Project.

95. Expert Report (November 2015) on behalf of Appellants in the matter of *Sierra Club, et al. v. Craig W. Butler, Director of Ohio Environmental Protection Agency et al.*, ERAC Case No. 14-256814.

96. Affidavit (January 2016) on behalf of Bridgewatch Detroit in the matter of *Bridgewatch Detroit v. Waterfront Petroleum Terminal Co., and Waterfront Terminal Holdings, LLC.*, in the Circuit Court for the County of Wayne, State of Michigan.

97. Expert Report (February 2016) and Rebuttal Expert Report (July 2016) on behalf of the challengers in the matter of the Delaware Riverkeeper Network, Clean Air Council, et. al., vs. Commonwealth of Pennsylvania Department of Environmental Protection and R. E. Gas Development LLC regarding the Geyer well site before the Pennsylvania Environmental Hearing Board.

98. Direct Testimony (May 2016) in the matter of Tesoro Savage LLC Vancouver Energy Distribution Terminal, Case No. 15-001 before the State of Washington Energy Facility Site Evaluation Council.

99. Declaration (June 2016) relating to deficiencies in air quality analysis for the proposed Millenium Bulk Terminal, Port of Longview, Washington.

100. Declaration (December 2016) relating to EPA's refusal to set limits on PM emissions from coal-fired power plants that reflect pollution reductions achievable with fabric filters on behalf of Environmental Integrity Project, Clean Air Council, Chesapeake Climate Action Network, Downwinders at Risk represented by Earthjustice in the matter of *ARIPPA v EPA, Case No. 15-1180.* (D.C. Circuit Court of Appeals).

101. Expert Report (January 2017) on the Environmental Impacts Analysis associated with the Huntley and Huntley Poseidon Well Pad on behalf citizens in the matter of the special exception use Zoning Hearing Board of Penn Township, Westmoreland County, Pennsylvania.

102. Expert Report (January 2017) on the Environmental Impacts Analysis associated with the Apex Energy Backus Well Pad on behalf citizens in the matter of the special exception use Zoning Hearing Board of Penn Township, Westmoreland County, Pennsylvania.

103. Expert Report (January 2017) on the Environmental Impacts Analysis associated with the Apex Energy Drakulic Well Pad on behalf citizens in the matter of the special exception use Zoning Hearing Board of Penn Township, Westmoreland County, Pennsylvania.

104. Expert Report (January 2017) on the Environmental Impacts Analysis associated with the Apex Energy Deutsch Well Pad on behalf citizens in the matter of the special exception use Zoning Hearing Board of Penn Township, Westmoreland County, Pennsylvania.

105. Affidavit (February 2017) pertaining to deficiencies water discharge compliance issues at the Wood River Refinery in the matter of *People of the State of Illinois (Plaintiff) v. Phillips 66 Company, ConocoPhillips Company, WRB Refining LP (Defendants)*, Case No. 16-CH-656, (Circuit Court for the Third Judicial Circuit, Madison County, Illinois).

106. Expert Report (March 2017) on behalf of the Plaintiff pertaining to non-degradation analysis for waste water discharges from a power plant in the matter of *Sierra Club (Plaintiff) v. Pennsylvania Department of Environmental Protection (PADEP) and Lackawanna Energy Center*, Docket No. 2016-047-L (consolidated), (Pennsylvania Environmental Hearing Board).

107. Expert Report (March 2017) on behalf of the Plaintiff pertaining to air emissions from the Heritage incinerator in East Liverpool, Ohio in the matter of *Save our County (Plaintiff) v. Heritage Thermal Services, Inc. (Defendant), Case No. 4:16-CV-1544-BYP*, (US District Court for the Northern District of Ohio, Eastern Division).

108. Rebuttal Expert Report (June 2017) on behalf of Plaintiffs in the matter of *Casey Voight and Julie Voight (Plaintiffs) v Coyote Creek Mining Company LLC (Defendant),* Civil Action No. 1:15-CV-00109 (US District Court for the District of North Dakota, Western Division).

109. Expert Affidavit (August 2017) and Penalty/Remedy Expert Affidavit (October 2017) on behalf of Plaintiff in the matter of *Wildearth Guardians (Plaintiff) v Colorado Springs Utility Board (Defendant,)* Civil Action No. 1:15-cv-00357-CMA-CBS (US District Court for the District of Colorado).

110. Expert Report (August 2017) on behalf of Appellant in the matter of *Patricia Ann Troiano (Appellant) v. Upper Burrell Township Zoning Hearing Board (Appellee)*, Court of Common Pleas of Westmoreland County, Pennsylvania, Civil Division.

111. Expert Report (October 2017), Supplemental Expert Report (October 2017), and Rebuttal Expert Report (November 2017) on behalf of Defendant in the matter of *Oakland Bulk and Oversized Terminal (Plaintiff) v City of Oakland (Defendant,)* Civil Action No. 3:16-cv-07014-VC (US District Court for the Northern District of California, San Francisco Division).

112. Declaration (December 2017) on behalf of the Environmental Integrity Project in the matter of permit issuance for ATI Flat Rolled Products Holdings, Breckenridge, PA to the Allegheny County Health Department.

113. Expert Report (Harm Phase) (January 2018) and Rebuttal Expert Report (Harm Phase) (May 2018) on behalf of Plaintiffs in the matter of *Natural Resources Defense Council, Inc., Sierra Club, Inc., and Respiratory Health Association v. Illinois Power Resources LLC, and Illinois Power Resources Generating LLC (Defendants)*, Civil Action No. 1:13-cv-01181 (US District Court for the Central District of Illinois, Peoria Division).

114. Declaration (February 2018) on behalf of the Chesapeake Bay Foundation, et. al., in the matter of the Section 126 Petition filed by the state of Maryland in *State of*

Maryland v. Pruitt (Defendant), Civil Action No. JKB-17-2939 (Consolidated with No. JKB-17-2873) (US District Court for the District of Maryland).

115. Direct Pre-filed Testimony (March 2018) on behalf of the National Parks Conservation Association (NPCA) in the matter of *NPCA v State of Washington, Department of Ecology and BP West Coast Products, LLC*, PCHB No. 17-055 (Pollution Control Hearings Board for the State of Washington.

116. Expert Affidavit (April 2018) and Second Expert Affidavit (May 2018) on behalf of Petitioners in the matter of *Coosa River Basin Initiative and Sierra Club (Petitioners) v State of Georgia Environmental Protection Division, Georgia Department of Natural Resources (Respondent) and Georgia Power Company (Intervenor/Respondent)*, Docket Nos: 1825406-BNR-WW-57-Howells and 1826761-BNR-WW-57-Howells, Office of State Administrative Hearings, State of Georgia.

C. Occasions where Dr. Sahu has provided oral testimony in depositions, at trial or in similar proceedings include the following:

117. Deposition on behalf of Rocky Mountain Steel Mills, Inc. located in Pueblo, Colorado – dealing with the manufacture of steel in mini-mills including methods of air pollution control and BACT in steel mini-mills and opacity issues at this steel mini-mill.

118. Trial Testimony (February 2002) on behalf of Rocky Mountain Steel Mills, Inc. in Denver District Court.

119. Trial Testimony (February 2003) on behalf of the United States in the Ohio Edison NSR Cases, *United States, et al. v. Ohio Edison Co., et al.*, C2-99-1181 (Southern District of Ohio).

120. Trial Testimony (June 2003) on behalf of the United States in the Illinois Power NSR Case, *United States v. Illinois Power Co., et al.*, 99-833-MJR (Southern District of Illinois).

121. Deposition (10/20/2005) on behalf of the United States in connection with the Cinergy NSR Case. *United States, et* al. *v. Cinergy Corp., et al.*, IP 99-1693-C-M/S (Southern District of Indiana).

122. Oral Testimony (August 2006) on behalf of the Appalachian Center for the Economy and the Environment re. the Western Greenbrier plant, WV before the West Virginia DEP.

123. Oral Testimony (May 2007) on behalf of various Montana petitioners (Citizens Awareness Network (CAN), Women's Voices for the Earth (WVE) and the Clark Fork Coalition (CFC)) re. the Thompson River Cogeneration plant before the Montana Board of Environmental Review.

124. Oral Testimony (October 2007) on behalf of the Sierra Club re. the Sevier Power Plant before the Utah Air Quality Board.

125. Oral Testimony (August 2008) on behalf of the Sierra Club and Clean Water re. Big Stone Unit II before the South Dakota Board of Minerals and the Environment.

126. Oral Testimony (February 2009) on behalf of the Sierra Club and the Southern Environmental Law Center re. Santee Cooper Pee Dee units before the South Carolina Board of Health and Environmental Control.

127. Oral Testimony (February 2009) on behalf of the Sierra Club and the Environmental Integrity Project re. NRG Limestone Unit 3 before the Texas State Office of Administrative Hearings (SOAH) Administrative Law Judges.

128. Deposition (July 2009) on behalf of MTD Products, Inc., in the matter of *Alice Holmes and Vernon Holmes v. Home Depot USA, Inc., et al.*

129. Deposition (October 2009) on behalf of Environmental Defense and others, in the matter of challenges to the proposed Coleto Creek coal fired power plant project at the Texas State Office of Administrative Hearings (SOAH).

130. Deposition (October 2009) on behalf of Environmental Defense, in the matter of permit challenges to the proposed Las Brisas coal fired power plant project at the Texas State Office of Administrative Hearings (SOAH).

131. Deposition (October 2009) on behalf of the Sierra Club, in the matter of challenges to the proposed Medicine Bow Fuel and Power IGL plant in Cheyenne, Wyoming.

132. Deposition (October 2009) on behalf of Environmental Defense and others, in the matter of challenges to the proposed Tenaska coal fired power plant project at the Texas State Office of Administrative Hearings (SOAH). (April 2010).

133. Oral Testimony (November 2009) on behalf of the Environmental Defense Fund re. the Las Brisas Energy Center before the Texas State Office of Administrative Hearings (SOAH) Administrative Law Judges.

134. Deposition (December 2009) on behalf of Environmental Defense and others, in the matter of challenges to the proposed White Stallion Energy Center coal fired power plant project at the Texas State Office of Administrative Hearings (SOAH).

135. Oral Testimony (February 2010) on behalf of the Environmental Defense Fund re. the White Stallion Energy Center before the Texas State Office of Administrative Hearings (SOAH) Administrative Law Judges.

136. Deposition (June 2010) on behalf of the United States in connection with the Alabama Power Company NSR Case. *United States v. Alabama Power Company*, CV-01-HS-152-S (Northern District of Alabama, Southern Division).

137. Trial Testimony (September 2010) on behalf of Commonwealth of Pennsylvania – Dept. of Environmental Protection, State of Connecticut, State of New York, State of Maryland, and State of New Jersey (Plaintiffs) in connection with the Allegheny Energy NSR Case in US District Court in the Western District of Pennsylvania. *Plaintiffs v. Allegheny Energy Inc., et al.,* 2:05cv0885 (Western District of Pennsylvania).

138. Oral Direct and Rebuttal Testimony (September 2010) on behalf of Fall-Line Alliance for a Clean Environment and others in the matter of the PSD Air Permit for Plant Washington issued by Georgia DNR at the Office of State Administrative Hearing, State of Georgia (OSAH-BNR-AQ-1031707-98-WALKER).

139. Oral Testimony (September 2010) on behalf of the State of New Mexico Environment Department in the matter of Proposed Regulation 20.2.350 NMAC – *Greenhouse Gas Cap and Trade Provisions,* No. EIB 10-04 (R), to the State of New Mexico, Environmental Improvement Board.

140. Oral Testimony (October 2010) on behalf of the Environmental Defense Fund re. the Las Brisas Energy Center before the Texas State Office of Administrative Hearings (SOAH) Administrative Law Judges.

141. Oral Testimony (November 2010) regarding BART for PSCo Hayden, CSU Martin Drake units before the Colorado Air Quality Commission on behalf of the Coalition of Environmental Organizations.

142. Oral Testimony (December 2010) regarding BART for TriState Craig Units, CSU Nixon Unit, and PRPA Rawhide Unit) before the Colorado Air Quality Commission on behalf of the Coalition of Environmental Organizations.

143. Deposition (December 2010) on behalf of the United States in connection with the Louisiana Generating NSR Case. *United States v. Louisiana Generating, LLC*, 09-CV100-RET-CN (Middle District of Louisiana).

144. Deposition (February 2011 and January 2012) on behalf of Wild Earth Guardians in the matter of opacity exceedances and monitor downtime at the Public Service Company of Colorado (Xcel)'s Cherokee power plant. No. 09-cv-1862 (D. Colo.).

145. Oral Testimony (February 2011) to the Georgia Office of State Administrative Hearings (OSAH) in the matter of Minor Source HAPs status for the proposed Longleaf Energy Associates power plant (OSAH-BNR-AQ-1115157-60-HOWELLS) on behalf of the Friends of the Chattahoochee and the Sierra Club).

146. Deposition (August 2011) on behalf of the United States in *United States of America v. Cemex, Inc.*, Civil Action No. 09-cv-00019-MSK-MEH (District of Colorado).

147. Deposition (July 2011) and Oral Testimony at Hearing (February 2012) on behalf of the Plaintiffs MYTAPN in the matter of Microsoft-Yes, Toxic Air Pollution-No (MYTAPN) v. State of Washington, Department of Ecology and Microsoft Corporation Columbia Data Center to the Pollution Control Hearings Board, State of Washington, Matter No. PCHB No. 10-162.

148. Oral Testimony at Hearing (March 2012) on behalf of the United States in connection with the Louisiana Generating NSR Case. *United States v. Louisiana Generating, LLC*, 09-CV100-RET-CN (Middle District of Louisiana).

149. Oral Testimony at Hearing (April 2012) on behalf of the New Hampshire Sierra Club at the State of New Hampshire Public Utilities Commission, Docket No. 10-261 – the 2010 Least Cost Integrated Resource Plan (LCIRP) submitted by the

Public Service Company of New Hampshire (re. Merrimack Station Units 1 and 2).

150. Oral Testimony at Hearing (November 2012) on behalf of Clean Wisconsin in the matter of Application of Wisconsin Public Service Corporation for Authority to Construct and Place in Operation a New Multi-Pollutant Control Technology System (ReACT) for Unit 3 of the Weston Generating Station, before the Public Service Commission of Wisconsin, Docket No. 6690-CE-197.

151. Deposition (March 2013) in the matter of various Environmental Petitioners v. North Carolina DENR/DAQ and Carolinas Cement Company, before the Office of Administrative Hearings, State of North Carolina.

152. Deposition (August 2013) on behalf of the Sierra Club in connection with the Luminant Big Brown Case. *Sierra Club v. Energy Future Holdings Corporation and Luminant Generation Company LLC*, Civil Action No. 6:12-cv-00108-WSS (Western District of Texas, Waco Division).

153. Deposition (August 2013) on behalf of the Sierra Club in connection with the Luminant Martin Lake Case. *Sierra Club v. Energy Future Holdings Corporation and Luminant Generation Company LLC*, Civil Action No. 5:10-cv-0156-MHS-CMC (Eastern District of Texas, Texarkana Division).

154. Deposition (February 2014) on behalf of the United States in *United States of America v. Ameren Missouri*, Civil Action No. 4:11-cv-00077-RWS (Eastern District of Missouri, Eastern Division).

155. Trial Testimony (February 2014) in the matter of *Environment Texas Citizen Lobby, Inc and Sierra Club v. ExxonMobil Corporation et al.*, Civil Action No. 4:10-cv-4969 (Southern District of Texas, Houston Division).

156. Trial Testimony (February 2014) on behalf of the Sierra Club in connection with the Luminant Big Brown Case. *Sierra Club v. Energy Future Holdings Corporation and Luminant Generation Company LLC*, Civil Action No. 6:12-cv-00108-WSS (Western District of Texas, Waco Division).

157. Deposition (June 2014) and Trial (August 2014) on behalf of ECM Biofilms in the matter of the *US Federal Trade Commission (FTC) v. ECM Biofilms* (FTC Docket #9358).

158. Deposition (February 2015) on behalf of Plaintiffs in the matter of *Sierra Club and Montana Environmental Information Center (Plaintiffs) v. PPL Montana LLC, Avista Corporation, Puget Sound Energy, Portland General Electric Company, Northwestern Corporation, and Pacificorp (Defendants)*, Civil Action No. CV 13-32-BLG-DLC-JCL (US District Court for the District of Montana, Billings Division).

159. Oral Testimony at Hearing (April 2015) on behalf of Niagara County, the Town of Lewiston, and the Villages of Lewiston and Youngstown in the matter of CWM Chemical Services, LLC New York State Department of Environmental Conservation (NYSDEC) Permit Application Nos.: 9-2934-00022/00225, 9-2934-00022/00231, 9-2934-00022/00232, and 9-2934-00022/00249 (pending).

160. Deposition (August 2015) on behalf of Plaintiff in the matter of *Conservation Law Foundation (Plaintiff) v. Broadrock Gas Services LLC, Rhode Island LFG GENCO LLC, and Rhode Island Resource Recovery Corporation (Defendants)*, Civil Action No. 1:13-cv-00777-M-PAS (US District Court for the District of Rhode Island).

161. Testimony at Hearing (August 2015) on behalf of the Sierra Club in the matter of *Amendments to 35 Illinois Administrative Code Parts 214, 217, and 225* before the Illinois Pollution Control Board, R15-21.

162. Deposition (May 2015) on behalf of Plaintiffs in the matter of *Northwest Environmental Defense Center et. al., (Plaintiffs) v. Cascade Kelly Holdings LLC, d/b/a Columbia Pacific Bio-Refinery, and Global Partners LP (Defendants)*, Civil Action No. 3:14-cv-01059-SI (US District Court for the District of Oregon, Portland Division).

RE: Tacoma LNG FEIS; Inquiry re Updating

Dear Ms. Schultz:

Puget Sound Energy (PSE) understands that the City of Tacoma received a request on June 15, 2016 via email (3:44 p.m., Claudia Riedener at ixia@harbornet.com) that the City prepare a supplement to the Final Environmental Impact Statement (FEIS) regarding Tacoma LNG. PSE respectfully submits that it is not appropriate for the FEIS to be supplemented.

PSE proposes the construction of a liquefied natural gas (LNG) facility that would liquefy and store natural gas for use as a marine vessel fuel and to provide natural gas for peak shaving to meet increases in regional demand for natural gas. The switch by marine vessels from bunker fuel to LNG will have immediate environmental benefits for Puget Sound by reducing greenhouse gases, sulfur dioxide and particulate emissions, health risks associated with the combustion of diesel fuel and the risk of potentially damaging fuel spills.

The Project was originally comprised of three elements: 1) an upland LNG processing facility, 2) a barge fueling (bunkering) facility on the Hylebos, and 3) a TOTE LNG Fueling Facility on the Blair.

Marine vessels conventionally receive fuel (a process known as "bunkering") from fuel barges (aka "bunker barges") that deliver the fuel to the ship while it is moored at a berth or anchored in harbor. This fuel transfer most often occurs at a "bunker station" which is a hose connection usually on the side of the ship.
The Hylebos Waterway bunkering facility PSE had initially proposed as part of Tacoma LNG was envisioned as a means to transfer LNG from the Tacoma LNG plant into a LNG bunker barge. The bunker barge would then deliver LNG for use as a fuel to ships in the Port of Tacoma or Seattle (assuming that market ever emerged – none exists today).
Unlike conventional marine vessel fueling, TOTE's two ORCA-class vessels that are being converted to run on LNG will be fueled with LNG via a bunker station that is located high and

on the stem of the ship between the mooring lines. As a result of this unique configuration, the TOTE Fueling Facility element of the Project, on the Blair Waterway, has been specifically designed to reach out and over the mooring lines to connect to the aft bunker station on the TOTE vessels at a significant height above the water.

An LNG bunker barge of conventional dimensions would not be capable of receiving LNG from the TOTE loading arm because it is only designed to reach and deliver LNG to the unique geometry of the TOTE vessel bunker location. Additionally, there are no barge mooring provisions at the TOTE Fueling Facility that would accommodate a bunker barge.

The City published a final Environmental Impact Statement (FEIS) under SEPA for Tacoma LNG in November 2015. The FIS evaluated the proposed facility for potential adverse environmental impacts from the Project's various constituent elements, including those described above.

In January 2016, PSE eliminated the Hylebos bunker barge element from the original proposal. The operations that would have resulted from the bunkering facility have not been relocated to the Blair, because the TOTE Fueling Facility is not configured to fuel bunker barges. The Shoreline Substantial Development Permit issued for Tacoma LNG does not allow for such a shifting of bunker barge facility construction or operations to the Blair Waterway. Moreover, no changes have been made to the configuration of the TOTE Fueling Facility to accommodate barges that would transport LNG to other vessels. Notably, the TOTE Fueling Facility is not configured to fuel tanker trucks, no changes to accommodate this are proposed, and PSE will not fuel LNG tanker trucks from the TOTE Fueling Facility. TOTE's fuel demands from PSE are unchanged by the elimination of the Hylebos element of the Project; therefore, the size and capacity of the pipeline to TOTE Fueling Facility remain unchanged. The impacts to the Blair Waterway from the TOTE Fueling Facility remain the same today as those examined in the FEIS. The Project today is simply smaller in scope, with fewer but no new or changed impacts.

Information about removal of the Hylebos aspect of the Project has been broadly disseminated since January of 2016. PSE memorialized this reduction in the scope by entry of a Stipulation with the State of Washington's Shoreline Hearings Board (SHB) on January 28, 2016. A copy of this Stipulation (attached hereto) was provided to the City contemporaneously with its entry at the SHB. All other agencies with jurisdiction to issue Tacoma LNG permits were similarly advised. The fact of this reduction in scope and impacts has also been placed in the public record in various legal proceedings before the SHB and Pierce County Superior Court.

A Supplemental EIS (SEIS) is required when substantial changes to a proposal or new information indicate probable significant adverse environmental impacts that were not adequately covered by the range of impacts analyzed in the FEIS. See WAC 197-11-405(4), -600(3)(b), (4)(d). Neither of these events occurred here. The activities dropped from the Project as a result of the Stipulation have not been moved to the Blair Waterway, and tanker truck

loading from the TOTE Fueling Facility will not, and cannot, occur due to the unique configuration of the Facility, regardless of whether the Hylebos element exists or not. The impacts that will result from work and operations in the Blair were studied in the FEIS, and nothing (including configuration, usage or volumes) has changed regarding that element since the FEIS was published.

To summarize, eliminating the in-water work and bunkering operations from the Hylebos simply reduces the impacts from the Project. Such elimination, without replacement or relocation on the Blair, does not create anything new or different for the City to review.

Nonetheless, the requests for supplementation are based on the following statements:

> "This new information [elimination of construction and bunkering operations on Hylebos] and development amounts to a substantial change to the EIS, since the LNG delivery would have to increase via:
>
> 1) Additional truck loading and transportation of the LNG (currently stated at two trucks per day)
> 2) Additional ship docking/loading on the Blair Pier, described as only being used by TOTE.
>
> The risk assessments for both Blair Pier and road trucking would be substantially different with increased traffic at either or at both and would significantly impact the EIS.
>
> 1) We urge you issue a supplemental EIS to clarify additional road loading at the facility and trucking in the Port of Tacoma and the region due to increased risks at loading, increased traffic, increased environmental impacts, increased noise impacts and increased risk to others on the road.
> 2) We urge you issue a supplemental EIS to re-evaluate the Blair TOTE Pier risk analysis, including increased LNG through LNG pipeline extending outside PSE property as well as increased LNG loading at the pier and increased transport through the Blair Waterway and the Puget Sound waterway area."

These conclusions are incorrect, as explained above. No trucks will fuel at the TOTE Fueling Facility on the Blair Waterway as a result of the removal of the Hylebos operations. TOTE's fuel supply demand remains unchanged, and the volume of LNG delivered via pipeline to the TOTE LNG Fueling Facility will not increase as a result. No other ships will dock and load at the TOTE Fueling Facility as a result of removal of the Hylebos operations. The TOTE Fueling Facility is not being converted into a bunker barge facility as a result of the elimination of the Hylebos element of the project.

Consequently, there is no substantial change to, or new information about, the Project that will cause 'additional road loading at the facility and trucking in the Port of Tacoma and the region'

that would give rise to the potential for 'increased risks at loading, increased traffic, increased environmental impacts, increased noise impacts and increased risk to others on the road' that require supplementation of the FEIS.

Likewise, the reduction of the Project scope is not new information or a substantial change that could cause previously unstudied impacts. The lack of new or changed impacts leaves the adequacy of the FEIS untouched. There is no legal or factual basis under SEPA to 'to re-evaluate the Blair TOTE Pier risk analysis, including increased LNG through LNG pipeline extending outside PSE property as well as increased LNG loading at the pier and increased transport through the Blair Waterway and the Puget Sound waterway area'.

There have been no substantial changes or new information that would change the SEPA analysis conducted by the City of Tacoma. The EIS is not deficient, and no supplementation is required.

PSE welcomes any questions you may have about the foregoing.

Very truly yours,

PUGET SOUND ENERGY

Subject: Tacoma LNG FEIS - Inquiry re Updating

Dear Mr. Tornberg:

Thank you very much for your July 11 letter in response to questions the City has received regarding changes to the proposal for the LNG facility at 1001 Alexander Avenue (PSE site) and 3115 East 11th Street (TOTE site). Your response and clarification of the reduction in scale of the proposal is very helpful and we will be able to use it in further conversations with both the public and other reviewing agencies.

I have reviewed your letter with Peter Huffman, the City's SEPA Official, and there are a few follow-up items that need to be addressed.

First, your letter answers very well the question of trucks fueling at the TOTE Site. However, the proposal still includes truck racks at the PSE Site. Please confirm that the removal of the Hylebos bunkering facility in the proposal will not result in an increase in trucking from the PSE Site.

Second, if you can, please describe in more detail what changes would be required at the TOTE site to allow fueling other ships or bunkering barges. Are there other ships which could be fueled using the same configuration that TOTE would be using? TOTE has permits for barge moorage at their site to allow for fueling; could the fueling arm that PSE will build be used to fill barges? What kind of permitting/agency review do you anticipate would be required for such changes to take place?

Finally, please clarify (in very simple terms): will the removal of the Hylebos bunkering operation mean that PSE would just liquefy less gas? Would this mean that, rather than operating at fullest capacity and distributing the product by truck or by bunkering or direct-ship fueling, the production levels at the liquefaction facility would be lower?

Please be aware that we may need additional information depending on the outcome of the Shorelines Hearings Board decision. Further, should there be a change in the number of LNG trucks entering or leaving either the PSE site or the TOTE site from that analyzed in the EIS, that will need to be addressed.

Re: **Response to City of Tacoma's July 14, 2016 Request to Update Information Re Tacoma LNG FEIS**

Dear Ms. Schultz:

This letter responds to your July 14, 2016 request for additional information on Puget Sound Energy, Inc.'s Tacoma Liquefied Natural Gas Facility ("Tacoma LNG Facility"). For clarity, the letter is organized by each question raised by the City of Tacoma ("City").

1) **Will there be an increase in trucking from the PSE Site due to the removal of the Hylebos bunkering facility? Does the presence of truck racks indicate a change in truck traffic?** No and No. Removal of the Hylebos bunkering facility is not expected to significantly increase truck traffic from the levels analyzed in the EIS. Additionally, as explained in the EIS, any traffic from the LNG Facility is unlikely to rise to the level of significance in light of baseline traffic conditions in the Port of Tacoma. *See* FEIS, Table 3.10-1.

   Construction traffic for the Tacoma LNG Facility was estimated to include 185 vehicles per day. *See* FEIS, Table 3.10-3 at pg. 3.10-12. Operational traffic was estimated to be 60 vehicles per day (including up to 14 LNG Tanker trucks per week). FEIS at 3.10-15. Loading an LNG Tanker requires truck racks. The FEIS concludes that, with mitigation measures identified in the FEIS (*e.g.*, PSE contribution to reconstruction of Taylor Way), the Project will have no significant unavoidable adverse impacts. The current traffic levels into and out of the Port of Tacoma was a significant factor in reaching this conclusion. FEIS at 3.10-15 (noting that "compared to daily traffic volumes on roadways, the addition of 60 vehicles would be insignificant).

2) **What changes would be required at the TOTE Site to allow for the fueling of other ships or bunkering barges? Could the TOTE Fueling Facility be used to fuel non-TOTE marine vessels? Bunker barges?** The specific loading arm designed for the TOTE Site is configured solely to fuel TOTE vessels and lacks components required to fuel other ships or barges. Unlike conventional marine vessel fueling, TOTE's two ORCA-class vessels will be fueled with LNG high above the ship's stern. Conventionally-designed marine vessels and bunker barges would not be capable of receiving LNG from the TOTE loading arm because it is only designed to deliver LNG to the unique geometry of the TOTE vessels. PSE is not aware of any other existing marine vessel or bunker barge with this fuel loading configuration. Moreover, PSE is not aware of existing demand beyond TOTE for LNG to fuel marine vessels or load bunker barges. PSE has no development plans to fuel non-TOTE ships or bunkering barges at the TOTE Fueling Facility.

   In sum, at this time, PSE believes that significant new facilities would have to be designed, permitted and built to accommodate fueling non-TOTE marine vessels or barges at the TOTE Fueling Facility. Additionally, a new market for LNG for marine vessels would have to develop before PSE undertook any such action.

3) **What kind of permitting/agency review would PSE anticipate for changes required to fuel marine vessels or load LNG onto bunker barges?** Any analysis of permit requirements at this time would be entirely speculative. If, at some future date, an LNG market for marine vessels were to emerge and PSE decided to participate in it, PSE would engage the City of Tacoma early in its design process and would dutifully pursue full compliance with all applicable local, state and federal permitting requirements.

4) **Does the removal of the Hylebos bunkering operation mean that PSE would liquefy less gas than originally estimated in the FEIS? Would production levels at the liquefaction facility be lower?** The Tacoma LNG Facility production levels are unknown at this time, but will depend on market demand for LNG when the facility becomes operational. The Tacoma LNG Facility's planned capacity is 250,000 gallons of LNG per day. PSE anticipates that LNG production will be within the range analyzed in the EIS.

Please let us know if there is any additional information that PSE can provide to assist you in your continued oversight over the proposed Tacoma LNG Facility.

Best regards,

Larry Tornberg

APPENDIX D

U.S. Department of Homeland Security
United States Coast Guard

16711
October 31, 2016

Totem Ocean Trailer Express, Inc.
Attn: Peter Keller
Executive Vice President
14 Nassau Street
Princeton, NJ 08540

MARPOL ANNEX VI, REGULATION 3 EXEMPTION PERMIT

Dear Mr. Keller:

By this letter, the United States Government (USG) is notifying Totem Ocean Trailer Express (TOTE) that effective 30 days from the date of this letter, the permit dated November 5, 2014 issued by the USG to TOTE exempting the MIDNIGHT SUN (IMO 9232278) and the NORTH STAR (IMO 9232280) from the requirements of MARPOL Annex VI regulation 14.4 is revoked.

In 2012, TOTE requested and the USG granted a permit under Regulation 3 of MARPOL Annex VI to allow TOTE to conduct trials for the development of ship emission reduction and control technologies onboard two ships, the MIDNIGHT SUN and the NORTH STAR. The research project consisted of 1) developing and retrofitting advanced liquefied natural gas (LNG) conversion kits and fuel system modifications for each of six marine diesel engines installed on each of the Vessels that operate between Tacoma, WA, and Anchorage, Alaska; 2) assisting in the development of LNG refueling facilities and procedures for the Vessels in the Puget Sound region; and 3) assisting in the development of alternative power generation and use procedures for the Vessels in Anchorage, AK. Under the terms of the permit, the vessels would be fully converted by September 30, 2016, with some engines being converted in 2014, 2015, and 2016. During the permit, the ships would be exempted from complying with the North American ECA fuel sulfur requirements.

In 2013, TOTE informed USG that it was unable to comply with the terms of the permit because the conversion kits would not be available as planned (the engine manufacturer withdrew from the project). TOTE indicated it was revising the project and the four main engines on each vessel would be replaced with new dual-fuel engines. In 2014, TOTE requested and USG granted an extension to the permit specifying the first vessel would be converted for LNG use by March 31, 2016 and the second vessel by March 31, 2017. TOTE indicated that a smaller steamship, EL FARO, would be used as a temporary replacement while each ship, in turn, was removed from service for the conversion.

On or about October 2, 2015, the EL FARO was lost as sea with all hands after losing propulsion during Hurricane Joaquin. Due to this tragedy, TOTE requested another one-year delay in the schedule to allow refitting an alternative replacement ship, EL YUNQUE, for operation in cold weather conditions. During discussions for this extension, TOTE notified USG of yet another change in plans due to a decision to retire the EL YUNQUE for safety reasons. In this latest revision, the program would revert to development of conversion kits (the engine manufacturer is now indicating they will develop the kits). However, due to the need to take each vessel out of service for installation of at least part of the conversion kits, TOTE now does not expect that the first vessel to be converted to LNG until 2019 and the second vessel until 2020. This would extend the length of the exemption from the fuel sulfur standards by approximately three years from the existing permit (totaling more than seven years of exemption).

The net result of these delays is that, today, vessels continue to operate on higher sulfur fuel inside the North American ECA, and there has been little or no progress in installing LNG technology on the ships.

16711
October 31, 2016

MARPOL ANNEX VI, REGULATION3 EXEMPTION PERMIT

The permit includes a provision expressly addressing the possibility of termination of a permit, including revocation of the exemption from the MARPOL Annex VI fuel sulfur requirements. Specifically, section C.3 (a) states:

> "The USG may revoke or modify this permit if at any point TOTE is not compliant with MARPOL Annex VI, including but not limited to the Regulation 3 trial program requirements and conditions herein. The requirements of MARPOL Annex VI Regulation 14 shall apply as of the date of the noncompliance which forms the basis for the revocation."

Due to the extensive time period that has passed since the permit was originally issued, the lack of substantive progress in the application of LNG technology for these vessels, and the associated adverse impact on public health and the environment, it is in the public interest to terminate the permit effective 30 days from the date of this letter. As of that date, the USG will no longer recognize the exemptions and permit, and the ships will be required to comply with the MARPOL Annex VI Regulation 14.4 sulfur limits for fuel used in ships operating in the U.S. portion of the North American and U.S. Caribbean Sea designated ECAs.

Sincerely,

Rear Admiral Paul F. Thomas
Assistant Commandant for Prevention Policy
U.S. Coast Guard

Christopher Grundler, Director
Office of Transportation and Air Quality
U.S. Environmental Protection Agency

APPENDIX E

BEFORE THE SHORELINE HEARINGS BOARD
STATE OF WASHINGTON

PUYALLUP TRIBE OF INDIANS, a Federally Recognized Indian Tribe, Petitioner, v. CITY OF TACOMA, a Municipal Corporation; PUGET SOUND ENERGY, INC., a Washington Corporation; PORT OF TACOMA; and WASHINGTON STATE DEPARTMENT OF ECOLOGY, Respondents.	SHB No. 16-002 PUGET SOUND ENERGY, INC.'S RESPONSE IN OPPOSITION TO PUYALLUP TRIBE'S DISPOSITIVE MOTION FOR REVERSAL AND REMAND OF SSDP SHR2015-40000246123

Puget Sound Energy, Inc. ("PSE") respectfully requests that the Puyallup Tribe's Dispositive Motion for Reversal and Remand of SSDP SHR2015-40000246123-5 ("Puyallup's Motion") be denied.[1] The motion rests almost entirely on the Tribe's speculation that: 1) PSE's binding Stipulation Restricting SSDP Re: In- and Over-water in Hylebos Waterway ("PSE's Voluntary Stipulation") reconfigures operations of the Tacoma Liquefied Natural Gas ("LNG") facility, and 2) PSE has some future plan for the Tacoma LNG Facility not analyzed during the City of Tacoma's ("City") review. The Tribe's speculation is unfounded and improper as a

[1] PSE incorporates by reference its Motion to Dismiss under CR 12(b)(1) and (6), and the Declaration of Erin Anderson ("Anderson Decl.") in support of the motion, with exhibits, filed in this appeal on March 4, 2016.

STOEL RIVES LLP
ATTORNEYS
600 University Street, Suite 3600, Seattle, WA 98101
Telephone (206) 624-0900

matter of law. The Tribe does not argue that PSE's Voluntary Stipulation is ambiguous. Nor does the Tribe offer any competent evidence to suggest that PSE intends to circumvent the Stipulation. All claims based on the Tribe's improper speculation should be dismissed.

The Puyallup's Motion raises two issues not premised on their speculation, an improper delegation claim and an attack on the City's "no net loss" determination. The City has not improperly deferred and/or delegated its authority under the SMA to other permitting agencies, as a matter of law. Instead, it has acted appropriately in relation to other agencies with jurisdiction over shorelines and marine waters consistently with City SSDP issuance practices. Moreover, the Tribe's delegation argument ignores the scope of this Board's *de novo* review and is based on eliminated activities in the Hylebos. This claim is moot and should be dismissed.

Finally, the Tribe's unsubstantiated attack on the sufficiency of the City's "no net loss" determination implicates a dispute of material fact and so cannot be resolved on summary judgment. This claim alone should be preserved for hearing.

I. BACKGROUND

SSDP No. SHR2015-40000246123 ("SSDP") authorized in- and over-water work related to the Tacoma LNG Facility in the Blair and Hylebos Waterways. As originally proposed, this project was comprised of a barge loading facility on the Hylebos Waterway for marine vessel bunkering and the installation of shore-based fueling equipment for Totem Ocean Trailer Express ("TOTE") vessels (not barges) on the Blair Waterway. *Puyallup Tribe of Indians v. City of Tacoma*, SHB No. 16-002, Appeal of Decision on Substantial Development Permit SHR2015-40000246123 ("Puyallup Appeal"), Exhibit A at 3 (containing the Notice of Decision on the SSDP).

Telephone (206) 624-0900

Following the Tribe's appeal, PSE filed a Voluntary Stipulation giving up the right to undertake certain activities authorized by the SSDP. *Id.*, Puget Sound Energy, Inc.'s Stipulation Restricting SSDP Re: In- and Over-Water in Hylebos Waterway (Jan. 28, 2016). The Voluntary Stipulation strictly limits PSE's in- and over-water activities in the Hylebos Waterway under the SSDP. Declaration of Lorna Luebbe ("Luebbe Decl."), Exhibit 1 at 1-2. The Voluntary Stipulation does not provide for transferring, relocating, modifying or adding the elements of the Project considered in the Tacoma Liquefied Natural Gas Tidelands Final Environmental Impact Statement ("FEIS") or SSDP. *Id.* Under the Voluntary Stipulation, PSE commits to engaging in only a subset of the *previously described and evaluated* in- and over-water work in the Blair Waterway. *Id.* PSE has no future plans to expand activities in the *Blair Waterway* (by either construction or operation) beyond those activities contemplated and authorized by the SSDP. *Id.* The single remaining LNG fueling facility on the Blair Waterway will operate approximately eight hours a week and is designed to fuel a single type of vessel. *Id.*

II. ARGUMENT

A. PSE's Voluntary Stipulation Reduces (but Does Not Reconfigure or Relocate) Project Components

The Tribe argues that PSE's Voluntary Stipulation means something other than what it says. It does not. The clear terms of the Voluntary Stipulation eliminate PSE's ability to develop a marine barge fueling and bunkering facility on the Hylebos Waterway, leaving the TOTE Marine Vessel Fueling System on the Blair Waterway as the only remaining in-water element of Tacoma LNG Facility permitted by SSDP SHR2015-40000246123-5. *See* Luebbe Decl., Exhibit 1 at 1-2. The activities authorized on the Blair Waterway remain unchanged. *Id.*

STOEL RIVES LLP
ATTORNEYS
600 University Street, Suite 3600, Seattle, WA 98101
Telephone (206) 624-0900

The infrastructure on the Blair Waterway is custom-engineered to TOTE's operations, including the loading arm to fuel TOTE's Orca-class vessels. None of the components of the marine bunkering element will (or can) be "transferred" from the Hylebos to the Blair Waterway without the construction of additional facilities, which are not planned and would themselves require countless new permits. In other words, notwithstanding the fact that the SSDP originally authorized both Blair and Hylebos Waterway components, PSE has stipulated to scale down the activities authorized by the SSDP to one component — the Blair Waterway TOTE Marine Vessel Fueling System. *Puyallup Tribe of Indians*, SHB No. 16-002, Puget Sound Energy, Inc.'s Stipulation Restricting SSDP Re: In- and Over-Water in Hylebos Waterway (Jan. 28, 2016).

The Tribe presents no evidence for its bald assertions that any of the now-eliminated elements (including barge loading activities, additional vessel traffic, shoreline improvements, or the "northeastern storage area") will be "transferred" from the Hylebos to the Blair Waterway. Puyallup's Motion at 3-4, 9-14 (alleging that "the barge loading activity that were to occur on the Hylebos will now occur on the Blair waterway"). Nor could they: the Order Granting Request for Reconsideration in Part and Modifying Approval of SSDP SHR2015-40000246123 at 8:17-18 provides that "[t]his [SSDP] permit is only applicable to the proposed project as described above and based upon the information submitted by the applicant." Puyallup Appeal, Exhibit B (containing the Order Partially Granting Reconsideration and Modifying Conditions of Approval of the Shoreline Substantial Development Permit).

The Tribe's contention that PSE plans to "transfer" the bunkering component of the LNG Project from the Hylebos to the Blair Waterway relies on a single hearsay sentence in the Declaration of Lisa Brautigam, an attorney employed by the Tribe. Ms. Brautigam states that "to

STOEL RIVES LLP
ATTORNEYS
600 University Street, Suite 3600, Seattle, WA 98101
Telephone (206) 624-0900

[her] knowledge based on numerous contacts with Puget Sound Energy, the portions of the LNG project planned to occur on or in the Hylebos Waterway will be moved to or operated from the Blair Waterway." Brautigam Decl. at 2. The Brautigam Declaration is dated March 4, 2016. *Id.*

Ms. Brautigam does not disclose to this Board the correspondence between her and PSE in advance of her March 4, 2016. On February 1, 2016, Ms. Brautigam received an email from PSE's Assistant General Counsel, Lorna Luebbe, reiterating the commitment in the Voluntary Stipulation and describing the proposed Blair operations in more detail:

> The LNG is piped from the Tacoma LNG plan storage tank underground approximately 800 feet to an area near the aft end of the TOTE vessel. At that point, the LNG piping exits the ground and extends upward over the Blair approximately 125 feet to the new loading platform. …
>
> From the loading platform, the LNG is transferred to the ship via [a] rigid loading arm … similar to the arm on a concrete pumping truck…. It takes up to four hours to fuel one ship. There are two ships a week, for a total fueling time of up to 8 hours….
>
> **There are currently no commercial opportunities for additional future LNG vessel or barge loading on the Blair waterway**. As the LNG market develops to displace the current practice of loading bunker fuel and diesel onto vessels in Commencement Bay or elsewhere in Puget Sound, PSE would serve this market with a cleaner fuel for a cleaner environment. … **Construction and operation of any barge infrastructure would be subject to the local, state and federal permitting regulations in effect at that time.**

Luebbe Decl., Exhibit 1 at 1-2 (emphases added).

There is not, and has never been, a proposal for a barge loading and bunkering facility on the Blair Waterway. *Id.* Because there is no legal requirement to analyze non-existent project components, the Tribe's claim that "the SSDP did not consider … or analyze a barge loading facility… to be located on the Blair waterway" should be dismissed. Puyallup's Motion at 5.

The Puyallup's' Motion places heavy reliance on *Quinault Indian Nation v. City of Hoquiam*, SHB No. 13-012c (2013), *subsequent proceedings in Quinault Indian Nation v.*

STOEL RIVES LLP
ATTORNEYS
600 University Street, Suite 3600, Seattle, WA 98101
Telephone (206) 624-0900

Imperium Terminal Services, LLC, 190 Wn. App. 696, 360 P.3d 949 (2015), to argue that the SSDP should be reversed for its failure to analyze the "new proposed configuration" of the LNG project. *See* Puyallup's' Motion at 11. Apart from being based on a false factual premise, the Tribe's argument fails. *Quinault* is inapposite.

Quinault addressed a lead agency's decision to issue a SEPA Threshold Determination of Mitigated Determination of Non-Significance ("MDNS"), not the adequacy of an SSDP. *Quinault* also involved the exact opposite threshold determination and factual context. In that case, two industrial facilities (Westway and Imperium Biofuels) received MDNSs for SSDPs required to expand their very similar and adjacent fuel transport and storage activities in Grays Harbor. Before issuing the MDNS, the SEPA co-leads did not consider a third, similar[2] proposal announced for development in Grays Harbor by U.S. Development Group, LLC ("USD"). The Westway and Imperium co-leads also deferred consideration of the potential for impacts of the cumulative rail and vessel traffic impacts of each other's proposals until after the threshold determination was issued. *See Quinault,* SHB No. 13-012c, Amended Order on Summary Judgment at 14-15. The Board granted Quinault's motion for summary judgment, and held that: 1) the USD project was reasonably foreseeable and thus should have been considered cumulatively with the Westway and Imperium Biofuels projects, and that 2) SEPA co-leads cannot delay studying foreseeable impacts until after the threshold determination.[3] *Id.* at 14-16.

---

[2] USD's plans involved construction of a new $50 million bulk liquids rail logistics facility with a 1.1 million-barrel storage capacity receiving about five vessels per month. *See Quinault*, 190 Wn. App. at 701-02; *see also* SHB No. 13-012c, Amended Order on Summary Judgment at 9.

[3] Note that here the City determined that the Tacoma LNG would have probable adverse environmental impacts and issued a Determination of Significance. The FEIS that followed studied the impacts of the Tacoma LNG and its constituent parts, the potential cumulative impacts of a prospective

(continued . . .)

STOEL RIVES LLP
ATTORNEYS

Telephone (206) 624-0900

In other words, a SEPA lead must assess impacts before concluding that such impacts are not significant. *Id.*

The Tribe's reliance on *Quinault* entirely misses the point. Here, the City issued an FEIS and did not defer analysis. The Tacoma LNG SSDP and the underlying environmental review documents analyzed both the Hylebos marine barge bunkering facility and Blair TOTE vessel fueling system. *See* SSDP No. SHR2015-40000246123, attached to Petitioner's Appeal as Exhibit A, Tab 2, at Finding 1. PSE scaled down its proposal. It did not relocate or redesign it. The Tribe offers no authority for its assertion that the SSPD should analyze non-existent "operational activities that were to occur on the Hylebos [and that] will now occur on the Blair Water." *See* Puyallup's Motion at 5. Moreover, the *Quinault* Board never applied its own holding to the SSDP, much less established a precedent on such challenges:

> Other challenges to the MDNS and SSDP's validity based on compliance with the SMA, the local SMP, the Coastal Zone Management Act, and critical areas ordinances are also moot because of the invalidity of the MDNS on other grounds. The Board declines to address these moot issues.

Quinault, SHB No. 13-021c at 21. The Tribe's motion should be denied.

B. The Tribe Fails to Provide Evidence That the City Improperly Delegated or Deferred Analysis

The Tribe's claim that the City improperly deferred or delegated required analysis fails for two principal reasons. Puyallup's' Motion at 4-5, 8.

(. . . continued)
methanol facility on the Blair, and the Puyallup Tribal Terminal permitted for shoreline development, also on the Blair. *See* FEIS at 3.13–3.19, http://cms.cityoftacoma.org/planning/pse/PSE%20LNG%20FEIS%20revised%20 (11-9-2015).pdf (last visited Mar. 17, 2016).

STOEL RIVES LLP
ATTORNEYS
600 University Street, Suite 3600, Seattle, WA 98101
Telephone (206) 624-0900

First, the Tribe ignores the evidence that the City undertook a thorough review of the Tacoma LNG project under all applicable provisions of the SMP/TSMP. *See, e.g.*, Puyallup Appeal, Exhibits A & B (including PSE's SSDP Permit Application, FEIS, the City's Notice of Decision and Order on Reconsideration). This review resulted in a Notice of Decision and Order on Reconsideration that relied on the City's own technical expert reports and analysis and mitigation required under PSE's Joint Aquatic Resource Application ("JARPA") and the FEIS. *See, e.g., id.* at 7-8 (containing the City's Notice of Decision).

Other state and federal agencies also have jurisdiction over aspects of the shorelines and can require additional analysis and permitting. The Department of Ecology has been delegated authority to ensure that all discharges do not interfere with water quality standards. *See* Ch. 90.48 RCW. The U.S. Army Corps of Engineers has statutory authority to permit construction and development that obstructs navigation or results in a dredge or fill on navigable waters. *See* 33 U.S.C. §§ 1344, 403. The U.S. National Oceanic and Atmospheric Administration and Fish and Wildlife Service have authority to regulate potential impacts to species and habitat protected under the U.S. Endangered Species Act. *See generally* 16 U.S.C. § 1539(a)(1). The United States Coast Guard has the responsibility for the overall safety and security of waterfront LNG facilities and LNG-fueled vessels within U.S. territorial waters. *See, e.g.*, 46 U.S.C. § 70101, *et seq.* Such is the nature of the complex environmental permitting systems that have evolved in our nation's federal-state framework, which results in various agencies' concurrent jurisdiction

over shorelines resources, a fact that is explicitly recognized in the Washington Shoreline Management Act,[4] the Tacoma Shoreline Master Program[5], and the SSDP itself.[6]

Concurrent jurisdiction, however, does not provide for concurrent permit review by separate agencies. Permitting review is necessarily sequenced. As a result, permits are routinely conditioned on a permittee's compliance with ***all*** applicable regulations. The Board should reject the Tribe's invitation to construe permit sequencing as improper delegation. Puyallup's' Motion at 5 (faulting the City for not requiring PSE to "secure all federal and state permits before development" prior to development permitting).

Permit sequencing is so ubiquitous, it is found in the Tribe's own projects. For example, the City's May 21, 2012 MDNS for the SSA/Puyallup Tribal Terminal Shoreline Substantial Development Permit SHR2009-40000136019 (which was reviewed for potential cumulative effects in the Tacoma LNG FEIS) contains a number of similar provisions. *See, e.g.*, Luebbe Decl., Exhibit 2 at 4 ("Compliance with the critical areas regulations, as well as other applicable regulations, will adequately prevent or mitigate for any significant adverse environmental impacts to the wetlands...."); at 5 ("Potential significant adverse impacts to fisheries habitat on

---

[4] *See, e.g.*, RCW 90.58.020 ("There is, therefore, a clear and urgent demand for a planned, rational, and concerted effort, jointly performed by federal, state, and local governments, to prevent the inherent harm in an uncoordinated and piecemeal development of the state's shorelines."); *see also* WAC 173-27-060(1) ("[T]hose direct federal agency activities affecting the uses or resources subject to the act must be consistent to the maximum extent practicable with the enforceable provisions of the act, regulations adopted pursuant to the act and the local master program.").

[5] *See, e.g.*, TSMP 1.7.1 ("[D]evelopments ... regulated by this Master Program may also be subject to . . . various other provisions of local, state and federal law."); TSMP 1.8 ("[F]ederal agency activities affecting the uses or resources subject to the Act must be consistent to the maximum extent practicable with the Act and this Program.").

[6] Notice of Decision at 12 ¶¶ 2-3 ("The authorization(s) granted herein is /are subject to all applicable federal state and local laws, regulations, and ordinances. By accepting these approvals, the applicant represents that the developments and activities allowed will comply with such laws....").

STOEL RIVES LLP
ATTORNEYS
600 University Street, Suite 3600, Seattle, WA 98101
Telephone (206) 624-0900

the shoreline will be adequately mitigated through compliance with this [Hydraulic Project Approval] requirement."); at 6 ("The Army Corps of Engineers and the Washington Department of Ecology, Fish and Wildlife Service, and Natural Resources have limited jurisdiction and require permits.... It is the sole responsibility of the applicant to secure all permits required for this project.").

Such conditions do not provide a *per se* legal basis for invalidation, as the Tribe asserts. *See, e.g., Kitsap County v. State Dep't of Nat. Res.*, 107 Wn.2d 801, 806-07, 733 P.2d 526, 529 (1987) (upholding a Board decision requiring future studies, but not requiring future consideration by the Board). This is especially true where, as here, these provisions provide conditions for permit revocation. Puyallup's Motion at 5 (citing the Reconsideration Order at 6:4-7) (the Tacoma LNG Facility "will need to comply with all water quality as well as safety requirements of all applicable permits and authorities. *This information will need to be provided prior to development permitting, this is clarified in the revised condition*"); Notice of Decision at 12, ¶ 5 ("This permit may be rescinded pursuant to *RCW* 90.58.140(8) of the Shoreline Management Act of 1971 and Section 13.10.2 of the *Tacoma Municipal Code* in the event the permittee fails to comply with *any condition thereof*." (emphases added)). In other words, the very provisions cited by the Tribe give the City enforcement authority to rescind PSE's SSDP permit upon non-compliance and therefore ensure that required actions are undertaken.

Second, the Tribe's argument cannot be resolved on summary judgment. The Board reviews SSDP appeals *de novo*. WAC 461-08-500(1). *See, e.g., Coal. to Protect Puget Sound Habitat v. Thurston County*, SHB No. 13-006c at 6, Order Denying Motions to Dismiss and Motion for Summary Judgment (Aug. 6, 2013). The moving party cannot rely on a previous

STOEL RIVES LLP
ATTORNEYS
600 University Street, Suite 3600, Seattle, WA 98101
Telephone (206) 624-0900

SSDP decision "to establish the factual basis for a motion for summary judgment" because to do so "defeats the purpose of *de novo* review." *Id.*; *GMA Advocates v. Potala Vill. Kirkland, LLC*, SHB No. 13-002, at *6 (Aug. 8, 2013) ("Kirkland cannot simply rely on the evidence from the proceedings and arguments made below to prevail before the Board now.... Respondents must still submit evidence to the Board that supports a *de novo* decision and addresses the merits of [petitioner's] claims."). The Tribe cannot obtain summary judgment based solely on an alleged deficiency in the City's review; rather a *de novo* review requires that the Tribe present sufficient evidence to this Board to establish the deficiency. Because the Tribe has failed to do so, its motion fails.

Finally, as the Tribe's "delegation and deferral" claims are based on analysis of construction and operational impacts *in the Hylebos*, they are moot. *See* Puyallup's Motion at 4-5. PSE has stipulated not to exercise the SSDP provisions relating to in-water work in the Hylebos. Because PSE has made an enforceable commitment to, in effect, withdraw portions of its SSDP permit relating to the Hylebos, the Tribe's Hylebos-related claims are moot. *See, e.g., Baker v. Tanger Factory Outlet Ctr., Inc.*, SHB No. 94-53, Order of Dismissal (Mar. 29, 1995) (dismissing a withdrawn permit as moot).

C. The Elimination of Project Components Is Not Piecemealing

The Tribe asserts that Respondents "piecemealed" the LNG project in violation of the SMA. "Piecemealing" occurs where the local authority "allow[s] one portion of the [single] project to proceed while the other portion of the project awaits approval." *Batchelder v. City of Seattle*, 77 Wn. App. 154, 160, 890 P.2d 25 (1995); *see also Merkel v. Port of Brownsville*, 8 Wn. App. 844, 847, 509 P.2d 390 (1973) (improper piecemeal review occurs where a

development is "so interrelated and interdependent that no part of the project can proceed until all provisions have been fully complied with"); *Murden Cove Preservation Ass'n v. Kitsap County*, 41 Wn. App. 515, 526, 704 P.2d 1242 (1985) (in the absence of specific plans for any future development, SEPA does not require consideration of every remote and speculative consequence of an action).

The Tribe offers no competent evidence that the Tacoma LNG project was "piecemealed" because it was not. PSE's Voluntary Stipulation is unambiguous and means what it says: PSE has eliminated the barge bunkering component of the Tacoma LNG Facility on the Hylebos Waterway. Further, PSE has informed the Tribe that its plans in the Blair Waterway are unchanged from those authorized under the SSDP, nor is an expansion technologically foreseeable at this time because the Blair fueling facility is custom-designed for TOTE's Orca vessels. Furthermore, "[t]here are currently no commercial opportunities for additional future LNG vessel or barge loading on the Blair waterway." Luebbe Decl., Exhibit 1. If, at some unknown future point, new market opportunities materialize, they would of course be subject to applicable local, state and federal permitting. *Id.*

Elimination of project components is not "piecemealing." The scaled-down project on the Blair Waterway is not dependent on the Hylebos barge bunkering component, which has been abandoned. There is no evidence that PSE has a specific plan or opportunity to expand the operation on the Blair Waterway beyond the fueling of the TOTE vessels. The Tribe's suspicion and speculation of piecemealing does not make it so.

The Tribe's own authority, *Donovan v. Sperry Ocean Dock*, refutes its piecemealing argument. SHB No. 10-024, Findings of Fact, Conclusions of Law, and Order (July 13, 2011).

STOEL RIVES LLP
ATTORNEYS
600 University Street, Suite 3600, Seattle, WA 98101
Telephone (206) 624-0900

In that case, the evidence before the SHB was that the applicants "ha[d] no plans to pursue their 2007 expansion plan to add facilities." *Id.* at 17. Petitioners' skepticism of the applicant's assertion was insufficient to establish improper segmentation. *Id.* The SHB held that no piecemealing had occurred. *Id.* It is the same here. Because the Tribe has failed to present evidence of some future PSE plan not evaluated in the SSDP and FEIS, its allegation of "piecemealing" should be dismissed.

D. The Tribe Cannot Challenge the City's "No Net Loss" Analysis Without Specific Evidence of Alleged Deficiencies

The Tribe challenges the sufficiency of the City's "no net loss" analysis without identifying any supporting evidence in the record. Instead, the Tribe directs the Board to hunt down facts that could support its allegations. *See* Puyallup's Motion at 3, n.1 ("This Statement of Facts is based on the records of the Appeal and the Declaration of Lisa Brautigam in Support of the Motion (and exhibits thereto)."); *id.* at 15 (neglecting to cite any evidence to support the allegation that the City deferred *unnamed* "key" elements of its analysis). The Tribe's motion should be denied.

III. CONCLUSION

For the foregoing reasons, PSE respectfully requests that all claims raised in the Tribe's Motion be denied, except for the challenge to the adequacy of the City's "no net loss" determination, which should be preserved for hearing.

Q. What is it?
A. So that is what we call the loading platform in the Blair.
MS. LATSINOVA: Move to admit R-49 into evidence, Your Honor.
PRESIDING BOARD MEMBER MARCHIORO: Ms. Anderson, any objection?
MS. LISA ANDERSON: No objection.
PRESIDING BOARD MEMBER MARCHIORO: Mr. Capell or Ms. Lake, any objection?
MR. CAPELL: No objection.
MS. LAKE: No objection.
PRESIDING BOARD MEMBER MARCHIORO: R-49 is admitted.
(Exhibit No. R-49 admitted.)
BY MS. LATSINOVA:
Q. Mr. Hogan, can you please describe the design of the loading platform?
A. Yes. It is a concrete pier, essentially, built on steel piles. I believe there's 48 piles in total. Again, it's a concrete decking surface. It's pretty straightforward.
Q. How far out into the waterway does it go? I think we all remember the catwalk that's there now. Is it short of the catwalk?
A. Well, you can see on this, this is superimposed over the existing catwalk. I believe the end is roughly 130 feet

from the shoreline. It's just inside the existing platform that's already there.

Q. And so was this custom designed for TOTE?

A. Yes.

Q. So can any other ship refuel at this dock?

A. No.

Q. Why is that?

A. The reason is is that the way this works is we have a -- the piping comes out. This mast right here does not show it, but there will be a customized loading arm on top of that -- it looks something like a bucket truck like you'd see -- so it's articulated in a couple of places. That reaches up and out to the fueling location on the aft end of the TOTE ship, which is quite a ways up in the air. I want to say something on the order of 50 to 90 feet up in the air depending on the tide. So that's purpose built just for them, and I can't imagine another instance where it could be used for something else.

Q. You mentioned that the loading dock is made out of concrete; is that right?

A. That's correct.

Q. And do you recall there was a discussion with Mr. Deshler? He was concerned that the concrete would cast a hard shadow that would be problematic for fish that swim underneath. Do you recall that?

You need to let her finish her question and then answer.

THE WITNESS: Oh, I'm sorry.

BY MS. LISA ANDERSON:

Q. Just to clarify. Are you aware of how many ships per week call on the Port of Tacoma?

A. No.

Q. Are there other ships that call on the Port of Tacoma per week?

A. Yes.

Q. During your testimony yesterday, you, I believe, referenced that due to TOTE switching over to LNG for two ships per week there would be significant reductions in emissions; is that correct?

A. Correct.

Q. Do you remember the percentages of those reductions?

A. Roughly.

Q. And what is your knowledge based upon on those percentages?

A. It is based upon information that TOTE has provided on the performance of their existing engines relative to the new engines that they're installing in the two vessels.

Q. So those percentages that led to your conclusion that they'll be a significant reduction in emissions, is that a significant reduction in emissions in Puget Sound?

A. It's a significant reduction for those two vessels.

Q. For those two vessels, but not in Puget Sound as a whole?
A. It shouldn't be, no.
Q. TOTE switching over to LNG, do you have any knowledge as to what the reductions for Puget Sound would be as result of their two ships per week switching technology?
A. No, I don't.
Q. Do you have any knowledge of the reductions overall of what would happen with all the ships switching their technology, whether it be LNG or another technology?
A. No, I do not.
Q. I may have asked this, and I apologize if I did, are you aware of any other ships in the Port of Tacoma that are switching over to LNG as a fuel source?
A. I'm aware of other ships, other companies that are considering it.
Q. Are you aware of their timeline for switching over?
A. We are under nondisclosure agreements with other companies that have spoken to us about using LNG, so I can't answer that.
Q. I'm going to jump ahead a little bit to the testimony you gave this morning that the loading facility on the Blair and the pier, the concrete pier loading area, is custom designed for TOTE. Should another shipping company switch over to LNG as fuel for their ships, how would you provide LNG to them?

A. It would be expected that they would bunker the same way they do now. So a bunker barge would bring them the fuel at whatever location they moor at.

Q. And where would those bunker barges load the LNG?

A. As of right now, we would have to design facilities either on the Hylebos or modify the Blair facility.

Q. Are you aware of any barges already designed and capable of bunkering LNG?

A. There's one barge in North America that is still under construction that will be the first barge for bunkering LNG.

Q. And where will that service area be for that barge?

A. It will go to Jacksonville, Florida.

Q. Yesterday you testified that one of the benefits or reasons that PSE, I believe, was successful in getting the contract or agreement with TOTE to provide LNG was that you had a right of first refusal on the property that the LNG facility is designed to be placed on; is that correct?

A. That is my belief. TOTE never provided us a specific list of reasons of why we were successful, but I believe our adjacency was beneficial.

Q. And so did PSE, to your knowledge, enter into a written agreement with the Port of Tacoma for that right of first refusal?

A. I do not know that.

Q. When did PSE obtain the right of first refusal?

deleted from the NPL list, and with some exceptions, it is generally assumed that the Blair Waterway sediment is cleaner than the Hylebos Waterway. Therefore, for this review EPA's main concerns from a CERCLA and sediment quality perspective are focused on the project components in the Hylebos Waterway. We have no concern with the work as proposed in the Blair Waterway, and believe the standard CERCLA paragraph language below will be sufficient."

Q. Mr. Tornberg, you were asked to testify earlier about a stipulation that was entered in this action, correct?

A. Correct.

Q. Do you recall that?

A. I do.

Q. What is your understanding of the affect of that stipulation?

A. That we would not be developing facilities in the Hylebos as a result of the stipulation.

Q. Do you have any understanding of whether there are any changes to the project as proposed in the Blair?

A. There are no changes.

MS. ERIN ANDERSON: I would move to admit R-29.

PRESIDING BOARD MEMBER MARCHIORO: Mr. Missall, any objection?

MR. MISSALL: No.

PRESIDING BOARD MEMBER MARCHIORO: R-29 is

Re: Comment on Draft SEIS

Thank you for this opportunity to comment on the Draft Supplemental Environmental Impact Statement for the proposed Tacoma Liquefied Natural Gas Project. I offer two categories of comment: substantive and procedural.

Substantively, the Attorney General's Office's Counsel for Environmental Protection Unit agrees with and incorporates here the comments submitted by the Washington State Department of Ecology.

In addition, we encourage the Agency to revise the draft SEIS to fully respond to other commenters' concerns about the calculations of the short- and long-term global warming potential value of methane. The draft SEIS should ensure that it applies the most current, valid, peer-reviewed assessment of the global warming potential of emissions related to this project. Similarly, the draft SEIS assumes that all gas associated with the Project will come from Canada, and bases its calculations on that assumption. It is not clear why that assumption should be expected to hold true for the 40-year lifespan of the Project, especially as United States natural gas production has increased substantially in recent years. Consequently, the SEIS should be revised to anticipate and adequately review the possibility of a change in the source and makeup of that gas over the facility's 40-year lifespan.

Procedurally, the SEIS should be significantly revised to accurately identify the actual circumstances and current status of the construction and permitting process on the site. As currently drafted, the SEIS evaluates a No-Action Alternative that can only be described as fictional. In so doing, the draft SEIS raises questions about whether the Agency's SEPA process allowed the kind of "snowballing effect" that the Washington Supreme Court warned about in *King County v. Washington State Boundary Review Board for King County*, 122 Wn.2d 648, 664

(1993) (concluding that the appropriate time to prepare an EIS is when "the responsible agency determines that significant adverse environmental impacts are probable following the government action").

As you are aware, the Project began construction in 2016. A PSCAA inspector visited the project site on March 15, 2017, and observed activity indicating that the facility should have, before that activity, submitted a Notice of Construction application and received an Order of Approval. PSCAA issued a Notice of Violation on that basis on April 12, 2017. Although the project developer then submitted a Notice of Construction application, construction has continued at the site. PSCAA has apparently taken no further action investigating or enforcing the Notice of Violation, beyond accepting the NOC application and undertaking this SEPA process.

The Draft SEIS, however, does not appear to acknowledge that construction of any type has occurred on the Proposed Action. In fact, it appears to assume that construction, and therefore impacts of construction, are still contingent on the selection of an alternative. That of course is not the case, and therefore the Draft SEIS's description of the Proposed Action and No Action Alternative fail to comport with the actual status of the project site. In short, the No Action Alternative as described in the Draft SEIS is no longer an available alternative.

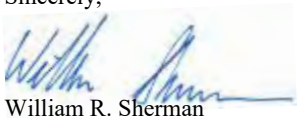
A few specific examples:

- The Draft SEIS's summary of the No Action Alternative states that "the existing land uses would continue at the proposed Tacoma LNG Facility site," p. 1-2. It is not clear that this could be the case; if so, substantial demolition and removal activity would be required. The Draft SEIS should include an accurate description of the No Action Alternative, or clearly indicate where the No Action Alternative diverges from the actual status of the project site.

- The Draft SEIS section on construction emissions is based on construction activities as defined in the September 30, 2015 Final Environmental Impact Statement (FEIS) (section 2.3 of the FEIS). Did PSCAA determine whether construction activities as actually conducted to date are substantially identical to those defined in the FEIS? If so, the SEIS should so indicate; if not, the SEIS should make such a determination.

- Section 3 of the Draft SEIS, "Description of the No Action Alternative," contains a number of statements that do not comport with the present status of the project site. For instance, on page 3-1, the draft states that "under the No Action Alternative, the Proposed Action would not be implemented." Because construction has advanced, those aspects of the Proposed Action would be, and in fact have been, implemented.

- The Draft SEIS discusses construction impacts on pp. 4-6 – 4-7, but fails to indicate that more than two years of the "four-year period" of construction have already occurred. The



0863-4 8. No Action Alternative
0863-5 8. No Action Alternative
0863-6 8. No Action Alternative
0863-7 8. No Action Alternative
0863-7 cont'd 8. No Action Alternative

Draft SEIS does not indicate whether the statements of GHG emissions on pp. 4-7 and 4-8 are based on construction as projected before the project began, or based on activities that have already occurred.

- In addition, the Draft SEIS asserts that "There are no construction impacts associated with the No Action Alternative." p. 4-9. This is plainly incorrect. Because construction impacts have already occurred, an alternative involving removal of the project would have further impacts associated with either demolition or repurposing of the already-built facilities.

Taken together, these shortcomings render the Draft SEIS's consideration of a No-Action alternative insufficient, and raises the concern that the SEPA process that produced it was insufficient to avoid the "snowballing effect" discussed above. We encourage the Agency to address those concerns prior to issuance of the final SEIS and issuing an Order of Approval.

Sincerely,

William R. Sherman

RE: Comments on Draft Supplemental Environmental Impact Statement
for Puget Sound Energy - Tacoma Liquefied Natural Gas Project

Dear Carole Cenci:

Thank you for the opportunity to comment on the Draft Supplemental Environmental Impact Statement (SEIS) for the Puget Sound Energy Tacoma Liquefied Natural Gas Project. We appreciate that the analysis includes a greenhouse gas (GHG) life cycle analysis related to the proposal. The state of the science underlying life cycle analysis has advanced in recent years and continues to progress.

Regarding the GHG analysis, Ecology offers several comments:

- Our technical experts note that marine emission comparisons in the analysis should be to diesel, not Marine Diesel Oil (MDO), as heavier fuels are being phased out in nearshore operations. Also, because this project would require a large amount of electricity and create new demand, the analysis would be more accurate if it used current marginal power emission factors.

- In the evaluation of emissions from peak shavings, we don't understand how peak shaving could result in a net emissions decrease because energy is needed to liquefy the natural gas. This should be clarified in the Final SEIS. Additionally, the LNG converted back into natural gas for peak shaving should be evaluated against natural gas thermal combustion or power generation rather than petroleum, because Washington does not have significant petroleum based power generation.

- The analysis assumes that 100% Canadian natural gas would be used. If correct, this could cause fuel shuffling that results in an increased use of non-Canadian natural gas for other projects.

- If analyses in the Final SEIS lead to consideration of mitigation, technical expertise from Ecology is available to assist with calculations, determinations, and mitigation. Specifically, we could assist with the design of mitigation strategies that would result in emission reductions that are:

    - real, specific, identifiable, and quantifiable;
    - permanent;
    - verifiable; and
    - additional to existing law, rule, or supplementary requirements.

- Mitigation projects occurring within Washington are typically more easily tracked and accounted for, and support more accurate state GHG inventories. In-state actions would provide the added benefit of helping Washington reach its GHG reduction targets.

Again, thank you for the opportunity to comment. Please do not hesitate to contact Ben Blank at Ben.Blank@ecy.wa.gov or me at Sally.Toteff(&,ecy.wa.gov if you have questions about our comments.

Sincerely,

Sally Toteff

Carole: Thank you. Jenn Adrien?

Jenn: Thank you for the opportunity to speak this afternoon. My name is Jenn Adrien. I'm the vice president for communications with the Economic Development Board for Tacoma-Pierce County. The organization I work with is in the business of helping companies create and retain family wages jobs for residents.

[01:02:04] But more than that, I'm a fifth generation Tacoman. I grew up in the shadow of the Asarco smelter. Tacoma's polluted, gritty past is one in which I spent the entirety of my childhood. Thanks to a lot of hard work, today, we experience a city that is far cleaner than that of my parents and grandparents. The LNG facility will allow us to take it yet another step forward. But what's most important to me is that I am now the mother of a sixth generation Tacoman. He is the reason I am here to express my support for the PSE LNG facility.

This draft SEIS published by your agency earlier this month clearly shows that replacing transportation diesel fuel with clean burning LNG has a strong environmental benefit. Every child and adult in the region, everyone in this room, people who live and work near the industrial areas, and yes, my own child will be granted a healthier environment, when LNG replaces diesel.

[01:03:10] In addition to the environmental benefits of LNG, our community needs a reliable supply of natural gas 365 days a year. Like many others in this very room, I use it to heat my home, wash my clothes, and prepare food for my family. Pierce County is among the fastest growing counties in the country. And new residents add to the demand for natural gas every day. The solutions to meet future demand are pipeline expansion or storage. Natural gas storage at Tacoma LNG helps ensure that natural gas remains available all year round, for residents and businesses, even in the times when demand and usage peak, such as cold, winter days.

I urge you promptly to complete your environmental review and issue the air permit, so that this project can move forward.

[01:04:07] It's better for the environment. It's good for jobs. And it will allow us to give our children a better Tacoma than what was passed to us. Thank you.

Bruce: Members of the agency, thank you for this opportunity to speak today. Welcome to the South Sound, by the way. I am Bruce Kendall, president and CEO of the Economic Development Board for Tacoma-Pierce County. We're in the business of helping companies create and retain family wage jobs for our citizens. Some of our clients are home grown. And others come from regions around the globe. In every case, they, like us, embrace a greener, more productive energy future that supports good jobs. That's why I'm here today to express my support for Puget Sound Energy's liquified natural gas facility.

[00:04:04] Replacing transportation diesel fuel with clean burning LNG has strong environmental benefits as shown in the draft supplemental environmental impact statement published by the agency on October 8. We now urge the agency to issue the necessary permits for the project to proceed. As you know, from your research, switching from diesel to LNG reduces green house gas emissions by nearly 15%, sulfur dioxide emissions by over 99%, and nitrogen oxide emissions by nearly 85%, all while eliminating visible particulate matter produced by ships by more than 85%.

It is these particulate emissions that are extremely harmful to the lung health of anyone breathing them in. This is no esoteric matter. Every child and adult, in the region, including everyone in this room, and particularly those who live or work near industrial areas, will be granted a healthier environment when LNG replaces diesel.

[00:05:07] We are so fortunate to have companies like Puget Sound Energy stepping up to make these investments on our behalf. It's also important to note that LNG powered ships will substantially exceed the North American emission control area requirements established by the International Marine Organization. In addition to helping with the environment, there are some economic benefits that are substantial. The project will create at least 250 construction jobs and over 300 indirect jobs due to the construction. And after the construction, another 125 permanent jobs.

The study is clear. It's time for the permits to move forward. It's good for the environment. It's good for human health. And it's good for jobs. Thank you.

Carole: Thank you, Mr. Kendall. The next speaker is Eric Johnson. And I only see one other person in the front, so I'm going to call the names again.

Carole: Thank you for your comments. Lou Paulsen.

Lou: Good afternoon, and thank you for the opportunity to speak today. My name is Lou Paulsen. I am the director of Strategic Operations Projects and Risk Management with the Board of Tacoma. And I am here to speak on behalf of the commissioners of the Board of Tacoma. The board is pleased that the SEIS confirms that we have long believed. That LNG, while not a perfect solution, is a step in the right direction, as the maritime shipping industry improves its impact on the environment. One day, renewable technology may be able to replace fossil fuels in the shipping industry.

[00:18:00] But that day is not now and won't be for many years. In the meantime, LNG is a better choice as evidenced by the SEIS. The maritime industry is investing heavily in LNG as a better alternative to the heavy fuel currently used in ships. Most new large ships are being built with dual fuel capability and will be able to use LNG. Exemplifying this, and largely for environmental reasons, Carnival Cruise Lines and others are making the transition from traditional fuels to LNGs. And BC Ferries, to the north of us, is now operating on LNG.

This facility will be a critical piece of our port infrastructure. It being in the tide flats and closed to our terminal operations will help the port remain competitive into the future. And local investments in LNG means that, in the future, cleaner ships will call our port, and the use of LNG will improve the local air quality.

[00:19:00] It will mean cleaner air for the men and women working in the tide flats and in the local community. Importantly, Puget Sound Clean Air Agencies use the correct approach to modeling emissions. The analysis is consistent with the Kyoto Protocol, the Paris Climate Agreement, USEPA, Washington State Department of Ecology, and its own policies. To deviate from this approach would be inconsistent with federal and state standards. The Port of Tacoma requests that Puget Sound Clean Air Agency make the draft SEIS final and allow this project to move forward. Thank you.

Steve: Thank you. Next up, Norma Ramirez. Next up, Tom Pierson?

[05:17:00]

Tom: Good evening. I'm Tom Pierson. I'm president and CEO for the Tacoma-Pierce County Chamber. I actually live here locally, Pierce County, South End. And I appreciate the opportunity to comment. We've been hearing from lots of folks about the greenhouse gas emissions and which formula is best to calculate emissions here in Tacoma. I, for one, haven't dated a climate scientist, I'm not a climate scientist. But what I'd like to do is highlight the bigger picture. And it starts with TOTE Maritime.

This conversation is happening because, in 2010, eight years ago, the United Nations and International Maritime Organization, the IMO, set rules regulating shipping companies to make serious reductions to emissions.

[05:18:02] And then, in April, the IMO said by 2050, global shipping industry must reduce its greenhouse gas emissions by 50% by the 2008 levels at least. They said that the stronger mandate lines line up with the Paris Agreement, temperature goals, and the path laid towards eliminating greenhouse gases entirely. TOTE Maritime stepped up. Imagine that. a locally based company who understands first hand how badly we need to protect the environment. It has been amongst the first, in the industry, to do so.

Because while we may argue the fine points of the formulas used here for this year or for that year, IMO has already set standards for maritime and for TOTE that has taken the lead to invest in technologies that will make the ships forever cleaner. In the context and the reality of the world, beyond Pierce County, the value of LNG as maritime fuel is even greater, using LNG results and real reduction in air particulates.

[05:19:10] While we may bicker the formulas to use, there's no question LNG is cleanest burning commercially available fuel for ships. And it is also the step in the right direction right now. Every day we are circling, it's another day that we've missed an opportunity for cleaner air here in Tacoma, here in Pierce County. I urge the people on this panel to be guided by the things that we know today. Take action today. TOTE has not hesitated to do what they can. And we should follow their lead and do the same. In closing, this project strengthens us by being united around the shared values.

Environmental stewardship, social justice, and economic prosperity. Thank you.

[05:20:00]

Steve: Okay. Before I call up the next speaker, just to give you a heads up, the next ones that are cued up after that group are Wendy Pantoja, Carole Sue Braaten, Carol Umbehocker, and Rayna Holtz. So, next up is Terry Velasquez. Chuck Valdez?

Carole: Thank you. Jordan Royer.

Jordan: Thank you for being here, and thank you for taking public comment. My name is Jordan Royer, and I'm the vice president for external affairs for the Pacific Merchant Shipping Association. I'm also with the Manufacturing Industrial Council of Seattle and now the South Sound Manufacturing Industrial Council. And I'm speaking on all of their behalf. First of all, a little, tiny bit of history. Dennis McLaren, when he was the chair of the board, started this ball rolling, with all of us in the industry, saying we needed to reduce our emissions. We needed to get ahead of all of these things.

[00:34:00] And we needed to clean the air. We pushed for a strong MARPOL Annex VI, which led to the emissions control area 200 miles out from shore. We were the first. Canada followed. Still waiting for Mexico to follow. And what came out of that is that TOTE decided that it would be a better idea for them to actually to all of the way and go to LNG because that's much cleaner. It reduces sulfur. It, virtually, reduces risk of oil spill. All of these things are very good. And they're an innovative company.

And the governor, at that time, just four years ago, said that this is the first time a tax incentive will be tied to concrete carbon emission reductions and includes other real accountability measures to ensure taxpayers receive maximum return on their investment. That was legislation that was passed at the state legislature to encourage this to happen. Somebody on your board, Jessica Finn Coven, the director of climate solutions, Jessica Finn Coven, the director of climate solutions, said, at the time, "I'm very pleased they are looking at ways to significantly reduce the greenhouse gases."

[00:35:00] That should be applauded. I'm part of also the governor's Maritime Blue. This is part of that. It's being discussed all of the time. The shipping industry is moving towards this. This is the bridge fuel. You cannot just eliminate all fossil fuels in the shipping industry. No way to move a 900 foot ship on electric motors yet. It would be nice if there were, but there's not yet. So, really, and I think your study and all of the time that we've spent on this really shows that this is going to help things. It's going to reduce greenhouse gases.

It's going to reduce sulfur. It's going to reduce nitrous oxides. It's going to make a cleaner environment for all of us. And TOTE

should be applauded for innovating the way they have, on so many other things like redundant propulsion systems, permanent ballast tanks. They've flushed no ballast out into the water. So, there's no invasive species risk. So, all of these things are very important. And if companies that do all of this get the rug pulled out from under them, after being encouraged to do things, there's not going to be much use in any of us in participating in Maritime Blue or any other thing. Thank you.

1141-1 23. General Support

[00:36:02]

Carole: Thank you. Greg Unruh.

Greg: Thank you for the opportunity to speak today. My name is Greg Unruh. And I am board chair of the Economic Development Board for Tacoma-Pierce County. I'm here today to express my support for Puget Sound Energey's LNG facility. I concur with the conclusion about the environmental benefit of replacing transportation diesel fuel with clean burning LNG contained in the October 8, 2018 draft SEIS issued by the Puget Sound Clean Air Agency.

And I support the agency in issuing necessary permits for the project to proceed. In addition to the environmental benefits, the LNG facility will also generate important economic benefits for all South Sound residents. In addition to helping local employers like TOTE remain competitive, it will create at least 250 construction jobs and over 300 indirect jobs, due to the construction.

[00:37:10] After the construction, the economic activity from the project will create another 126 permanent jobs. I have lived and worked in Pierce County for the past 30 years and have seen amazing improvements in our economy and our environment. Our companies have embraced a strong environmental ethic and strive every day to do the right thing. Their customers and their workers demand it. And LNG is another step, in the right direction. Thank you.

Subject: TOTE MARITIME ALASKA LNG PROJECT

Good afternoon,

I am writing as the head of logistics at Honda, longtime partners with TOTE Maritime. We have followed with great anticipation TOTE's conversion to LNG as it aligns very closely with our corporate initiative to leave the world better than we find it today (our "Blue Skies for Our Children" initiative).

I lead the teams responsible for shipping automobiles from factories around the world to our dealerships in the U.S. As you can imagine this activity creates a significant carbon / GHG footprint, which we are striving to reduce. We do this by collaborating with likeminded Ocean Carriers, Railroads and Trucking Partners who are proactively seeking to reduce the carbon footprint and GHG emissions related to their trade.

I was concerned to hear of delays in TOTE Maritime's conversion plan when I last inquired. It seems as though the environmental review has taken on a life of its own and has gone on far too long already. I have seen this happen in other regions to the detriment of the Port's competitiveness and ability to serve the growing demand of shippers (like Honda) for clean air alternatives. Further delay puts the port of Tacoma (in my opinion) at a competitive dis-advantage while continuing to un-necessarily pollute our environment. As I understand them, the benefits of this conversion are quite clear:

- Nearly 14% reduction in GHG
- The practical elimination of particulate emissions
- 100% reduction in SOX
- 90% reduction in Nitrogen Oxides

We can all be proud of these outcomes. As a company concerned with the environment we leave our children and grandchildren, I felt it important to express my concern regarding the delays and urge you to move swiftly forward with the approvals necessary to enable TOTE's LNG conversion plan.

Sincerely,

AMERICAN HONDA MOTOR CO., INC.

Re: Puget Sound Energy Proposed Tacoma LNG Project Final Environmental Impact Statement.

The hard-working men and women of Laborers' Local 252 are stakeholders in the construction and maintenance of the LNG facility being constructed by Puget Sound Energy at the Port of Tacoma.

Our members are trained to build and maintain the liquid gas infrastructure of our country and are the best at doing what we do. We are proud to be part of the solution to reduce the overall emissions at the port of Tacoma. Using LNG to cut particulate matter produced by ships more than 85 percent will give our members, our families, and our community cleaner air to breathe.

Also, overall, the switch to LNG from the current diesel will be good for the long-term impact of greenhouse gasses. The Draft Supplemental Environmental Impact Statement stated, "When evaluating direct, upstream, and end use GHG emissions, replacing a diesel propulsion engine with a pure LNG propulsion engine result in reduced life-cycle GHG emissions."

This project is a step in the right direction to reduce particulates in our air, provides good, family-wage jobs for our community, and will help us bridge to cleaner, greener fuels.

Please approve this project in Tacoma. Thank you.

In solidarity,

Brian Belarde
Business Manager/Secretary-Treasurer

To the Puget Sound Clean Air Agency:

I am writing on behalf of the Transportation Institute (TI) in support of the findings in the Puget Sound Clean Air Agency's Draft Supplemental Environmental Impact Statement for the proposed Tacoma liquefied natural gas project to be located in an area zoned as Port Maritime Industrial and owned by the Port of Tacoma. We respectfully ask that the report findings that the Proposed Action sufficiently improves regional air quality relative to the No Action Alternative and lead to a rapid approval of any further permits needed for the completion of the project without any further hindrances or delay.

The Transportation Institute was established in 1967 as a Washington-based, non-profit organization dedicated to maritime research education and promotion. The Institute's member companies participate in all phases of the nation's deep sea foreign and domestic shipping trades, and barge and tugboat operations on the Great Lakes and on the 25,000 mile network of America's inland waterways. These operations embrace deep-sea and river passenger vessels, and liquid, dry-bulk, container and special purpose ships. Many are contracted to the U.S. military services. All are of U.S. registry -- crewed by American citizens operating under the world's highest safety standards, and proudly flying the American flag. With offices on the East and West Coasts (Seattle), the Transportation Institute supports a wide range of programs promoting the strength of America's maritime capability. Here in the Pacific Northwest our members include Alaska Tanker Company, Crowley Maritime, Matson Navigation, and TOTE, Inc.

The Transportation Institute has a long history of working with TOTE on their vision to use clean LNG for the propulsion of their diesel-electric ORCA Class vessels. The clear expectation at that time was for the effort to get underway and engender the support of a community having a long history of problems exacerbated by foul emissions and airborne pollutants. This was due to Pierce County (the region TOTE operates in and homeports its twice-weekly 2900 nautical mile shuttles to Anchorage, Alaska by its 840 foot-long, 118-foot-wide roll-on/roll-off vessels) having the worst wood smoke particulate matter problem in the country, according to the PSCAA. Further, fine particular matter, also known as PM 2.5, is an air pollutant known to cause asthma attacks, strokes, heart attacks and cancer. Parts of Tacoma/Pierce County are in non-attainment for PM 2.5 air quality (https://www.co.pierce.wa.us/2288/Air-Quality).

Back in 2012, TOTE sought help in seeking a partnership with government agencies to recognize the significance of their taking the risk and being the first large, ocean-going cargo vessel operator in the world to commit to using LNG as a propulsion fuel. Subsequent outreach to leadership of Region 10 of

the EPA, USCG, Obama Administration, PSCAA, Maritime Administration, and others led to TOTE being able to obtain the confidence, regulatory certainty, and support to take the risk, and make the multi-millions of dollar investment to proceed with converting their relatively new vessels to LNG and to seek a production partner for the supply of LNG. In fact, TOTE's decision to convert to LNG was seen as a great breakthrough in fixing the region's air pollution problems. Not only would we gain improved environmental quality by having a large customer like TOTE use clean-burning LNG, but the placement of a LNG storage and peak-shaving facility would be a great regional asset by allowing for commercial vehicle fleets to access LNG and assure regional utility customers could have a dependable and reliant store of fuel when heating or cooling demand peaked. The potential for heavy-duty trucks using LNG once available is already being recognized in Europe as reported earlier in the year by Platts https://www.spglobal.com/platts/en/market-insights/latest-news/natural-gas/022718-feature-industry-sees-bright-future-for-lng-to-fuel-europes-trucks. An example of a local small vehicle fleet using LNG was recognized by Western Washington Clean Cities in 2016 when they awarded Potelco for successfully deploying what is believed to be the first liquefied natural gas (LNG) fueled Ford F-450s in the country and first fleet operators to convert to LNG in Washington. As a result, Potelco's vehicles displaced nearly 250,000 gallons of petroleum in 2015 for their estimated 157 vehicles converted to LNG.

After many months of negotiations with regulatory agencies and LNG purveyors, TOTE settled upon a trusted partnership with Puget Sound Energy, a well-known and local energy supplier. In part, this decision was based on PSE's access to an existing LNG pipeline along the I-5 highway corridor and just miles from the intended peak-shaving/storage facility. Consequently, there is less marginal risk of methane leakage with an existing pipeline for PSE to tap into as opposed to having to construct, test, and provide regional access to a new source of LNG.

TOTE has long held a worthy reputation for being a locally-owned, responsible, and environmentally-forward thinking vessel operator. Their ORCA class vessels are widely known as being environmentally sensitive in their design –having an internal ballast water system, redundant propulsion and navigation systems, double-hulled fuel containment, and specially designed and located oil-spill response stations within the cargo holds. The two ships themselves together handle the same volume of cargo as the three ships they replaced. This is achieved at a roughly 25 percent reduction in overall consumption of fuel. Furthermore, the ORCA-class vessels can accommodate the 53-foot trailers typically used on the I-5/Alcan Highway overland truck route to Anchorage. Shifting truck trailers from making the 2400 mile land route to the 1450 sea route provides a considerable reduction in emissions emitted per metric ton of freight. This equates to roughly a 3.75 to 6.0 ratio reduction of emissions per ton/mile in the movement of freight via waterborne transportation. Additional environmental benefits include less highway congestion, asphalt oil run-off, and decreased toxic brake lining and rubber tire particles leeching into streams and navigable waters.

Ecologically-sensitive Alaskans are particularly appreciative of TOTE's contribution to assuring recyclable materials collected from Alaskans for Litter Prevention and Recycling (ALPAR) are brought to Puget Sound for proper handling as TOTE transports over 400 trailer loads of such materials southbound. They were among the first cargo operators to seek to establish shore-side electrification for their vessels to

avoid burning fossil fuel while in port and were the very first terminal operator in the region to establish an industrial rainwater garden to reduce harmful runoff from reaching the Thea Foss waterway.

Unsurprisingly, TOTE has been recognized with numerous awards for these vessels and its business practices, including the State/British Columbia Oil Spill Task Force Legacy Award, the Alaska Department of Conservation Commissioner's Pollution Prevention Award, Washington Governor's Award for Pollution Prevention and Sustainability, and the US Coast Guard's prestigious William M. Benkert Environmental Excellence Bronze Award.

In fact, TOTE's President and CEO during the decision making on whether to take on the cost and risk of converting and building the world's first LNG-propelled cargo ships, Anthony Chiarello, was honored by no less than President Barack Obama in 2014 as recipient of the White House Champion of Change award. This was presented during the Obama Presidency for his work bringing LNG to the maritime industry. According to the award pronouncement:

> "Anthony has led TOTE to build the first liquefied natural gas (LNG) powered container ships in the world; TOTE is the first maritime company in the U.S. to convert its entire fleet to natural gas. As a result of his vision and leadership, natural gas suppliers are now creating distribution networks in major U.S. ports, making gas available to all transportation modes in those markets. Natural gas powered ships will achieve emissions reductions far below even the world's most stringent regulatory standards. These emissions reductions will have long-lasting and far-reaching positive effects on the health and safety of citizens along the U.S. coastline, particularly in Washington, Alaska, Florida, and Puerto Rico where TOTE ships are part of the critical domestic supply chain. As the adoption of natural gas fuel spreads, air emissions will be lowered along the coastline as part of the North American Emissions Control Area, and additional environmental benefits will accrue in ports, on roads, and rail lines."

This 2014 statement is prophetic as numerous U.S.-flag and foreign-flag vessel operators have followed TOTE's lead by completing or beginning construction on new LNG-propelled vessels or are in the planning stages to do so. In large measure this is due to the International Maritime Organization (IMO) banning ships from using fuels with a sulfur content above 0.5 percent, compared with 3.5 percent now, unless they are equipped to clean up sulfur emissions. This will be enforced by fines levied by the IMO's member states. A small sampling of these new-builds or orders includes:

(Tankers)

Furthermore, an August 2018 article in Reuters (https://www.reuters.com/article/us-shipping-fuel-lng-analysis/new-fuel-rules-push-shipowners-to-go-green-with-lng-idUSKBN1L01I8) demonstrates the gaining popularity of the use of LNG by vessel operators to address global concern regarding GHG and meet International Maritime Organization limits on sulfur content. The article notes Gibraltar, the largest bunkering port in the Mediterranean, is building an LNG facility and seeks to make available LNG bunker barges to be able to bunker the 125 ships around the world using LNG. Furthermore, the article mentions that ship certification experts DNV GL, estimates another 400 to 600 LNG capable ships are expected to be delivered by 2020. The Reuters article quotes Martin Wold, a senior consultant at DNV GL as stating, "Over the last year or so there is a growing consensus among shipowners that LNG is a reasonable next step. It is gaining traction."

According to the October 4th 2018 issue of LNG Industry, Allard Castelein, CEO Port of Rotterdam, the largest port in Europe and located in the Netherlands (Europe's lowlands and most susceptible to flooding from global warming-related flooding), said:

> "The Port of Rotterdam Authority highly values and actively supports a more sustainable transport sector. As a result of cooperation with many parties like Shell and Sovcomflot we are leading the way in this transition. Compared to other fuels, LNG offers significant benefits to local air quality and contributes to the reduction of greenhouse gasses. We welcome the Gagarin Prospect and her sister vessels to our port and look forward to many more secure and efficient LNG bunker operations."

In its promotion of marine LNG, the Port of Rotterdam is now offering seagoing vessels bunkering liquefied natural gas (LNG) in the port a ten percent discount on gross seaport dues among other LNG-related promotional efforts.

Similarly, the US Department of Transportation through its Maritime Administration (Marad) remains a steadfast advocate of the use of LNG as a marine fuel. Marad recognizes LNG as a "promising alternative marine fuel that can result in significant criteria pollutant reductions" and in the recent past "partnered with a number of organizations (including TOTE) to assess and, as appropriate, demonstrate the use of LNG for vessels." Former Maritime Administrator Paul 'Chip' Jaenichen has stated:

> "These investments accelerate the growth of alternative fuel and environmental technologies throughout the United States' maritime industry. These projects will yield data that will support future commercial investment decisions and will provide lasting benefits for our nation while helping us reduce the industry's environmental footprint,...this is how government can work to encourage technology advancement and environmental stewardship."

It would be beyond absurd for an agency dedicated to clean air emissions, in a state that fancies itself the most trade dependent in the Nation, in a county hosting the largest port in the state –which for years distinguished itself as the singular county in Washington for routinely being in non-attainment of EPA air quality standards, not to support the beneficial impact access to marine LNG has in drastically reducing criteria air pollutants while sustaining our economy and the family-wage jobs maritime commerce provides.

Furthermore, given the demonstrated direction enlightened ports and vessel operators are going to embrace LNG as a marine and transport propulsion source offering the best current and foreseeable bridge fuel alternative for world shipping, Washington and Puget Sound regulators, public policy leaders, government officials, and residents should not create barriers to its implementation and undermining its burgeoning embrace by the worldwide maritime community as a lower-carbon transition fuel. International cooperation in assuring there is a worldwide network of LNG bunkering services/facilities is what is needed for the increasing number of LNG-propelled vessels.

Having attended much of the public hearing on the DSEIS offered by PSCAA in Tacoma on October 30, 2018, I wish to share some additional comments addressing some issues raised at the event. First, more than one individual mentioned increased levels of benzene were likely to be emitted as a result of the PSE LNG facility. According to Applied Analytics, https://aai.solutions/applications/lng-liquefied-natural-gas-analysis) contaminants in natural gas which need to be removed prior to liquefaction include benzene, toluene and xylenes (BTEX). Natural gas process producers often need to comply with contractual pipeline agreements and are interested in corrosion prevention on their liquefaction equipment. Benzene, toluene and xylenes (BTEX) in pre-liquefied natural gas readily freezes at the cold temperatures required in the liquefaction process. The liquefaction equipment can become blocked or coated by these solids which would then require shut down for maintenance. As a preemptive measure, LNG producers remove BTEX from the natural gas before liquefaction. Thus it seems more likely there

would be higher levels of benzene emissions from surrounding area commercial gas stations than from the PSE facility.

The Global Warming Potential (GWP) modeling completed by the DSEIS authors, Ecology and Environment, Inc, uses a 100-year impact calculation standard. This method is described by the EPA as one primarily used in the United States as a GWP measure of the relative impact of different GHGs (https://www.epa.gov/ghgemissions/understanding-global-warming-potentials#Learnwhy). Detractors of the findings of the DSEIS have claimed a briefer 20 or 25-year GWP model should have been used. The PSCAA should accept the authors' decision to use the 100-year GWP standard in their presentation of the DSEIS findings and valid conclusion.

Numerous commentators at the public hearing gave short shrift to the viability and merit of the case for LNG/methane and its increasing role as a lower-carbon transition fuel. Little acknowledgment was given by the commentators, nor is it recognized by the SDEIS authors, as to the realistic technological innovation to harnessing emissions that can be achieved by reducing methane slippage. According to the Climate and Clean Air Coalition (http://www.ccacoalition.org/en/activity/ccac-oil-gas-methane-partnership), the International Energy Agency (IEA) has identified minimizing methane emissions from upstream oil and gas production as one of five key global greenhouse gas mitigation scenarios. Referring to opportunities to limit methane slippage, the IEA notes:

> "...low-cost reductions in this area could account for nearly 15% (over 0.5 Gt CO2-eq) of the total greenhouse gas reductions needed by 2020 to keep the world on a 2-degree path. The IEA estimates that global oil and gas related methane emissions in 2015 were 76 mt, but also that it is technically possible to reduce these by roughly 75% - and by up to 50% just by implementing approaches that have no net costs, taking into account the value of the gas saved."

There is little reasonable doubt not to expect more widespread use of abatement technologies and practices as the LNG sector grows and modernizes in the near-term.

For these many reasons we urge the PSCAA to accept the findings in the DSEIS and rapidly approve the final permits needed to advance the Tacoma LNG Facility and TOTE Marine Vessel Fueling Facility to fruition and thus enhance the air quality in our region.

Thank you for this opportunity to share our views on this critical issue for the U.S.-flag maritime community.

Respectfully yours,

Richard Berkowitz

GUNNAR LUNDEBERG • PRESIDENT / SECRETARY-TREASURER

October 30, 2018

The Sailors' Union of the Pacific wishes to express our support for Puget Sound Energy's (PSE) liquefied natural gas (LNG) facility at the Port of Tacoma, as well as in support of the Puget Sound Clean Air Agency (PSCAA) finalizing its SEIS consistent with the draft it issued on October 8, 2018 and timely issuing PSE the necessary permit(s) to proceed.

There are many stakeholders in the effort to reduce emissions, and even more moving parts involved in the actual process of doing so. In the last five years alone, the Port of Tacoma, the Port of Seattle and the Vancouver Fraser [Canada] Port Authority have created an updated Northwest Ports Clean Air Strategy with the objectives of reducing port-related air quality impacts of diesel particulate matter, reducing greenhouse gas emissions, and meeting air quality standards and objectives for the airshed. The PSCAA itself is a partner in the implementation of this effort, along with agencies including the Environmental Protection Agency (EPA).

The PSE LNG facility is one part of the task of reducing diesel emissions. LNG fuel cuts particulate matter (PM) emissions produced by ships by more than 85%. These particulates are extremely harmful to the lung health of dock workers and those in the surrounding neighborhoods. According to dock workers, they not only see the black diesel particulates floating in the air, but they breathe them in while ships (still burning diesel) are waiting to dock. Besides eliminating the PM emissions, LNG fuel also reduces greenhouse gas emissions by nearly 15%, sulfur dioxide (SOx) emissions by over 99% and nitrogen oxide (NOx) emissions by nearly 85%. Another important environmental advantage of the utilization of LNG as a fuel is that in the unlikely event of a spill, LNG turns into vapor and dissipates with no lasting effects on water or marine life.

Reducing these real-time emissions is a matter of social justice. Sailors & port workers should not be subjected to this polluted air just for doing their jobs. Workers across the West Coast ports have been vocal about the need to reduce these emissions in their work place, and they have played an integral role in supporting ports' efforts such as the Northwest Ports Clean Air Strategy to reduce emissions. Locating the Tacoma LNG facility within the Port of Tacoma advances the effort to reduce emissions at their source.

Beyond emissions affecting ports and immediately adjacent neighborhoods, the United States has staked out the position that vessels must control emissions when travelling America's coastlines up and down the Pacific Ocean. Annex 6 to the MARPOL Treaty, for which the EPA is the enforcing agency, requires Jones Act-flagged ships that travel near to shore to significantly reduce their emissions by using cleaner fuels. TOTE's use of fuel from Tacoma LNG to power its fast-transit, near-shore ships allows the company to substantially exceed its regulatory commitment to the EPA. By using LNG, TOTE will provide major emissions reductions benefitting public health for all communities and residents along its West Coast route, which transits nearly all of Puget Sound and ends in Anchorage, Alaska. Furthermore, US flag vessels engaged in International commerce are faced with ever increasing emission regulations in foreign ports. Vessels are consistently being called upon to be cutting edge and to be within compliance of often more stringent international standards than we face in the United States. Non-compliance with International emission reduction standards will create further disadvantages and barriers to US shipping and industry.

The draft SEIS, prepared by Ecology and Environment, Inc. and released by PSCAA on October 8, 2018, stated "When evaluating direct, upstream, and end use GHG emissions, replacing a diesel propulsion engine with a pure LNG propulsion engine result in reduced life-cycle GHG emissions."

Taking into consideration the overall reduction in greenhouse gas emissions confirmed by the draft SEIS for Tacoma LNG, and the human and environmental benefits of such reductions, I fully support PSCAA finalizing its SEPA review and granting the necessary permit(s) so this important addition to our region can be completed within its new scheduled timeframe.

The Tacoma LNG facility is a project that allows multiple stakeholders – Washington coastal communities, the Port of Tacoma, adjacent neighborhoods, PSCAA, EPA and TOTE - to affirmatively advance their interests in emissions reductions. Speaking for the US Merchant Mariners serving in the ports of the Pacific Northwest, our health and economic well-being are substantially furthered by this project's timely environmental review and permit process conclusion. Please, support the creation of sustainable, family wage jobs at the Port of Tacoma, which also improve air quality and workers health.

PSCAA
Attn: Public Comment
1904 3rd Ave
Suite 105
Seattle, WA 98101

To Whom it may concern:

I am writing to you today as a resident of Tacoma and as President of Patriot Fire Protection. Speaking for 250 of our employees here in the Northwest, we have been installing quality fire protection systems for Northwest facilities for over 25 years. Our work includes significant amounts of installed fire sprinklers and other types of similar suppression systems in over 300 million square feet of facilities throughout the region.

Patriot Fire Protection considers itself a leader in our industry, we understand and protect against varied hazards, whether storing highly combustible materials in a warehouse, fire control in a 50 story Hi-rise in Seattle, or Special Hazard protection for unique manufacturing facilities. I have watched Puget Sound Energy's attempt to build a Liquified Natural Gas (LNG) facility and TOTE Maritime's innovative and environmentally friendly initiative to convert its Alaska bound ORCA class vessels to LNG very closely after the last year. Fire Protection is not an unresolved concern.

From a Fire Safety standpoint, The National Fire Protection Association has written Standard 59A. The specific standard was written for the sole purpose of providing fire safety for "The Production, Storage, and Handling of Liquefied Natural Gas". The Origin of 59A goes back to a technical committee dealing with the risks associated with LNG, they first met in 1960. The standard has been updated over a dozen times in the last 50 years and has now been adopted into the National Fire Codes. By comparison, NFPA Standard 70 is our National Electric Code. I would urge the Puget Sound Air Agency to follow the extensive data, analysis, and engineering that has been completed. The City of Tacoma has completed an Environmental Impact Statement that includes all extensive analysis of the safety of the LNG facility. In addition, the City of Tacoma Fire Department commissioned an additional independent safety review of the facility done by Braemar, a widely respected safety firm that further evaluated the design, siting, and overall safety of the facility. The analysis concludes: "The technical review of Tacoma's LNG fire and safety systems did not reveal any fatal flaws or visible design deficiencies. Tacoma LNG

PATRIOT FIRE PROTECTION, INC.
Fire Sprinklers Save Lives!
2707 70TH Avenue East
Tacoma, WA 98424
TEL: (253) 926.2290
FAX: (253) 922.6150

was designed to applicable codes and standards with significant attention to detail, a perceived objective of becoming a best in class LNG Facility." Put simply, this facility is being built to the highest standards in the industry with State-of-the-art safety standards.

As a fire protection professional, it is important that we take every step to ensure the safety of the facility, but it is irresponsible to ignore data, science, engineering, and simply "shout out" false assumptions on the safety of the facility. In our day to day lives, there is nothing we do that is risk free. However, I praise the City of Tacoma for going the extra mile to seek an independent review to address safety issues of the LNG facility. Now it is time to follow the data and issue all the permits necessary to get the LNG facility operational.

Tacoma and Pierce County benefit a great deal with the construction of the LNG facility and TOTE's conversion to LNG fueled ships. We stay competitive in the world shipping market and we improve our local air and water quality. Let me close with the environmental data to date:

100% reduction in Sulphur Oxides
99% reduction in Particulate Matter
90% reduction in Nitrogen Oxides
13.5% overall reduction in greenhouse gases as outlined in your draft Supplemental Environmental Impact Statement.

Again, I would urge you to follow the data, the science, and engineering analysis. This process has gone on way too long and the delays in issuing all the appropriate permits flies in the face of the data. What will we be telling the larger community and all current and future businesses interested in innovation by providing environmental leadership if we say no after all the data and merits say yes.

Thank you for considering my comments.

Sincerely,

James Boulanger

President,
Patriot Fire Protection

Dear PSCAA,

The Puyallup Tribe is strongly opposed to this facility right next to their marina on the Hylebos.
Puyallup treaty rights and fishing rights need to be respected by our local government. 28 WA
tribes voted to oppose the PSE LNG. From the very beginning, the public was kept out of the loop. There was no notification to residents. Neighbors half a mile from the LNG tank proposal were not notified. As a result, SEPA only had a handful comments from the general public. The city and port have been pushing for this development and Jake Fey, state representative, created a special LNG tax break several years ago after he was contacted by a PSE lobbyist. PSE has been spending millions on political campaigns and green-washing. The city is not acting as a neutral lead agency.

0960-1 12. LCA Inputs and Assumptions - Global Warming Potential Value

November 20, 2018

To: Puget Sound Clean Air Agency (PSCAA)

Re: Comments on Draft SEIS for Proposed Tacoma LNG Facility

Thank you for conducting a Supplemental EIS of greenhouse gas emissions for the Tacoma LNG project. We write representing thousands of health professional members of Washington and Oregon Physicians for Social Responsibility, statewide organizations committed to protecting human health from the greatest threats we face, including climate change.

We stand with the Puyallup Tribe in asking for the most thorough and science-based review of this facility possible. We support their request, echoed by many other organizations and individuals, for a final EIS with more complete and accurate information about the true climate impacts of this project. The proposed LNG refinery, storage, and distribution facility is sited on Puyallup tribal land and is being built without their permission.

Global Warming Potential for Methane Leakage

The SEIS uses a 100-year timeline to assess methane leakage for the facility and its upstream impacts.[1] We request that the final EIS instead use the more accurate 20-year timeline, used by the United Nations Intergovernmental Panel on Climate Change.[2] While we understand that the 2007 standard is used by Washington State following the Environmental Protection Agency greenhouse gas reporting program, we ask that the final EIS utilize more up-to-date accounting based on the latest science.

0960-2 13. LCA Inputs and Assumptions - Natural Gas Source
0960-3 3. Outside of SEIS Scope

Using the 100-year timeline also incorrectly biases the analysis in favor of the project which is proposed to have a 40-year lifespan.
The climate forcing potency of methane is far greater in the short term. Using the best available science and the more recent assessment of climate impacts of methane leakage shows that the LNG project likely has a significantly greater climate impact than the “no action alternative” in PSCAA’s analysis.

Fracking in British Columbia

The SEIS asserts that the Tacoma LNG project will result in a net reduction of greenhouse gas emissions if the gas is sourced from British Columbia. It identifies the province’s regulations on the fracking and transport process as more protective than those found in the United States, in the end arguing that the gas for this facility must come from B.C. sources if the facility is to have a net benefit for greenhouse gas emissions.

As an organization of health professionals, we are concerned about any increase in demand for fracked gas and the health impacts that will have in B.C. communities. The emerging research on fracking finds that it is linked to various public health threats,[3] including air pollution that exacerbates asthma, heart disease, contributes to premature births and affects the brain and nervous system. Surface water and groundwater contamination have also become more prevalent near fracking sites and through disposal of fracking fluids. Fluid and wastewater from fracking has been found to contribute to adverse neurodevelopmental and reproductive outcomes.[4]

The construction of additional pipelines and increase in gas volume traveling through the region also raise concerns about erosion, loss of tree cover, leakage, fires, and explosions. Though the fracking may occur beyond Washington’s borders, we have a duty to consider the health and well-being of others in our region and throughout the gas supply chain.

Estimates of Methane Leakage

0960-4 14. LCA Inputs and Assumptions - Leakage/Slippage
0960-5 16. LCA Inputs and Assumptions - Hydraulic Fracturing
0960-6 22. General Opposition

The SEIS uses conservative estimates to model methane leaks from fracking in British Columbia.[5] More recent estimates find that pipelines and wells leak as much as 6 times more than previously reported.[6] We are concerned that the SEIS significantly underestimates the true increase in greenhouse gas emissions from the project due to methane leakage at each point along the supply chain, including LNG production, delivery, and storage, from B.C. to Tacoma and beyond. It is also likely that gas will come from other areas of the US and Canada. This additional impact of methane leakage along the supply chain from other places than B.C. must be included in a proper evaluation of the impacts of this project.

GHG Impact of Supply Chain for Frack Sand and Water

Fracking requires large consumption of water and sand for its operations, some of it coming long distances to the fracking well. GHG emissions from the diesel trucks and locomotives transporting the water and sand were not included in the analysis for this draft SEIS. One gas well uses a hundred rail cars of sand for fracking. One unit-train (100+cars) plus intermediate transport by diesel truck makes a significant quantity of diesel emissions to obtain gas from one well. Many, many wells and many trucks are required to fill a tanker ship with gas. The potential leakage from this supply chain has not been estimated in the draft EIS and would contribute greatly to the GHG emissions and footprint of this project.

Net Effect on Climate Change

According to Puget Sound Energy (PSE), the proposed plant will serve future customer demand, serve as a fueling station for ships that run on natural gas, and will be used to sell LNG to other industry merchants. The proposed plant, storing 8 million gallons of fracked gas, will likely bring a commensurate increase in bunkering barge and tugboat traffic in the Hylebos and Blair Waterways. PSE also plans to use the Tacoma facility to load barges and trucks with LNG destined for other regional markets. We are concerned that the SEIS has not accounted for the full potential of these activities to contribute to greenhouse gas emissions. Although ships that run on LNG emit lower particulate

0960-7 3. Outside of SEIS Scope

matter than those that run on diesel, will the increased conventional maritime and truck traffic negate any gains the region receives in air quality from converting ship traffic from diesel to LNG? Is there sufficient commitment among shipping companies to convert from diesel to LNG, in order to realize such gains? Furthermore, it is quite troubling that this plan to use precious time and resources to replace one fossil fuel with another will not address the greater and more urgent need to develop true alternatives in a short time frame for our survival. This analysis must consider the most up to date scientific evidence and methods in estimating the climate impact of this project. It has not done so.

Health Impacts of Climate Change

As health professionals, we are especially concerned about the impact the proposed LNG plant will have on the health of Puget Sound residents, as well as residents of the Region and the Planet. Climate change poses significant health consequences, and it is our duty to speak out against projects that could drive further climate change.

Climate change impacts health in several ways. It contributes to extreme heat events and urban flooding, which pose obvious health and safety risks. In our region, climate change is causing warmer, drier summers. This means increased levels of ozone pollution, creating health risks to those with lung and heart diseases. It also means a longer and more severe wildfire season, with its damaging particle pollution in smoke, as well as loss of life and infrastructure. (Visualize the wildfires currently burning in California.) Ozone can reduce lung function, trigger asthma attacks, inflame and damage the lungs, and aggravate emphysema and bronchitis.[7] Children are the group at highest risk from ozone exposure.

The principal threat from wildfire smoke is particulate matter, and exposure can cause serious disorders, including reduced lung function, bronchitis, pneumonia, exacerbation of asthma, strokes, chronic obstructive pulmonary disease, heart failure, and premature death. Children, pregnant women, and the elderly are especially vulnerable to smoke exposure. But particulate matter can also affect healthy people, causing respiratory

symptoms, transient reductions in lung function, and pulmonary inflammation.[8,9] Particulate matter, along with other air pollutants, accounts for over 1,000 deaths per year in Washington state. If the proposed plant results in more pollution from diesel burning trucks and maritime vehicles that don't run on LNG, this will add to the particulate matter burden of the region.

Furthermore, wildfires can also hasten ecosystem changes and release large amounts of carbon dioxide into the atmosphere—contributing further to climate change.[10] Increases in the number and intensity of wildfires spurred by climate change could release enough CO2 to endanger the state's and region's progress toward meeting its greenhouse gas reduction targets.

Missing Data

The review process was reopened for a Supplemental Environmental Impact Statement to take into account the life cycle impacts of fracked/natural gas in terms of its role in climate change. The Draft Supplemental Environmental Impact Statement (SEIS) released by the Puget Sound Clean Air Agency is inadequate and needs to be reworked in light of current scientific knowledge about the impacts of methane on climate change. And, in light of current scientific evidence indicating the urgent need to take action within the next 10-12 years to curb and radically reduce the release of greenhouse gases for the survival of a habitable planet, we are greatly concerned that this project will increase the demand for, production of, and burning of fossil fuels, resulting in a greater not lesser contribution to catastrophic climate disruption. The authors of the draft SEIS, in stating that the project will reduce our local, state, or regional carbon footprint, have biased the analysis in favor of their conclusions. The current version of the draft SEIS does not contain all the information that is needed to fully assess the accuracy of this study and the predicted impact of the LNG facility. There are at least 10 places in the study that have "placeholder" values instead of actual data. We request that the PSCAA complete the draft SEIS, re-issue it, and then reset the public comment period so that we may better formulate our questions about this project.

The Puget Sound Clean Air Agency has two principal goals: I) to protect public health and the environment from air pollution, and II) to become the most climate friendly region in the United States. We believe that the proposed Tacoma LNG plant, which will add to our fossil fuel infrastructure and has the potential to increase our overall greenhouse gas emissions, is incompatible with those goals. For these reasons, we request that PSCAA deny this permit.

Thank you for your attention to our concerns,

Sheri Tonn

Citizens for a Healthy Bay (CHB) is a 28-year-old organization whose mission is to represent and engage people in the cleanup, restoration, and protection of Commencement Bay, its surrounding waters and natural habitat. We are a 501(c)3 nonprofit providing practical, solutions-based environmental leadership in the Puget Sound area. We work side-by-side with residents, businesses, and government to prevent and mitigate pollution and to make our community healthier and more vibrant.

Staff and expert members of CHB's Policy and Technical Advisory Committee have reviewed the SEIS. Due to the significant amount of missing and outdated information, as well as our conclusion that this project will increase greenhouse gas (GHG) emissions, CHB is opposed to the completion of the LNG facility. We also found the SEIS to be extremely difficult to understand for lay people, which will prohibit the public from participating in this process. We ask the Puget Sound Clean Air Agency (PSCAA) to redraft the SEIS using accurate, up-to-date figures in its analysis, and reissue the SEIS for public review and comment. Our comments are outlined below, in addition to our letter dated October 26, 2018 and oral testimony from staff on October 30, 2018.

1095-1 14. LCA Inputs and Assumptions - Leakage/Slippage
1095-2 13. LCA Inputs and Assumptions - Natural Gas Source
1095-3 7. SEPA Alternatives
1095-4 11. LCA Inputs and Assumptions - General

Background

In 2014, PSE proposed building a new LNG facility in the Tacoma Tideflats. PSE stated the project is needed to provide fuel to TOTE Maritime and other marine shipping customers to meet emissions standards and provide fuel to residential customers during times of increased energy demand. In early 2018, PSCAA determined that a SEIS was needed because the original EIS did not provide quantitative analysis of the GHG emissions from the proposed project. The SEIS serves as a life cycle assessment (LCA) of GHGs, from extraction to combustion.

Methane Gas Source and Leakage

The SEIS' conclusion that the LNG project will result in a GHG reduction hinges on the requirement that all the methane gas comes from British Columbia (BC). The SEIS assumes the BC network has less fugitive emissions because flaring is prohibited and because of their "comprehensive drilling and production regulations that reduce methane emissions." Literature shows that BC's methane leakage rate is 2.5-6 times higher than previously reported [1, 2]. The LCA assumes the leakage rate in BC to be 0.32% - this leakage rate is extremely low and needs to be raised. **The SEIS should be revised by using a 3% leakage rate, to more accurately reflect the methane leakage that happens on the ground, and then reissued for public comment [3].**

Additionally, as the latest version of the 2018 *Flaring and Venting Reduction Guideline* from the BC Oil and Gas Commission shows, methane flaring is permitted in BC [4]. **This literature should be reviewed and the SEIS should be revised to show the emissions resultant from methane flaring in BC, and then reissued for public comment.**

Alternatives Considered

The SEIS uses WAC 197-11-620(1) to justify only considering two alternatives, the proposed and no action alternatives. The WAC states, "The SEIS should not include analysis of actions, alternatives, or impacts that is in the previously prepared EIS." Consequently, the SEIS *should* have considered alternatives that were not analyzed in the prepared EIS. On page 65 of Appendix C of the SEIS, several alternatives to meet the stated need are listed: marine gasoil, exhaust scrubbers, and low-sulphur fuel oil. In addition to these alternatives, the following operational changes can be employed to decrease emissions: optimized ship trim, slow steaming, hull cleaning, enhanced network routing, and engine maintenance [5]. **The SEIS should be updated with additional alternatives that serve to meet the stated need, and then reissued for public comment.**

Extraction Method

The SEIS fails to outline how the method of natural gas extraction. As stated on page 36 of Appendix C, "GHG emissions from petroleum production depend on the crude oil type and the extraction method." The same is true for methane gas. Methane gas extraction itself has associated fugitive emissions, and can contaminate ground and surface water [6]. **The SEIS should be revised to include the methane gas extraction method, and then reissued for public comment.**

1095-9 17. LCA Inputs and Assumptions - Peak Shaving
1095-10 19. LCA Inputs and Assumptions - End Use

Fugitive Emissions

The language in the SEIS is misleading concerning what fugitive emissions are being included in the LCA.

LNG Storage

Page 2-3 states, "The storage tank would be vapor- and liquid-tight without losses to the environment." The very following paragraph says, "GHG emissions would also occur from fugitive losses that occur from valves associated with the LNG storage tank." **This language and subsequent emissions calculations should be revised to accurately reflect the volume of fugitive emissions that occur from LNG storage, and the SEIS reissued for public comment.**

LNG Delivery to TOTE and Others

Page 2-4 states, "Fugitive GHG emissions would occur from valves and piping associated with the transfer of LNG to TOTE's ships, and from LNG loading to other marine vessels." But then goes onto say on page 2-5 "LNG bunkering of ships at the TOTE terminal would not produce any fugitive emissions." **This language and subsequent emissions calculations should be revised to accurately reflect the volume of fugitive emissions that occur from bunkering operations, and the SEIS reissued for public comment.**

Local LNG Transport

Page 30 and 31 of Appendix C states, "Since the natural gas for the Tacoma LNG project is supplied directly by a transmission pipeline, the fugitive emissions associated with transmission line will be attributed to Tacoma LNG emissions, but the local delivery or distribution portion will be estimated as zero." Fugitive methane emissions occur at every juncture between extraction and combustion [3, 6]. Fugitive emissions will result from trucking LNG from the Tacoma facility to the Gig Harbor facility, and by whatever other means are used to transport LNG. **This language and subsequent emissions calculations should be revised to accurately reflect the volume of fugitive emissions that occur from local transport operations, and the SEIS reissued for public comment.**

No Action Alternative

The description of the No Action alternative (NAA) is inaccurate, and makes the NAA seem worse than it actually is by assuming a 1:1 displacement of LNG with heavy diesel fuel (Appendix C p. 36). The described NAA does not reflect the reality of the current situation, and needs to be updated.

Peak Shaving

The NAA assumes that PSE will fuel peak shaving generators using diesel fuel, despite currently using natural gas to achieve peak shaving needs. **This language and subsequent emissions calculations should be revised to show that NAA peak shaving operations are achieved using natural gas, not diesel, and the SEIS should be reissued for public comment.**

On Road Trucking and Truck-to-Ship Bunkering

The NAA assumes all trucking is achieved with the use of diesel fuel, even though biodiesel and renewable diesel are available, as referenced on page 35 of Appendix C. What evidence supports this assumption that all associated trucking is currently achieved with heavy diesel fuel? **This language in the SEIS and subsequent emissions calculations should be revised to accurately reflect the fuel type and emissions that occur from NAA on road trucking and truck-to-ship bunkering, and the SEIS should be reissued for public comment.**

1095-11 18. LCA Inputs and Assumptions - Marine Diesel Oil
1095-12 19. LCA Inputs and Assumptions - End Use
1095-13 19. LCA Inputs and Assumptions - End Use
1095-14 17. LCA Inputs and Assumptions - Peak Shaving

Use of Marine Diesel as a Marine Fuel

The NAA assumes without LNG, all marine vessels would operate on heavy marine diesel. This is not true of the current shipping fleet. TOTE itself is currently meeting emissions standards by operating on ultra-low sulphur diesel marine gasoil [7].

Matson, another large shipping company in the Port of Tacoma, has actively removed LNG infrastructure from its new vessels, and plans on using this ultra-low sulphur gasoil to meet standards [8]. Additionally, the NAA assumes that without LNG, no marine shipping companies will adopt new fueling protocols to meet the International Maritime Organization's new emissions standards, even though they will be required to do so. **This language in the SEIS and subsequent emissions calculations should be revised to accurately reflect the fuel type and emissions that occur from NAA shipping operations, and the SEIS should be reissued for public comment.**

Proposed Alternative

The description of the proposed alternative (PA) is inaccurate, and makes the PA seem better than it actually would be by assuming a 1:1 displacement of LNG with heavy diesel fuel (Appendix C p. 36). The described PA does not reflect reality, and needs to be updated.

Use of LNG in non-TOTE Marine Vessels

The LCA assumes 46.3-69.15% of the total LNG produced will be sold to marine application customers other than TOTE, despite this assumption not being outlined in the original EIS, and despite not having any confirmed customers other than TOTE. **Because there are no other confirmed customers, the PA end use applications should be adjusted to reflect this, subsequent GHG emissions should be recalculated, and the SEIS should be reissued for public comment.**

Use of LNG in On-Road Trucks

The LCA assumes with the LNG facility in place, all on-road trucking will be fueled by LNG. The assumption that all trucks are LNG capable and ready is not reflective of reality. **Because not all associated trucks are capable or ready to run on LNG, the PA end use applications should be adjusted to reflect this, subsequent GHG emissions should be recalculated, and the SEIS should be reissued for public comment.**

Peak Shaving

The LCA assumes that LNG will be used for peak shaving needs for only 10 years, and then will "presumably [be sold] for additional marine fuel applications." (Appendix C p. 24). To stay consistent with the 1:1 displacement assumption, the NAA should show diesel being used to fuel peak shaving for the first 10 years, and then revert back to natural gas. **The PA end use applications should be adjusted to show peak shaving switching back to natural gas after 10 years, subsequent GHG emissions recalculated, and the SEIS should be reissued for public comment.**

1095-18 11. LCA Inputs and Assumptions - General

Methods

Emissions to be Reviewed

End-use emissions from use of LNG in TOTE and other marine vessels are included in the LCA. The SEIS fails to include the emissions resultant from the incomplete combustion of methane in marine engines, known as methane slip. Emissions from uncombusted methane are anywhere from 7-36g/kg LNG, depending on the engine load and combustion temperature [9]. **This language in the SEIS and subsequent emissions calculations should be updated to accurately reflect the rate of methane slip, and the SEIS should be reissued for public comment.**

GHGs used as Life Cycle Criteria

This life cycle assessment only analyzes carbon dioxide, methane and nitrous oxide. Given that the stated need of the project is a "cleaner" fuel source for marine applications, this LCA should include particulate matter, as particulate matter is both a contributor of global warming and a product of both diesel and LNG combustion [9]. **The SEIS should be updated to include particulate matter as a GHG, and then reissued for public comment.**

This LCA uses the 2007 Intergovernmental Panel on Climate Change (IPCC) Fourth Assessment Report as its reference for Global Warming Potential (GWP) values, despite the availability of the IPCC's more recent 2013 Fifth Assessment. Additionally, this LCA uses the 100-year GWPs for all GHGs analyzed, stating that "[t]he 100-year GWP is consistent with the time horizons for the Tacoma LNG project." This assertion is demonstrably false, as the Tacoma LNG project will only be operational for 40 years, and methane, the primary component of LNG, is 85-times more potent than carbon dioxide in the first 20-years after it is emitted [10]. Using the 100-year GWP obscures the real climate change impacts of this project by effectively smoothing the rate of global warming over a longer period of time. When the 20-year GWPs from the 2013 report are used to calculate the GHG emissions from scenarios A and B, the LNG project produces 307,825.60 - 666,975.32 more tons of GHG emissions per year, compared to the NAA (see attached Excel file). **The SEIS should be updated using the 20-year GWPs from the 2013 IPCC report, and then reissued for public comment.**

Cut Off Criteria

Emissions that represent less than 1% of the total GHG emissions from well to combustion are excluded from this LCA. The choice to exclude these emissions was not justified with peer-reviewed guidelines or research - this decision requires justification, which should be included as a reference in the SEIS. Additionally, these smaller sources of emissions should be included in the LCA, as multiple small sources of emissions that are excluded could add up to a big impact. Especially since the SEIS touts such a small GHG benefit, smaller emission sources from the proposed alternative should be included, as they could flip the SEIS' conclusion. **The SEIS should be updated with credible references that justify the cut off criteria and should include emission sources less than 1% of the total in the LCA, and then should be reissued for public comment.**

Analysis

Carbon Content of LNG

Both pages 71 and 74 of Appendix C state, "Note that the emissions from the LNG facility plus upstream emissions are higher than those or the no action alternative. However, the carbon content of LNG results in lower end use emissions; so, the net life cycle GHG emissions are reduced under most circumstances." Page 117 of Appendix C shows "placeholder values" being used for the fuel properties of natural gas, which would then be used to calculate the fuel properties - including the carbon content - of LNG. It is completely unacceptable to

[10] IPCC (2013). *Climate Change 2013: The Physical Science Basis. Contribution of Working Group I to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change*. Cambridge University Press, Cambridge, United Kingdom and New York, NY, USA, 1535 pp.

1095-19 15. LCA Inputs and Assumptions - Natural Gas Properties

release a LCA that uses placeholder values, especially for the components of the analysis that are responsible for "result[ing] in lower end use emissions." Further, page 88 of Appendix C shows that the values of direct emissions from the LNG facility operation "are representative and actual data have been requested." This LCA is not complete until accurate data on the fuel properties of the natural gas to be used have been attained and incorporated into the analysis. Furthermore, what are the circumstances under which the end use emissions from LNG do not result in a net reduction of GHGs? These scenarios need to be fully described to allow for complete and transparent review from the public. **The SEIS should be revised by using accurate fuel property data of the natural gas, and then reissued for public comment.**

Due to the significant amount of missing and outdated information, as well as our conclusion that this project will increase GHG emissions, CHB is opposed to the completion of the LNG facility. We ask PSCAA to redraft the SEIS using accurate, up-to-date figures in its analysis, and reissue the SEIS for public review and comment. Please contact me if there are questions regarding my comments. Thank you for the opportunity to provide feedback on the Tacoma LNG SEIS.

Sincerely,

Melissa Malott

Hello,

Please see the attached comments from Washington Environmental Council on the DSEIS for the PSE LNG project.

We appreciate your consideration and the opportunity to provide comment. If you have questions or would like additional detail related to any of our comments, please contact me and I will either answer your question or put you in touch with the relevant policy expert.

Sincerely,
Anna

November 20, 2018

Puget Sound Clean Air Agency
ATTN: Public Comment on DSEIS, PSE LNG Project
1904 Third Ave, Suite 105
Seattle, WA 98101

Dear Puget Sound Clean Air Agency,

Thank you for providing a public comment period and process for input into the draft Supplemental Environmental Impact Statement (SEIS) for greenhouse gas emissions on Puget Sound Energy's liquefied natural gas facility at the Port of Tacoma.

We appreciate the opportunity to provide comment and the work that PSCAA has done thus far to evaluate the environmental impacts of this project. However, we are concerned that the analysis in the draft SEIS inaccurately and inadequately accounts for the GHG emissions associated with this proposal. At this point, the project has not been properly evaluated and there is a lack of a comprehensive review of impacts associated with climate pollution, safety, and the environment, as well as an incomplete process, including consultation with the Puyallup Tribe. Unless these evaluations and processes are completed, this project should not move forward. We support the position of the Puyallup Tribe that calls for a new and comprehensive EIS.

Among our key concerns are that the draft SEIS relies on incorrect assumptions, does not properly consider a range of scenarios, and does not use the best available science in accounting for the possible GHG emissions of the proposed LNG facility. We request that PSCAA address the following concerns in conducting a new analysis:

The assumption that all gas supplying this facility will come from British Columbia is inappropriate. The draft SEIS analysis assumes that the gas for the facility will be sourced exclusively from British Columbia. Not only is this assumption inadequate in accounting for the range of possible GHG emission scenarios associated with this facility, it is not even reflective of PSE's current gas supply. PSE's own 2017 filing with the Security and Exchange Commission (SEC) indicates that in 2017 it purchased gas for its gas customers from British Columbia (54.8%), Alberta (19.1%) and the United States (26.1%).[1] An updated SEIS should consider a full range of possible gas supplies and associated emission and leakage rates.

The draft SEIS does not use the best available science for leakage rates. In addition to inappropriately assuming constant and exclusive gas supply from British Columbia, the draft SEIS does not incorporate the most recent, peer-reviewed science indicating that both B.C. and U.S. methane leakage rates are severely underreported.[2][3] The draft SEIS should include new scenarios that reflect the likely and possible gas supply mix for the facility and account for the range of leakage rates and emissions associated with these

0956-3 12. LCA Inputs and Assumptions - Global Warming Potential Value
0956-4 6. Purpose and Need
0956-5 17. LCA Inputs and Assumptions - Peak Shaving

different sources. In order to understand the environmental impact of this proposal, PSCAA should use this best available science and use more conservative leakage rate estimates.

The draft SEIS does not accurately evaluate the global warming potential (GWP) of the proposal. The draft SEIS uses a 100-year timescale for global warming potential (GWP) to analyze the proposed LNG facility. However, this timescale discounts the near-term warming impact of shorter-lived climate pollutants, such as methane, which is 84-87 times more powerful a warming agent than carbon dioxide over a 20 year period.[4] Because the emissions associated with the proposed facility are primarily methane and because the facility will only be operational for 40 years, a 20-year GWP timescale would more accurately account for the climate impact of the project. Furthermore, the most recent IPCC report affirms near-term emission reductions are the most critical factor in avoiding the most catastrophic impacts of climate change.[5] Analyzing methane at its 100-year potency minimizes the impact of methane on our climate, makes the LNG proposal appear cleaner than business as usual, and does not prioritize near-term emissions reductions when scientific-consensus affirms we need them most. Finally, the analysis does not apply the IPCC's Fifth Assessment Report that has the most up to date estimates and should be used as the best available science.

PSE has not demonstrated adequate demand for this project. The assumed GHG benefits of the project identified in the draft SEIS rely on a significant conversion of marine shipping customers to LNG. However, PSE has not demonstrated the need for a project of this scale. The conclusion that PSE LNG will produce GHG benefits relies partly on the assumption that marine shipping companies other than TOTE will utilize between about 50-70% of the LNG produced, by volume. One stated need for the conversion to LNG is the new emissions requirements established by the North American Emission Control Area (ECA). However, there are other mechanisms for meeting these standards, both technological and operational, and in fact TOTE is already in compliance with these rules. PSE has not demonstrated their ability to secure these contracts nor demonstrated a clear demand from the marine shipping industry. The draft SEIS does not consider GHG and air quality impacts in the absence of PSE's fulfillment of additional marine transportation fuel contracts and the subsequent application of this gas toward other uses, including electricity generation. Until end-users are identified, the GHG impact of this project cannot be accurately assessed. This uncertainty must be accounted for in the scenarios presented in the SEIS.

The draft SEIS does not consider a range of possible scenarios for meeting the stated "peak shaving" needs identified by PSE. Without clear limits to the use of LNG for electricity generation, the GHG impacts or benefits of this project cannot be fully accounted for. The proposed LNG facility allows PSE to regasify LNG for electricity generation. The draft SEIS considers 250,000 gpd and 500,000 gpd scenarios in which end use share of end-product LNG expected to go toward "peak shaving" is 11% and 5.48%, respectively. The draft SEIS finds the combustion of regasified LNG for "peak shaving" will produce a net benefit in GHG emissions from this project. The assertion that this component of the project will produce GHG benefits relies on the assumptions that PSE has accurately forecasted future "peak shaving" needs in its service territory and that, in the absence of available regasified LNG, this need will be addressed exclusively through the use of diesel fuel. A proper evaluation of this project should consider the full range of options available to PSE for load management. Furthermore, the draft SEIS assumption that no more

[4] US EPA. 2018. Understanding Global Warming Potentials. https://www.epa.gov/ghgemissions/understanding-global-warming-potentials#Learn%20why
[5] IPCC, 2018: Global warming of 1.5°C. An IPCC special report on the impacts of global warming of 1.5°C above pre-industrial levels and related global greenhouse gas emission pathways, in the context of strengthening the global response to the threat of climate change, sustainable development, and efforts to eradicate poverty [V. Masson-Delmotte, P. Zhai, H. O. Pörtner, D. Roberts, J. Skea, P.R. Shukla, A. Pirani, Y. Chen, S. Connors, M. Gomis, E. Lonnoy, J. B. R. Matthews, W. Moufouma-Okia, C. Péan, R. Pidcock, N. Reay, M. Tignor, T. Waterfield, X. Zhou (eds.)]. In Press.

than 9.73 MGal/year of LNG will be used for electricity generation is not enforceable. As part of the analysis, the SEIS should consider other methods available to PSE for load management and "peak shaving" and evaluate the impact of additional regasification of LNG for electricity generation in the absence of other end-use customers.

PSCAA must conduct full and comprehensive consultation with the Puyallup Tribe. The Puyallup Tribe of Indians has cited a lack of adequate government-to government consultation, as required by law, regarding the environmental and public safety risks posed by the LNG facility. We support the position of the Puyallup Tribe that calls for a new and comprehensive EIS, with full government-to-government consultation.

In summary, we appreciate your consideration and commitment to evaluating the full environmental impacts of this project. Unless the environmental impacts of this proposal are fully evaluated, understood, and addressed, this project should not move forward.

Sincerely,

Rebecca Ponzio

MASTER BUILDERS

To the Members of the Puget Sound Clean Air Agency,

I write on behalf of the Master Builders Association of Pierce County to provide the organization's comments and to express support for the Puget Sound Clean Air Agency (PSCAA) to issue the necessary permit(s) for Puget Sound Energy (PSE) to continue construction of its liquefied natural gas (LNG) facility at the Port of Tacoma.

The Port of Tacoma is the right place for a facility such as this. The Port is an established industrial area, and this project is consistent with the types of uses and aesthetic appearance of other marine-related industrial activities in the area. In accordance with Washington's Growth Management Act, cities and towns must first study the environmental effects of, and then zone, land for industrial use in appropriate locations. The land within the Port has been reviewed by the City of Tacoma and zoned for precisely this type of industrial facility.

Port districts exist to promote economic activity and vitality. The Port has long been a substantial economic engine in Tacoma, in alignment with the purpose for which Washington laws authorize the formation of ports. The building and operation of the LNG facility represents hundreds of millions of dollars of private investment on a state-of-the-art facility. It will help local business remain competitive by providing a needed supply of LNG for its soon-to-be-reconfigured marine vessels. The siting of this facility in the Port of Tacoma, within the city of Tacoma, will be a competitive advantage for the NW Seaport Alliance and the State of Washington.

The Tacoma LNG facility will create at least 250 construction jobs and 18 permanent jobs directly within the Port, along with the economic activity from the project creating another 125 permanent jobs in the region. The facility is consistent with the on-going efforts by the Port, the City and region to encourage a healthy local business climate and help retain and grow companies who call Pierce County home. As the FEIS for the proposal demonstrated, it will also contribute millions of dollars in new tax revenues to benefit local schools, city services, and other state and local government services by making more public funds available to meet road and public safety needs.

The environmental and health benefits of LNG are also very important. LNG is a cleaner alternative to conventional fuels such as diesel. The PSCAA's Draft SEIS, published on October 8, 2018, confirms this. Switching to LNG reduces greenhouse gas emissions by nearly 15% and eliminates visible particulate

mbapierce
MASTER BUILDERS

emissions produced by ships by more than 85%. This helps improve air quality and reduce health risks, while helping local employers like TOTE comply with new stricter low-sulfur emission standards.

PSCAA, by preparing the draft SEIS, has confirmed the environmental benefits and overall reduction in greenhouse gas emissions which should allow the finalization of environmental review so that the project permit(s) can be issued. We fully support this project and are confident it will provide great benefits to the residents and businesses of Pierce County and the Puget Sound region for years to come.

Always,

Jessie Gamble
Government Affairs Director

Steve: Thank you. Next is Bret Stein. Dave Gering?

Dave: Yeah, thank you. My name is Dave Gering. I'm the executive director of the Manufacturing Industrial Council of Seattle. I wanted to mention something we haven't talked about tonight.

[05:15:00] There's more than a half million people who live in Alaska. They'll all wake up tomorrow morning, and most of them are going to be hungry for breakfast. Around lunch time, they're all going to want a lunch. And around evening time, they're all going to want dinner. And almost all of the food and the other consumer products that they get are going to wind up coming from our state. A huge proportion of those are actually shipped up there by TOTE and other companies like that. Somehow, they've got to get that food. At some point, this decision is about what's the best way for them to get it, in terms of that plant.

And most of the information I'm aware of that's before you says that we're better off environmentally, if that is carried on a ship driven by natural gas. If you were trying to serve that market with trucks, the environmental impact would be far, far greater than it is today. As you know, and you've heard, if you serve it with diesel, you're going to have a bigger impact on the environment that way. So, the urgency – and I really am glad that I came down here tonight and had a chance to sort of hear everybody out.

[05:16:02] The urgency that is being called for here drives the decision to natural gas. It's all incremental. In a way, we're all Alaskans. None of us here are self-sufficient. We're all getting our food, our clothing, everything from distant sources all over the place. And we're going to have to make these incremental changes to make that system better. Everything that I've read about this plant says that's going to accomplish that small good. It won't fix all of the problems that we've talked about today. And many of them are legitimate.

But it's one step forward that's positive that's supported, in my view, by your records. So, we would urge you to issue the permit. Thank you.

Puget Sound Clean Air Agency
ATTN: Public Comment on DSEIS, PSE LNG Project
1904 Third Ave, Suite 105
Seattle, WA 98101

The Manufacturing Industrial Council of Seattle urges the Puget Sound Clean Air Agency (PSCAA) to issue the permits required for Puget Sound Energy (PSE) to continue construction of its liquefied natural gas (LNG) facility at the Port of Tacoma.

The draft SEIS clearly documents the local environmental and public health benefits of the proposed LNG facility. Regional benefits will also be achieved as a cleaner fuel source becomes available to power the supply chain that's required to meet essential consumer needs in Alaska.

Please approve the permits required to move the project forward.

Sincerely,

Dave Gering, Executive Director
Manufacturing Industrial Council of Seattle

1223-1 22. General Opposition

[00:44:04]

Carole: Thank you. Steven Gilbert?

Steven: Thank you. I'd first like to take a second to thank the tribes for stewarding the land and the Salish Sea. Everything about the future generations that I think we're all here to protect. I am Steven Gilbert. I am director of the Institute for Neurotoxicology and Neurologic Disorder, PhD in toxicology. And I'm a full professor at University of Washington School of Public Health. And I wrote a book called *A Small Dose of Toxicology*, which is free on the internet, and you're welcome to download the book. And I have two granddaughters that I care a lot about. And I think we need to be thinking about future generations of health.

The previous speaker gave a great litany of all of the issues and health problems associated with what's going on here.

[00:45:00] The point I want to make is that we need to move away from the polluting economy. We have repeatedly gone after easy to get resources and trying to make money off of them. We need to stop this. We need to move away from the current based economy and, with that, move away from polluting economy that we've been on for so long. One thing I learned as a toxicologist is a small amount of something can make a big difference. To start with, methane is a big difference than carbon dioxide. We need to really look at the methane, the 90% increased and problem compared to carbon dioxide.

One thing I learned as a toxicologist is that small amounts are important, and also, we know so much about so many things. We need to make good decisions. And we need to help protect the decisions. The decisions that guard our children, not just our children, but also children of the orcas**,** the salmon.

[00:46:00] We need to be thinking of the lifecycle and the lifecycle is about fracking and the pipelines that are developed and everything that is associated with it. It's not just the use of LNG here in Tacoma, but it's the whole process of getting the fracked gas together and shipping it down here. So, with that, thank you very much. And please, think about your children and grandchildren, and think about the future of the globe. These are global issues. Thank you very much.

0724-1 23. General Support

Puget Sound Clean Air Agency
1904 Third Avenue, Suite 105
Seattle, WA 98101

I wish to express my support for Puget Sound Energy's (PSE) liquefied natural gas (LNG) facility at the Port of Tacoma. This letter reflects my comments in support of the Puget Sound Clean Air Agency (PSCAA) finalizing its SEIS consistent with the draft it issued on October 8, 2018 and timely issuing PSE the necessary permit(s) to proceed.

There are many stakeholders in the effort to reduce emissions, and even more moving parts to the actual process of doing so. In the last five years alone, the Port of Tacoma, the Port of Seattle and the Vancouver Fraser [Canada] Port Authority have created an updated Northwest Ports Clean Air Strategy with the objectives of reducing port-related air quality impacts of diesel particulate matter, reducing greenhouse gas emissions, and helping meet air quality standards and objectives for the airshed. The PSCAA itself is a partner in the implementation of this effort, along with agencies including the Environmental Protection Agency (EPA).

The PSE LNG facility is one part of the task of reducing diesel emissions. LNG fuel cuts particulate matter (PM) emissions produced by ships by more than 85%. These particulates are extremely harmful to the lung health of dock workers and those in the surrounding neighborhoods. According to dock workers, they not only see the black diesel particulates floating in the air, but they breathe them in as well while ships (still burning diesel) are waiting to dock. Besides eliminating the PM emissions, LNG fuel also reduces greenhouse gas emissions by nearly 15%, sulfur dioxide (SOx) emissions by over 99% and nitrogen oxide (NOx) emissions by nearly 85%. Another important environmental advantage of LNG as fuel is that in the unlikely event of a spill, LNG turns into vapor and dissipates with no lasting effects on water or marine life.

Reducing these real-time emissions is a matter of social justice. Port workers should not be subjected to this polluted air just for doing their jobs. Workers all across the West Coast ports have been vocal about the need to reduce these emissions in their work place, and they have played an integral role in supporting ports' efforts such as the Northwest Ports Clean Air Strategy to reduce emissions. Locating the Tacoma LNG facility within the Port of Tacoma advances the effort to reduce emissions at their source.

Beyond emissions affecting ports and immediately adjacent neighborhoods, the United States has staked out the position that vessels must control emissions when traveling America's coastlines up and down the Pacific Ocean. Annex 6 to the MARPOL Treaty, for which the EPA is the enforcing agency, requires Jones Act-flagged ships that travel near to shore to significantly reduce their emissions by using cleaner fuels. TOTE's use of fuel from Tacoma LNG to power its fast-transit, near-shore ships allows the company to substantially exceed its regulatory commitment to the EPA. By using LNG, TOTE will provide major emissions reductions benefiting public health for all communities and residents along its West Coast route, which transits nearly all of Puget Sound and ends in Anchorage, Alaska.

The Tacoma LNG facility is a project that allows multiple stakeholders – coastal communities, the Port of Tacoma, adjacent neighborhoods, PSCAA, EPA and TOTE - to affirmatively advance their interests in emissions reductions. Speaking for the dock and port workers, both our health and economic well-being are furthered by wrapping up this project's environmental review and permit effort promptly without

undue delay. Please, let's keep those good, family wage jobs at the Port of Tacoma and make the air the workers breathe healthier.

The draft SEIS, prepared by Ecology and Environment, Inc. and released by PSCAA on October 8, 2018, stated "When evaluating direct, upstream, and end use GHG emissions, replacing a diesel propulsion engine with a pure LNG propulsion engine results in reduced life-cycle GHG emissions."

Taking into consideration the overall reduction in greenhouse gas emissions confirmed by the draft SEIS for Tacoma LNG, and the human and environmental benefits of such reductions, I fully support PSCAA finalizing its SEPA review and granting the necessary permit(s) so this important addition to our region can be completed within its new scheduled time frame.

To the Puget Sound Clean Air Agency:

Great Land and *Westward Venture* are the names of the ships that comprised two-thirds of TOTE Maritime Alaska's original fleet in its service between Tacoma and Alaska, starting June 4, 1976. Forty years ago, TOTE chose Tacoma for its outstanding longshoremen and the ability to exceed expectations for cargo service between Puget Sound and Anchorage. Our commitment to Tacoma and this community has grown and together, we have prospered. Today, our 120-person workforce may seem small among the corporate giants of this region, but our economic impact is substantial. We provide a cargo lifeline between the lower 48 and Alaska, sailing 2900 miles across the Gulf of Alaska every week. Folks in this area have grown so accustomed to ships in Puget Sound, they've become a key fixture of the landscape. Those ships represent goods made, sold and destined for – or from – around the globe. At TOTE, we consider it a privilege to be in Tacoma.

Our commitment to the community is why retrofitting our vessels to run on liquefied natural gas (LNG) is an imperative for our company, and the pursuit of cleaner air at the Port of Tacoma is a step in the right direction for us all.

For TOTE, our obligation to this community is reflected in how we integrate local values into our daily operations. We make improvements everywhere we can to be cleaner and more responsible to the environment around us. Our track record proves it. In 2010, we were the first to install rain gardens at the Port of Tacoma which prevents 250,000 gallons of run-off from entering Commencement Bay each year. The year before, we began "cold ironing" at the Port of Tacoma, which means we plug in to power sources on shore to prevent emissions caused by "idling" ships. Cold ironing reduces carbon dioxide emissions by 1,360 tons and diesel particulates by 1.9 tons annually. Additional emissions reductions will come from converting our Orca class vessels to run on LNG. LNG is the best, commercially-available fuel for TOTE in its efforts to reduce emissions. Using LNG will result in significant reductions in particulate matter, SOx, NOx and carbon dioxide. We have already made the conversion in Jacksonville, Florida, where our ships run between the Port of Jacksonville and Puerto Rico and are powered by LNG. We do not take the commitment to care for the environment and the communities we serve lightly and we have not hesitated to invest in these improvements.

This decision to convert to LNG was not made without careful consideration, and while it reflects our environmental values, it is not an entirely altruistic decision. Environmental standards driving

the use of LNG for maritime use are developed by the United Nation's International Maritime Organization and further shaped by the Environmental Protection Agency. For TOTE, the transition to LNG is both the right thing to do and is the best alternative to diesel. LNG has been safely used overseas for shipping and passenger ferries. SEA/LNG estimates that global LNG shipments have covered more than 100 million miles – about 4,000 times around the earth – without a major safety incident.

Sensitivities around clean air and water, and construction of a safe facility for access to LNG are appropriate. We welcome rigorous scientific and expert evaluation of the facility at the Port of Tacoma and we will abide by what is determined. To date, this agency's own additional evaluation determined in its draft supplemental environmental impact statement a conservative 13.5 percent reduction in greenhouse gas emissions from the TOTE vessels once converted to LNG. We celebrate that finding even while we believe it will be even greater than what is estimated so far.

The ramifications of not converting to LNG are serious. They come with true environmental consequences. It would mean more Particulate Matter and Nitrogen Oxides emitted in Puget Sound and our coastal waters at least for a decade or more. A status quo approach should be a non-starter for anyone who cares about cleaner air and water because it means an ongoing use of diesel fuel. The use of diesel offers no environmental benefits while continuing to erode environmental health. The Air Agency must take seriously both avoidable impacts this would have on human health and the signal it would send to other companies interested in doing more than the current Federal, State and Local regulations.

Change will not happen overnight. But when the opportunity to make improvements – even incremental improvements – that will result in verifiable reductions in air emissions are not only realistic, but common and available, we must pursue them. We urge you to finalize the SEIS and issue a permit for the construction of the LNG facility at the Port of Tacoma and we stand ready to answer questions about our role as its primary customer and as an employer and committed community member in Tacoma.

Sincerely,

Grace Greene

Public Comment on DSEIS, PSE LNG Project

The Honorable Carole J. Cenci

Puget Sound Clean Air Agency
1904 Third Avenue
Suite 105
Seattle, WA 98101

The New Progressive Alliance at http://newprogs.org/ agrees with your decision to analyze the lifecycle of the greenhouse impacts of the PSE LNG Project and to conduct a more rigorous analysis. Thank you.

Puget Sound Energy's (PSE) eight million gallon liquefied natural gas (LNG) project threatens Tacoma, the nearby Puyallup Tribe, and our global climate.

Building more fracked gas infrastructure now commits the company to decades of buying gas from fracking wells with massive methane leaks. Estimates of methane releases have been drastically underestimated. (1) In light of the latest report from the Intergovernmental Panel on Climate Change, we know we don't have decades to spare. The time is now to turn to clean energy alternatives.

Fracked gas is not a lesser evil. Scientists' understanding of methane's impact on the climate continues to evolve, and at every step along the way we learn that fracking allows more methane escapement than we had previously observed and that the impact of methane on the climate, particularly in the short term, is even more serious than had been previously understood.

The answer is not natural gas obtained by fracking - "in essence, explode a pipe bomb a few thousand feet beneath the surface, fracturing the surrounding rock." See reference 594. (Fracking is also used for uranium mining.) Unregulated by the EPA because of congressional action combined with the support of Presidents Obama and Trump, companies refuse to even reveal the chemicals they are "fracking" with, nobody is monitoring the pollution to water and our aquifers, and nobody is factoring the release of

0679-2 cont'd 3. Outside of SEIS Scope

methane as a GHG. Of the 750 chemicals that can be used in the fracking process, more than 650 of them are toxic or carcinogens, according to a report filed with the U.S. House of Representatives in April 2011.

See references 60, 63, 150, 183, 194, 220, 244, 280, 288, 296, 301, 303, 345, 355, 359, 370, 374 - 377, 404, 410, 414, 434, 456, 475, 483, 521, 542 - 544, 594, 602, 639, 683 - 689, 712, 713, 715 - 718, 734 - 736, 745, 746, 776, 815 - 824, 845, 846, 929 - 941, 989, 1052 - 1071, 1166 - 1173, 1345-1362, 1557, 1560-1561, 1576-1583, 1668-1669, 1687-1689, 1724, 1731, 1783-1787, 1937-1957, 2133-2139, 2249, 2317, 2421-2436, 2558-2564, 2598, 2667, 2747, 2776-2787, 2980-2982, 3168, 3170, 3171, 3187, 3222-3236, 3347, 3494-3496, 3507, 3853-3860, 3920, 4022, 4029, 4101, 4102, 4173 of the article at http://www.newprogs.org/the_environment_under_the_democratic_republican_uniparty

Together, this should be seen as a sufficient basis for denial of the Notice of Construction application. Thank you for your time and consideration of these comments.

RE: Support Letter for Tote's Conversion
of their ORCA Class Vessels to LNG

Lynden Transport is a longtime customer of Tote serving the Alaska (AK) market from the PNW. Lynden Transport is a multimode transportation company that provides an important service to the Alaska market in partnership with Tote. Prior to ship service to AK goods were transported over the road in hundreds of trucks per week on the highway to AK. Once the ship service started 90%+ of our trucks were removed from road service utilizing a more efficient mode by placing those trailers on Tote ships rather than driving tractor/trailer to AK. Our industry prides itself on continuing to be efficient and stewards of the environment. At that time it was a very efficient move for Lynden and Tote to partner on the change from the highway to ship service. Now Tote is looking at a next level evolutionary change in being efficient and stewards of the environment by converting their ships from diesel fuel to LNG. As technologies improve and evolve it is prudent that our industry, and in this case Tote, continues moving forward with the benefits of conversion from diesel to LNG.

The environmental benefits involve 100% reduction in S0x, 99% reduction in particulate matter, 90% reduction in nitrogen oxides and 13.5% reduction in greenhouse gases as cited in their DSEIS. This conversion in many ways speaks for itself of the importance to the environment without compromising the performance of the ships. It takes a considerable investment on Tote's part to acknowledge the improved benefits to the environment from this conversion to their ships. In addition Tote has ships on the east coast that perform under LNG power displaying a safe operation, consistent performance and provides an environmental clean air improvement.

If the air permit is not approved the continued use of diesel even in its' lowest sulfur offering does not achieve the environmental benefits that Tote is trying to achieve with LNG, nor is it efficient for the ships to burn ultra-low sulfur. The performance of the ship suffers. This type of change to LNG will help to keep our ports competitive by being one of the early change agents in the PNW to LNG consistent with other ports around the world that are already using and building LNG facilities.

This process has been taking too long to get approval and consensus on an environmental clean air improvement that makes good sense. Further delays only lead to continued poor and unnecessary

air pollution.

The transportation industry recognizes the equipment required to keep our economies moving impacts our environment and it is always looking for new technologies and efficiencies to limit its' impact yet still provide the goods and services needed to the world. In our part of the world, the PNW, this is a smart change requiring considerable investment from Tote. As a customer of Tote, Lynden Transport supports their efforts to convert their ships to LNG and have the LNG support facilities to help improve the air quality without compromising safety or performance. We ask for the air permit to be approved.

[00:23:00]

Carole: Thank you. Our next commenter is Jason Hagey.

Jason: Thank you. Good afternoon. My name is Jason Hagey. I'm vice president of communications at the Association of Washington Business. AWB is Washington's oldest and largest statewide business association representing nearly 7,000 members from across all industries. Thank you for the opportunity to comment today. AWB supports continued construction of PSE's LNG facility at the Port of Tacoma because of the numerous environmental and economic benefits it will provide.

Locating this facility, the Port of Tacoma will allow maritime operations to transition from dirty, conventional fuels to cleaner LNG fuels reducing sulfur emissions more than 99%, nitric oxide and nitrogen dioxide emissions by nearly 85%, and greenhouse gas emissions by nearly 15%.

[00:24:00] The draft SEIS stated that replacing a diesel engine with an LNG engine will result in reduced lifecycle greenhouse gas emissions. TOTE Maritime is planning on switching to LNG for its vessels. And locating this state of the art facility here will give the Port of Tacoma and the state of Washington a competitive advantage. This project will improve reliability allowing PSE to serve customers on the coldest days of the year, when our electricity system depends on natural gas to meet demand, and when there are disruptions to the system like the one that occurred earlier this month.

On October 9, a pipeline that fees Washington State ruptured, and its gas supply was turned off. As a resident of Pierce County and a customer of PSE, I received an email notifying me of the situation and asking me to conserve natural gas. Many of PSE's major customers were required to curtail their use of natural gas impacting their businesses. With the LNG facility in production, this curtailment could have been avoided.

[00:25:02] Finally, we support this project because of the good jobs it will create and support throughout the Port of Tacoma and this region. This is the right place for this kind of job creation. The port, which has long been a major economic driver for Pierce County is an established industrial area. And this project is consistent with the types of uses located in the area. Our members are continually striving to reduce their carbon footprint and expand economic opportunity throughout Washington. The PSE LNG project will

further both of these objectives, and we urge you to support. Thank you.

1219-1 23. General Support

Steve: Good afternoon. My name is Steve Hartmann. I am a resident of Pierce County, Washington. And I am the vice president of Linden Transport based here in Fife, Washington. Linden Transport is a major provider of transportation services between the state of Washington and the state of Alaska. We have been a long term partner customer of TOTE Maritime Alaska. In fact, we've been their largest customer, since Day 1, in 1975. And when we began using TOTE Maritime, we took over 125 semi tractors off the road that made the route ever week between Washington and Alaska.

[01:19:05] We urge you, with all of our support, to issue the needed air permit to Puget Sound Energy for their planned LNG facility. This facility is needed, so TOTE can complete the LNG conversion of their Orca class ships. We operate our gateway service center just a couple of miles from the planned location in Fife, Washington.

We're a long time employer of the Puget Sound area, with over 1,000 employees throughout the Linden family of companies. TOTE's conversion to LNG in Puget Sound Energy's LNG facility will create the following environmental benefits as mentioned in the supplemental environmental impact statement: 100% reduction in sulfur oxides, 99% reduction in particulate matter, 90% reduction in nitrogen oxides, and 13.5% reduction in greenhouse gases.

[01:20:07] The maritime industry has realized the clean fuel of the future is LNG. And to be competitive, the ports throughout the world are making LNG available to their maritime customers. The northwest ports need to do the same. Thank you.

Carole: Thank you. Councilmember Anna Bean? Dan Kovacich? Dakota Case? And Christopher Winters.

Puget Sound Clean Air Agency (PSCAA)
Attn: Public Comment
1904 3rd Avenue, Suite 105
Seattle, WA 98101

Re: Timely Issuance of Air Permit for Puget Sound Energy and their LNG Facility

Dear Puget Sound Clean Air Agency,

My name is Steve Hartmann, I live in Bonney Lake, WA and I can see the Port of Tacoma from my subdivision. I am the Vice President, Sales & Marketing at Lynden Transport, Inc. Lynden Transport is a major provider of transportation services between the States of Washington and Alaska. We have been a long term partner customer of TOTE Maritime Alaska, in fact we've been their largest customer since day 1. TOTE Maritime Alaska is an excellent high quality provider of ship services to and from Alaska and we depend on TOTE to move roughly 80% of our business each and every week on their twice a week sailings. TOTE is a reputable partner with good integrity. They care about people and the environment.

We urge you with our full support to issue the needed Air Permit to Puget Sound Energy for their planned LNG Facility. This Facility is needed so TOTE can complete the LNG Conversion of their ORCA Class Ships. We operate our Gateway Service Center just a couple of miles from the planned location in Fife, WA. We are a long time employer in the Puget Sound Area with over 1000 employees throughout the Lynden Family of Companies.

TOTE's conversion to LNG and Puget Sound Energy's LNG facility will create the following environmental benefits,

1) 100% reduction in Sulfur Oxides (SOx)
2) 99% reduction in particulate matter
3) 90% reduction in Nitrogen Oxides
4) 13.5% reduction in greenhouse gases as cited in their Draft Supplemental Environmental Impact Statement

Non approval of this Air Permit would cause TOTE to continue to burn Diesel which significantly falls short of achieving these environmental benefits.

The Maritime Industry has realized the clean fuel of the future is LNG and to be competitive the Ports throughout the world are making LNG available to their Maritime Customers.

It is our request of you to act promptly and to do what is right in issuing this Air Permit to Puget Sound Energy. For whatever reason the current environmental review is taking much too long. Much of the additional analysis should have been completed in the original EIS. In order for these very large investments and improvements to take place please act promptly so this progress can stay on schedule and we can reap the benefits of a cleaner healthier environment. Any further delay just leads to more unnecessary air pollution.

Thank you for your time and consideration. We look forward to your responsible decision to allow these improvements to move forward.

Sincerely,

Steve Hartmann
Vice President, Sales & Marketing
Lynden Transport, Inc.

Carole: Thank you. Todd Hay?

Todd: Good afternoon. My name is Dr. Todd Hay. I'm the president of Advocates for a Cleaner Tacoma, a local environmental nonprofit. And I'm here representing a coalition of 28 environmental health and social justice groups, including the Sierra Club, Earth Ministry, 350 Tacoma, 350 Seattle, as well as other groups. We are all in agreement that the SEIS, as currently written, is unacceptable. We have written a letter with our concerns, but I want to highlight a few of those now. Our first concern is that you are not using the best available scientific data and considering longer term climate impacts.

[01:15:03] The report uses a methane global warming potential value from the UN from 2007, despite the fact that the value was updated by the UN in 2013 and then, again in a peer reviewed scientific paper in 2016. Also, given the recent UN report that talked about how we need to drastically change our energy fuel mix by 2030, otherwise face dire environmental consequences by 2040. The analysis should really be using the 20 year GWP value for methane. When making either of these changes, in the model, which I did, it shows that the LNG plant is actually dirtier than the existing diesel solution, 50% dirtier when used at 20 year value.

Fifty percent dirtier. The report also misrepresents the true methane leakage rate coming from BC. It relies upon three references, all upon further scrutiny show start breaking down. One report, for instance, is based on a master's thesis that covers gas fuels in Alberta, not even in BC. And it explicitly states that the wells under study are not representative of the entire industry.

[01:16:03] And so, the leakage rate should not be extrapolated as such. The report also fails to recognize three independent scientific empirical studies that provide hard evidence that the methane leakage rates are significantly underreported, upwards of two times under reported. The report also claims the emission reduction credits for customers that they don't even have. They only have TOTE Maritime secured. None of these other maritime customers are secured. The report uses lower methane slippage rates for the TOTE vessels, counter to PSE's own peer reviewer, in their own analysis.

Changing that value as well shows that the entire facility is dirtier than diesel. The report is missing data such as rail and truck emissions for transporting the fracking sand, which comes from

1228-1 12. LCA Inputs and Assumptions - Global Warming Potential Value
1228-2 13. LCA Inputs and Assumptions - Natural Gas Source
1228-3 14. LCA Inputs and Assumptions - Leakage/Slippage
1228-4 19. LCA Inputs and Assumptions - End Use
1228-5 10. LCA Calculations

Wisconsin 1,500 miles away, and the water, as well, for the fracking wells. It uses incorrect units of measurement, when doing certain calculations. And it still has placeholder values, as we already heard. Now, we recognize that you're required to follow the law. And we respect that. And the WAC says to use these older 2007 GWP numbers.

[01:17:00] We also know that the RCW talks about doing specific greenhouse gas emission reductions in this state. And then, we have the UN telling us to change our energy fuel mix in 12 years. So, we challenge the Air Agency, use the RCW that calls out for these greenhouse gas emissions, use that as a lever to, basically, include the best available scientific data and to focus on the near term impacts of this plan, as that is of the utmost importance. Nature, after all, doesn't care about the WAC code and its older GWP numbers.

So, we respectfully ask you to retract the SEIS, modify it to address our technical issues, and then, reissue a document, with a full public comment period following this new analysis. Thank you.

Carole: Thank you. So, the next five commenters are Steve Hartmann, Councilmember Anna Bean, Dan Kovacich, Dakota Case, and Christopher Winters.

[01:18:08] And we have about 75 more people signed up to speak. So, please, if you at all possibly can, limit your comments to two minutes. That will at least get through a few more people.

1279-1 19. LCA Inputs and Assumptions - End Use
1279-2 17. LCA Inputs and Assumptions - Peak Shaving

1.0 INTRODUCTION & EXECUTIVE SUMMARY

This technical report describes a review of the Draft Supplemental Environmental Impact Statement (SEIS) for the Tacoma Liquefied Natural Gas (LNG) facility (project). Specifically, the review focuses on the SEIS life-cycle analysis modeling of greenhouse gas (GHG) emissions and impacts for the project.

This review has been prepared by Air Resource Specialists, Inc. (ARS) on behalf of Advocates for a Cleaner Tacoma (ACT), a non-for-profit 501(c)(3) citzens' organization based in Tacoma. Qualifications of the author are provided in Attachment A.

The technical analyses in this report describe concerns with the modeling results, in particular areas that project inputs or assumptions favor lower GHG emissions for the LNG project. For several reasons, as explained within this report, the net reduction in GHG emissions attributed to the project compared to the No Action alternative may be greatly overstated.

2.0 NEW LNG PLANT - END USE LNG CONSUMPTION

The SEIS GHG analysis assumes an "end use mix" (Scenario A, 250,000 or Scenario B, 500,000 gallons per day (gpd) production) for the project's LNG production, which is stated in sections 2.4.5 and 3.3 of Appendix C: GHG Analysis Report. The report only states the end use mix is "assumed as input." The "DSEIS LCA calculations" Excel spreadsheet(s) input tab includes the following comment "Source: PSE-BID". No further explanation appears to be provided by references, sources, etc. for these consumption levels in the SEIS or Excel calculations (with the exception of the known commitment by TOTE). Since the conclusions of the GHG analysis rely on the replacement of other or existing petroleum-based fuels with LNG, the SEIS should fully document the critical LNG end use mix assumptions for both project scenarios.

3.0 DIESEL ON-SITE PEAK SHAVING - END USE LNG CONSUMPTION

Chapter 3.3.1 of SEIS discusses the diesel peak shaving assumed for the No Action Alternative. The 5.89 million gallons of diesel fuel per year value does not appear to have a source or reference, and it is not clear if it is based on a historical Puget Sound Energy, Inc. (PSE) peak shaving value, so clarification is necessary.

Appendix C section 2.2.1 states that PSE operates peak shaving turbines burning natural gas or diesel fuel. Explanation is needed for discussion that the No Action alternative assumed diesel for peak shaving due to insufficient natural gas pipeline capacity. Unless justified, the No Action assumption that the displaced fuel consists entirely of diesel appears to overestimate No Action GHG emissions. The SEIS should fully document these peak shaving assumptions related to the project's LNG end use.

1279-3 14. LCA Inputs and Assumptions - Leakage/Slippage
1279-4 7. SEPA Alternatives
1279-5 14. LCA Inputs and Assumptions - Leakage/Slippage
1279-6 13. LCA Inputs and Assumptions - Natural Gas Source

4.0 TOTE & OTHER MARINE VESSEL METHANE SLIPPAGE

The SEIS appears to assume methane slip emission factors from "GHG and NOx Emissions from Gas Fueled Engines", SINTEF, 2017, as indicated by the “DSEIS LCA calculations” Excel spreadsheet (EF Marine Vessels spec. TOTE tab). However, it appears the SEIS spreadsheet(s) incorrectly uses the 5.3 g/kW-hr methane emission factor for the “Average, all engine type”, instead of the 6.9 g/kW-hr factor for low pressure dual fuel (LPDF) engines, as recommended by the SINTEF report’s Table 1.1.

This correction significantly increases the marine LNG (TOTE Marine and Other Marine) end use methane emissions calculated by the spreadsheets for the SEIS analysis and therefore decreases or cancels out any net CO_{2e} emissions benefit from the overall LNG project compared to the No Action (net emissions reduction for Scenario A estimated to decrease by 79% - GHG emissions reduction in % becomes 1.13% instead of 5.48%; Scenario B estimated to have a net increase instead of reduction - increase of 0.53% instead of reduction of 3.93%).

5.0 OTHER MARINE & ON-ROAD TRUCKING END USE LNG

Besides TOTE Marine, the largest other LNG end use is "Other" marine, which is also the source of the New LNG Plant's largest reduction of CO_{2e} compared to the No Action Alternative. However, other than the Appendix C section 4 discussion of the mandated marine fuel oil sulfur limit (January 1, 2020), and the corresponding options for compliance such as scrubbers, low sulfur fuel, etc., the SEIS does not substantiate the assumptions made for non-TOTE marine LNG end use consumption (for either 250,000 or 500,000 gpd scenarios).

Section 4 presents some of the negatives of the non-LNG options (additional power use, fuel consumption, increased GHG emissions), but no corroborated conclusions. Given the known barriers (cost, etc.) of converting ships and other equipment to LNG from marine diesel, an analysis should be performed to determine the appropriate level of LNG adoption by other marine companies. For on-road trucking’s conversion from diesel to LNG (Scenario B only), similar barriers to adoption of the new fuel need to be addressed as well. The SEIS should document any LNG end use assumptions, and most conservatively, the GHG modeling should not assume additional LNG end uses beyond current commitments when presenting potential GHG emissions.

6.0 NEW GREET 2018 RELEASE

A recent GREET model release (Oct 10, 2018) has “Updated Methane Leakage of Natural Gas Supply Chain”, relevant to the SEIS analysis. The model updates should be evaluated to insure that assumptions in the GHG analysis are up-to-date.

7.0 UPSTREAM LIFECYCLE – B.C. GAS FROM HYDRAULIC FRACTURING

SEIS Appendix B section 2.4.4 for Natural Gas well-to-tank (WTT) states "Data on the source of natural gas have been requested." The analysis needs to indicate if this information has been provided to the public. Appendix B, Table 3.7 and the LCA calculation spreadsheets note that the GHGenius model is the source for the British Columbia (B.C.) gas upstream emission factors,

1279-6 cont'd 13. LCA Inputs and Assumptions - Natural Gas Source
1279-7 14. LCA Inputs and Assumptions - Leakage/Slippage
1279-8 12. LCA Inputs and Assumptions - Global Warming Potential Value

however the SEIS does not provide sufficient information on the assumptions used in the model, or quality of the source data, etc. Therefore, the SEIS should include background and assumptions related to the values obtained from GHGenius model, along with explanation regarding whether the model accounts for emissions associated with trucks transporting water and sand for fracturing (presumably part of the extraction step of upstream emissions reported on Table 3.7).

8.0 UPSTREAM LIFECYCLE – GAS WELL METHANE LEAKAGE

Appendix B.1 discusses upstream methane emissions/losses from upstream processing of natural gas, noting the GHGenius result for B.C. gas is the appropriately regionally specific value for the project. However, the appendix also states that data and studies indicate methane emission rates vary and can be much higher than those assumed for the analysis and the B.C. region in general, as shown in the summary presented on Table B-3. In light of the most recent GREET model data (new model release previously discussed) and studies included on Table B-3, along with other recent research or studies indicating that methane leak rates may be underestimated by the B.C. government, the SEIS analysis should assume a more conservative upstream methane emission rate.

In addition, general statements in this appendix that B.C. and Canada GHG emissions are lower than United States averages do not appear to be sufficiently justified. The SEIS should describe the "better management practices and potentially Canadian requirements on emission controls" that support a lower B.C. emission rate. Information should be provided in the SEIS as to why newer wells, pads and super pads have lower emissions, and that these are common in B.C., if this supports the lower methane emission rate assumed in the analysis. Incorporating a more conservative, higher upstream methane leak rate would significantly decrease the net CO_{2e} emissions benefit from the overall LNG project vs the No Action.

9.0 IPCC GWP

The more recent Intergovernmental Panel on Climate Change (IPCC) Fifth Assessment Report (AR5) should be used, which will increase the LNG project CO_{2e} emissions (specifically, by the methane Global Warming Potential (GWP)) and have a significant effect on reducing the claimed net reduction. EPA presents a methane GWP range of 28-36 over 100 years as current state of the science, compared to GWP 25 employed in the analysis. The SEIS does not provide any reason not to use the newer, updated AR5 guidance, and doing so would also make the analysis more conservative.

The use of the shorter term 20-year time horizon is also recommended, as more conservative. The SEIS states the 100-year horizon is consistent with the time horizons for the project, but the estimated project duration of 40 years does not appear to support this. If the 20-year time horizon is assumed, it is estimated the GWP value for methane (84-87) would make the LNG project a net CO_{2e} increase due to the higher methane emissions from marine vessels LNG. Given recent information regarding potential climate change implications in the very near term, the SEIS should use or evaluate the 20-year GWP, or document why the shorter time horizon is not appropriate for a project with a 40 year life, in order to appropriately consider GHG impacts relative to gases with shorter lifetimes such as methane.

10.0 SUMMARY & CONCLUSIONS

A technical review has been conducted of the SEIS life-cycle analysis modeling of GHG emissions and impacts of the Tacoma Liquefied Natural Gas LNG facility.

The technical analyses in this report describe concerns with the modeling results, in particular areas that project inputs or assumptions favor lower GHG emissions for the LNG project. For the reasons summarized below, recommended modifications to the analysis are likely to increase the LNG project's CO_{2e} emissions, and therefore, significantly reduce the net reduction in GHG emissions attributed to the project compared to the No Action alternative.

- The SEIS's assumption of levels of LNG "sales" above known commitments (such as from TOTE), is concerning, resulting in significantly overstating the potential GHG reduction benefits of the project.
- The SEIS should fully document the peak shaving assumptions related to the project's LNG end use and the No Action's diesel use.
- The SEIS appears to use the incorrect methane slip emission factor for marine vessel LNG end use.
- The SEIS should include an analysis determining the appropriate level of LNG adoption by other marine and on-road trucking companies. The SEIS should completely document LNG end use assumptions, and most conservatively, the GHG modeling should not assume additional LNG end uses beyond current commitments.
- The SEIS should include background and assumptions related to the values obtained from the GHGenius model for upstream natural gas hydraulic fracturing emissions, including explanation whether or not the model accounts for emissions associated with trucks transporting water and sand for fracturing.
- Based on the most recent GREET model data and studies included on SEIS Table B-3, along with other recent research and studies indicating methane leak rates may be significantly underestimated, the modeling analysis should assume a more conservative upstream methane emission rate.
- The SEIS should use the newer IPCC AR5, with a more conservative methane GWP range of 28-36 over 100 years, the current state of the science (EPA), compared to the GWP 25 employed in the analysis. In addition, the SEIS should use or evaluate the 20-year GWP, or document why the shorter time horizon is not appropriate for the project.

JAMES WU

Project Manager / Greenhouse Gas Services Manager

EDUCATION

B.S.E. Chemical Engineering, Princeton University 1989

MEMBERSHIPS

Air & Waste Management Association

EXPERIENCE SUMMARY

Mr. Wu has 23 years' experience in air quality compliance and permitting, and has performed hundreds of stationary and mobile source analyses. He specializes in bringing a variety of complex projects through technical review to agency approval. He currently is the greenhouse gas (GHG) services manager and a project manager in the environmental compliance section at Air Resource Specialists, Inc., and provides technical studies and evaluations, and prepares client permit applications and air quality modeling analyses.

PROJECT EXPERIENCE

- Produces and manages quality assurance documents including quality management plans and quality assurance project plans. Provides emissions and GHG inventories, dispersion modeling, regulatory analysis and interpretation, and air compliance auditing.
- Prepares applications for new source permits under federal Prevention of Significant Deterioration (PSD) and state construction and operating permit programs.
- Provides technical studies supporting Environmental Impact Statements (EISs) and Environmental Assessments (EAs) under the National Environmental Policy Act (NEPA).
- Provides GHG emissions management and climate change management planning.
- Participates in all aspects of client projects, including business development, proposals, and overall quality control.
- Performs permitting and air quality studies for bio-fuel (ethanol), oil & gas/petroleum, mining and minerals, semiconductor, and National Park Service (NPS) projects, with experience representing both government and private clients.
- Previous project management experience (with former employer) includes mobile and stationary source air quality studies for transportation and infrastructure, urban development, power generation, wastewater treatment, industrial, and construction projects.
- Knowledgeable in the use of a wide range of software applications for environmental analyses, including U.S. Environmental Protection Agency (EPA) mobile source models MOVES, NONROAD, CAL3QHC, and CAL3QHCR, and such stationary source emission models as AERMOD, SIMS, TANKS, and INPUFF.

Puget Sound Clean Air Agency
ATTN: Public Comment on DSEIS, PSE LNG Project
1904 Third Ave, Suite 105
Seattle, WA 98101

Dear Puget Sound Clean Air Agency,

We are a coalition of environmental, health, and social justice groups writing in response to the draft Supplemental Environmental Impact Statement (SEIS) for greenhouse gas (GHG) emissions for the Puget Sound Energy (PSE) liquefied natural gas (LNG) facility in the Port of Tacoma. We would like to thank you for requiring this GHG SEIS and for taking seriously the environmental impacts of this project. We also stand with the Puyallup Tribe in opposition to the LNG facility.

Having examined the draft SEIS, we have a number of serious concerns when it comes to the impact of this facility on public health and climate change. The entire list of these concerns is detailed in the attachment, but we would like to raise some of the main points directly in this letter. These include:

Not Using the Best Available Science - Our first concern is that the SEIS is not using the best available science in calculating its greenhouse gas emissions. The SEIS relies upon 11-year old global warming potential (GWP) values, for methane in particular, rather than the most recent scientific evidence from 2016.[1] Merely making this one modification in using the 2016 GWP values, reveals that the LNG plant will actually produce more GHGs than the No Action Alternative.

Using 100-year GWP values instead of 20-year values - We are also concerned that the SEIS uses the 100-year GWP values, and not the more immediate 20-year GWP values. We understand that the 100-year values have traditionally been used for this type of analysis, but the looming impacts of climate change warrant using the 20-year values. On the same day that the SEIS was released, the United Nations' Intergovernmental Panel on Climate Change (IPCC) released their latest report[2] outlining imminent climate change impacts. Their report indicates that we have only 12 years to change our energy fuel mix away from fossil fuels and towards renewable technologies, otherwise we will face severe environmental consequences in 2040. Their estimates are not based on 100 year projections, but 12 and 22 year projections. By appropriately analyzing the impacts over the next 20 years, the GHG model demonstrates that

[1] https://agupubs.onlinelibrary.wiley.com/doi/full/10.1002/2016GL071930
[2] https://www.ipcc.ch/news_and_events/pr_181008_P48_spm.shtml

1298-2 cont'd 12. LCA Inputs and Assumptions - Global Warming Potential Value
1298-3 14. LCA Inputs and Assumptions - Leakage/Slippage
1298-4 13. LCA Inputs and Assumptions - Natural Gas Source

the LNG project is actually more than 50% dirtier from a GHG perspective than the No Action Alternative.

British Columbia Methane Leakages Rates Used are Highly Suspect - We are also concerned about the purported B.C. methane leakage rates used in the GHG emissions modeling. The SEIS provides three references for B.C. methane leakage rates, all of which require further review to fully determine if they are legitimate representations of B.C.-wide fracked gas methane leakage rates. We know, for instance, that one of them (Brandt et al, 2017 [3]) is derived from a Master's Thesis covering gas wells in Alberta, not B.C., that states that the emissions examined in the report are lower than industry average due to a variety of reasons. Therefore, it would be inappropriate to extrapolate the results of such a study to all B.C.-fracked gas wells. The SEIS also fails to incorporate recent, peer-reviewed reporting indicating that B.C. methane leakage rates are severely underreported[4]. As a result, we do not believe the SEIS's methane leakage rates are accurate; instead we believe that they need to be re-evaluated and likely revised to a higher value. We suspect that using a realistic methane leak rate would also show that the GHG emissions of the LNG plant are greater than the No Action Alternative.

No Guarantees that Gas will only come from B.C. - The draft SEIS requires that all of the gas for the facility will be sourced from British Columbia. During the recent gas pipeline explosion in B.C. on October 10th, it is our understanding that PSE used gas from North Dakota. The methane leak estimates from North Dakota are noticeably higher than those reported from B.C. PSE's own 2017 10K filing with the Securities and Exchange Commision (SEC) shows that in 2017 they obtained gas from British Columbia (54.8%), Alberta (19.1%) and the United States (26.1%). We have concerns that PSE will source gas from places other than B.C., as well as concerns about their accountability for their sourcing.

The remainder of our comments are described in the attachment. This draft SEIS does not account for the full climate impacts of fracked gas. In light of these serious concerns, we respectfully request that you address these concerns and reissue the SEIS with a new, full public comment period. We look forward to your response.

Sincerely,

---

Technical Concerns

The draft SEIS uses an outdated methane global warming potential (GWP) - GWP is a measure of how much heat a greenhouse gas traps in the atmosphere relative to carbon dioxide (CO2). CO2 has a GWP value of 1. Methane, however, has a much larger GWP for timescales of 500 years or less. The draft SEIS uses the United Nations' 2007 value of 25 for the 100-year GWP of methane. However, they should be using the peer-reviewed 2016 value of 32[5]. This single modification in SEIS GHG model makes the LNG plant dirtier from a greenhouse gas emissions perspective than if the LNG plant were not built. The following chart shows different GWP values for 20 and 100 year periods based on IPCC reports in 2007 and 2013, and an independent scientific study completed in 2016. The SEIS used the lowest values possible.

Report	20-year GWP	100-year GWP
2007 IPCC AR4	72	25
2013 IPCC AR5	84	28
2016 Scientific Study (authors include the lead scientist from 2013 IPCC report)	96	32

Methane is significantly more potent in the short-term, yet the SEIS analysis only looks at the long-term impact - Methane has a much higher GWP than carbon dioxide over time periods of less than 500 years. The draft SEIS analysis is based on the 100-year GWP of methane. The IPCC report released a report on October 8th, indicating that we must change our energy fuel mix in the next 12 years to avoid the worst effects of climate change. Therefore, the SEIS should use the 20-year GWP, as that is the timeframe when action is required. Using the most recent 20-year GWP value of 96 makes the LNG plant 50% dirtier than the No Action Alternative.

Lack of evidence that B.C. fracked gas is as clean as claimed - The draft SEIS falsely assumes that B.C. fracked gas would result in a GHG emissions reduction. The SEIS provides three references for B.C. methane leakage rates, all of which require further review to fully determine if they are legitimate representations of B.C.-wide fracked gas methane leakage rates or not. We know, for instance, that one of them (Brandt et al, 2017[6]) is derived from a Master's Thesis covering Canadian gas wells outside of B.C. that states that the emissions examined in the report are lower than industry average due to a variety of reasons. It is inappropriate to extrapolate the methane leakage rate from that report to all of B.C. fracking wells. Additionally,

[5] https://doi.org/10.1002/2016GL071930
[6] https://ngi.stanford.edu/sites/default/files/110_Brandt.pdf

the SEIS fails to incorporate methane leakage data from a 2017 peer-reviewed report[7] and a 2018 non-profit foundation report[8], that use empirical, independent physical studies at well sites. The 2018 report found that 85 percent of active wells are directly venting methane daily, and that those leakages have been historically underreported. The same report found that methane emissions in B.C. are significantly higher than reported by industry.

No guarantee that all of the fracked gas would come from B.C. - The draft claims that all of the gas will be coming to the facility from British Columbia. During the recent gas pipeline explosion in BC on October 10th, it is our understanding that PSE sourced gas from the Rocky Mountains or North Dakota. The methane leak estimates from North Dakota are noticeably higher than those reported from B.C. PSE's own 2017 10K filing with the Securities and Exchange Commision (SEC) shows that in 2017 they obtained gas from British Columbia (54.8%), Alberta (19.1%) and the United States (26.1%). We are not convinced that the facility will only use gas sourced from B.C.

No alternative sourcing plan in the event of larger than anticipated methane leaks - The SEIS requires the PSE LNG facility to get its fracked gas from Canada even in the case of larger methane leakage rates. If later studies show that actual leaks are considerably larger, it is unclear whether the facility will stop production and distribution.

Discrepancies between regulations and implementation - The SEIS claims that we should expect to see reductions in the amount of upstream fugitive emissions given B.C.'s new, tough regulations on fugitive methane emissions. However, simply because a regulation has been passed, implementation of that regulation in the field is typically not immediate. Regulations also depend upon political will and are therefore susceptible to change. The SEIS should only assume methane emission leak rates based on empirically collected data, and not on unsupported predictions.

Analysis assumes credit for extra maritime customers that currently do not exist - The analysis appears to assume that Puget LNG (the for-profit arm of this venture that will be selling the LNG to maritime customers) already has additional maritime customers, and so is claiming greenhouse gas emissions reduction credit for them. They have no such customers and so cannot legitimately claim such credit.

Questionable Methane Slippage Rates for TOTE Vessels - The SEIS appears to be using unacceptably small methane slippage rates (the amount of unburned methane that will escape into the atmosphere) for the TOTE maritime vessels that will be burning the LNG. In fact, even in PSE's own greenhouse gas life cycle analysis included in the SEIS, their external peer

1298-12 14. LCA Inputs and Assumptions - Leakage/Slippage

reviewer questioned PSE's assumption of their methane slippage rate indicating that they should be using the higher rate, as that is considered best practice.

Cut Off Threshold - The SEIS includes a 1% cutoff threshold, such that any emissions source which produces less than 1% of the total GHGs for the system is automatically excluded from the overall calculations. We would like to know all of the sources that fall into this cutoff threshold category and the estimated percentage of GHG emissions coming from those sources. Our concern is that if the analysis incorporates multiple sources less than 1%, but cumulatively these add up to a significant percentage of the overall GHG emissions (say, three 0.8% sources adding up to 2.4%), then this could significantly under represent the true GHG emissions value.

No fuel alternative options for ships is a false assumption - Currently TOTE Maritime is the only shipping company in the Port of Tacoma that has committed to converting their vessels to run on LNG, yet all of the shipping companies are required to meet the 2020 International Maritime Organization (IMO) low sulfur emissions requirements. TOTE is already compliant with this requirement; it has been using ultra-low sulfur diesel (ULSD) since February 2017. Therefore they have no regulatory need to convert to LNG. Other companies are either also using ULSD or are incorporating scrubbers into their vessels to meet the IMO requirement. Additionally, TOTE converted to using electric, shore-based power when they are in port in Tacoma. Finally, the Washington State Ferries were considering converting to using LNG, but have since abandoned that in favor of electric engines in order to reduce their carbon footprint and cut costs.[9]

Peak shaving demand for PSE electricity customers can be met by other means - The peak shaving component of the LNG plant will be used to generate electricity for PSE electricity customers. Currently, without the LNG plant, PSE must burn diesel to generate this extra electricity on a peak-shaving day. The SEIS indicates that the Frederickson combined cycle turbine is where the peak shaving will occur and that an additional 26 MW of power can be created during peak-shaving operations. We would like to be provided with more details concerning the peak shaving need, such as the full power and energy required for peak shaving operations. These are not explicitly stated in the draft SEIS. PSCAA should then use that information to perform GHG emissions analysis for other technology alternatives such a battery storage or even purchasing wholesale electricity from Tacoma Power (which is 97% fossil-fuel free).

Analysis does not incorporate all emissions - The vast majority (85 - 98% as of 2016[10,11]) of the gas wells in British Columbia are fracking wells and fracking requires large consumption of

water and sand for its operation. The SEIS, however, does not include the GHG emissions from the trains and diesel trucks used to transport the water and sand to the wells. It is our understanding that sand for fracking may come from places as far away as Wisconsin which would incur significant transportation emissions.

The draft SEIS is incomplete - The report has inconsistencies, missing data, or simply incorrect units of measurement. These errors appear in multiple places throughout the document, making it difficult to provide a thorough analysis. In one instance, the report uses inconsistent units of measurement; in calculating the B.C. methane leakage rate, the amount of leaked gas measured in billions of cubic meters is directly compared to the total gas produced in billions of cubic feet. There are also multiple locations of missing data. For instance, CO_2 emission factors for natural gas are indicated merely as placeholder values, with a corresponding note that the data had been requested. These few examples raise obvious questions about the completeness and accuracy of the SEIS. We recommend a robust revision and reissue of the document to include complete and accurate information, as well as a new period for public comment.

Subject: Public Comment on DSEIS, PSE LNG Project

I wish to express my support for Puget Sound Energy's (PSE) liquefied natural gas (LNG) facility. This includes my agreement with the conclusion about the environmental benefit of replacing transportation diesel fuel with clean burning LNG contained in the October 8, 2018 Draft SEIS issued by the Puget Sound Clean Air Agency (PSCAA) and my support for the agency in issuing the necessary permit(s) for the project to proceed.

The Washington Department of Ecology's State Environmental Policy Act (SEPA) regulations recognize that air quality is a part of the environment. It's hard to ignore the environmental and air quality benefits of replacing diesel or bunker fuel currently used by the maritime industry with LNG fuel. Switching from diesel to LNG reduces greenhouse gas emissions by nearly 15%, sulfur dioxide (SOx) emissions by over 99% percent, and nitrogen oxide (NOx) emissions by nearly 85% while eliminating visible particulate matter (PM) produced by ships by more than 85%.

The LNG facility will also generate important economic benefits for all South Sound residents, which I am one. It will create at least 250 construction jobs and over 300 indirect jobs due to the construction. After the construction, the economic activity from the project will create another 125 permanent jobs.

Since the draft SEIS independently prepared for and published by PSCAA has confirmed the environmental benefits and overall reduction in GHG emissions from use of LNG as a replacement for diesel, I fully support PSCAA promptly finalizing its October 8, 2018 draft SEIS and granting the necessary permit(s), so the LNG facility can be completed as soon as possible.

Sincerely,

Michael E. Hutchinson, LG, LHG
Senior Principal Hydrogeologist
Chief Executive Officer
GeoEngineers, Inc.

[03:51:05] Is Todd Iverson here?

Todd: Yes. Good evening. My name is Todd Iverson. And I'm sorry I don't have a song prepared. But I'm a longshoreman at the Port of Tacoma, and I'm here to represent the 1,500 longshoremen at the Port of Tacoma. We support TOTE's transition to LNG because 1) is they're a great employer, and they've taken the strides to make the investments to do this. Secondly, as I was coming here tonight, I told one of our crane drivers at the union hall, I said I'm heading up there to the thing, and he goes, "Thank you. I'm a crane driver. I have to sit next to the smoke stacks."

Currently, all of the vessels pretty much use bunker fuel. It's a dirty, ugly, bad substance that has a lot of particulates.

[03:52:00] We know the LNG is better for us. We know LNG is not perfect. I don't dispute a lot of what's been said here tonight. We hope that the findings show that it's an alternative for now. We know it's not the end product. I, ultimately, hope that Elon Musk events some battery that can power those vessels. But right now, that technology is not there. And this is the bridge to that point. I'm also speaking as a father. I have three little boys, and everything I do, I want to make sure their dad has a job, so they can eat tonight and tomorrow and the next day.

But, most important, that they inherit an earth that is going to be for them. So, I encourage you guys to A) pass this permit, but also, hold PSE accountable. Make sure that they use the best technology to get the best environmental results and move us forward. And I thank you for your time. And feel free to contact us for anymore information. Thank you.

Steve: Thank you.

Re: Tacoma LNG Facility
publiccomment@pscleanair.org
October 25, 2018

Puget Sound Clean Air Agency;

On behalf of the Skagit Business Alliance I am writing to provide our comments and to express support for PSCAA to issue the necessary permits for Puget Sound Energy (PSE) to continue construction of its liquefied natural gas (LNG) facility at the Port of Tacoma.

The Port of Tacoma is clearly the right place for a facility such as this. The Port is an established industrial area, and this project is consistent with the types of uses and aesthetic appearance of other marine-related industrial activities in the area. In accordance with Washington's Growth Management Act, cities and towns must first study the environmental effects of, and then zone, land for industrial use in appropriate locations. The land within the Port has been reviewed by the City of Tacoma and zoned for precisely this type of industrial facility.

Port districts exist to promote economic activity and vitality. The Port has long been a substantial economic engine in Tacoma, in alignment with the purpose for which Washington laws authorize the formation of ports. The building and operation of the LNG facility represents hundreds of millions of dollars of private investment on a state-of-the-art facility. It will help local business remain competitive by providing a needed supply of LNG for its soon-to-be-reconfigured marine vessels. The siting of this facility in the Port of Tacoma, within the city of Tacoma, will be a competitive advantage for the NW Seaport Alliance and the State of Washington.

The Skagit Business Alliance is a coalition of representatives from the Anacortes, Burlington, Concrete, La Conner, Mount Vernon and Sedro-Woolley Chambers of Commerce, the Skagit/Island Counties Builders Association (SICBA) and the North Puget Sound Association of Realtors (NPSAR).

Mount Vernon Chamber of Commerce · SICBA · Sedro-Woolley · Anacortes Chamber of Commerce · Concrete · Burlington Chamber of Commerce · North Puget Sound Association of REALTORS® · La Conner

Skagit Business ALLIANCE

The Tacoma LNG facility will create at least 250 construction jobs and 18 permanent jobs directly within the Port, along with the economic activity from the project creating another 125 permanent jobs in the region. The facility is consistent with the on-going efforts by the Port, the City and region to encourage a healthy local business climate and help retain and grow companies who call Pierce County home. As the FEIS for the proposal demonstrated, it will also contribute millions of dollars in new tax revenues to benefit local schools, city services, and other state and local government services by making more public funds available to meet road and public safety needs.

The environmental and health benefits of LNG are also very important. LNG is a cleaner alternative to conventional fuels such as diesel. The PSCAA's Draft SEIS, published on October 8, 2018, confirms this. Switching to LNG reduces greenhouse gas emissions by nearly 15% and eliminates visible particulate emissions produced by ships by more than 85%. This helps improve air quality and reduce health risks, while helping local employers like TOTE comply with new stricter low-sulfur emission standards.

PSCAA, by preparing the draft SEIS, has confirmed the environmental benefits and overall reduction in greenhouse gas emissions which should allow the finalization of environmental review so that the project permit(s) can be issued. We fully support this project and are confident it will provide great benefits to the residents and businesses of Pierce County and the Puget Sound region for years to come.

Sincerely,

Christina Jennings

[00:06:00] Rich Voget, Nancy Shimeall, and Chris Chapin. Mr. Eric Johnson.

Eric: Thank you very much. Good afternoon. My name is Eric Johnson. I'm the executive director of the Washington Public Ports Association. That's the association based out of Olympia that represents the port districts of the state of Washington. And I'm here in support of finalizing the draft environmental impact statement for this facility and issuing the permit for this facility once that DEIS becomes final. LNG is a lot cleaner fuel than bunker fuel, which is what it replaces. And we have taken the additional step now of studying the lifecycle impact of that fuel. And the study shows that, on balance, we're better off.

The air in this harbor will be cleaner with this facility than it will be without this facility. Ports across our state are striving to continuously improve our environmental practices. And moving to cleaner fuels is one part of that process. And transitioning to cleaner vessels is something that the global shipping fleet is evolving towards.

[00:07:00] If we, in the Pacific Northwest, want to be a part of that transition, we're going to need facilities like this one to be available to shipping lines like TOTE who want to use them. So, in closing, I would urge the air agency to finalize the EIS and issue the permit for the facility. Thank you very much.

Puget Sound Clean Air Agency
ATTN: Public Comment on DSEIS, PSE LNG Project
1904 Third Ave, Suite 105
Seattle, WA 98101

Re: Draft Supplemental Environmental Impact Statement (SEIS), PSE LNG Project

On behalf of the Association of Washington Business (AWB), I write to express support for Puget Sound Energy's (PSE) liquefied natural gas (LNG) facility at the Port of Tacoma and to urge the Puget Sound Clean Air Agency (PSCAA) to issue the necessary permit(s) to allow construction of this important facility to continue.

AWB is the state's oldest and largest statewide business association representing nearly 7,000 employers and more than 1 million employees. AWB serves as both the state's chamber of commerce and state manufacturing association.

We are pleased to see the release of the draft Supplemental Environmental Impact Statement (Draft SEIS) and appreciate the work put forward by the Puget Sound Clean Air Agency. This letter reflects my comments in support of the PSCAA finalizing its SEIS consistent with the draft issues Oct. 8, 2018 and timely issuing PSE the necessary permit(s) to proceed.

Our members are continually striving to reduce their carbon footprint and expand economic opportunity in every part of the state. The PSE LNG project will further both of these objectives.

The facility will create at least 250 construction jobs and 18 permanent jobs directly within the Port of Tacoma, along with the economic activity from an additional 125 permanent jobs the project will create in the region. In addition, it will help local businesses remain competitive by providing a needed supply of LNG for marine vessels that will soon be reconfigured to run on this clean alternative to conventional fuels.

This is the right place for this kind of job creation. The port is an established industrial area, and this project is consistent with the types of uses located in the area. The City of Tacoma has reviewed the land where this project is located and zoned it for exactly this type of industrial facility.

Washington is one of the most trade-driven states in the country. The Port of Tacoma has long been an economic driver, not only for Tacoma and Pierce County but also for the entire state, moving products that are made here to export markets around the world. When it's finished, this state-of-the-art facility will be a competitive advantage for the Northwest Seaport Alliance and for the state of Washington.

In addition to job creation, this project will contribute significant environmental benefits as documented by the Draft SEIS. Switching ships to LNG reduces greenhouse gas emissions by nearly 15 percent and reduces visible particulate emissions from ships by more than 85 percent, improving air quality and reducing health risks.

Finally, increased reliability to employers and residential consumers is an additional benefit that would result from the project. On Oct. 9, many of PSE's major customers were required to curtail their use of natural gas when a major pipeline supplying gas to Washington state ruptured and the supply was turned off. This negatively impacted business operations and served as an example of how the project will provide benefit to the community. With the LNG facility in production, the mandatory curtailment could have been avoided.

For all of these reasons, we offer our strong support of PSE's LNG facility at the Port of Tacoma. It will create good jobs, reduce greenhouse gas emissions and provide our region and state with an important competitive advantage.

Sincerely,

Kris Johnson

Subject: TOTE MARITIME ALASKA LNG PROJECT

Good afternoon,

I am writing as the head of logistics at Honda, longtime partners with TOTE Maritime. We have followed with great anticipation TOTE's conversion to LNG as it aligns very closely with our corporate initiative to leave the world better than we find it today (our "Blue Skies for Our Children" initiative).

I lead the teams responsible for shipping automobiles from factories around the world to our dealerships in the U.S. As you can imagine this activity creates a significant carbon / GHG footprint, which we are striving to reduce. We do this by collaborating with likeminded Ocean Carriers, Railroads and Trucking Partners who are proactively seeking to reduce the carbon footprint and GHG emissions related to their trade.

I was concerned to hear of delays in TOTE Maritime's conversion plan when I last inquired. It seems as though the environmental review has taken on a life of its own and has gone on far too long already. I have seen this happen in other regions to the detriment of the Port's competitiveness and ability to serve the growing demand of shippers (like Honda) for clean air alternatives. Further delay puts the port of Tacoma (in my opinion) at a competitive dis-advantage while continuing to un-necessarily pollute our environment. As I understand them, the benefits of this conversion are quite clear:

- Nearly 14% reduction in GHG
- The practical elimination of particulate emissions
- 100% reduction in SOX
- 90% reduction in Nitrogen Oxides

We can all be proud of these outcomes. As a company concerned with the environment we leave our children and grandchildren, I felt it important to express my concern regarding the delays and urge you to move swiftly forward with the approvals necessary to enable TOTE's LNG conversion plan.

Sincerely,

AMERICAN HONDA MOTOR CO., INC.

Puget Sound Clean Air Agency
ATTN: Public Comment on DSEIS, PSE LNG Project
1904 Third Avenue, Suite 105
Seattle, WA 98101

RE: PSE LNG Project

To whom it may concern:

I wish to express my support for Puget Sound Energy's (PSE) liquefied natural gas (LNG) facility. Maxum Petroleum is a marine diesel fuel and lubricant provider. Locally, we have terminals on the water, barges, vessels and trucks that we use to distribute our products to tugs, vessels and ships throughout Puget Sound. Additionally, we have operations on the Columbia River, San Francisco/Oakland and LA/ Long Beach, which provide the same mode of distribution to the maritime community. Several of our clients are and have begun to transition their vessels propulsion system to operate on LNG due to the environmental and regulatory pressures outlined in this letter. The facility at Puget LNG is an important supply source for these vessels to receive the services they require to operate. This specifically includes my concurrence with the conclusion about the environmental benefit of replacing transportation bunker fuel with clean burning LNG contained in the October 8, 2018 Draft SEIS issued by the Puget Sound Clean Air Agency (PSCAA) and my support for the agency in issuing the necessary permit(s) for the project to proceed.

The Washington Department of Ecology's State Environmental Policy Act (SEPA) regulations recognize that air quality is a part of the environment. It's hard to ignore the significant environmental and air quality benefits of replacing bunker fuel currently used by the maritime industry with LNG fuel. Switching from bunker to LNG reduces greenhouse gas emissions by nearly 15%, sulfur dioxide (SOx) emissions by over 99% percent, and nitrogen oxide (NOx) emissions by nearly 85% while eliminating visible particulate matter (PM) produced by ships by more than 85%. It is these particulate emissions that are extremely harmful to the lung health of anyone breathing them in.

It is also important to note that LNG powered ships will substantially exceed the North American Emission Control Area requirements established by the International Marine Organization's (IMO). The IMO regulations have required a reduction in the bunker fuel sulfur content from 3.5 percent to 0.5 percent. Both US EPA and the US Coast Guard are enforcing these fuel regulations, which have been estimated by EPA to reduce mortality by as much as 30,000 people per year. TOTE has made the commitment to use LNG fuel, which provides substantially greater benefits than even the IMO regulations mandate. Maxum Petroleum has assisted its clients that have already moved from bunker fuel to Ultra Low Sulfur diesel fuel over the last decade. In each case, the clients have placed their environmental stewardship programs at the forefront of their company's core values and have

remained not only competitive but also safe and efficient operators. These shipping lines as well as several others that call in Puget Sound are incorporating LNG propulsion systems into their new build programs. The future primary source of fuel for bunkering vessel is LNG.

Another important environmental advantage of LNG as fuel is that in the unlikely event of a spill, LNG turns into vapor and dissipates with no lasting effects on water or marine life.

The LNG facility will also generate important economic benefits for all South Sound residents. In addition to helping local employers like TOTE remain competitive, it will create at least 250 construction jobs and over 300 indirect jobs due to the construction. After the construction, the economic activity from the project will create another 125 permanent jobs.

The draft SEIS, prepared by Ecology and Environment, Inc. and released by PSCAA on October 8, 2018, stated "When evaluating direct, upstream, and end use GHG emissions, replacing a diesel propulsion engine with a pure LNG propulsion engine results in reduced life-cycle GHG emissions."

Since the draft SEIS independently prepared for and published by PSCAA has confirmed the environmental benefits and overall reduction in GHG emissions from use of LNG as a replacement for diesel, I fully support PSCAA promptly finalizing its October 8, 2018 draft SEIS and granting the necessary permit(s) so the LNG facility can be completed as soon as possible.

Sincerely,

Dan Kovacich

[03:53:00] Virginia Lohr?

Virginia: I'm Virginia Lohr. I'm a volunteer with Citizens' Climate Lobby, which is working for a livable future. An analysis that will have an impact on the future of humanity should not be based on an isolated bubble like just the city of Tacoma. So, I thank you, the agency, for requiring that there be a supplemental environmental impact statement that evaluates the emissions, including the upstream ones. My comments here will focus on just one problem that I see with the draft statement, though there are, obviously, many that we've heard.

And this one has also been alluded to. The project should not be allowed to go ahead with the assumption that BC gas has less leakage of methane than other sources.

[03:54:00] One reason is that leakage numbers for BC have been called into question. Also, individual sites will vary. It can't be an assumption that every site in BC will be acceptable. "Unexpected ruptures", which is what PSE told us was the gas pipe breakage recently in BSC should be expected. Did you know that that was a 36 inch pipe that broke? And did you know that about 40 feet away was a 30 inch pipe? We are very fortunate that that accident, that unexpected rupture, was not extremely worse. I assume that that has a little effect on leakage rates of methane in BC, when that happens.

And as you've also heard about the IPCC report that was released this month on the dire nature of climate change.

[03:55:00] This should weigh heavily on those making these decisions, for the next 40 years, as we've heard from the children before me. At the very least, this draft statement should be revised to use methane leakage numbers from independent researchers such as the Davis Suzuki Foundation and use a reasonable life span for methane and something that is in keeping also with the life span of this proposed project. And I stand with the Puyallup Nation in their opposition to the LNG facility. Thank you.

Steve: Thank you. Betsy Seaton?

1235-1 14. LCA Inputs and Assumptions - Leakage/Slippage
1235-2 13. LCA Inputs and Assumptions - Natural Gas Source
1235-3 12. LCA Inputs and Assumptions - Global Warming Potential Value

Steve: Thank you. Next is Melissa Malott.

Melissa: Hello. I'm Melissa Malott. I'm the executive director of Citizens for a Healthy Bay. We engage people in the cleanup, restoration, and protection of Commencement Bay and surrounding waters. CHB stands in opposition to this project. In coming to this unanimous decision, we found three things. First of all, the LNG project will be worse for climate emissions. Lots of people in the room tonight do not understand this. The SEIS only looks at climate emissions after methane emissions lose their potency. So, at a time that we must be dramatically reducing emissions, this project is worse than the status quo.

For that reason, we find that it poses unacceptable risks to Commencement Bay and Tacoma. Second, we find that the SEIS, as drafted, is incomplete and misleading.

[04:08:00] I've worked in government before. I've worked with government my entire career. I believe in government. But I am so disappointed in this. This fails to inform the public of the climatic impacts of this project. It's dishonest as drafted, and it hides the most important information. You must disclose the climate impacts of the LNG project during the life of the project because that's when climate emissions matter because that's when we have to be reducing them. Please pull this back. Update it with complete and accurate information and reissue it for public comment.

Finally, our third finding is that the Puyallup Tribe of Indians was excluded from this project at a critical stage in the process. The city of Tacoma had a legal responsibility to meaningfully involve the tribe in consultation, at early stages of the project. We did an open records request of the city and found that they did not have the records to show that they meaningfully consulted the tribe under the requirements of the Land Claim Settlement Act.

[04:09:05] Please do not perpetuate the illegal denial of meaningful consultation with the tribe about actions that impact tribal resources. Take time to address the flaws in this process. Consult with the tribe about the information and the SEIS and the significant risks to the tribe's resources. Then, please revise and update the SEIS with full and complete information and rerelease it to the public for public comment. Thank you.

Puget Sound Clean Air Agency (PSCAA)
ATTN: Public Comment on DSEIS, PSE LNG Project
1904 Third Ave, Suite 105
Seattle, WA 98101
publiccomment@pscleanair.org

Hello,

Thank you for the information contained in the draft Supplemental Environmental Impact Statement (SEIS) for the Tacoma Liquefied Natural Gas Project (LNG project).

Citizens for a Healthy Bay (CHB) is a 28-year-old organization whose mission is to represent and engage people in the cleanup, restoration, and protection of Commencement Bay, its surrounding waters and natural habitat. We are a 501(c)3 nonprofit providing practical, solutions-based environmental leadership in the Puget Sound area. We work side-by-side with residents, businesses, and government to prevent and mitigate pollution and to make our community healthier and more vibrant.

We commented on the original draft EIS for this project in 2015, and had concerns that were addressed by Puget Sound Energy's modifications to the project. After that, we were neutral on the LNG project. For the SEIS, CHB's Policy and Technical Advisory Committee, staff, and board have reviewed information in light of recently published reports on climate change, and we are alarmed by the new information available on this project.

Within the SEIS is information that shows the LNG plant would have higher climate impacts than the no action alternative for the life of the project, and CHB finds that the LNG project poses unacceptable risks to Commencement Bay and the Tacoma environment. We also find important parts of the SEIS to be incomplete and misleading for the public. By unanimous vote of our board of directors, CHB opposes any further development of the LNG project. We urge PSCAA to revise and update the SEIS and re-release it for public input.

The most alarming information in the SEIS relates to the amount and impact of methane emissions during the life of the project. A key step to PSCAA's conclusion that the LNG project is better than the no action alternative is evaluating the impacts of the methane emissions after 100 years, at a time when their potency would be significantly diminished. At 100 years, after the methane emissions have lost most of their potency, the SEIS says the emissions from the plant would only be 4 or 5% better than the no action alternative. However, because methane's potency is much higher in the first few decades it is emitted,

examining the impact of methane emissions on a shorter timeline would show the climate impact of the LNG plant to be much worse than the no action alternative.

Climate change is an immediate local and global concern. The 0.5 degrees Celsius increase we have already experienced has impacted our Puget Sound communities and environment. These changes affect the planet as a whole and impact Commencement Bay. Ocean acidification is one example of a global problem from climate change impacting the Puget Sound and Commencement Bay; ocean acidification is hurting shellfish and the people who eat or sell shellfish. We know that climate change impacts Puget Sound and Commencement Bay, and that cutting greenhouse gas emissions now must be a global and local priority.

Recent reports about the progress of climate change indicate that the planet is experiencing rapid warming. Without drastic, unprecedented cuts to greenhouse gas emissions, the planet will warm by more than 1.5 degrees Celsius in the next few decades, and potentially 4 degrees Celsius by 2100. The impact of changes beyond 1.5 degrees Celsius is unacceptable to us. It will massively impact the Puget Sound fishery and ecosystem, and change our communities and economy in ways we cannot yet imagine. To prevent more than 1.5 degrees warming, scientists report that global greenhouse gas emissions must fall to zero by 2050 and then go negative. Cutting greenhouse gas emissions to zero by 2050 is a massive task, and will take drastic, unprecedented measures to accomplish.

With the scale of change that needs to happen in mind, the LNG project is a step in exactly the wrong direction. Increasing methane emissions, which are 86 times more potent than carbon dioxide as a greenhouse gas, in the next few decades is the opposite of what we should be doing. This LNG project would release hundreds of thousands of tons of a potent greenhouse gas at the exact time when we must drastically reduce greenhouse gas emissions. It is a bad idea and should not proceed.

We are also extremely concerned that this SEIS is incomplete and relies on outdated, inaccurate information and is misleading for the public. A critical table in the analysis appendix, Table C.1. uses placeholder figures rather than actual data. Although we have requested the accurate data for this table, it has not been provided.

In the SEIS, the global warming potential of methane and nitrous oxide is assessed based on an outdated standard (AR4) from 2007. The newest standard, AR5, shows that methane has a greater impact on climate change than previously thought. Bizarrely, the SEIS discusses the updated standard and includes the figures for it in its report, but then chooses to use the outdated standard from 2007 for its analysis.

Additionally, the conclusions in the SEIS rely heavily on the assertion from PSE that the plant will only use natural gas from British Columbia. The SEIS fails to provide any analysis or discussion of the potential greenhouse gas emissions if the plant's natural gas comes from another source, such as the United States or other Canadian provinces. As a result, it is impossible to assess the true impact of the project in the likely scenario that the natural gas will be sourced from multiple locations. The SEIS provides an incomplete picture of greenhouse gas impacts because it insisted on an analysis restricted to a certain geography.

Further, the SEIS fails to indicate how the LNG plant scenario compares to the no action alternative in terms of global warming impacts during the 40 year life of the project. The SEIS relies on a 100-year timescale to assess greenhouse gas emissions even though the life of the plant is only anticipated to be 40 years. The public deserves to know the true impact of the project during its lifespan, or, at least, during a timeframe that is relevant to the important changes that need to be made to address climate change. Why have an SEIS that is scoped to explore the greenhouse impacts of a project and then not disclose the greenhouse impacts in a relevant way?

Finally, we are concerned about the exclusion of tribal communities at a critical stage in the process. The City of Tacoma had a legal responsibility to meaningfully involve the Puyallup Tribe of Indians in consultation at the

1304-2 cont'd 12. LCA Inputs and Assumptions - Global Warming Potential Value
1304-3 3. Outside of SEIS Scope
1304-4 12. LCA Inputs and Assumptions - Global Warming Potential Value
1304-5 13. LCA Inputs and Assumptions - Natural Gas Source
1304-6 12. LCA Inputs and Assumptions - Global Warming Potential Value
1304-7 5. Regulatory Framework

early stages of this project. CHB did an open records request earlier in 2018, and found that the City did not have records to show it followed the meaningful consultation requirements under the Land Claims Settlement Act. Please do not perpetuate the illegal denial of meaningful consultation with the Puyallup Tribe about actions that impact tribal resources. Take the time to address the flaws in this process. Consult with the Tribe about the information in the SEIS and the significant risks to the Tribe's resources. Then, please revise and update the SEIS with full and complete information, and to re-release it to the public for public comment.

In its current state, the SEIS is incomplete, inaccurate and unreliable. We stand in opposition to this project. We encourage you to pause this process and reissue a complete SEIS on which the public can comment. Thank you for your consideration. Please do not hesitate to contact me with any questions about this letter.

Sincerely,

Melissa Malott
Executive Director, Citizens for a Healthy Bay
mmalott@healthybay.org, (253) 383-2429

CC: Victoria Woodards, City of Tacoma Mayor
Members of the City of Tacoma City Council
Members of the Puyallup Tribe of Indians Tribal Council
Members of the Puget Sound Clean Air Agency Board of Directors
Jay Inslee, Governor of Washington State
Rep. Jake Fey, Washington State House of Representatives
Rep. Laurie Jinkins, Washington State House of Representatives
Sen. Jeannie Darnielle, Washington State Senate
Hartleigh Caine, TOTE Maritime Alaska

Steve: Thank you. Before we call the next speaker, let me just give you the next five after that. Kathy Lawhon, David Perk, Alex Hofeling, Renee Cournoyer, Josh Clearman. So, next up would be Mark Martinez.

Mark: Thank you. And please tell me when I take up my two minutes, as was stated before.

[04:41:00] My name is Mark Martinez. I live in Tacoma's fabulous east side. I'm here tonight representing the Pierce County Building and Construction Trades Council. The council consists of 16 craft unions and about 6,000 skilled union workers that make Tacoma and Pierce County their home. The council urges the Puget Sound Clean Energy Agency to adopt the draft SEIS as written and issue the necessary permits to put 400 of our members to work. LNG powers our economy and heats our homes, heats our schools, heats our businesses, and heats the entertainment venues that we all enjoy.

Replacing diesel with LNG, on this project, is said to reduce or will reduce greenhouse gas emissions by 13.5% and sulfur emissions by 85%. Your own draft SEIS states, when evaluating direct, upstream, and end use greenhouse gas emissions, replacing the diesel propulsion engine with a pure LNG propulsion engine results in reduced lifecycle greenhouse gas emissions.

[04:42:13] Your own quote. So, what's the alternative? We get to burn more diesel. On behalf of our 6,000 members and our 16 craft unions, we ask the Puget Sound Clean Air Agency to adopt the draft SEIS as written and issue the air permits to put people to work. One more thing, I hope everybody has a safe drive home.

MOUNT VERNON CHAMBER OF COMMERCE

Puget Sound Clean Air Agency
1904 3rd Ave #105
Seattle WA 98101
Re: Tacoma LNG Facility
publiccomment@pscleanair.org

Puget Sound Clean Air Agency:

I write on behalf of the **Mount Vernon Chamber** to provide the organization's comments and to express support for the Puget Sound Clean Air Agency (PSCAA) to issue the necessary permit(s) for Puget Sound Energy (PSE) to continue construction of its liquefied natural gas (LNG) facility at the Port of Tacoma.

The Port of Tacoma is the right place for a facility such as this. The Port is an established industrial area, and this project is consistent with the types of uses and aesthetic appearance of other marine-related industrial activities in the area. In accordance with Washington's Growth Management Act, cities and towns must first study the environmental effects of, and then zone, land for industrial use in appropriate locations. The land within the Port has been reviewed by the City of Tacoma and zoned for precisely this type of industrial facility.

Port districts exist to promote economic activity and vitality. The Port has long been a substantial economic engine in Tacoma, in alignment with the purpose for which Washington laws authorize the formation of ports. The building and operation of the LNG facility represents hundreds of millions of dollars of private investment on a state-of-the-art facility. It will help local business remain competitive by providing a needed supply of LNG for its soon-to-be-reconfigured marine vessels. The siting of this facility in the Port of Tacoma, within the city of Tacoma, will be a competitive advantage for the NW Seaport Alliance and the State of Washington.

The Tacoma LNG facility will create at least 250 construction jobs and 18 permanent jobs directly within the Port, along with the economic activity from the project creating another 125 permanent jobs in the region. The facility is consistent with the on-going efforts by the Port, the City and region to encourage a healthy local business climate and help retain and grow companies who call Pierce County home. As the FEIS for the proposal demonstrated, it will also contribute millions of dollars in new tax revenues to benefit local schools, city services, and other state and local government services by making more public funds available to meet road and public safety needs.

The environmental and health benefits of LNG are also very important. LNG is a cleaner alternative to conventional fuels such as diesel. The PSCAA's Draft SEIS, published on October 8, 2018, confirms this. Switching to LNG reduces greenhouse gas emissions by nearly 15% and eliminates visible particulate emissions produced by ships by more than 85%. This helps improve air quality and reduce health risks, while helping local employers like TOTE comply with new stricter low-sulfur emission standards.

PSCAA, by preparing the draft SEIS, has confirmed the environmental benefits and overall reduction in greenhouse gas emissions which should allow the finalization of environmental review so that the project permit(s) can be issued. We fully support this project and are confident it will provide great benefits to the residents and businesses of Pierce County and the Puget Sound region for years to come.

Regards,

Andrew T. Mayer
President & C.E.O.

Port of Tacoma

November 8, 2018

Craig Kenworthy
Executive Director
Puget Sound Clean Air Agency
1904 Third Ave, Suite 105
Seattle, WA 98101

RECEIVED
NOV 13 2018
Puget Sound
Clean Air Agency

Dear Craig Kenworthy:

The Port of Tacoma (Port) is pleased to provide these comments on the Draft Supplemental Environmental Impact Statement (DSEIS) for Puget Sound Energy's proposed Tacoma Liquefied Natural Gas (LNG) plant. The port is encouraged by the focus and rigor of the authors and the Puget Sound Clean Air Agency (PSCAA) as lead agency applied to this DSEIS.

The Port is pleased that the SEIS confirms what we have long believed—that LNG, while not a perfect solution, is a step in the right direction as the maritime shipping industry improves its impact on the environment.

One day, renewable technology may be able to replace fossil fuels in the shipping industry. But that day is not now, and won't be for many years. In the meantime, LNG is a better choice – as evident by the SEIS.

The maritime industry is investing heavily in LNG as a better alternative to the heavy fuel currently used in ships. Most new, large ships are being built with dual fuel capability and will be able to use LNG.

Exemplifying this, and largely for environmental reasons, Carnival Cruise Lines is making the transition from traditional fuels to LNG. Also, BC Ferries in Canada is now operating on LNG.

This facility will be a critical piece of our Port infrastructure. It being in the Tideflats and close to our terminal operations will help the Port remain competitive into the future. Local investment in LNG means that in the future, cleaner ships will call our port and the use of LNG will improve local air quality. Emissions of particulate matter, a clear human health hazard, will be very substantially reduced by switching to LNG. Those of us living through the last two summer fire seasons know the value of reducing particulate emissions. In fact, the ports of Seattle, Tacoma and Port Metro Vancouver have worked in partnership for over a decade to collectively reduce emissions associated with our operations. While the focus has been on trucks and yard equipment, moving ships to cleaner fuels is a significant step forward. Switching to LNG will mean cleaner air for the men and women working in the Tideflats and the local community.

The port is encouraged that while the authors of the study took a conservative approach to the analysis, they still demonstrated that the life cycle Greenhouse Gas (GHG) emissions would be reduced by displacing the use of diesel fuel with natural gas. And while that reduction is not as steep as a less conservative approach may have found, it is important nonetheless.

The Port provides the following specific comments:

- PSCAA used the correct approach to modeling emissions: The approach PSCAA used in doing this analysis is consistent with the approach prescribed in the Kyoto Protocol, Paris Climate Accord, U.S. Environmental Protection Agency, Washington State Department of Ecology and its own policies. To deviate from that approach would constitute policy making via project analysis, which is inconsistent with Chapter 34.05 RCW, Administrative Procedures Regarding Rule Making, among others.
- Tacoma Power vs. Washington State Emission Factor: Tacoma Power produces some of the lowest climate footprint electricity in the state (or in the world, for that matter). We are very proud of their efforts on this front and believe the final analysis should include Tacoma Power's actual GHG emission factor and not the state average. Further, the Port pays a monthly premium to Tacoma Power to purchase electricity from their renewable portfolio. TPU has been a leader on this front for years. Please use their specific GHG emission factor within the final analysis. While it likely will not change the numbers significantly, it will give Tacoma Power their due credit for producing electricity with a very low GHG footprint.
- Dictating Commodity Source: Normally the Port would strenuously oppose any suggestion of dictating where a commodity is purchased and restricting free and open markets. However, given the current federal administration's abandonment of the methane standards for the oil and gas industry and British Colombia's (BC) care and attention to the matter, we understand why the authors suggested restricting gas purchases to BC.

Again, thank you for the opportunity to comment on this DSEIS. Overall, we believe the authors and PSCAA did an excellent job of focusing on the specific question at hand and applying a rigorous approach to a difficult modeling problem. The Port of Tacoma remains firmly committed to helping the maritime industry reduce the negative impacts to air quality and human health, as well as reduce GHG emissions through multiple efforts, including switching to cleaner fuels.

Sincerely,

Port of Tacoma Commission

0734

0734-1 23. General Support
0734-2 23. General Support
0734-3 23. General Support

Carole: Thank you. The next group is David Mills, Lisa Simmons, Bliss Moore, William S. Clark, and Holly I think it's Brewer, possibly Drewer. So, if you could do two minutes that would be great. Thank you.

David: I'll do my best. Good afternoon. I'd like to thank the Puget Sound Clean Air Agency for hosting this important public comment opportunity. My name is David Mills. I'm senior vice president for policy and energy supply for Puget Sound Energy. I'm the guy responsible for ensuring the lights are on and the heat is running for millions of people every day by developing and operating a diverse portfolio of energy resources to meet the energy demand of an economically vibrant and growing region. I'm here today to talk to you, specifically, about the Tacoma LNG draft SEIS, which specifically addresses greenhouse gas.

However, I want to emphasize how important this project is to improving air quality, in our community, by providing substantial reductions in particular matter, sulfur dioxides, and oxides of nitrogen.

[01:25:09] This is our home, and we care deeply about it. With this project, we have the opportunity to signify and significantly reduce emissions with cleaner alternatives to diesel and other fuels. PSE's partnership with TOTE Maritime will make this kind of impact. When TOTE's first ship leaves Tacoma for Alaska fueled with LNG, it will result in a material reduction of harmful air pollutants. In concert with the vessels' owners, our LNG facility will create the greenest shipping fleet here on the west coast. Transportation is the single largest source of carbon in our entire state.

Imagine the positive impact on our state's overall carbon emissions, if more ships and trucks were powered with LNG. With the Tacoma LNG facility, we have the opportunity to create a better and cleaner energy future. I have the following very quick, specific comments.

[01:26:00] PSE appreciates the care and diligence that PSCAA brings to the mission of cleaning our air shed and work that PSCAA has put into the supplemental draft EIS. We also look forward to the Tacoma LNG facility being a positive agent of change and reducing greenhouse gas emissions in our community and the region. Our company recognizes that climate change concerns are real and appreciates that PSCAA has comprehensively considered the lifecycle emissions in the draft SEIS. PSE supports the SEIS's

evaluation and the full range of greenhouse gas effects.

We endorse the SEIS's consistent use of global warming metrics that align with the Paris Climate Agreement, and that have been adopted and used by the EPA, Department of Ecology, and setting national, regional, and statewide greenhouse gas reduction goals. We at PSE concur with the draft SEIS conclusion that displacing diesel fuel with cleaner natural gas reduces net greenhouse gas reductions. PSE will comply with the detailed state and federal greenhouse gas reporting requirements, at this facility, just as we do at all of our facilities.

[01:27:05] We look forward to working with our regulators, so that the natural gas that we use at the facility results in a variety of environmental benefits, including a net reduction in greenhouse gas emissions. Thank you for your diligence and attention to detail, in this process.

1947-1 23. General Support

The Voice For The Manufacturing, Industrial and Maritime Community in the South Sound

November 20, 2018

Puget Sound Clean Air Agency
ATTN: Public Comment on DSEIS, PSE LNG Project
1904 Third Ave, Suite 105
Seattle, WA 98101

Subject: Tacoma Liquefied Natural Gas (LNG) facility SEIS

To Whom It May Concern;

The Manufacturing Industrial Council for the South Sound urges the Puget Sound Clean Air Agency (PSCAA) to:

- Approve the Final SEIS for SEPA compliance with no proposed mitigation
- Issue a Final Order of Approval for the Proposed Action
- Issue the permit(s) required to complete the Puget Sound Energy (PSE) Tacoma Liquified Natural Gas (LNG) Facility at the Port of Tacoma without further delay.

We all want a cleaner future. Manufacturing, industrial and maritime businesses in the Tacoma Tideflats are working together with agencies like yours to ensure that we are safeguarding and improving people's lives, creating a sustainable environment, and providing the jobs that anchor our local and state economy.

We have a wonderful resource here with the Port of Tacoma and the Tacoma Tideflats area, with over 40,000 jobs. These jobs are good living wage jobs, jobs that you can truly support a family with. The port is a major economic driver regionally and statewide, and supplies most consumer goods to Alaska. We need to make sure that our port remains competitive and having the preferred fuel source available for maritime trade is an important step in keeping global trade lines open.

In the PSCAA 2014-2020 Strategic Plan, Goal 1 is to "Protect public health and the environment from air pollution." Objective 1.2 is to "Reduce transportation emissions, especially diesel particulate, in highly impacted locations." Delaying the construction of this facility and delaying issuing of the permit(s) will mean added diesel and heavy particulates and greenhouse gases in our local neighborhood air quality.

As a longtime Tacoma resident, I am concerned about the air impacts from the bunker fuel that large vessels visiting the Port of Tacoma currently burn, air that my family breathes, including my children and my aging parents who both are identified as sensitive populations. I applaud shipping lines like TOTE who are meeting and exceeding federal regulations to improve local air quality by transitioning to LNG as a cleaner burning fuel, and plugging into shore power while they are at the dock to improve neighborhood air quality.

950 Pacific Avenue, Suite 300, Tacoma, WA 98401 • Telephone: 253.254.2767 • hello@micsouthsound.com •

The Manufacturing Industrial Council for the South Sound is a program of the Tacoma-Pierce County Chamber

The Tacoma LNG facility has already been through a thorough Environmental Impact Statement (EIS), along with the current Draft Supplemental EIS (SEIS). Both the original EIS and the Draft SEIS clearly document the benefits of this facility, including a reduction in greenhouse gases and heavy particulate.

The environmental and health benefits of LNG when used instead of bunker fuel/heavy marine diesel are very important. LNG is a cleaner alternative to conventional fuels such as diesel. The PSCAA's Draft SEIS, published on October 8, 2018, confirms this. Switching to LNG reduces greenhouse gas emissions by nearly 15% and eliminates visible particulate emissions produced by ships by more than 85%. This helps improve air quality and reduce health risks, while helping local employers like TOTE comply with new stricter federal emission standards.

We ask that you issue the final Order of Approval for the Proposed Action and release any permit(s) to continue construction on the LNG project.

The PSCAA board of directors has committed to "work to protect public health, improve neighborhood air quality, and reduce our region's contribution to climate change." By allowing the completion of the LNG facility and a cleaner fuel alternative for the maritime industry, you are meeting all of those criteria.

Thank you for your time.

Sincerely,

Meredith Neal, Director
Manufacturing Industrial Council for the South Sound
meredithn@tacomachamber.org
253-254-2767

Steve: Okay. Betsy Seaton?

[03:58:00] Mike O'Brien?

Mike: Hi. My name is Mike O'Brien. I'm a Seattle city councilmember. But I'm here as a board member of the Sierra Club. Earlier this month, the United Nations International Climate Conference released their latest report, and it comes as no surprise that what they said was catastrophic climate change is coming much faster than we thought. They gave us a little over 10 years to radically redefine our economy. Now, the good news was that they told us it was no longer a challenge of physics or chemistry. We figured that part out. We have the technology to change course.

But the big question mark they left for us is do we have the political will to make those changes. It's no longer on the scientists. It's on all of us to make that decision. Now, we can debate the science around what is slightly worse or better, fracked gas versus bunker fuel.

[03:59:00] You all can decide the value of the life of a crane operator who is breathing that bunker fuel versus the value of life of a family who lives near a fracking well and is drinking that contaminated water. But we know that we have solutions that are actually clean that work for everybody. We just need to have the political will to do that. Unfortunately, because of our generation's negligence, we have already left a disaster for our kids and our grandkids to clean up. Some of them are here today. And some of them are already standing up and doing this fight. But this is not a problem they created.

They're going to inherit it from us. They're going to spend significant resources over their lifetime dealing with the catastrophes that are coming and putting resources into solutions. I beg of you, don't make their work harder than it is. Please deny this permit.

[00:29:00] So, the next group of five, we've got Tim O'Donnell, Steve Hoffman, Jordan Royer, Greg Unruh, and Dan Streiffert. And I can tell by the sheer number of people that want to speak, which is fantastic, I'm going to ask you to voluntarily, if you can cut your time back below the three minutes that would be really helpful. Then, everyone that signed up in this session could, actually, at least so far, could potentially speak during the afternoon and won't have to come back. So, Tim O'Donnell.

Tim: All right. And thank you for your time today. My name is Tim O'Donnell. I represent the IBW Local 76 in Tacoma and surrounding jurisdictions. I represent 1,300 members. A lot of them have been employed down there at the LNG facility, which has been idle for the past few months. It is a great living wage facility.

[00:30:00] It will help our membership increase their health and welfare and their benefit contributions. With them being idle, we are losing money there. We believe in strong science. We understand the economic concerns or the ecology concerns. I'm an outdoorsman. My family has grown up, since the '20s, on the Pacific Ocean from California to Alaska working there. And we understand the science and the concerns with the environment. But we also understand that this is a bridge fuel, and it's something to help get rid of the fossil fuels and the two ships down there burning diesel.

This past spring, I was in Alaska with the governor of Alaska who is supporting this. This will help our brothers and sisters in Alaska and preserve pollution up there. So, with that, we rise, the IBW and the building trades, as a whole, in support of this project and want to see its continuation. Thank you.

Carole: Thank you. Vincent O'Halloran.

Vincent: Good afternoon. I'm Vince O'Halloran. I represent the Sailors Union of the Pacific. And I'm the vice president of the Puget Sound Ports Council, Maritime Trades Department, AFLCIO.

[02:16:00] I have three quick remarks. So, LNG in Tacoma is a component of the Puget Sound gateway, which will help Washington State maritime compete with Canada's aggressive marketing to take Washington jobs in trade. Canada's increasing investment in expanding LNG facilities will offset any reduced use of LNG in the Puget Sound. Keeping Alaska commerce strongly tied to Washington will grow Washington State jobs and support Washington agricultural business. LNG replaces marine bunker oil in the marine shipping industry struggling to meet carbon reduction goals globally.

The technology is available to minimize methane leakage in the LNG production process to address climate change. And we should focus on this, instead of being stuck with using obsolete fuels, such as bunker oil, which is harmful to workers in the community.

[02:17:04] We encourage a continued process of tribal consultation and recognition of treaty rights. Issue groups come and go, but respect of tribal sovereign nations should be the paramount concern in addressing the impacts of LNG. I thank you for your remarks, and I hope that you move forward with the Tacoma LNG plan. Thank you.

CHAMBER OF COMMERCE

October 29, 2018

To Puget Sound Clean Air Agency:

On behalf of the Bellingham Regional Chamber of Commerce, I wish to provide the organization's comments and to express support for the Puget Sound Clean Air Agency (PSCAA) to issue the necessary permit(s) for Puget Sound Energy (PSE) to continue construction of its liquefied natural gas (LNG) facility at the Port of Tacoma. This project is a great representation of both economic development, energy diversity, and improvements to our environmental stewardship.

The Port of Tacoma is the right place for a facility such as this. The Port is an established industrial area, and this project is consistent with the types of uses and aesthetic appearance of other marine-related industrial activities in the area. In accordance with Washington's Growth Management Act, cities and towns must first study the environmental effects of, and then zone, land for industrial use in appropriate locations. The land within the Port has been reviewed by the City of Tacoma and zoned for precisely this type of industrial facility.

Port districts exist to promote economic activity and vitality. The Port has long been a substantial economic engine in Tacoma, in alignment with the purpose for which Washington laws authorize the formation of ports. The building and operation of the LNG facility represents hundreds of millions of dollars of private investment on a state-of-the-art facility. It will help local business remain competitive by providing a needed supply of LNG for its soon-to-be-reconfigured marine vessels. The siting of this facility in the Port of Tacoma, within the city of Tacoma, will be a competitive advantage for the NW Seaport Alliance and the State of Washington.

The environmental and health benefits of LNG are also very important. LNG is a cleaner alternative to conventional fuels such as diesel. The PSCAA's Draft SEIS, published on October 8, 2018, confirms this. Switching to LNG reduces greenhouse gas emissions by nearly 15% and eliminates visible particulate emissions produced by ships by more than 85%. This helps improve air quality and reduce health risks, while helping local employers like TOTE comply with new stricter low-sulfur emission standards.

PSCAA, by preparing the draft SEIS, has confirmed the environmental benefits and overall reduction in greenhouse gas emissions which should allow the finalization of environmental review so that the project permit(s) can be issued. We fully support this project and are confident it will provide great benefits to the residents and businesses of Pierce County and the Puget Sound region for years to come.

Dear Mr. Kenworthy,

Foss Maritime Company writes in support of Puget Sound Energy's air permit application relating to the construction of a liquefied natural gas ("LNG") facility in the Tacoma Tide Flats. We are a tug and barge company founded in Tacoma, Washington in 1889. We have grown and evolved as the Puget Sound region has grown and evolved. From our humble beginnings in 1889 with a single rowboat, we now have one of the most versatile, advanced fleets of tugs and barges providing harbor towage up and down the West Coast and ocean towage around the world.

Foss has a long and storied history as a responsible corporate citizen of the Puget Sound area, and in every other area in which we operate. Foss developed and operated the first two hybrid tugs in the US industry. We have also been deeply involved as project managers in designing and executing the bunkering operations of the first U.S.-flagged LNG bunker barge, the *Clean Jacksonville*.

We know and care about the role we play in operating our business based on responsible environmental management and with concern for the well-being of our common environment. Consistent with our commitments to sustainability, we support the integration of LNG as a fuel source for our industry. TOTE, our sister company, expects significant environmental benefits from the conversion of its ships to LNG fuel – 100% reduction in SOx, 99% reduction in particulate matter, 90% reduction in nitrogen oxides, and 13.5% reduction in greenhouse gases. TOTE's ability to convert to this cleaner fuel source depends on the approval of the air permit.

As first adopters ourselves, we know that commitment to the environment yields benefits in fits and starts. We cannot afford to wait for the perfect solution if that means we reject interim solutions that take some of the environmental pressure off. Any and every delay in the transition to a cleaner burning fuel means increased air pollution caused by the ongoing use of bunker diesel.

Foss strongly supports the transition to LNG as an important and significant step in the right direction for our communities here in the region.

Regards,

John Parrott | President & CEO

Puget Sound Clean Air Agency
ATTN: Public Comment on DSEIS, PSE LNG Project
1904 Third Ave, Suite 105
Seattle, WA 98101

Subject: Tacoma Liquefied Natural Gas (LNG) facility SEIS

To Whom It May Concern:

The Tacoma-Pierce County Chamber **urges the Puget Sound Clean Air Agency (PSCAA) to issue the permits required to complete the Puget Sound Energy (PSE) Tacoma Liquified Natural Gas (LNG) Facility without further delay.**

We all want a cleaner future. Manufacturing, industrial and maritime businesses in the Tacoma Tideflats are working together with agencies like yours to ensure that we are safeguarding and improving people's lives, creating a sustainable environment, and providing the jobs that anchor our local and state economy.

We have a wonderful resource here with the Port of Tacoma and the Tacoma Tideflats area, with over 40,000 jobs. These jobs are good living wage jobs, jobs that you can truly support a family with. The port is a major economic driver regionally and statewide and supplies most consumer goods to Alaska. We need to make sure that our port remains competitive and having the preferred fuel source available for maritime trade is an important step in keeping global trade lines open.

In the PSCAA 2014-2020 Strategic Plan, Goal 1 is to "Protect public health and the environment from air pollution." Objective 1.2 is to "Reduce transportation emissions, especially diesel particulate, in highly impacted locations." Delaying the issuing of the permit will mean added diesel and heavy particulates and greenhouse gases in our local neighborhood air quality.

We are concerned about the air impacts from the bunker fuel that large vessels visiting the Port of Tacoma currently burn, air that my family breathes, our members families. We have 1,500 members with thousands of employees who live and breath the air every day. Reducing emission-based particulate has the potential to significantly improve health outcomes for everyone in our County and beyond. We applaud shipping lines like TOTE who are meeting and exceeding federal regulations to improve local air quality by transitioning to LNG as a cleaner burning fuel and plugging into shore power while they are at the dock.

TACOMA-PIERCE COUNTY CHAMBER

The Tacoma LNG facility has already been through a thorough Environmental Impact Statement (EIS), along with the current Draft Supplemental EIS (SEIS). Both the original EIS and the Draft SEIS clearly document the benefits of this facility, including a reduction in greenhouse gases and heavy particulate.

The environmental and health benefits of LNG when used instead of bunker fuel/heavy marine diesel are very important. LNG is a cleaner alternative to conventional fuels such as diesel. The PSCAA's Draft SEIS, published on October 8, 2018, confirms this. Switching to LNG reduces greenhouse gas emissions by nearly 15% and eliminates visible particulate emissions produced by ships by more than 85%. This helps improve air quality and reduce health risks, while helping local employers like TOTE comply with new stricter federal emission standards.

We ask that you approve the permits to move the LNG project forward.

The PSCAA board of directors has committed to "work to protect public health, improve neighborhood air quality, and reduce our region's contribution to climate change." By allowing the completion of the LNG facility and a cleaner fuel alternative for the maritime industry, you are meeting all of those criteria.

Best wishes,

Tom Pierson, President & CEO
Tacoma-Pierce County Chamber

I am writing to submit comments on Puget Sound Clean Air Agency's Draft Supplemental Environmental Impact Statement (DSEIS) for the Tacoma LNG project. The aim of the supplemental impact statement was to quantify the life cycle air emissions of Tacoma LNG. This work was contracted out to Ecology and Environment, Inc., and Life Cycle Associates, LLC. In terms of project details and a clear understanding of the project's scope, the DSEIS was better prepared than the City of Tacoma's environmental impact statement (EIS), but the DSEIS nevertheless contains substantial errors which resulted in an erroneous conclusion.

Please accept the following comments and requests for correction to the draft SEIS.

Executive Summary

1. **ES.2 SEIS Objectives, Purpose, and Need** – The document uses biased and misleading language at the end of paragraph one: "In addition, PSE is also proposing to load LNG onto trucks or barges for use by other regional markets **seeking a cleaner fuel source**." The SEIS has yet to establish how LNG for marine uses is a cleaner fuel source. Since the SEIS establishes that Tacoma LNG would be a dirty project from a GHG perspective in all but the most exacting scenario, this section should either specify how PSE's project is cleaner (i.e. reducing particulate matter pollution) or omit language that the document does not support.

   While this section is supposed to establish a need for the project, it does not. It notes that the Proposed Action would address a need for new peak-day resources as identified in PSE's 2013 biennial integrated resource plan. The DSEIS ignores the fact that PSE has since prepared a more recent IRP for the Washington Utilities and Transportation Commission, the *2017 PSE Integrated Resource Plan*. The DSEIS should have used the most current information.

1098-3 6. Purpose and Need
1098-4 6. Purpose and Need
1098-5 6. Purpose and Need

The 2017 IRP was available at the time of preparation of the DSEIS, and contains several elements that contradict the claim that the project is needed. First, the majority of the gas PSE uses for peak days comes from Northwest Pipeline firm contracts and the Jackson Prairie underground storage field.[1] Second, PSE is now undertaking improvements to its Swarr LP-Air facility in Renton, Washington, in order to use that plant for additional peaking needs.[2] In fact, PSE acknowledged in its 2017 IRP that adding Tacoma LNG to its portfolio would create a peak capacity ***surplus*** for roughly four years after the project's anticipated in-service date.[3] Third, much of the deficit PSE anticipates beginning in 2022/2023 would be the direct result of transferring 10,000 Dth/day of its gas to TOTE's marine fueling needs. In other words, the anticipated deficit is self-inflicted. The company cannot claim it needs the project due to the deficit that would be created if the project went forward. This is circular logic.

Lastly, the primary justification of PSE's need forecast in the 2017 IRP was the anticipated construction of the Kalama methanol project and Woodfibre LNG in British Columbia. Woodfibre LNG has been delayed well past its anticipated timeline and lacks sufficient buyers. Kalama methanol has not been approved and is in fact still undergoing review. Without Kalama methanol, PSE's demand calculations show sufficient resources through 2032. Since PSE indicated to PSCAA that it would no longer even use Tacoma LNG for peaking after 10 years (2028),[4] there is no demonstrated demand when considering the most current IRP.

The second need justification states, "the Proposed Action would enable TOTE to meet new fuel standards for maritime vessels in response to the North American Emissions Control Area (ECA) […]." If TOTE is already meeting these standards through current pollution reduction mechanisms, the second justification of need is also moot.

2. ES.4 Major Conclusions

The major conclusions of the report are flawed. They read, in relevant part,

> *"The use of LNG produced by the Proposed Action, instead of petroleum-based fuels for marine vessels, trucks, and peak shaving is predicted to result in an overall decrease in GHG emissions in the Puget Sound region, a net beneficial impact compared to the No Action Alternative. […] The conclusion regarding the overall reductions in GHG emissions stated above is dependent upon the assumption that the sole source of natural gas supply to the facility is from British Columbia. The analysis supports the recommendation that the facility's air permit include the condition regarding the sole source of the natural gas from British Columbia as a requirement so the analysis and this conclusion is consistent with the proponent's project description."*

This is a conditional conclusion. The first element, that there will be an overall GHG reduction, is dependent on the second, that all gas used by the facility must be sourced in British Columbia. Yet it is impossible to enforce the condition that British Columbia be the sole source of gas supply to the facility, rendering the conclusion moot.

1098-6 13. LCA Inputs and Assumptions - Natural Gas Source
1098-7 13. LCA Inputs and Assumptions - Natural Gas Source
1098-8 4. Language
1098-9 7. SEPA Alternatives

a. PSCAA cannot enforce a requirement that all gas is sourced from BC. PSCAA may make such a recommendation, but it would be nonbinding. A nonbinding recommendation would allow gas to come from any or all supply sources, just as it does today. Utilities, including PSE, purchase gas supplies from the cheapest and most readily available sources. Since the gas can come from other supply sources, the conditional portion of the conclusion is not met. BC would not be the sole source of gas supply to the facility.
b. Even if PSE did *purchase* all of its gas supply from BC, it would not *solely receive* BC gas. Once pipeline gas is injected into an interstate pipeline, it commingles with gas from other sources. PSE's gas supply to the Tacoma LNG facility would include commingled gas from the Westcoast Pipeline and Northwest Pipeline. Westcoast Pipeline transports gas produced in the Western Canadian Sedimentary Basin, a vast basin that is not solely located in BC. Northwest Pipeline is a bidirectional transmission system whose supply areas include the Rocky Mountain states and the San Juan basin.[5] Because the facility does not have a sole-source direct pipeline from the point of extraction, it is also impossible from a pipeline perspective that the sole source of gas supply to the facility comes from British Columbia.

Because the first conclusion in the report (an overall GHG reduction) is conditioned on the second conclusion, and the second conclusion is actually an unenforceable recommendation, PSCAA should not have concluded that that there will be an overall GHG reduction.

Purpose, Need, and Alternatives Considered

1. **1.1 Purpose and Need (p. 1-1)** - The document uses biased and misleading language throughout this section, referring to LNG as a "cleaner fuel" four times without having established that LNG for marine uses is a cleaner fuel source from a GHG perspective, which is the entire scope of this document. Since the SEIS establishes that Tacoma LNG would be a dirty project from a GHG perspective in all but an unenforceable scenario, this section should omit language that the document does not support.
2. **1.2 Alternatives Considered (p. 1-1)** - While the SEIS does not have to analyze alternatives not considered in the FEIS, there does not appear to be a statutory prohibition to doing so. There are a number of pollution reduction alternatives that the SEIS could have analyzed aside from the no-action alternative. Strictly using the no-action alternative is not reasonable given that the document already established that marine vessels in the North American Emissions Control Area (ECA) will have to comply with stringent emissions standards within 200 miles of the United States and Canadian Coasts. (*ES p. 2*) The no-action alternative is not even an option – the very existence of the new standards requires action, so "no action" was not a reasonable scenario to which Tacoma LNG should have been compared in either the FEIS or the DSEIS.
3. **1.2.1 Proposed Action** (p. 1-1) – This section (and others) states that Tacoma LNG would replace the use of marine diesel oil and diesel fuel. It is not true that it would entirely replace those

1098-9 cont'd 18. LCA Inputs and Assumptions - Marine Diesel Oil
1098-10 13. LCA Inputs and Assumptions - Natural Gas Source
1098-11 20. LCA Inputs and Assumptions - Facility Downtime
1098-12 19. LCA Inputs and Assumptions - End Use
1098-13 18. LCA Inputs and Assumptions - Marine Diesel Oil

fuels. Some of the vessels fueled at the facility would use dual-fuel propulsion systems. Second, no one, including PSE, has any idea what other vessel types would visit the facility besides TOTE, so the DSEIS should not assume that LNG would replace MDO and diesel fuel in vessels whose propulsion systems are unidentified. In fact, this assumption is contradicted by the DSEIS itself, which states that some vessels and trucks would simply move LNG from Tacoma LNG to other regional markets. (p. 2) There is no evidence that these "regional supply" vessels would run on LNG at all, so the DSEIS errs in assuming all vessel and truck traffic calling at the project site would be LNG-powered.

Description of Proposed Action

1. Thank you for analyzing both minimum and maximum production rates at the proposed facility. Other permit documents and pollution analyses used a production rate of 250,000 gallons per day (gpd), the minimum production rate, while ignoring that the facility can produce up to 500,000 gpd. This has resulted in gross underrepresentation of the facility's pollution impacts throughout the permitting process. Further details throughout section 2.3 should have been acquired by the lead agency.
2. **2.2.1 Natural Gas Extraction and Transportation and 2.3 LNG Processing Facility** – States that the gas supply to the facility would come exclusively from British Columbia. As noted above, this is neither a reasonable understanding of interstate pipeline transportation nor an enforceable condition. For the sake of brevity, I raise the same objection to every repetition of this assertion in the DSEIS.
3. **2.3.2 Liquefaction (p. 2-3) -** States that the facility would liquefy LNG for about 51 weeks of the year, while LNG would be vaporized for up to 10 days of the year. This is a very packed schedule that does not recognize any of the downtime that will be necessary at the facility. Scheduled maintenance usually occurs a few times per year at an LNG facility, and since Tacoma LNG will not be operating on fairy dust and magic, we must assume that the facility will need to perform regular maintenance like all other LNG plants. Other possible short-duration downtimes include unplanned repairs or maintenance, and emergency situations. Downtime flares produce larger flames and black smoke, as well as emissions including carbon dioxide, carbon monoxide, nitrogen oxides, particulate matter and trace quantities of hydrocarbons. Emissions produced during standard downtimes should be included, and the number of operation days in this section should be amended for accuracy.
4. **2.3.5 Delivery to TOTE and Other Vessels** – The DSEIS notes where nitrogen for purging will be captured and routed to the ground flare. But for bunkering vessels that would conduct ship-to-ship bunkering, there is no indication that nitrogen or hydrocarbons would be captured rather than vented into the atmosphere. Since these bunkering vessels could consume 69.15% of the end use share of LNG in Scenario B and 46.3% in Scenario A, questions about nitrogen and other hydrocarbon releases from ship-to-ship bunkering should be addressed.

1098-14 13. LCA Inputs and Assumptions - Natural Gas Source
1098-15 10. LCA Calculations
1098-16 13. LCA Inputs and Assumptions - Natural Gas Source

The rationale for not evaluating the majority of bunkering emissions appears to be the statement that "the current situation (i.e., the No Action Alternative) involves bunker barge operations using fuel oil." Bunkering with marine fuel oil and bunkering with LNG are vastly different operations – only LNG bunkering requires constant purging of GHG emissions from hoses and other connections. LNG bunkering also somewhat regularly causes GHG emissions releases due to the difference in density between the LNG already in the fuel tank and density of the new LNG fuel. Since the primary purpose of the facility is LNG bunkering, PSCAA has erred in declining to assess any emissions that will be produced by the majority of bunkering activities. Basing this decision on the no-action alternative would be justified if the no-action alternative already captured gaseous emissions from purging LNG bunkering hoses. It does not.

BC Gas Supply and Life Cycle Analysis (LCA) Problems

The following comments pertain to issues that can be found throughout the DSEIS, including Appendices B and C, due to underlying issues with the life cycle analysis.

1. The DSEIS's analysis relies on flawed assumptions about BC's methane emissions. There is no evidence that BC's fugitive emissions rate is substantially lower than that of the US. This assertion comes from non-representative bottom-up studies whose flaws have been extensively critiqued and contradicted by scientists including the following:
    a. A peer-reviewed study published in Atmospheric Chemistry and Physics, "Mobile measurement of methane emissions from natural gas developments in northeastern British Columbia, Canada" (2017) found that BC's emissions are at least 2.5 times higher than what the province estimates.
    b. More than 130 scientists and climate policy experts penned a May 2016 letter to the Minister of Environment and Climate Change saying a leakage rate assumption similar to that used in the GHGenius model *(Table B.3)* "has not been verified by field studies."
2. Upstream emissions factors from the GREET and GHGenius models were used to calculate life cycle emissions. These models allow users to input data specific to their project into the model so they may calculate project-specific emissions. The LCA errs where it uses placeholder data rather than project-specific data.
3. The LCA uses a global warming potential of methane from the AR4 (IPCC 2007) instead of the AR5 (IPCC 2014). The DSEIS should use the most current scientific consensus in its analysis, which is represented in the AR5.
4. The document repeatedly refers to "comprehensive" BC regulations that reduce methane without actually citing said regulations so that claims that they greatly reduce methane emissions can be verified. (*See section 2.2 of the DSEIS and Appendix C section 2.4.1, which refers to but does not clearly identify "comprehensive drilling and production regulations".*) Section 2.4.1 of Appendix C (p. 41) says that flaring is prohibited in British Columbia. To my knowledge, there are no laws preventing flaring in BC. In fact, the Oil and Gas Activities Act

1098-17 12. LCA Inputs and Assumptions - Global Warming Potential Value

explicitly permits flaring. *(See for example Part 7, Sections 42, 43, 44 of the Act)* This calls into question the accuracy of other references to BC's methane emissions laws.

Thank you for this opportunity to submit comments on the DSEIS for Tacoma LNG. It is my hope that the final document will be revised to address the above errors, and that PSCAA will rewrite its conclusion to reflect what's clear from a critical analysis of the DSEIS: Tacoma LNG would not reduce emissions in the Puget Sound region except in a blue-sky scenario that has no basis in fact or enforceability.

Thank you very kindly,

Tarika M. Powell, Researcher

Re: Comments on Tacoma LNG Project Draft Supplemental Environmental Impact Statement

Dear Agency:

Puget Sound Energy, Inc. ("PSE") appreciates this opportunity to comment on the Draft Supplemental Environmental Impact Statement ("DSEIS") prepared by the Puget Sound Clean Air Agency ("PSCAA") and currently in the public notice process.

As the Northwest's largest utility, PSE has been a leader in developing and promoting clean energy and advancing efficiency programs and technologies. In the last decade, PSE has deployed over 770 megawatts of wind generation and other green energy projects and is currently the nation's third-largest utility producer of wind power.

In addition to developing renewables, we have gone above and beyond in our conservation efforts establishing award-winning programs in Energy Conservation and Green Power. PSE has one of our country's best and most comprehensive energy-efficiency programs for helping homes and businesses reduce their energy use. PSE offers our customers financial incentives and technical help to conserve energy, and PSE also promotes the growth of renewable electricity production in its service area through various customer programs. We are keenly aware of our customers' interest in reducing carbon emissions, and we share their concern and commitment to achieving meaningful carbon reduction. At the end of 2017, we announced our TOGETHER commitment to reduce carbon emissions 50 percent by 2040 and have developed a measurable plan with short- and long-term steps to reach this goal while continuing to meet our customers' needs.

If we are going to significantly reduce carbon emissions in our state, however, we have to address transportation. In Washington, nearly half of all carbon emissions come from

transportation. PSE has been supporting the market growth of electric vehicles and is working to further expand our efforts through our alternative vehicle strategies and supporting charging stations the region needs to make electric vehicles a central part of our transportation future. At the same time, we have to think of the whole picture and consider commercial and industrial transportation uses.

We have the opportunity to significantly reduce emissions with cleaner alternatives to diesel and other fuels. PSE's partnership with TOTE Maritime will make just this kind of impact. When TOTE's first ship leaves Tacoma for Alaska fueled with LNG, it will result in material reductions of harmful air pollutants, including diesel particulate, sulfur dioxide, oxides of nitrogen and greenhouse gases. In concert with the vessel owners, the Tacoma LNG facility will create the greenest shipping fleet on the West Coast. In short, Tacoma LNG is a critical component of moving to lower carbon and cleaner energy infrastructure.

PSCAA's DSEIS is an integral step in moving this effort forward. As with any draft document, there are inevitably items that merit correction, which is why SEPA provides for public input and comment in the first instance. While the DSEIS text itself is succinct, the life-cycle analysis is broad in reach and quite dense. PSE has given the DSEIS and its referenced materials meticulous review, and we largely concur with its methodology, analysis and conclusions. Consequently, our comments are minor and carefully focused on accuracy and detail, so that the Final Supplemental Environmental Impact Statement ("FSEIS") sets the bar high for other greenhouse gas ("GHG") impacts analyses in the future across Washington. With these thoughts in mind, PSE respectfully submits the following comments to PSCAA for consideration in finalizing the Tacoma LNG DSEIS. We think that you have a quality product based on a reputable consultant that reaches the correct conclusion that the proposed project will result in a net reduction in GHG emissions. Nevertheless, there are specific improvements suggested below that, without changing the conclusion, will enhance the internal consistency and accuracy of the final product. These comments are not necessarily presented in order of importance.

Comment #1: PSE supports the inclusion of a condition in the Tacoma LNG air permit that requires that natural gas come exclusively from British Columbia.

Several commenters have wrongly criticized PSCAA for assuming that the natural gas to be used by the Tacoma LNG facility will come from British Columbia. This criticism is misplaced. PSE has identified from the outset of the PSCAA review process that the natural gas to be used by the Tacoma LNG facility will come from British Columbia. All gas delivered to PSE's gas system flows under firm pipeline capacity contracts on Williams' Northwest Pipeline, LLC ("NWP"). NWP is the only pipeline system for gas to get to PSE's system. NWP is fully contracted and has been since their last expansion in 2003. Each firm pipeline contract has a firm receipt point

and a firm delivery point(s). Firm receipts from Sumas can only originate in British Columbia. The firm receipt point on contracts acquired to serve the Tacoma LNG facility is Sumas.

PSE has consistently stated that the gas delivered to Tacoma LNG for liquefaction, storage and subsequent use will originate in British Columbia. For that reason, PSE supports a condition in the air permit to memorialize this commitment and put to rest the factually inaccurate suggestion that natural gas from other regions will be used by the facility.

Comment #2: PSE supports the methodology employed by PSCAA to quantify upstream greenhouse gas emissions associated with extraction and transportation of natural gas.

Several commenters have wrongly criticized PSCAA for relying upon a British Columbia-specific analysis using the GHGenius model. We believe that the estimate of greenhouse gas emissions generated by GHGenius for British Columbia natural gas production is conservative and overstates the upstream greenhouse gas emissions. More accurate information can be obtained from the Canadian National Inventory Report ("NIR") in conjunction with provincial data on how the NIR value (which covers the oil and gas sector broadly) was developed. Both the GHGenius values and the NIR values are widely used and accepted. Although a small number of articles suggest that these values underreport fugitive emissions, general consensus has not been reached on this point and the values in the articles suggesting that underreporting has occurred are speculative. As explained further below, PSCAA must rely on the most recent widely accepted data and not arbitrarily base estimates on isolated studies.

The SEIS should be based on the Provincial data

On May 25, 2018, PSE submitted a Background Information Document ("BID") that assessed the life-cycle greenhouse gas emissions associated with the proposed facility. As part of that analysis, PSE determined emissions for natural gas production in British Columbia based on Province-specific data from the Canadian NIR and British Columbia natural gas production data as reported by the Province in its Natural Gas & Oil Statistics data series. PSE believes that this is the most accurate means of determining greenhouse gas emissions associated with natural gas production in British Columbia. PSE recognizes that there is not a substantial difference between using the Province-specific fugitive emission rate (estimated at 0.2%) and the GHGenius fugitive emission rate (estimated at 0.32%). However, the SEIS should represent the most accurate information available. For that reason, we recommend that PSCAA revise its analysis to use the current British Columbia-specific data presented in the BID rather than relying on the data generated by GHGenius.

The SEIS cannot inflate fugitive emissions based on incomplete studies

Comments that PSCAA should artificially inflate the upstream fugitive emission rates based on limited and problematic mobile studies should be rejected. The primary article that forms the basis for these comments (the Atherton study) was published in October 2017.[1] The Atherton study provided valuable information about the need for increased measures to identify and reduce fugitive methane emissions from specific emission points. As the authors conclude, "Our study highlights the need for emission reduction efforts in the Montney to be focused on the few higher-emitting active gas wells, as well as abandoned, and aging infrastructure."[2] PSE supports this conclusion and notes that, unlike many areas in the U.S., the Canadian and British Columbia governments have implemented extensive measures in the years following the time period when the data underlying the Atherton study were collected (8/14/2015-9/5/2015). For example, in 2016, British Columbia implemented new guidelines eliminating routine flaring.[3] On April 26, 2018, the Canadian national government adopted new regulations that require companies to control methane leaks from equipment and the release of methane from compressors starting on January 1, 2020.[4] The Atherton paper concluded that "compressor stations emitted most frequently" and so the 2018 regulations appropriately target a source that Atherton expressly called out.[5] The 2018 Canadian regulations also limit methane leaks associated with well completion with the requirements taking effect on January 1, 2020.[6] These Canadian regulations also impose limits on methane venting and the release of methane from pneumatic devices starting January 1, 2023.[7] In short, the Atherton study was an important data point about the state of methane fugitive emissions in 2015 and the need for more regulation. Consistent therewith, the Canadian and British Columbia governments have acted since that study was performed, implementing a broad swath of regulations targeting fugitive methane emissions from the oil and gas sector.

It is also important to note that there were significant limitations relating to the Atherton study that call its quantitative conclusions into question. PSE recognizes the value of the Atherton study for qualitatively focusing the provincial and national governments on the need for further regulation of fugitive methane sources. As explained above, however, that has already been

accomplished. Nonetheless, there are serious questions regarding the representativeness of the quantitative estimates of methane emissions expressed in the Atherton paper and the limitations of using the study for quantifying methane emission rates. As discussed in the recent paper published by the National Academy of Sciences ("NAS"), methane emissions from gas wells peak during mid-afternoon hours.[8] As described by the NAS authors, "maintenance activities, such as manual liquid unloadings (MLUs) or depressurization of equipment ("blowdowns"), are often triggered by human operators during daytime work-week hours and may produce high emission rates for short durations."[9] As discussed in the 2018 NAS paper, daytime weekday measurements, such as the Atherton study relied upon, should not be used to estimate a methane emission rate as they typically will reflect the absolute peak of emitting activity and can greatly distort the overall inventory.[10] While Atherton's qualitative recommendation that the government focus on "the few higher-emitting active gas wells, as well as abandoned, and aging infrastructure" may have merit, the quantitative component of the paper is highly suspect.

In summary, studies such as the Atherton report help focus regulatory priorities, but cannot be used, nor are intended, to adjust accepted inventory values for methane emission rates. As the Atherton authors themselves stated in response to peer review comments, "The primary purpose of the paper was to determine emission frequencies, not to create a highly accurate volumetric inventory."[11] At this point in time, the most accurate estimate of the emission rate for natural gas production in British Columbia is the Province-specific data from the Canadian NIR and British Columbia natural gas production data previously provided to PSCAA by PSE.

Comment #3: The DSEIS has inconsistencies regarding the TOTE fuel oil terminology.

The DSEIS is internally inconsistent in describing the type of fuel that TOTE currently uses and would continue to use under the No Action Alternative. We suggest that the DSEIS be revised to use a consistent acronym to describe the fuel to be used by TOTE and other ships under the No Action Alternative, and accordingly the emission factors used in the spreadsheets need to reflect the correct fuel.

The DSEIS describes the Proposed Action as a terminal to supply LNG to vessels "replacing the use of marine diesel oil ("MDO") and diesel fuel."[12] Table 3-1 of the DSEIS states that under the No Action Alternative, MDO would continue to be used by TOTE and other potential future customers of the Tacoma LNG facility. This is further discussed in Section 3.3.3 of the DSEIS:

[8] Vaughn et al.; *Temporal variability largely explains top-down/bottom-up difference in methane emission estimates from a natural gas production region*, Proceedings of the National Academy of Sciences (Nov. 2018) 115 (46) 11712-11717; DOI: 10.1073/pnas.1805687115; http://www.pnas.org/content/115/46/11712.

[12] DSEIS Section 1.2.1.

1328-1 cont'd 18. LCA Inputs and Assumptions - Marine Diesel Oil
1328-2 18. LCA Inputs and Assumptions - Marine Diesel Oil

> Under the No Action Alternative, marine engines would continue to operate on MDO. Under the 250,000 gpd scenario, the Proposed Action would displace 21.48 million gallons of MDO used by TOTE marine vessels, and would provide additional capacity to replace another 23.21 million gallons of MDO used by other marine vessels. Under the 500,000 gpd scenario, the expanded capacity would also displace 21.48 million gallons of MDO used by TOTE marine vessels, and would provide additional capacity to replace up to 69.32 million gallons of MDO used by other marine vessels.

As seen in the quote above, the DSEIS repeatedly states that under the No Action Alternative, TOTE will utilize MDO. However, in Appendix C to the DSEIS, LCA states that the fuel used by TOTE is Marine Gas Oil ("MGO"). We recognize that MGO and MDO are very similar distillate fuels that are both referred to in common maritime use as diesel. However, in order to avoid confusion the SEIS needs to consistently describe the fuel used by TOTE. In its May 3, 2018 response to PSCAA's information request, TOTE stated that if the LNG terminal is not constructed, "[t]he current engines would remain and utilize 0.1% Sulphur compliant marine fuel (MGO)."[13] Therefore, we recommend that the DSEIS text be revised to be consistent with the LCA report in Appendix C and identify the fuel that TOTE employs as MGO.

Comment #4: The DSEIS spreadsheets should use marine diesel factors instead of bunker fuel factors to calculate the upstream emissions associated with TOTE's fuel oil.

Comment #3 is about the use of a consistent term to describe the fuel that TOTE uses and would continue to use under the No Action Alternative. Separate from that issue, but related to TOTE's current fuel use, there are calculation issues with the spreadsheets because they are based on the assumption that TOTE burns bunker fuel when in actuality it burns distillate fuel (diesel). The DSEIS calculations rely in many places on assumptions that vary based on the type of fuel employed. Several emission calculation errors derive from the incorrect assumption that the fuel TOTE will utilize under the No Action Alternative is appropriately modeled as residual oil or "bunker fuel for marine vessels" in GREET. As explained above, the appropriate fuel under the No Action Alternative for TOTE vessels is MGO. The MGO fuel that TOTE currently uses and would use under the No Action Alternative is most closely approximated as low sulfur diesel fuel within the GREET model, not bunker fuel. Assuming that TOTE will employ bunker fuel leads to an over-estimation of emissions under both the Action and No Action Alternatives.

[13] Response to Question 8, *Tacoma LNG SEIS Data and Information Request for TOTE Maritime* (May 3, 2018).

This confusion between MGO and bunker fuel does not change the DSEIS conclusions. In fact, the net impact of this misunderstanding, which includes both upstream and downstream inaccuracies, is that the DSEIS underestimates the total GHG benefit associated with the Action Alternative. Nevertheless, the factors should be corrected so the numbers provided in the analysis are accurate. In this Comment #4 and the following Comment #5 we describe specific corrections needed for the upstream and downstream emissions. These comments are made in reference to the Scenario A spreadsheet (250,000 gpd), but apply equally to the Scenario B spreadsheet (500,000 gpd).

The DSEIS spreadsheets contain an error relating to the calculation of the upstream GHG emissions associated with producing TOTE's fuel oil because they use the GREET bunker fuel emission factor instead of the GREET diesel fuel emission factor. This leads to the under-estimation of upstream emissions associated with TOTE's fuel under the No Action Alternative.

The upstream emissions related to TOTE marine diesel production (tonnes/year CO2e) are identified in cell H140 of the "Upstream" sheet. The individual constituent GHGs (CO2, CH4 and N2O) are calculated in cells E140:G140. Each of those three is calculated similarly; the formula for CO2 is as follows:

=$C140*C$87/1000

Where:
C140 = GBtu/year of diesel fuel consumed
C87 = CO2 emission rate for bunker fuel

As you can see from the defined terms, there is an error in the emission rate being used. The purpose of the calculation is to determine the CO2 emissions associated with producing and delivering marine diesel (MGO) and yet the emission rate used is for the less refined bunker fuel. Because the upstream emissions associated with refining an MMBtu of bunker are roughly half the emissions associated with refining an MMBtu of diesel, this error results in the upstream emissions associated with TOTE marine diesel being understated. Table 1 shows how the upstream TOTE marine diesel emissions increase by approximately 12,500 tonnes per year when the appropriate emissions rate is utilized.

Table 1. No Action Alternative: Upstream TOTE Marine Diesel Emissions

	GHG Emissions tonne/year (as proposed)	**GHG Emissions tonne/year** (corrected)
Upstream TOTE Marine Diesel (MGO) Emissions	52,448	64,775

Comment #5: The DSEIS spreadsheets should use diesel fuel factors as opposed to bunker fuel factors to calculate the downstream emissions.

As introduced in Comment #4, the confusion over distillate fuel versus bunker fuel also resulted in errors in the downstream emissions calculations for both LNG and oil-fired vessels. These errors all derive from the incorrect assumption that the fuel TOTE will utilize under the No Action Alternative is appropriately modeled as residual oil or "bunker fuel for marine vessels" in GREET. As explained above, the distillate fuel TOTE vessels use today and will continue to use under the No Action Alternative is most closely approximated as low sulfur diesel fuel within the GREET model. Assuming that TOTE employs bunker fuel leads to over-estimated emissions under both the Action and No Action Alternatives. An example of how this impacts the spreadsheets is presented below.

In response to an information request from PSCAA, PSE provided data on the grams per trip of CO2 and the estimated tonnes of fuel that would be consumed during each trip. The estimated fuel use is calculated from the modeled engine work required over the course of a trip using fuel consumption factors listed in cells C110:C112 of the "EF Marine Vessels spec. TOTE" sheet. These fuel consumption factors are themselves calculated from direct CO2 emission factors for the Main Engine, Auxiliary Engine and Boiler. The formula used for calculating the fuel consumption factor for the Main Engine (cell C110) was:

=Q13*(12/44)/Fuel_Specs!$F$18

Where:

Q13 = the gCO2/kWh for a medium speed diesel.
Fuel_Specs!$F$18 = Carbon percentage by weight for 2.8% sulfur bunker fuel

This generated a fuel consumption factor with reported units of gallons MDO/kWh.

However, the 2.8% sulfur bunker fuel used in the SEIS calculation shown above is both (a) illegal to be used in a TOTE (or equivalent) vessel and (b) not equivalent in carbon content to the correct MGO baseline fuel for TOTE. Thus, the carbon percentage by weight for 2.8% bunker fuel should not be used to generate a 0.1% sulfur MGO fuel consumption factor. This matters because the carbon percentage by weight is lower for low sulfur diesel than that for high sulfur bunker fuel. By using the wrong denominator value, the fuel consumption factor is slightly off. When the proper fuel consumption factor is applied, the amount of distillate fuel consumed per trip changes by 1.5 tonnes per trip for the Main Engine as shown in Table 2 below.

Table 2. Fuel Consumption Estimates

	Fuel Consumption Estimate in Spreadsheet Using Wrong Fuel Consumption Factor	Fuel Consumption Estimate Using Accurate Fuel Consumption Factor
	(MT MGO)	(MT MGO)
Fuel Consumed Within 200 nm	62.0	62.2
Fuel Consumed Outside 200 nm	386.5	387.9
Total Fuel Consumed	448.6	450.1

This technical error is then carried into the calculation of the g/tonne MGO emission rate used to calculate the ultimate g/MMBtu MGO, LHV emission rate that is the foundation of the calculations. For example, the emissions rate (g/tonne MGO) for CO2 is calculated in cell L48 of the "End use TOTE-Fuel Oil Vessel" sheet using the following formula:

=L47*1000000/SUM($D$59:$F$59)

Where:

L47 = total emissions
$D$59:$F$59 = fuel consumption as determined using the fuel consumption factors

With the fuel consumption factors corrected, the emission rates (g/tonne MGO) shown in cells L49:P49 in the "End use TOTE-Fuel Oil Vessel" sheet change as shown in Table 3 below.

Table 3. Emission Rates Under No Action Alternative (g/tonne MGO)

	Emission Rate Estimate in Spreadsheet Using Wrong Fuel Consumption Factor	Emission Rate Estimate Using Accurate Fuel Consumption Factor
	(g/tonne MGO)	(g/tonne MGO)
CO2	3,182,667	3,171,667
NO2	143	152
CH4	49	49
CO2c	3,198,951	3,187,895
CO2e	3,242,897	3,234,406

As you can see, this technical error results in the DSEIS overstating the GHG emission rates (g/tonne MGOe) associated with the No Action Alternative.

Similarly, with the fuel consumption factors corrected, the emission rates (g/tonne MGO) shown in cells L49:P49 in the "End use TOTE-LNG Vessel" change as shown in Table 4 below.

Table 4. Emission Rates Under Action Alternative (g/tonne MGO)

	Emission Rate Estimate in Spreadsheet Using Wrong Fuel Consumption Factor	Emission Rate Estimate Using Accurate Fuel Consumption Factor
	(g/tonne MGOe)	(g/tonne MGOe)
CO2	2,180,117	2,172,582
NO2	153	152
CH4	25,931	25,841
CO2c	2,194,855	2,187,269
CO2e	2,888,582	2,878,599

As you can see, this results in the DSEIS overstating the GHG emission rates (g/tonne MGOe) associated with the Action Alternative.

This technical error is further magnified when the emission rates are divided by the fuel-specific heating value in the "Fuel_Specs" sheet to convert the g/tonne MGO emission rate to a g/MMBtu basis. In cell L49 of the "End use TOTE-Fuel Oil Vessel" sheet, a g/MMBtu MGO emission rate is calculated using the following formula:

=L48/(lbperkg*Fuel_Specs!$P$18)*1000

Where:

L48 = the emission rate in g/tonne MGO
Fuel_Specs!$P$18 = the heating value for 2.8% sulfur bunker fuel

As you can see, cell L49 incorrectly imports the heating value for 2.8% sulfur bunker fuel (i.e., "Fuel_Specs" sheet cell P18) rather than the heating value for a fuel equivalent to MGO such as low sulfur diesel (e.g., "Fuel_Specs" sheet cell P14). Fuel with a 2.8% sulfur level is prohibited from use within an Emission Control Area ("ECA") and is prohibited from use anywhere after January 1, 2020 unless the vessel is operating scrubbers. Therefore, there is no basis for using the bunker fuel heating value. As a result of using the bunker fuel heating value rather than the diesel fuel heating value, the g/MMBtu emission rate calculation is incorrect. In order to calculate an accurate g/MMBtu emission factor, the denominator in cell L49 must be the heating value associated with a low-sulfur diesel (cell C14 in the "Fuel_Specs" sheet). The use of a heating value associated with an obviously wrong fuel type is clearly inappropriate. This same technical error affects both the Action Alternative ("End Use TOTE-LNG Vessel" sheet) and the No Action Alternative ("End Use TOTE-Fuel Oil Vessel" sheet). Comparisons of the erroneous

emission rates and the accurate emission rates for each scenario are shown in Table 5 and Table 6 below.

Table 5. Emission Rates Under No Action Alternative (g/MMBtu MGO, LHV)

	Emission Rate Estimate in Spreadsheet Using Wrong Heating Value	Emission Rate Estimate Using Accurate Heating Value
	(g/MMBtu MGO, LHV)	(g/MMBtu MGO, LHV)
CO2	85,081	78,179
NO2	4	4
CH4	1	1
CO2c	85,517	78,579
CO2e	86,691	79,725

Table 6. Emission Rates Under Action Alternative (g/MMBtu MGO, LHV)

	Emission Rate Estimate in PSCAA Spreadsheet Using Wrong Heating Value	Emission Rate Estimate Using Accurate Heating Value
	(g/MMBtu MGO, LHV)	(g/MMBtu MGO, LHV)
CO2	58,280	53,552
NO2	4	4
CH4	693	637
CO2c	58,674	53,914
CO2e	77,220	70,995

Ultimately, the values in the two tables above are used to calculate the marine vessel emissions associated with the Action and No Action Alternatives. For example, in cell F59 of the "Direct End use" sheet, methane emissions from LNG combustion are calculated using the following formula:

=$F31*Factors!E$73/1000

Where:

F31 = the annual LNG consumption in GBtu/yr, LHV
Factors!E$73 = the methane emission rate in the table above (693 g/MMBtu LHV, uncorrected; 637 g/MMBtu LHV, corrected)

Because the emissions are calculated by multiplying the LNG consumption by a flawed emission rate, the ultimate result is inaccurate.

Correcting the errors is relatively straightforward and does not result in a material change in the overall conclusions expressed in the DSEIS. Once the emission rates are corrected, the GHG emissions attributable to the upstream and downstream marine use of LNG fuel and MGO decline. As shown in cell H59 of the "Direct End use" sheet, direct end use emissions from LNG drop from 529,859 tonnes/year CO2e to 490,443 tonnes/year CO2e. The GHG emissions attributable to the downstream marine use of MGO (i.e., the No Action Alternative) decrease from 609,291 tonnes/year CO2e to 558,611 tonnes/year CO2e. Tables 7 and 8 below summarize the changes under Scenario A (250,000 gpd) that result from the corrections outlined above.

Table 7. Action Alternative: End Use Emissions

	GHG Emissions tonne/year (as proposed)	**GHG Emissions tonne/year** (corrected)
End Use LNG	**529,859**	**490,443**
On-site Peak Shaving	43,854	43,854
TOTE Marine	225,993	207,659
TOTE Marine Diesel Pilot fuel	7611	7,000
Other Marine LNG (by Bunker Barge)	244,185	224,375
Other Marine Diesel Pilot Fuel	8,216	7,555

Table 8. No Action Alternative: End Use Emissions

	GHG Emissions tonne/year (as proposed)	**GHG Emissions tonne/year** (corrected)
Total End Use Diesel /Fuel Oil/LNG	**602,291**	**558,611**
Diesel Peak Shaving for Power	58,891	58,891
TOTE Marine Diesel	261,325	240,326
Other Marine Diesel (by Bunker Barge)	282,076	259,394

When these corrections are combined with the corrections to the upstream marine diesel emissions rates, total emissions under the No Action Alternative ("Results" sheet, cell E51) decline from 727,536 tonnes/year CO2e to 696,183 tonnes/year. Total emissions under the Action Alternative ("Results" sheet, cell E31) decline from 687,639 tonnes/year to 648,223

tonnes/year. The decline in emissions under the Action Alternative is slightly greater than the decline under the No Action Alternative, thereby modestly improving the GHG reductions for the Action Alternative.

The DSEIS and associated spreadsheets should be revised to correct the errors identified above. Although these corrections do not change the ultimate conclusion expressed in the DSEIS that the Action Alternative results in a net decrease in life cycle GHG emissions as compared to the No Action Alternative, the FSEIS should reflect the accurate fuel assumptions and resulting calculations. We have included as an attachment to this letter a set of revised spreadsheets that reflect the suggested changes discussed in comments 4 and 5. You will see that the revised spreadsheets include toggles ("Input" sheet; cells H32 and H33) that allow you to turn on and off the corrections so as to be able to see the impact of using the correct factors/values.

Comment #6: The DSEIS greenhouse gas calculations should be revised to reflect the greenhouse gas emissions associated with Tacoma LNG's electricity supplier rather than a Washington State average mix.

Section 2.2.3 of the DSEIS accurately describes the specific electric power generation mix serving the facility, but then does not use that mix to calculate the greenhouse gas emissions from the facility's consumption of electricity. Instead the DSEIS imputes to the Tacoma LNG facility GHGs associated with the Washington statewide average for electric generation into the GHG calculations thus overstating emissions. In addition, the text of the DSEIS misstates the greenhouse gas emission rate that is imputed to the facility, by taking into account only the upstream power generation emissions and not the emissions from the generating facility itself. This second error relates only to the text of the DSEIS and not the actual calculations performed in the supporting spreadsheets. Both errors appear to be oversights that should be corrected.

As accurately stated in section 2.2.3 of the DSEIS, the Tacoma LNG facility electricity load will be exclusively served by and sourced from Tacoma Power ("Power would be delivered to the Tacoma LNG facility through the Tacoma Power electrical system."). There is no option for the facility to be served by other suppliers. Section 2.2.3 of the DSEIS also accurately notes that the majority of Tacoma Power's electricity portfolio is generated by hydroelectric, nuclear and non-hydroelectric renewable energy sources. The spreadsheets supporting the PSCAA life cycle analysis identify the combined upstream and power plant emissions associated with the Tacoma Power grid mix as 29.9 g/kWh CO_2e.[14] The same spreadsheets identify the combined upstream and power plant emissions associated with the average Washington grid mix as 215 g/kWh

[14] "Upstream" sheet; sum of cells H29 and H30.

CO_2e.[15] The DSEIS then calculates the greenhouse gas emissions associated with construction and operation of the Tacoma LNG facility using the 215 g/kWh CO_2e emission factor.[16]

The electricity supply for the facility must come from Tacoma PUD, so it is not accurate to use a state-wide grid mix when specific information exists for Tacoma PUD. Tacoma Power generates all the electricity it distributes, including that provided to the facility and has a surplus of power. Tacoma Power has had decreasing load and is forecasting the continuing sale of surplus power to the grid in the future.[17] As a result, there is no basis to assume that the greenhouse gas emissions associated with the generation mix serving Tacoma LNG's load will increase above the current level. Calculating the greenhouse gas emissions associated with Tacoma LNG's electricity consumption based on the Washington average (215 g/kWh CO_2e) as opposed to the emission rate associated with Tacoma Power (29.9 g/kWh CO_2e) is not accurate and should be corrected in the SEIS.

In addition, we believe that the text of the DSEIS needs to be revised to accurately reflect the emission rates used in the spreadsheet calculations for calculating GHGs associated with upstream statewide average electricity generation GHG emissions. Section 2.2.3 of the DSEIS states that "an average emission rate of 18 g/kWh carbon dioxide equivalent (CO_2e), was used to estimate upstream electricity emissions (State Energy Office at the Washington Department of Commerce)." 18 g/kWh CO_2e comes from cell H27 of the "Upstream" sheet in the supporting spreadsheets. We believe that the wrong value was copied out of the "Upstream" sheet and that the sum of cells H27 and H28 (i.e., 215 g/kWh CO_2e) should be referenced for calculations where the Washington average electricity generation GHG emission rate is appropriately employed. As explained above, it is not appropriate to use the Washington average electricity generation GHG emission rate for the Tacoma LNG facility because all of its electricity will be obtained from Tacoma Power. However, to the extent that the Washington average electricity generation GHG emission rate is used for calculations such as upstream refining, the text should accurately reference the emission factors used in the calculations.

In summary, the emission rate associated with Tacoma Power's generation portfolio must be used to calculate greenhouse gases associated with constructing and operating the Tacoma LNG facility. This emission rate must then be reflected in the text of the SEIS. While not changing the conclusion in the DSEIS, accurately characterizing the GHG emissions attributable to the electricity used by the proposed facility will more fully recognize the benefits attributable to the Action Alternative. The spreadsheets placed on public comment as an attachment to the DSEIS include a toggle ("Input" sheet; cell H24) that allows one to correct the generation portfolio to reflect the Tacoma Power generation mix. It may simply have been an oversight that the toggle

[15] "Upstream" sheet; sum of cells H27 and H28.
[16] "Upstream" sheet; cells G42 and G47.
[17] Tacoma Power Integrated Resource Plan, 2017 Update https://www.mytpu.org/file_viewer.aspx?id=64787.

was switched to the state-wide mix given that the text of the DSEIS accurately reflects that electricity for the proposed project would come exclusively from Tacoma Power. This oversight should be corrected in the FSEIS.

Comment #7: The DSEIS should be revised to employ the correct CA_GREET value for liquefaction and storage of LNG and to remove the inaccurate statement that the proposed facility is not energy efficient.

On page 89 of Appendix C of the DSEIS (the LCA report) LCA incorrectly states that "[t]he power consumption of Tacoma LNG is considerably higher than the CA_GREET default value." This misstatement should be corrected because the Tacoma LNG facility is in fact highly energy efficient. The unnumbered table on page 89 of Appendix C states that the electricity consumption for Tacoma LNG is 1,348 kWh/1,000 gal LNG while the CA_GREET value is 43.89 kWh/1,000 gal LNG. Based on these values, LCA reaches the conclusion that the proposed facility is not energy efficient. This conclusion is wrong because LCA uses an incorrect CA_GREET energy consumption value to derive the kWh/1,000 gal LNG power consumption value. LCA employed a Total Energy/Unit LNG value from CA_GREET of 1,607 $Btu_{energy}/MMBtu_{LNG}$. When one performs the unit conversion with a 91 percent efficiency, you get 43.89 kWh/1,000 gal LNG--the figure in the unnumbered table on page 89 of Appendix C. The derivation of this value is shown below.

	Incorrect Derivation **Assumes LNG Storage (As a Transportation Fuel)**		
A	Heating Value	84,820 BTU / gallon	HHV Fuel Spec GREET
B	Conversion BTU to kW-h	3412.14 BTU / kW-h	Constant
C	Total Energy / unit LNG	1,607 BTU_{energy} / $MMBTU_{LNG}$	GREET Value below for Energy Consumption
D	Convert to kW-h / MMBTU(LNG)	0.47 kWh_{energy} / $MMBTU_{LNG}$	= C / B
E	Convert to kW-h / (1) BTU(LNG)	4.71E-07 kWh_{energy} / BTU_{LNG}	= D / 1E6
F	Convert to kW-h / gallon(LNG)	0.04 kWh_{energy} / $gallon_{LNG}$	= E / A
G	Energy / 1000-gallons	**40 kWh_{energy} / 1000-$gallon_{LNG}$**	= F * 1000
	Assuming 91% LOSS	**43.89 kWh_{energy} / 1000-$gallon_{LNG}$**	= F / 0.91 ← **Incorrect**

However, 1,607 $Btu_{energy}/MMBtu_{LNG}$ is the CA_GREET default factor for the energy associated with storage of LNG. The CA_GREET default factor for the energy associated with both liquefaction and storage of LNG is 125,772 $Btu_{energy}/MMBtu_{LNG}$. When one performs the unit conversion from the correct energy consumption value, you get 3,623 kWh/1,000 gal LNG.

	Correct Derivation Natural Gas to Liquefied Natural Gas (As a Transportation Fuel)		
A	Heating Value	84,820 BTU / gallon	HHV Fuel Spec GREET
B	Conversion BTU to kW-h	3412.14 BTU / kW-h	Constant
C	Total Energy / unit LNG	125,772 BTU_{energy} / $MMBTU_{LNG}$	GREET Value below for Energy Consumption
D	Convert to kW-h / MMBTU(LNG)	36.86 kWh_{energy} / $MMBTU_{LNG}$	= C / B
E	Convert to kW-h / (1) BTU(LNG)	3.69E-05 kWh_{energy} / BTU_{LNG}	= D / 1E6
F	Convert to kW-h / gallon(LNG)	3.13 kWh_{energy} / $gallon_{LNG}$	= E / A
G	Energy / 1000-gallons	**3,126 kWh_{energy} / 1000-$gallon_{LNG}$**	= F * 1000
	Assuming 91% LOSS	**3,623 kWh_{energy} / 1000-$gallon_{LNG}$**	= F / 0.91 ← Correct

As shown in Table 9 below, a comparison of Tacoma LNG's power consumption value of 1,348 kWh/1,000 gal LNG to the correct CA_GREET derived power consumption value of 3,623 kWh/1,000 gal LNG demonstrates how energy efficient the Tacoma LNG facility will be.

Table 9. Energy Efficiency of the Tacoma LNG Facility

Tacoma LNG (kWh/1,000 gal LNG)	CA_GREET (kWh/1,000 gal LNG)
1,348	3,623

The DSEIS should be revised to accurately reflect the CA_GREET figure for liquefaction and storage as well as to note the high energy efficiency of the proposed facility.

Comment #8: The carbon balance on page 92 of Appendix A to the LCA Report contains errors.

The "Annual Throughput" figure on page 92 (Appendix A) of the LCA Report, which is Appendix C of the DSEIS contains several minor technical errors. Specifically, we have identified the following corrections for PSCAA's consideration:

- The amount of natural gas exiting the LNG Pretreatment system annually should be corrected to 322,354 tonnes, not 315,523 tonnes as shown in the DSEIS mass balance figure. The mass balance shows 326,239 tonnes of natural gas entering LNG Pretreatment and 3,885 tonnes exiting as "Pretreatment fired NG." The difference is 322,354 tonnes, not 315,523 tonnes.
- The amount of LPG produced annually should be corrected to 8,910 tonnes, not 8,722 tonnes as calculated in the DSEIS mass balance figure. Because the mass of natural gas exiting the pretreatment increases by 6,831 tonnes natural gas (322,354 tonne NG –

315,523 tonne NG = 6,831 tonne NG), the amount of LPG production will increase by 188 tonnes.

- The CO_2 produced annually by flaring the LPG should be corrected to 24,083 tonnes, not 23,573 tonnes as calculated in the DSEIS. Using a value of 8,910 tonnes LPG, CO2 emissions will increase by 510 tonnes CO2.
- The CO_2 produced annually for the facility should be corrected to 95,164 tonnes, not 94,654 tonnes as calculated in the DSEIS. Adding 510 tonnes CO2 to the facility total brings the total emissions to 95,164 tonnes.

The corrected values are summarized in Table 10 below.

Table 10. Carbon Balance Corrections

DSEIS Calculated (Incorrect)	Correct Value
315,523 tonne NG	322,354 tonne NG
8,722 tonne LPG	8,910 tonne LPG
23,573 tonne CO2 from flared LPG	24,083 tonne CO2 from flared LPG
94,654 tonne CO2 Facility Total	95,164 tonne CO2 Facility Total

While these are not significant differences, the FSEIS should be revised to reflect accurate values.

Comment #9: Table C.1 in Appendix C incorrectly identifies natural gas data as "placeholder data."

Table C.1 in Appendix C of the LCA Report, which, in turn, is Appendix C of the DSEIS incorrectly suggests that natural gas carbon content, heating value and the CO_2 emission factor are interim "placeholder" values. Our understanding is that the emission factors stated in Table C.1 are never used in the analysis so perhaps this is an editing oversight because this table does not have to be included in the appendix. However, if the table is to be included, there are minor errors that should be corrected. For example, the higher heating value ("HHV") for natural gas stated in Table C.1 is 1,054 Btus/scf. However, the correct value (which is accurately shown in the "Input" sheet of the supporting spreadsheets at cell C90) is 1,090 Btus/scf. Again, if Table C.1 is to be included in the FSEIS, the values should be corrected to reflect the values used in the actual analysis. While not affecting the conclusions in the DSEIS, it is confusing for Table C.1 to inaccurately reference "placeholder data" and to reflect values inconsistent with the DSEIS spreadsheets.

1328-10 10. LCA Calculations
1328-11 17. LCA Inputs and Assumptions - Peak Shaving
1328-12 10. LCA Calculations

Comment #10: Note "a" in Table C.2 of Appendix C incorrectly states that natural gas properties will be recalculated based on requested data.

Table C.2, Note "a" in Appendix C of the LCA Report, which, in turn, is Appendix C of the DSEIS incorrectly states that "Natural gas properties will be recalculated based on data that has been requested." Note "a" also indicates that the fuel properties in Table C.1 match those on the "Fuel_Specs" sheet in the supporting spreadsheets. However, PSE responded to the PSCAA information requests on May 25, 2018--over four months prior to completion of the LCA Report in Appendix C. Therefore, the language in Note "a" appears to be out of date and should be removed. We also note that the fuel values in Table C.2 should be amended to match the numbers in the "Fuel_Specs" sheet of the underlying spreadsheets.

Comment #11: The DSEIS misstates the amount of LNG that would be gasified during times of peak demand.

There are inconsistencies in the DSEIS about the amount of LNG that would be gasified during peak demand periods. Section ES.2 of DSEIS inaccurately states "During times of peak gas demand, 85,000 dekatherms of NG would be re-gasified and re-injected into PSE's distribution system." However, in Section 2.3.4 the DSEIS accurately states that the vaporization system would have the capacity to deliver 66 MMSCF/day (i.e., 66,000 Dth/day) of natural gas at standard distribution pipeline pressure. We believe that the confusion may stem from language in the FEIS which speaks of the Proposed Action being to "re-inject and divert approximately 85,000 Dth/day." (emphasis added). The FEIS was accurate in this description, but that does not mean the entire 85,000 Dth/day is from re-gasified natural gas. As described in Section 1.3.4.1 of the BID, the Tacoma LNG facility will have the capacity on a peak demand day to re-gasify up to 66,000 Dth/day of gas from storage, but can add additional supply by diverting up to 19,000 Dth of natural gas that would normally be delivered to the facility for liquefaction. Therefore, Section ES.2 of DSEIS should be revised to state "During times of peak gas demand, 66,000 dekatherms of natural gas per day would be re-gasified and re-injected into PSE's distribution system and 19,000 dekatherms of NG per day would be diverted from being routed to the liquefaction plant and be left in the pipeline for consumer use."

Similar to our other comments, this is not a significant error that affects the overall DSEIS conclusions, but nonetheless should be corrected.

Comment #12: Table A.11 in the LCA Report contains values that should be corrected.

Table A.11 in Appendix C of the LCA Report, which, in turn, is Appendix C of the DSEIS includes incorrect values. For example, Table A.11 indicates that 2,299 gallons of LNG are lost per bunkering event. The sheet entitled "PSE_LNG_Operations" in the DSEIS spreadsheet contains the value of 114 gallons per event. The latter value reflects the assumptions built into

1328-12 cont'd 10. LCA Calculations
1328-13 17. LCA Inputs and Assumptions - Peak Shaving
1328-14 21. LCA Inputs and Assumptions - Additional Air Pollutants

the DSEIS spreadsheet and the 2,299 gallon value currently in Table A.11 is inconsistent with what is actually used in the DSEIS spreadsheets. Table A.11 appears to have had the wrong data populated into many of the cells in the table and should be corrected to avoid confusion. These corrections to the table do not alter the conclusions of the DSEIS because the spreadsheets are accurate.

Comment #13: Section 2.3.4 of the DSEIS incorrectly suggests that the LNG that is re-gasified and injected into the pipeline during peak demand periods would be used for electricity generation.

Section 2.3.4 of the DSEIS states "GHG emissions would also occur during the combustion of the natural gas in the power generation facility associated with peak shaving." This statement is incorrect. During a peak demand period when the immediately available gas supply is insufficient, PSE's priority is residential and commercial natural gas customers. At such a time, the Tacoma LNG facility would gasify LNG in storage and re-inject this natural gas into the pipeline for use by its residential and commercial natural gas customers. As explained in Section 1.3.6.3 of the BID:

> The Tacoma LNG Facility would also enable PSE to avoid repurposing firm gas transmission from peak period electricity generation to residential gas service. In the absence of the Tacoma LNG Facility, during peak periods PSE would have to use this firm gas transmission to supply gas customers and thus would be required to operate "peaker" dual-fuel combustion turbine electric generating units utilizing fuel oil rather than using natural gas. The additional GHG emissions attributable to use of fuel oil in dual-fuel combustion turbine electric generating units is not quantified in this analysis, but will occur if the Project is not built.

As this provision makes clear, one benefit of the project is that during peak demand periods, PSE has the ability to vaporize LNG and put that natural gas into the pipeline to supply residential and commercial gas service. None of the peak shaving natural gas would be supplied to electricity generation. The natural gas used for electricity generation is in a separate portfolio of gas resources designated for PSE's electricity generation. Tacoma LNG is an exclusively natural gas customer gas supply resource.

Comment #14: The SEIS must accurately calculate emissions of black carbon and organic carbon relative to the Action and No Action Alternatives.

As noted above, the 2018 IPCC Special Report recommended an increased focus on reduction of short-term climate forcers such as black carbon and organic carbon. Black carbon is a

component of $PM_{2.5}$ generated primarily by the incomplete combustion of fossil fuels.[18] Black carbon emissions are estimated to be the second or third largest contributor to current warming, after CO_2 and methane. Black carbon influences climate by directly heating surrounding air when suspended in the atmosphere, by reducing the reflectivity of the earth's surface when deposited (an effect particularly strong over snow and ice), and through additional indirect effects related to interaction with clouds. Black carbon has a tremendous impact locally and along the Canadian and Alaska coastlines on snow and ice fields, not to mention on human health.

One of the critical benefits presented by the proposed project is that it will result in a substantial decrease in black carbon emissions from vessels. PSCAA has appropriately included black carbon and organic carbon calculations in the DSEIS spreadsheets. However, those calculations contain errors that we presume are due to incorrect fuel assumptions (in the absence of the Tacoma LNG project TOTE vessels will run on diesel and not bunker fuel).[19] Whatever the reason for the mistakes, the FSEIS should be corrected as outlined below:

1. The "End use TOTE - Fuel Oil Vessel" sheet references incorrect BC/OC ratios for transit, maneuvering and hoteling emissions in cells Q44:R44, Q45:R45 and Q46:R46, respectively. For example, the transit black carbon emissions for the fuel oil vessel are calculated in cell Q44 using the following formula:

   =H44*BC_OC Ratios'!$C$6/100

   Where:
   H44 = PM2.5 emissions
   BC_OC Ratios'!$C$6 = the black carbon percentage for a natural gas fired engine

   The correct "BC_OC Ratios" sheet reference should be to cell O6, for a diesel-fired engine. In other words, the spreadsheet is calculating black carbon emissions for a fuel oil-fired vessel using the black carbon percentage of PM2.5 specific to a natural gas-fired engine. The formula should reference BC_OC Ratios'!$O$6, the correct BC percentage for a diesel-fired engine and consistent with the PM2.5 emissions factors used for an MGO-fueled marine vessel engine.

2. The Emissions Factors tables in rows 63 through 90 of the "End use TOTE - Fuel Oil Vessel" sheet misapply the Fuel Correction Factors. The formulae in these cells use

[18] https://www.ipcc.ch/publications_and_data/ar4/wg1/en/ch2s2-4-4-3.html.
[19] See comments 4 and 5 above.

emission factors contained in Table B.2 (cells D8:K17 of the "EF Marine Vessels spec. TOTE" sheet), and reflect emissions of an ocean going vessel operating on 0.1% S MDO as reported in the 2016 Puget Sound Maritime Air Emissions Inventory.[20] The Emissions Factors tables in rows 63 through 90 of the "End use TOTE - Fuel Oil Vessel" sheet then apply Fuel Correction Factors to the 0.1% MGO emissions rates. The Fuel Correction Factors are shown in Table 3.22 (cells B96:L105 of the "EF Marine Vessels spec. TOTE" sheet). However, these Fuel Correction Factors are intended to adjust emissions factors from a baseline of 2.7%S HFO (the baseline in the 2011 Puget Sound Maritime Air Emissions Inventory), not the 0.1% MGO baseline used in the current analysis.[21] By applying these Fuel Correction Factors to the updated baseline emissions factors for 0.1% MGO shown in Table B.2, particulate emissions for the fuel oil-fired vessel are incorrectly reduced by 83%.

3. Cells Q44:Q46 and R44:R46 of the "End use TOTE - Fuel Oil Vessel" and "End use TOTE-LNG Vessel" sheets are intended to represent the tonnes per trip values for black carbon and organic carbon, respectively, for each of the three phases of transportation. The values in cells Q48 and R48 of these two sheets are intended to represent the sum of the values for each of the phases. However, the values in cells Q48 and R48 of both of these two sheets are hard-entered numbers and do not reflect the sum of values above them.

Correcting these errors results in a four-fold increase in black carbon emissions associated with the TOTE Fuel Oil Vessel and a halving of the organic carbon emissions.

It is also noted that Table B.12 (cells B58:K60 of "EF Marine Vessels spec. TOTE") contains an error for the PM10 emissions rate of a fuel oil auxiliary boiler. The listed value is 16 g/kW-hr. The correct value is 0.16 g/kW-hr, as reported in the 2016 Puget Sound Maritime Air Emissions Inventory. Because the PM10 emissions rates of auxiliary boilers are assumed to be the same for fuel oil and natural gas, this error doesn't create a relative emissions difference between the two fuels. However, the error should still be addressed so as to ensure that the SEIS is accurate.

Given the substantial climate forcing impacts of black carbon, PSCAA must accurately address these emissions in the analysis. Failure to do so would cause the FSEIS to understate the life cycle benefits of the Proposed Action. The errors in the spreadsheets identified above should be corrected and the black carbon and organic carbon impacts of the Action Alternative as

[20] htbtps://pugetsoundmaritimeairforum.files.wordpress.com/2018/10/final-2016-psei-report-19-oct-2018-scg.pdf
[21] See, Section 3.6.10, Table 3.22 of the 2011 Inventory ("emission factors were given for engines using residual fuel with an average 2.7% sulfur content.")
https://pugetsoundmaritimeairforum.files.wordpress.com/2016/06/2011pseireportupdate_20130523.pdf

compared to the No Action Alternative should be identified. While more commonly considered in the context of the 20-year horizon, it is important that even this 100-year horizon assessment recognize the huge benefit achieved by reducing black carbon emissions and reducing the substantial effects that black carbon has on the glaciers and snow fields that lie in immediate proximity to Pacific Northwest maritime traffic.

We have included as an attachment to this letter a set of revised spreadsheets that include a toggle ("Input" sheet; cells H30 and H31) that allow you to consider the black carbon and organic carbon impacts ("Input" sheet; cell H30) as well as to correct the inaccurate black carbon and organic carbon computations ("Input" sheet; cell H31).

Comment #15: The DSEIS uses an appropriate methane emission rate for marine LNG-fired engines.

Recent data lend further support for the use of the methane emission rate for marine LNG-fired engines that is in the DSEIS. The DSEIS relies upon the June 13, 2017 SINTEF report (Table 7.2) for the methane emission rate value for an LNG-fired LPDF 4-stroke engines. The 5.3 g/kW-hr value was derived from actual tests on two ships equipped with Low Pressure Dual Fuel ("LPDF") engines. Since the time of that report and preparation of the DSEIS, MAN Energy Solutions ("MAN"), the company upgrading the TOTE propulsion system to LNG, has performed its own testing. As described in the attached October 26, 2018 letter, MAN has tested methane emissions for a converted MAN 58/64 engine as part of their engineering development program. This engine is the equivalent of those that will power the MV Midnight Sun and MV North Star on LNG once fully converted. When adjusted for density to match the conditions of the SINTEF report, the emission rate is 5.3 g/kW-hr. Note that MAN compares their tested value to the value reported in the SINTEF report reflecting the average of actual tests and manufacturer testbed data. MAN's value comes out at exactly the same rate (5.3 g/kW-hr) as the other *in situ* tests. This lends tremendous credibility to the value used in the DSEIS.

Comment #16: PSCAA is correct to employ the AR4/100-year assumptions in assessing life cycle GHG emissions under the Action and No Action Alternatives.

At the public hearing held on October 30, 2018, multiple commenters suggested that PSCAA should apply AR5, 20-year average Global Warming Potentials ("GWPs") instead of the AR4, 100-year average GWPs employed in the DSEIS. The stated justification for this shift, which several other commenters acknowledged would put the SEIS at odds with Washington's statutes, rules and policies, was the belief that because a recent IPCC study says significant action must be taken in the next 12 years, that the average GWPs must more closely match this period. This comment reflects a misunderstanding of the SEIS process, what the IPCC report says, and the policy underlying the 100-year GWP horizon.

Focusing on a 20-Year Average GWP as Opposed to a 100-Year GWP Inaccurately Minimizes the Long Term Effect of Carbon Dioxide on Climate Change

GWP is the ratio between the climate warming effect of 1 tonne of a non-CO2 GHG and the climate warming effect of 1 tonne of CO2 had each been emitted on the same day. The IPCC has estimated that the average relative GWP for methane over the first 20 years after it is emitted is 86 (without climate-carbon feedbacks).[22] This means that over 20 years (and with no consideration beyond 20 years) the average relative global warming potential of 1 ton of methane equals that of 86 tonnes of CO2.

Because GWP is a ratio (as opposed to an absolute number) the relative decline in CO2 and methane distort the 20-year average GWP value. Specifically, over the first 3.3 years, the fraction of a tonne of CO2 emitted that remains in the atmosphere declines faster than methane. Thus methane's GWP over the first three years goes up notwithstanding the fact that its levels are declining significantly over that time period. This artificially inflates the global warming effect of methane during that 3.3-year period.

More importantly, half of methane's global warming effect has occurred within 8.6 years of being emitted and 3/4 of its effect has occurred within 17.2 years of being emitted. By 100 years, the direct effect of methane on global warming drops to negligible levels, with the fraction of remaining methane decreasing to 0.000009 percent, while slightly less than 40 percent of the CO2 is still present.[23] As the IPCC has stated, "About half of a CO2 pulse to the atmosphere is removed over a timescale of 30 years; a further 30% is removed within a few centuries; and the remaining 20% will typically stay in the atmosphere for many thousands of years."[24] Climate researcher, David Archer, et al., concluded that "climate effects of CO2 releases to the atmosphere will persist for tens, if not hundreds, of thousands of years into the future."[25] The authors of that paper cautioned against even limiting consideration to the 100-year horizon given the longevity of CO2.

Because methane is reduced by roughly 98 percent within the first 50 years, but it takes tens of thousands of years to reach the same reduction in CO2 stocks, it is bad policy to focus on the 20-year average GWP values. This ignores the much greater long-term impact that an equivalent

amount of CO2 has for centuries into the future. As the IPCC noted, "Adoption of a fixed horizon of e.g., 20, 100 or 500 years will inevitably put no weight on the long-term effect of CO2 beyond the time horizon."[26] Simply ignoring the impacts of CO2 after 20 years, as the 20-year average GWP does, makes no sense from a policy point of view and is why all creditable policy making organizations rely upon the 100-year horizon. The 100-year average GWP still understates the long-term impact of CO2 as opposed to methane, but it gives a more accurate sense of the long-term impacts.

The 2018 IPCC Special Report on the Impacts of Global Warming Does Not Suggest That it is Necessary or Appropriate to Rely on the 20 Year Average GWP

In October 2018, the UN Intergovernmental Panel on Climate Change ("IPCC") released a Special Report on the impacts of global warming exceeding 1.5 degrees Celsius above preindustrial levels. The Paris Climate Accord commits to actions to stay below an increase in global temperatures of 2 degrees Celsius but to also pursue actions that would strive to keep increases in temperature to 1.5 degrees Celsius. The report concludes that to stay below an increase of 1.5 degrees Celsius, greenhouse gas emissions will need to be reduced by 45% from 2010 levels by 2030 and 100% (net zero) below 2010 levels by 2050. Nowhere does that report state that it is appropriate to use the 20-year average GWP in place of the 100-year average GWP as a policy tool. Doing so would mean that climate impacts are only considered for the first 20 years and effects after 20 years are not considered.

The 2018 IPCC Special Report does discuss the need for an increased focus on reduction of short-term climate forcers such as methane and black carbon. Methane reduction through industry and governmental efforts to reduce leakage in natural gas production such as those already underway in British Columbia is identified as a key tool that is highly achievable and has economic benefits as well. Reduction in black carbon emissions through reductions in diesel emissions is also identified as a pathway that not only has highly significant short-term climate reduction potential, but also has significant corollary public health benefits. However, the 2018 IPCC Special Report's focus on addressing short-term climate forcers is distinct from saying that policymakers should stop considering the long-term relative impacts of greenhouse gases. Some greenhouse gases, such as CO2, will be around for millennia, while others, such as methane, will essentially be gone in a few decades or less. There are benefits and tradeoffs related to each. However, governments must make decisions based on the long-term impacts to climate.

The 2018 IPCC Special Report does not specifically recommend a particular pathway or scenario to be followed. However, it does identify the consequences of inaction and identifies a number of methods that can be chosen by policy makers.

[26] IPCC; Anthropogenic and Natural Radiative Forcing (2013); https://www.ipcc.ch/pdf/assessment-report/ar5/wg1/WG1AR5_Chapter08_FINAL.pdf

In the context of the Tacoma LNG project, use of LNG as a marine fuel is consistent with a number of the identified alternative pathways in the report. Substituting LNG for oil in ship engines reduces climate emissions directly and also reduces black carbon, creating not only long- and short-term climate benefits, but improvements to public health through reduced exposure to diesel particulates. The use of British Columbia natural gas is also consistent with the identified pathways. As part of the Pan-Canadian Framework on Clean Growth and Climate Change, the Canadian government committed to reduce methane emissions from the oil and gas sector by 40 to 45 percent from 2012 levels by 2025. In April 2018, Environment and Climate Change Canada ("ECCC") adopted federal methane regulations to deliver on this commitment.[27] These regulations included the requirement that by January 1, 2020, well completions involving hydraulic fracturing must prevent fugitive releases. British Columbia has charted an even more aggressive course than the Canadian national government by setting its own aggressive targets of reducing Province-wide greenhouse gas emissions by 18 percent (relative to 2007 levels) by 2016, 33 percent by 2020 and 80 percent by 2050.[28] By committing to its natural gas feedstock coming exclusively from British Columbia, Tacoma LNG is supporting responsible development from a region that is aggressively pursuing greenhouse gas reductions. This pathway is consistent with the pathways outlined in the 2018 IPCC Special Report.

Use of AR4/100-year average GWPs is consistent with Washington, PSCAA, and U.S. EPA policy, in addition to that adopted by the Paris Accord

As noted by many commenters at the October 30 hearing, federal and state GHG reporting regulations and all major GHG policy considerations and goals, including those of the State of Washington, U.S. EPA, PSCAA, the Paris Accord and the Kyoto Protocol, are based on the AR4/100-year average GWPs. At page 4-5 of the DSEIS PSCAA states correctly that it is applying the GWP factors because it is the currently accepted international reporting standard and the methodology for State of Washington GHG reporting. Neither the State of Washington, U.S. EPA, PSCAA, the Paris Accord nor the Kyoto Protocol have adopted the AR5 GWPs and it would be inappropriate for PSCAA to adopt those standards here. Emissions are reported using these assumptions and goals are based on these assumptions. As explained above, the basis for this approach is that focusing on the 20-year average GWP eliminates consideration of the long-term impact of CO2 and other GHGs. Maintaining consistency when making policy considerations is key.[29] Also, compelling reasons exist for looking at the long-term impacts of emissions on climate change.

---

[27] See, e.g., https://www.canada.ca/en/environment-climate-change/news/2018/04/federal-methane-regulations-for-the-upstream-oil-and-gas-sector.html.
[28] http://www.bclaws.ca/EPLibraries/bclaws_new/document/ID/freeside/00_07042_01.
[29] We note that even if 20 year average GWP values are assessed, a correct analysis incorporating the impacts of black carbon demonstrates that the Action Alternative results in a substantial net reduction in GHG emissions.

Comment #17: Although PSCAA has not been presented with a permit application for liquefaction of 500,000 gallons of LNG per day, there is no error in assessing that amount in the context of the SEIS.

There was confusion at the October 30 hearing about the end use contemplated for LNG in excess of the amount to be consumed by TOTE, peak shaving and truck transfers (the "unallocated LNG"). The primary purposes of the Tacoma LNG facility would be to provide LNG for marine vessel fuel and to PSE customers by re-gasification during times of peak demand (i.e., peak shaving). A small amount of LNG would be capable of transfer by truck. At either a 250,000 or 500,000 gallon per day production volume, there would be additional unallocated LNG available for maritime use.

PSE has only requested authority from PSCAA to build and operate a facility with the capacity to produce 250,000 gallons per day of LNG. This is based exclusively on the use of the infrastructure proposed in the Notice of Construction ("NOC") application. In order to perform a complete life cycle analysis of the greenhouse gas emissions associated with both a 250,000 and 500,000 gallon per day scenario, it was assumed that all remaining LNG not used by TOTE, for on-road heavy duty trucking or for peak shaving would be combusted in other marine vessels. All of this unallocated LNG was assumed to be transferred into barges on the Blair Waterway; no bunkering could occur in the Hylebos Waterway. Methane losses associated with the bunkering process and emissions associated with marine combustion were calculated and included in the spreadsheets on the "Direct End use" sheet. Different fuel transfer alternatives might be considered in the future if a market is identified. At that time, should modifications to the Tacoma LNG facility be necessary, all appropriate environmental review and permitting processes would be conducted.

As part of the original Proposed Action, the FEIS studied the Tacoma LNG Facility's ability to liquefy between 250,000 and 500,000 gallons per day. The DSEIS prepared by PSCAA to study GHG emissions consistently analyzes the facility's ability to generate up to 500,000 gallons of LNG per day. PSCAA's decision to review the environmental impacts of the Proposed Action at 500,000 gallons per day as studied in the original FEIS is appropriate. However, environmental review and environmental documents such as an FEIS or FSEIS do not constitute permits–they simply inform decision-makers when reviewing permit applications. Here, the NOC permit application submitted by PSE asks PSCAA to approve a facility that is limited to a daily average production capacity of 250,000 gallons. PSE would need to seek additional NOC permitting in the future to modify the 250,000 gallon per day amount of LNG sought by the NOC before PSCAA. There is no error in PSCAA's decision to review the Proposed Action at 500,000 gallons per day of capacity consistent with the FEIS, and there is no bar to PSE's ability to seek approval for a facility that is smaller than the maximum studied.

Comment #18: PSCAA is not reviewing a proposal for export of LNG to foreign markets.

At least one commenter at the October 30 hearing wrongly asserted that PSE is going to use Tacoma LNG for export of LNG to another country. This assertion is incorrect. The Tacoma LNG Project is not and cannot be operated as an LNG export facility. LNG import and export terminals are subject to the jurisdiction of the Federal Energy Regulatory Commission ("FERC"), which is the only agency in the United States that has authority to certify such facilities. The Tacoma LNG Facility is not a FERC-certificated export terminal.

Beyond the legal inability to operate the Tacoma LNG Facility as an export terminal, the proposal lacks the physical ability to perform as one. The Tacoma LNG Facility is sized only to serve the needs of natural gas customers and TOTE vessels: the project NOC is for authorization to "produce up to 250,000 gallons of fuel-grade (to satisfy PSE's supply agreement with TOTE) LNG per day, and store up to 8 million gallons of LNG on site." Even assuming all 250,000 gallons per day were diverted away from TOTE and natural gas customers (something PSE cannot do legally), it would take six months of round-the-clock daily production at 250,000 gallons per day just to produce enough LNG to fill one LNG export tanker. Beyond PSE's legal and physical inability to produce the volumes necessary for LNG export, there is no existing infrastructure at the Tacoma LNG Facility, and none proposed, that could fuel such a vessel.

PSE appreciates this opportunity to comment on the DSEIS relating to our proposed Tacoma LNG project. We recognize and appreciate the tremendous effort that PSCAA and its contractors have invested in this document. We hope that our comments are accepted in the constructive manner in which they are intended. We believe strongly that the best SEIS is one that is accurate and firmly rooted in established approaches. We recognize that some of our comments are complicated technically and may merit or be best addressed through real-time discussion. As you review our comments if additional information is needed from PSE, as the project applicant, we will make the PSE Team available at any time.

Ultimately, we believe that the DSEIS reached an accurate conclusion in determining that the Action Alternative will result in a net decrease in GHG emissions. This conclusion is reached based on an established approach that is consistent with the procedures adopted by PSCAA, the State of Washington, U.S. EPA and reflected in the Paris Accord and the Kyoto Protocol. We believe that the edits identified in this letter and addressed (in regards to comments 4, 5, 6 and 14) through revisions to the spreadsheets should be incorporated into the FSEIS.[30] These edits

[30] Again, we note that the changes in the spreadsheet needed to address comment #6 simply requires changing a toggle in the spreadsheet version released for public comment to be consistent with the text. There is no dispute that

will make the FSEIS more accurate, but they do not alter the fact that by building and operating the Tacoma LNG facility, PSE will be helping to reduce GHG emissions in addition to helping reduce NOx, SO2 and particulate emissions.

With the conclusion of the comment period, PSE looks forward to expeditious issuance of the Final SEIS so that we can proceed with the application for a minor source Notice of Construction from PSCAA. When it commences operation, the Tacoma LNG project will result in the reduction of criteria pollutants and greenhouse gases. We look forward to being able to recognize those benefits for the community as soon as possible.

Please do not hesitate to contact the PSE team if you have any questions or would like to set up a meeting. The team contact is Keith Faretra who can be reached at keith.faretra@pse.com or (425) 456-2561.

Sincerely,

Steve R. Secrist on behalf of David Mills
Senior Vice-President, Policy and Energy Supply

---

the sole potential source of electricity for the proposed project is Tacoma Power and that Tacoma Power's generation portfolio is significantly greener than the state-wide average for Washington.

MV Midnight Sun & MV North Star

Emission Information regaring Methane after the 58/64 conversion to Dual-Fuel operation.

Dear Ladies and Gentlemen,

Herewith we would like inform you about the requested values regarding the Methane values of the converted 58/64 engine to Dual-Fuel Operation for the vessels MV Midnight Sun and MV North Star.

The provided data from the SINTEF report dated 2017-06-13 have been used for a comparison with the values we have derived in the meantime.

Our provided values are only for information and not binding since we are in the development process according to schedule.

MAN Energy Solutions

		E2-Cyclus Factor Methane [g/kWh]	Density [kg/m³]
SINTEF Report 2017-06-13		6,9	0,78
MAN Augsburg			
	Preliminary 07/2018	4,7 @ 75% only	0,536
	Comparable to SINTEF	5,3	0,78

As a result, we are at least 23% of CH4 below the SINTEF value at a comparable density which has been used as a reference value for the study. The overall GHG should be much better than the stated 13,5%.

We hope that we have provided the requested information. If you should have any questions, please do not hesitate to contact us any time.

Yours sincerely,
MAN Energy Solutions

Tacoma LNG Plant

Total NG end use	**6,839 GBtu, LHV/year**
On-site Peak Shaving	750 GBtu, LHV/year
LNG Output	6,089 GBtu, LHV/year

LNG Preatreatment

Operational hours	8,520 hr/yr
NG WPG heater	9 mmBtu/hr
	76,680 mmBtu/year
NG Regenerator heater	1.6 mmBtu/hr
	13,632 mmBtu/year
Total Annual Consumption	**90,312 mmBtu/year**
CO2 seperation efficiency	99.76%

Waste gas Flare

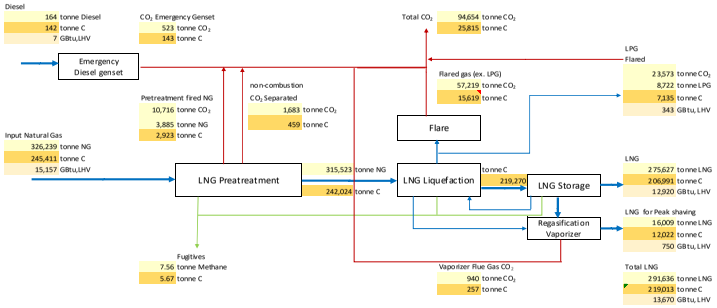
Operational hours	8,760 hr/yr
Waste Gas Flow	40,417 scf/hr
Waste Gas Heat Capacity	35.6 mmBtu/hr
Total Heat Input	**311,856 mmBtu/yr**
Seperated CO2	

Vaporizer

Operational hours	240 hr/yr
LNGg Heater Capacity	66.00 mmBtu/hr
Total Consumption	15,840 mmBtu Fuel gas
Power requir. (Grid)	0.04500 kWh/gal
	0.00347 kWhel/mmBtu
	(estimate need of 1830 Btu/gal LNG)

Emergency equipment

Diesel genearator ULSD	
Operational hours	500 hr/yr
Capacity	1,500 kW
Electricity generation	750,000 kWh/yr
Diesel consumption	104.6 gal/h
	52,300 gal/year
	6,666 mmBtu/year
	164.3 tonne/year



Liquefaction

Power requirs. (Grid)	1.35 kWh/galLNG
Operational hours Liqu.	8,520 hr/year

Fugitives - Refrigerant losses through Compressor Seals

	tonne/year
Methane	3.78

Annual throughput

The carbon balance accounts for the hydocarbons and CO_2 in the natural gas such that the carbon entering the LNG system is equal to the carbon in the combustion gas, fugitive emissions and LNG. Carbon in the Flared gas ex. LPG is determined by difference. Inputs to the analysis include overall NG to LNG mass balance, and fired pretreament NG. Waste gas to flare is based on elemental composition and mass flows.

Vaporizing onside peak shaving			940		**257**		Boiler primary fuel is NG. Hoveve r, the fuel gas mix can include compressed boil-off gas (BOG) . BID response p.9
Total Emissions			45,983	4	**13,133**		
Total Product + Emissions			45,983	4	**122,706**		
Total NG Input - Product + Emissions					**0**		

Comments:
A: How much LPG is produced as product? LPG production is not mentioned in the Response.
B: In the FEIS report page 103 the value is 10,703tonne/year. Could you clarify this?

Annual throughput

The carbon balance accounts for the hydocarbons and CO_2 in the natural gas such that the carbon entering the LNG system is equal to the carbon in the combustion gas, fugitive emissions and LNG. Carbon in the Flared gas ex. LPG is determined by difference. Inputs to the analysis include overall NG to LNG mass balance, and fired pretreament NG. Waste gas to flare is based on elemental composition and mass flows

If Capacity is 500.000 gal/day
a factor of 2 is applaied
metric tonne&year
3.78108556

Calculations:

[a] Hourly Emissions (lb/hr) = [Emission Factor (lb/hr per component)] x [Component Count] x [Pollutant Content (%wt)] x [1 - LDAR Control Efficiency (%)]

Annual Emissions (tpy) = [Emission Factor (lb/hr per component)] x [Component Count] x [Pollutant Content (%wt)] x [1 - LDAR Control Efficiency (%)] x [Hours of Operation (hrs/yr)] / [2,000 lb/ton]

Hours of Operation (hrs/yr) = 8,760

[b] Pollutant Concentration (ppmw) = [Pollutant Concentration ($\mu g/m^3$)] / [453.6 g/lb] / [10^6 $\mu g/g$] / [35.31 ft^3/m^3] / [Gas Density (lb/cf)] x 10^6

Benzene Concentration ($\mu g/m^3$) =	2,980	[5]
Ethylbenzene Concentration ($\mu g/m^3$) =	144	[5]
m,p-Xylene Concentration ($\mu g/m^3$) =	986	[5]
o-Xylene Concentration ($\mu g/m^3$) =	165	[5]
Toluene Concentration ($\mu g/m^3$) =	2,570	[5]
Natural Gas Density (lb/scf) =	0.046	[5]

Notes:

[1] Provided by CB&I.

[2] From "Natural Gas Analysis"; Environmental Partners, Inc.; February 3, 2014. Most HAPs will go through with the heavy hydrocarbons, but the fraction is unknown. Therefore, we assume each fluid has the full concentration of HAP to provide a conservative emissions estimate.

[3] Terminal/Depot factors from South Coast Air Quality Management District's "Guidelines for Fugitive Emissions Calculations" (June 2003). In this guidance, the District updated emissions factors that were identified in the EPA's "Protocol for Equipment Leak Emission Estimates (November 1995).

[4] Control effectiveness from Texas Commission for Environmental Quality (TCEQ) "Control Efficiencies for TCEQ Leak Detection and Repair Programs" (July 2011) for its 28M fugitive leak detection program.

[5] See fuel characteristics in Table B-2.

[6] Assume all VOC is CH_4.

Medium speed means RPM>130
LNG emissions factors from "GHG and NOx Emissions from Gas Fueled Engines", SINTEF, 2017. PM emissions based on EPA certification data of 2017 Wartsila DF engine (rated at 8MW)
VOC emissions for LNG engines are estimated as NMVOC, based on a typical ratio of 3.8% NMVOC/CH4 emissions, as described in "Methane Emissions from Natural Gas Bunkering Operations in the Marine Sector", MARAD, 201:
https://www.nho.no/siteassets/nhos-filer-og-bilder/filer-og-dokumenter/nox-fondet/dette-er-nox-fondet/presentasjoner-og-rapporter/methane-slip-from-gas-engines-mainreport-1492296.pdf
https://www.marad.dot.gov/wp-content/uploads/pdf/Methane-emissions-from-LNG-bunkering-20151124-final.pdf
Sulfur emissions rates for Low Pressure DF LNG engines based on SINEF report (Table 5.1) indicating 95-98% SOx reductions from LNG operation relative to MDO. Assume pilot fuel is MDO with a 0.5% sulfur content based on 2020 global sulfur ca

LNG Aux Boiler	All	LNG Aux Boiler All	644	0.075	0.002

Source: 2013 POLB Emissions Inventory

CO2 emissions for LNG based on ratios of carbon-per-BTU for bunker fuel and natural gas, as given in ANL GREET's fuel properties worksheet
N2O emissions for LNG assumed to be equal to fuel oil. CH4 emissions for LNG scaled based on fuel oil emissions and ratios of CH4 emissions from medium speed FO and LNG engines.

Notes:

[a] Provided by CB&I.

[c] Based on the Williams Gas Pipeline tariff of 0.25 grains per 100 cubic feet for H2S, the past 12-month maximum total sulfur (reported as H2S by Williams Gas Pipeline) of 0.603 grains per 100 cubic feet, and sulfur from odorant of 0.23 grains per 100 cubic feet (odorant injection rates provided by PSE).

[b] From "Natural Gas Analysis"; Environmental Partners, Inc.; February 3, 2014. Most hazardous air pollutants (HAPs) will go through with the heavy hydrocarbons, but the fraction is unknown. Therefore, we conservatively assume the waste gas has the full concentration of HAP.

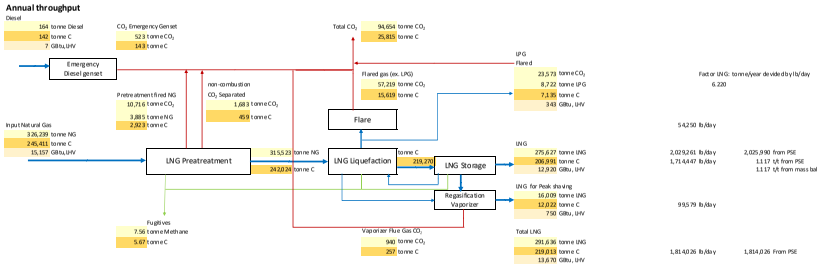
Liquefaction
Power requir.s. (Grid) 1.35 kWh/galLNG
Operational hours Liqu. 8,520 hr/year

Fugitives - Refrigerant losses through Compressor Seals
tonne/year
Methane 7.56

Annual throughput

The carbon balance accounts for the hydocarbons and CO_2 in the natural gas such that the carbon entering the LNG system is equal to the carbon in the combustion gas, fugitive emissions and LNG. Carbon in the Flared gas ex. LPG is determined by difference. Inputs to the analysis include overall NG to LNG mass balance, and fired pretreament NG. Waste gas to flare is based on elemental composition and mass flows.



This way <—>

Carbon Mass balance

Total Emissions			92,448	8	**26,398**		
Total Product + Emissions			92,448	8	**245,411**		
Total NG Input - Product + Emissions					**0**		

Comments:
A: How much LPG is produced as product? LPG production is not mentioned in the Response.
B: In the FEIS report page 103 the value is 10,700 tonne/year. Could you clarify this?

Annual throughput

The carbon balance accounts for the hydocarbons and CO_2 in the natural gas such that the carbon entering the LNG system is equal to the carbon in the combustion gas, fugitive emissions and LNG. If Capacity is 500.000 gal/day a factor of 2 is applied

metric tonne&year
7.562171126

Calculations:

[a] Hourly Emissions (lb/hr) = [Emission Factor (lb/hr per component)] x [Component Count] x [Pollutant Content (%wt)] x [1 - LDAR Control Efficiency (%)]

Annual Emissions (tpy) = [Emission Factor (lb/hr per component)] x [Component Count] x [Pollutant Content (%wt)] x [1 - LDAR Control Efficiency (%)] x [Hours of Operation (hrs/yr)] / [2,000 lb/ton]

Hours of Operation (hrs/yr) = 8,760

[b] Pollutant Concentration (ppmw) = [Pollutant Concentration ($\mu g/m^3$)] / [453.6 g/lb] / [10^6 $\mu g/g$] / [35.31 ft^3/m^3] / [Gas Density (lb/cf)] x 10^6

Benzene Concentration ($\mu g/m^3$) =	2,980	[5]
Ethylbenzene Concentration ($\mu g/m^3$) =	144	[5]
m,p-Xylene Concentration ($\mu g/m^3$) =	986	[5]
o-Xylene Concentration ($\mu g/m^3$) =	165	[5]
Toluene Concentration ($\mu g/m^3$) =	2,570	[5]
Natural Gas Density (lb/scf) =	0.046	[5]

Notes:

[1] Provided by CB&I.

[2] From "Natural Gas Analysis"; Environmental Partners, Inc.; February 3, 2014. Most HAPs will go through with the heavy hydrocarbons, but the fraction is unknown. Therefore, we assume each fluid has the full concentration of HAP to provide a conservative emissions estimate.

[3] Terminal/Depot factors from South Coast Air Quality Management District's "Guidelines for Fugitive Emissions Calculations" (June 2003). In this guidance, the District updated emissions factors that were identified in the EPA's "Protocol for Equipment Leak Emission Estimates (November 1995).

[4] Control effectiveness from Texas Commission for Environmental Quality (TCEQ) "Control Efficiencies for TCEQ Leak Detection and Repair Programs" (July 2011) for its 28M fugitive leak detection program.

[5] See fuel characteristics in Table B-2.

[6] Assume all VOC is CH_4.

Medium speed means RPM>130
LNG emissions factors from "GHG and NOx Emissions from Gas Fueled Engines", SINTEF, 2017. PM emissions based on EPA certification data of 2017 Wartsila DF engine (rated at 8MW)
VOC emissions for LNG engines are estimated as NMVOC, based on a typical ratio of 3.8% NMVOC/CH4 emissions, as described in "Methane Emissions from Natural Gas Bunkering Operations in the Marine Sector", MARAD, 201!
https://www.nho.no/siteassets/nhos-filer-og-bilder/filer-og-dokumenter/nox-fondet/dette-er-nox-fondet/presentasjoner-og-rapporter/methane-slip-from-gas-engines-mainreport-1492296.pdf
https://www.marad.dot.gov/wp-content/uploads/pdf/Methane-emissions-from-LNG-bunkering-20151124-final.pdf
Sulfur emissions rates for Low Pressure DF LNG engines based on SINEF report (Table 5.1) indicating 95-98% SOx reductions from LNG operation relative to MDO. Assume pilot fuel is MDO with a 0.5% sulfur content based on 2020 global sulfur ca

CO2 emissions for LNG based on ratios of carbon-per-BTU for bunker fuel and natural gas, as given in ANL GREET's fuel properties worksheet
N2O emissions for LNG assumed to be equal to fuel oil. CH4 emissions for LNG scaled based on fuel oil emissions and ratios of CH4 emissions from medium speed FO and LNG engines.

Notes:

[a] Provided by CB&I.

[c] Based on the Williams Gas Pipeline tariff of 0.25 grains per 100 cubic feet for H2S, the past 12-month maximum total sulfur (reported as H2S by Williams Gas Pipeline) of 0.603 grains per 100 cubic feet, and sulfur from odorant of 0.23 grains per 100 cubic feet (odorant injection rates provided by PSE).

[b] From "Natural Gas Analysis"; Environmental Partners, Inc.; February 3, 2014. Most hazardous air pollutants (HAPs) will go through with the heavy hydrocarbons, but the fraction is unknown. Therefore, we conservatively assume the waste gas has the full concentration of HAP.

Calculations:

[a] Hourly Emissions (lb/hr) = [Emission Factor (lb/hr per component)] x [Component Count] x [Pollutant Content (%wt)] x [1 - LDAR Control Efficiency (%)]
Annual Emissions (tpy) = [Emission Factor (lb/hr per component)] x [Component Count] x [Pollutant Content (%wt)] x [1 - LDAR Control Efficiency (%)] x [Hours of Operation (hrs/yr)] / [2,000 lb/ton]

Hours of Operation (hrs/yr) =	8,760	

[b] Pollutant Concentration (ppmw) = [Pollutant Concentration ($\mu g/m^3$)] / [453.6 g/lb] / [10^6 $\mu g/g$] / [35.31 ft^3/m^3] / [Gas Density (lb/cf)] x 10^6

Benzene Concentration ($\mu g/m^3$) =	2,980	[5]
Ethylbenzene Concentration ($\mu g/m^3$) =	144	[5]
m,p-Xylene Concentration ($\mu g/m^3$) =	986	[5]
o-Xylene Concentration ($\mu g/m^3$) =	165	[5]
Toluene Concentration ($\mu g/m^3$) =	2,570	[5]
Natural Gas Density (lb/scf) =	0.046	[5]

Notes:

[1] Provided by CB&I.

[2] From "Natural Gas Analysis"; Environmental Partners, Inc.; February 3, 2014. Most HAPs will go through with the heavy hydrocarbons, but the fraction is unknown. Therefore, we assume each fluid has the full concentration of HAP to provide a conservative emissions estimate.

[3] Terminal/Depot factors from South Coast Air Quality Management District's "Guidelines for Fugitive Emissions Calculations" (June 2003). In this guidance, the District updated emissions factors that were identified in the EPA's "Protocol for Equipment Leak Emission Estimates (November 1995).

[4] Control effectiveness from Texas Commission for Environmental Quality (TCEQ) "Control Efficiencies for TCEQ Leak Detection and Repair Programs" (July 2011) for its 28M fugitive leak detection program.

[5] See fuel characteristics in Table B-2.

[6] Assume all VOC is CH_4.

Medium speed means RPM>130

LNG emissions factors from "GHG and NOx Emissions from Gas Fueled Engines", SINTEF, 2017. PM emissions based on EPA certification data of 2017 Wartsila DF engine (rated at 8MW).

VOC emissions for LNG engines are estimated as NMVOC, based on a typical ratio of 3.8% NMVOC/CH4 emissions, as described in "Methane Emissions from Natural Gas Bunkering Operations in the Marine Sector", MARAD, 2015

https://www.nho.no/siteassets/nhos-filer-og-bilder/filer-og-dokumenter/nox-fondet/dette-er-nox-fondet/presentasjoner-og-rapporter/methane-slip-from-gas-engines-mainreport-1492296.pdf

https://www.marad.dot.gov/wp-content/uploads/pdf/Methane-emissions-from-LNG-bunkering-20151124-final.pdf

Sulfur emissions rates for Low Pressure DF LNG engines based on SINEF report (Table 5.1) indicating 95-98% SOx reductions from LNG operation relative to MDO. Assume pilot fuel is MDO with a 0.5% sulfur content based on 2020 global sulfur cap

Notes:

[a] Provided by CB&I.

[c] Based on the Williams Gas Pipeline tariff of 0.25 grains per 100 cubic feet for H2S, the past 12-month maximum total sulfur (reported as H2S by Williams Gas Pipeline) of 0.603 grains per 100 cubic feet, and sulfur from odorant of 0.23 grains per 100 cubic feet (odorant injection rates provided by PSE).

[b] From "Natural Gas Analysis"; Environmental Partners, Inc.; February 3, 2014. Most hazardous air pollutants (HAPs) will go through with the heavy hydrocarbons, but the fraction is unknown. Therefore, we conservatively assume the waste gas has the full concentration of HAP.

Calculations:

[a] Hourly Emissions (lb/hr) = [Emission Factor (lb/hr per component)] x [Component Count] x [Pollutant Content (%wt)] x [1 - LDAR Control Efficiency (%)]
Annual Emissions (tpy) = [Emission Factor (lb/hr per component)] x [Component Count] x [Pollutant Content (%wt)] x [1 - LDAR Control Efficiency (%)] x [Hours of Operation (hrs/yr)] / [2,000 lb/ton]

Hours of Operation (hrs/yr) =	8,760	

[b] Pollutant Concentration (ppmw) = [Pollutant Concentration ($\mu g/m^3$)] / [453.6 g/lb] / [10^6 $\mu g/g$] / [35.31 ft^3/m^3] / [Gas Density (lb/cf)] x 10^6

Benzene Concentration ($\mu g/m^3$) =	2,980	[5]
Ethylbenzene Concentration ($\mu g/m^3$) =	144	[5]
m,p-Xylene Concentration ($\mu g/m^3$) =	986	[5]
o-Xylene Concentration ($\mu g/m^3$) =	165	[5]
Toluene Concentration ($\mu g/m^3$) =	2,570	[5]
Natural Gas Density (lb/scf) =	0.046	[5]

Notes:

[1] Provided by CB&I.

[2] From "Natural Gas Analysis"; Environmental Partners, Inc.; February 3, 2014. Most HAPs will go through with the heavy hydrocarbons, but the fraction is unknown. Therefore, we assume each fluid has the full concentration of HAP to provide a conservative emissions estimate.

[3] Terminal/Depot factors from South Coast Air Quality Management District's "Guidelines for Fugitive Emissions Calculations" (June 2003). In this guidance, the District updated emissions factors that were identified in the EPA's "Protocol for Equipment Leak Emission Estimates (November 1995).

[4] Control effectiveness from Texas Commission for Environmental Quality (TCEQ) "Control Efficiencies for TCEQ Leak Detection and Repair Programs" (July 2011) for its 28M fugitive leak detection program.

[5] See fuel characteristics in Table B-2.

[6] Assume all VOC is CH_4.

Medium speed diesel	2000 - 2010	Medium speed diesel 2000 - 2(	12.2	0.5	1.1	0.42	0.24	0.23	0.24
Slow speed diesel	2011 - 2015	Slow speed diesel 2011 - 2015	14.4	0.6	1.4	0.38	0.24	0.23	0.24
Medium speed diesel	2011 - 2015	Medium speed diesel 2011 - 2(	10.5	0.5	1.1	0.42	0.24	0.23	0.24
Lean Burn SI LNG	All	Lean Burn SI LNG All	0.9	0.0	1.7	0	0.02	0.02	0
Low Pressure DF LNG	All	Low Pressure DF LNG All	1.9	0.0	1.9	0.00	0.02	0.02	0
Gas turbine	All	Gas turbine All	6.1	0.1	0.2	0.6	0.1	0.04	0
Steamship	All	Steamship All	2.1	0.1	0.2	0.6	0.8	0.6	0

Medium speed means RPM>130

LNG emissions factors from "GHG and NOx Emissions from Gas Fueled Engines", SINTEF, 2017. PM emissions based on EPA certification data of 2017 Wartsila DF engine (rated at 8MW).

VOC emissions for LNG engines are estimated as NMVOC, based on a typical ratio of 3.8% NMVOC/CH4 emissions, as described in "Methane Emissions from Natural Gas Bunkering Operations in the Marine Sector", MARAD, 2015

https://www.nho.no/siteassets/nhos-filer-og-bilder/filer-og-dokumenter/nox-fondet/dette-er-nox-fondet/presentasjoner-og-rapporter/methane-slip-from-gas-engines-mainreport-1492296.pdf

https://www.marad.dot.gov/wp-content/uploads/pdf/Methane-emissions-from-LNG-bunkering-20151124-final.pdf

Sulfur emissions rates for Low Pressure DF LNG engines based on SINEF report (Table 5.1) indicating 95-98% SOx reductions from LNG operation relative to MDO. Assume pilot fuel is MDO with a 0.5% sulfur content based on 2020 global sulfur cap

Attachments: image001.jpg

I write on behalf of the Puyallup Sumner Chamber of Commerce to provide the organization's comments and to express support for the Puget Sound Clean Air Agency (PSCAA) to issue the necessary permit(s) for Puget Sound Energy (PSE) to continue construction of its liquefied natural gas (LNG) facility at the Port of Tacoma.

The Port of Tacoma is the right place for a facility such as this. The Port is an established industrial area, and this project is consistent with the types of uses and aesthetic appearance of other marine-related industrial activities in the area.

Port districts themselves exist to promote economic activity and vitality. The building and operation of the LNG facility represents hundreds of millions of dollars of private investment on a state-of-the-art facility. It will help local business remain competitive by providing a needed supply of LNG for its soon-to-be-reconfigured marine vessels. The siting of this facility in the Port of Tacoma will be a competitive advantage for the NW Seaport Alliance and the State of Washington.

The Tacoma LNG facility will create at least 250 construction jobs and 18 permanent jobs directly within the Port, along with the economic activity from the project creating another 125 permanent jobs in the region. The facility is consistent with the on-going efforts by the Port, the City and region to encourage a healthy local business climate and help retain and grow companies who call Pierce County home. It will also contribute millions of dollars in new tax revenues to benefit local schools, city services, and other state and local government services by making more public funds available to meet road and public safety needs.

The environmental and health benefits of LNG are also very important. LNG is a cleaner alternative to conventional fuels such as diesel. Switching to LNG reduces greenhouse gas emissions by nearly 15% and eliminates visible particulate emissions produced by ships by more than 85%. This helps improve air quality and reduce health risks, while helping local employers like TOTE comply with new stricter low-sulfur emission standards.

PSCAA, by preparing the draft SEIS, has confirmed the environmental benefits and overall reduction in greenhouse gas emissions. We fully support this project and are confident it will provide great benefits to the residents and businesses of Pierce County and the Puget Sound region for years to come.

0725-1 23. General Support

Puget Sound Clean Air Agency
1904 Third Avenue, Suite 105
Seattle, WA 98101

I wish to express my support for Puget Sound Energy's (PSE) liquefied natural gas (LNG) facility at the Port of Tacoma. This letter reflects my comments in support of the Puget Sound Clean Air Agency (PSCAA) finalizing its SEIS consistent with the draft it issued on October 8, 2018 and timely issuing PSE the necessary permit(s) to proceed.

There are many stakeholders in the effort to reduce emissions, and even more moving parts to the actual process of doing so. In the last five years alone, the Port of Tacoma, the Port of Seattle and the Vancouver Fraser [Canada] Port Authority have created an updated Northwest Ports Clean Air Strategy with the objectives of reducing port-related air quality impacts of diesel particulate matter, reducing greenhouse gas emissions, and helping meet air quality standards and objectives for the airshed. The PSCAA itself is a partner in the implementation of this effort, along with agencies including the Environmental Protection Agency (EPA).

The PSE LNG facility is one part of the task of reducing diesel emissions. LNG fuel cuts particulate matter (PM) emissions produced by ships by more than 85%. These particulates are extremely harmful to the lung health of dock workers and those in the surrounding neighborhoods. According to dock workers, they not only see the black diesel particulates floating in the air, but they breathe them in as well while ships (still burning diesel) are waiting to dock. Besides eliminating the PM emissions, LNG fuel also reduces greenhouse gas emissions by nearly 15%, sulfur dioxide (SOx) emissions by over 99% and nitrogen oxide (NOx) emissions by nearly 85%. Another important environmental advantage of LNG as fuel is that in the unlikely event of a spill, LNG turns into vapor and dissipates with no lasting effects on water or marine life.

Reducing these real-time emissions is a matter of social justice. Port workers should not be subjected to this polluted air just for doing their jobs. Workers all across the West Coast ports have been vocal about the need to reduce these emissions in their work place, and they have played an integral role in supporting ports' efforts such as the Northwest Ports Clean Air Strategy to reduce emissions. Locating the Tacoma LNG facility within the Port of Tacoma advances the effort to reduce emissions at their source.

Beyond emissions affecting ports and immediately adjacent neighborhoods, the United States has staked out the position that vessels must control emissions when traveling America's coastlines up and down the Pacific Ocean. Annex 6 to the MARPOL Treaty, for which the EPA is the enforcing agency, requires Jones Act-flagged ships that travel near to shore to significantly reduce their emissions by using cleaner fuels. TOTE's use of fuel from Tacoma LNG to power its fast-transit, near-shore ships allows the company to substantially exceed its regulatory commitment to the EPA. By using LNG, TOTE will provide major emissions reductions benefiting public health for all communities and residents along its West Coast route, which transits nearly all of Puget Sound and ends in Anchorage, Alaska.

The Tacoma LNG facility is a project that allows multiple stakeholders – coastal communities, the Port of Tacoma, adjacent neighborhoods, PSCAA, EPA and TOTE - to affirmatively advance their interests in emissions reductions. Speaking for the dock and port workers, both our health and economic well-being are furthered by wrapping up this project's environmental review and permit effort promptly without

undue delay. Please, let's keep those good, family wage jobs at the Port of Tacoma and make the air the workers breathe healthier.

The draft SEIS, prepared by Ecology and Environment, Inc. and released by PSCAA on October 8, 2018, stated "When evaluating direct, upstream, and end use GHG emissions, replacing a diesel propulsion engine with a pure LNG propulsion engine results in reduced life-cycle GHG emissions."

Taking into consideration the overall reduction in greenhouse gas emissions confirmed by the draft SEIS for Tacoma LNG, and the human and environmental benefits of such reductions, I fully support PSCAA finalizing its SEPA review and granting the necessary permit(s) so this important addition to our region can be completed within its new scheduled time frame.

0866-1 13. LCA Inputs and Assumptions - Natural Gas Source
0866-2 19. LCA Inputs and Assumptions - End Use

October 30th, 2018

Puget Sound Clean Air Agency
ATTN: Public Comment on DSEIS, PSE LNG Project
1904 Third Ave, Suite 105
Seattle, WA 98101

Dear Puget Sound Clean Air Agency,

We are scientists who are in agreement that anthropogenic emissions of greenhouse gases due to the burning of fossil fuels has led to dangerous climate change, and that we must keep global temperature rise below 1.5 degrees Celsius to avoid the worst effects of climate change.

Thank you for requiring a greenhouse gas (GHG) lifecycle analysis for the Puget Sound Energy (PSE) liquefied natural gas (LNG) facility in the Port of Tacoma. We are writing in regards to the Draft Supplemental Environmental Impact Statement (DSEIS).

We disagree with the conclusion of the DSEIS that the LNG plant will reduce greenhouse gas emissions by 5% (Scenario A) or 4% (Scenario B). For two values to be considered different, scientific practice dictates that they must differ by more than their uncertainties. However, uncertainties were not given in the DSEIS, and it is evident in the DSEIS that uncertainties are large, particularly for the upstream methane leakage rate. Additionally, the DSEIS cites references that cannot be found, fails to use current values published in the scientific literature, fails to reference relevant studies, and fails to use the most current version of the model for the lifecycle analysis. Data is indicated as missing in numerous places, and incorrect units and math errors make mathematical calculations difficult or impossible to follow. We believe that if corrected to use the best available scientific methods, data, and models, it is likely that the analysis would show that greenhouse gas emissions would increase relative to the no-action alternative.

Moreover, while the proposal requires that all LNG come from British Columbia (BC), there is no discussion of what happens if BC is unable or unwilling to continue supplying LNG, or if future studies demonstrate that methane leaks in BC are higher than stated in the DSEIS. Further, the DSEIS fails to demonstrate the stability of the BC market.

The analysis assumes rather than requires that all LNG will be used to replace diesel. It also assumes additional marine shipping customers will be found, but no evidence that this is feasible is presented. To determine the likely greenhouse gas emissions, it is necessary to understand what options will be pursued if additional marine customers cannot be found so that relevant greenhouse gases can be determined (e.g. emissions due to trucking or barging of additional LNG for residential use).

0866-3 13. LCA Inputs and Assumptions - Natural Gas Source
0866-4 11. LCA Inputs and Assumptions - General
0866-5 14. LCA Inputs and Assumptions - Leakage/Slippage
0866-6 12. LCA Inputs and Assumptions - Global Warming Potential Value
0866-7 10. LCA Calculations
0866-8 10. LCA Calculations
0866-9 10. LCA Calculations

Specific details follow.

1) Sources cited for the methane leak rate in BC state that there is a high degree of uncertainty in reported values, but resulting uncertainty in the GHG emissions of the plant is not reported. References for the U.S. suggest that the methane leak rate in BC is probably underestimated.
2) Sources of greenhouse gas emission estimated to be less than 1% of the total are excluded. Given that the reduction in emissions is only 5%, the combined fraction of ignored emissions needs to be estimated and reported.
3) Several references that conclude that the methane leak rate in Canada is higher than reported are not included in the DSEIS, including a published peer-reviewed article.[1]
4) Several references for upstream methane leakage values cannot be found (e.g. "Province of British Columbia, 2018" references a website[2] where relevant data cannot be found, and it is unclear what "BC 2017" refers to).
5) The DSEIS uses outdated values for the global warming potential (GWP) of methane. The DSEIS should use the values from the most recent (AR5) International Panel on Climate Change report,[3] or the most recently reported values.[4] Given that it is essential to reduce greenhouse gases within 12 years to avoid the worst effects of climate change, emissions should be quantified for the 20-year GWP in addition to the 100-year GWP.
6) Calculations use incorrect units or have math errors, making them difficult or impossible to follow (e.g. Appendix C, Section A, page 88 and Appendix C, Section B.1, Page 102).
7) The DSEIS used version 4 of GHGenius, which is no longer available. The current, available version, with updated methane leak rates, should be used (V. 5 https://ghgenius.ca/index.php/downloads).
8) Data is missing/TBD in numerous places (e.g. Sections 2.2 – 2.4, Pages 9 - 11, 14 - 15, 18, 19, 21, 22, 24, 25).

We the undersigned believe that if these errors are corrected, it is unlikely the SEIS will show that the PSE LNG plant will reduce GHG emissions relative to the no-action alternative, and will likely show that it will result in an increase. On this basis, we ask that PSCAA deny a permit to the plant. If evidence for denying the permit is believed to be insufficient, we ask that the numerous and substantial errors in the DSEIS be corrected and the comment period be extended to allow a full review of a revised DSEIS.

Puget Sound Clean Air Agency
ATTN: Public Comment on DSEIS, PSE LNG Project
1904 Third Avenue, Suite 105
Seattle, WA 98101

Email: publiccomment@pscleanair.org

Thank you for the opportunity to provide comments on the Draft Environmental Impact Statement (EIS) for the Puget Sound Energy (PSE) Tacoma Liquefied Natural Gas (LNG) project. Created in 1874, the Thurston County Chamber of Commerce is a member-based organization operating in Thurston County. The Chamber works with an array of community partnerships, ranging from private businesses, non-profits, and government, to address the challenges and opportunities before our community.

The Thurston County Chamber of Commerce supports issuing the necessary permit(s) for Puget Sound Energy (PSE) to continue construction of its LNG facility at the Port of Tacoma by the Puget Sound Clean Air Agency (PSCAA).

We believe that the Port of Tacoma is the right location for this facility. The Port is an established industrial area and the project is consistent with the types of uses and aesthetic appearance of other marine-related industrial activities in the area. The land within the Port has been reviewed by the City of Tacoma and zoned precisely for this type of industrial facility. We recognize that port districts exist to promote economic activity and vitality. The Port is a substantial economic driver in Tacoma and the greater South Puget Sound region. The construction and operation of the LNG facility will help local businesses and industries remain competitive by providing a needed supply of LNG for soon-to-be-reconfigured marine vessels. The siting of a LNG facility at the Port of Tacoma will provide a competitive advantage for the NW Seaport Alliance and the State of Washington.

The Thurston County Chamber of Commerce also sees large environmental and health benefits associated with the transition to LNG. Recent reports indicate that LNG is a cleaner alternative to conventional fuels and that switching to LNG reduces greenhouse gas emissions by almost 15 percent and eliminates visible particulate emissions produced by ships by more than 85 percent. Switching to LNG and providing facilities to make the transition will help improve air quality and reduce health risks for the region. At the same time, switching to LNG will help local employers, like TOTE Maritime, comply with new emission standards. PSCAA, in preparing the draft SEIS, has confirmed the environmental benefits and reductions in greenhouse gas emissions. This confirmation should allow the finalization of environmental review so that the project permit(s) can be issued. We fully support this project and are confident it will provide benefits to the residents and businesses of in the South Puget Sound region.

Again, thank you for the opportunity to comment on the Draft Environmental Impact Statement (EIS) for the Puget Sound Energy (PSE) Tacoma Liquefied Natural Gas (LNG) project. Please feel free to contact me by calling (360) 357-3362 or emailing DSchaffert@thurstonchamber.com if you have questions regarding our comments.

Sincerely,

Doug Mah, Director Public Policy
Thurston County Chamber of Commerce

Re: Public Comment on Tacoma LNG Facility

Dear Responsible Officials at PSCAA:

I am writing on behalf of the Washington Maritime Federation (the Federation) to provide comments on the Draft Supplemental Environmental Impact Study for the Tacoma Liquefied Natural Gas Project (DSEIS), and in support of the expeditious final permitting and completion of that liquefied natural gas (LNG) facility. The Federation is a statewide organization representing all sectors of the maritime industry—cargo and logistics, fishing and seafood processing, recreational boating, passenger vessel operations, shipyards, maritime labor and numerous support industries.

From its inception, one of the top priorities of the Federation has been to support the further 'greening' of the industry in this state. We say 'further' because Washington's ports and maritime businesses have long been leaders in environmental stewardship, whether it relates to clean water, clean air, site cleanups and remediation or species health.

One of the best recent examples of Washington State's leadership has been Saltchuk/TOTE's commitment to convert existing container ships and build new ones that use LNG as fuel. TOTE was the first container line in the world to commit to this environmental improvement, and was justifiably and universally lauded for this action when it was announced. As a result of the support from regulatory agencies and the state, TOTE moved ahead with the substantial additional investment required to convert and build these ships.

Subsequently, questions were raised about the greenhouse gas impact from use of LNG as a fuel (as opposed existing diesel fuels) to try to stop construction of the Tacoma LNG plant. We are pleased that the Puget Sound Clean Air Agency took a second look at this issue and confirmed that use of LNG as fuel would reduce CO2 emissions. As you know, this greenhouse gas reduction is in addition to the undisputed and significant reductions in particulate matter, sulfur oxides and nitrogen oxides. These latter improvements are very significant as well, as they improve air quality for the local populace—and especially for our maritime workers. In addition, LNG as fuel for vessels eliminates the risk of an oil spill.

As a result of these many environmental benefits and International Maritime Organization requirements to reduce vessel sulfur emissions, use of LNG power is now the trend in construction of vessels by environmentally conscious companies. Not only does LNG use help the environment, but a growing number of major companies are constructing vessels that use LNG, rather than low sulfur diesel with 'scrubber' technology, because it makes more long-term economic sense. Our ports are in an extremely vulnerable competitive environment. Much of the cargo that moves through them can go through any port on the west coast, and in recent years there has been a loss of market share to other ports, especially those in Canada. In order for our ports to compete successfully for the cargo, jobs and economic benefits their activity creates, we need to be able to fuel this new generation of container, cruise and other vessels. If we can't, they will take their business elsewhere.

We are fully aware that, long-term, cleaner fuels are desirable. But right now, and until commercially available non-fossil-fuel alternatives exist for these large vessels, use of LNG over diesel is by far the best available environmental alternative. For all of these reasons we urge you to follow the scientific data and issue the air permit in a timely manner, which will support Saltchuk, TOTE and Puget Sound Energy's efforts as leaders in improving the maritime environment, and will also support the competitiveness of our vital maritime industry.

Sincerely

Peter Schrappen

RE: Columbia Riverkeeper Comments on Draft SEIS for Tacoma LNG

Dear Puget Sound Clean Air Agency,

Columbia Riverkeeper and our members are concerned with the potential development of the PSE LNG project in Tacoma. The PSE LNG project would impact regional fracked gas infrastructure, and the Draft Supplemental Environmental Impact Statement (DSEIS) for the proposal could set a troubling precedent for how Washington assesses the greenhouse gas (GHG) pollution impacts of fracked gas projects. We have a number of serious concerns about this facility's impact on public health and climate change, and the DSEIS falls short of addressing these issues.

Recently, the same company that conducted the lifecycle GHG analysis for the Tacoma LNG facility—Life Cycle Associates—also produced an analysis for Northwest Innovation Works' methanol refinery proposal in Kalama, Washington. We are concerned that both of these analyses contain similar flaws.

We urge the Puget Sound Clean Air Agency to address the following issues when writing the final SEIS for PSE's Tacoma LNG proposal:

- The greenhouse gas emissions calculations in the DSEIS do not use the best available science. The DSEIS uses outdated global warming potential (GWP) values for methane and other GHGs rather than the most recent scientific evidence from 2016.[1] If the analysis used 2016 GWP values, the LNG proposal would actually produce more GHGs than the No Action Alternative.

- The DSEIS uses the 100-year GWP for methane instead of the 20-year GWP. Because the State of Washington has aggressive GHG reduction goals, and recent studies demonstrate the urgency of reducing climate-changing pollution in the near future, the

[1] https://agupubs.onlinelibrary.wiley.com/doi/full/10.1002/2016GL071930

20-year GWP potential for methane is the more relevant and informative value in this context. On the same day that the DSEIS was released, the United Nations' Intergovernmental Panel on Climate Change (IPCC) released its latest report outlining pending climate change impacts.[2] The IPCC report indicates that we have only 12 years to shift away from fossil fuels to avoid severe climate disruption. If the final SEIS used the 20-year GWP for methane, it would show that PSE's LNG project is significantly more polluting than the No Action Alternative.

- The DSEIS relies on extremely low estimates for methane leakage rates in fracked gas production in British Columbia. A similar error underpins the DSEIS for the proposed methanol refinery in Kalama. The DSEIS assumes an extremely low methane leakage rate—0.32% in the GHGenius model.[3] The DSEIS also fails to incorporate recent information indicating that B.C. methane leakage rates are severely underreported.[4] As a result, the DSEIS vastly understates the contribution of GHG pollution from upstream fracked gas production that would feed PSE's proposal. Using more realistic methane leakage rates would demonstrate that PSE's LNG facility will create more GHG pollution than the No Action Alternative.

- The DSEIS assumes that all gas for the project will come from British Columbia. This assumption is unlikely to remain true through the lifespan of the project. According to the DSEIS, methane leakage estimates from U.S. sources are higher than the values the DSEIS uses for British Columbia. PSE's 2017 10K filing with the Securities and Exchange Commission shows that PSE obtained gas from British Columbia (54.8%), Alberta (19.1%), and the United States (26.1%) for PSE's natural gas customers in 2017.[5] Similarly, a significant percentage of PSE's gas supply for its power generation facilities came from non-B.C. sources in 2017.[6] The final SEIS should evaluate how much GHG pollution would come from the PSE LNG proposal if more of its gas came from sources outside of B.C. The final SEIS should also use realistic methane leakage values for all gas sources involved.

[6] *Id.* at 17.

In summary, we urge the PSCAA to address these flaws, and additional issues identified by other commenters, in the final SEIS. As written, the DSEIS likely dramatically understates the GHG pollution impact of PSE's LNG proposal.

Sincerely,

Dan Serres

1221-1 23. General Support

Carole: Thank you. Steve Sewell?

Steve: Good afternoon. My name is Steve Sewell. I'm here representing the Washington Maritime Federation as a statewide organization representing all sectors of the maritime industry, which employs about 70,000 people directly and employs, indirectly, another 70,000. Important part of our state's economy. When TOTE Maritime announced the construction of two new vessels and the conversion of two other vessels, they were understandably and justifiably praised as being environmentally responsible, for good reason.

The analyses showed all of the benefits that you've heard too many times today, in terms of reductions and NOx and SOx and particulate matter and greenhouse gases.

[02:10:05] Both of your analyses have confirmed what we believed, at the time. Several people have mentioned competitiveness. Ports here, in the maritime industry here, are particularly vulnerable. Most of the cargo that comes through our ports could go through any port on the west coast. A lot of it, recently, has been moving to British Columbia, where they will be able to fuel with LNG fueling stations. We fully understand that getting rid of fossil fuels, we, the Maritime Federation, and all of our members who operate fully on consensus, that getting rid of fossil fuels is critical. We need to do it.

But there are not options, at this time, for you can ask any naval architect or engineer, options for ocean going vessels that do not include fossil fuels, in some form. Clearly, LNG is the better solution over continuing to use heavy bunker fuels.

[02:11:05] And there are dozens of ships being built now. They are being built with dual fuel capacity. If they do not run on LNG, they will continue to run on the same dirty bunker fuels that they have been running on. This makes no sense. So, please move ahead and issue the permit without delay. Thank you.

Puget Sound Clean Air Agency
ATTN: Public Comment on DSEIS, PSE LNG Project
1904 Third Ave, Suite 105
Seattle, WA 98101

Re: Public Comment on Draft Supplemental Environmental Impact Statement (DSEIS) for the Puget Sound Energy (PSE) Liquefied Natural Gas (LNG) Project

To Whom it May Concern:

The increased use of clean-burning natural gas in the United States has delivered significant air quality benefits. By displacing coal in the electricity sector, natural gas has enabled the United States to reduce greenhouse gas emissions more than any other country. Natural gas has delivered reductions of over 12% in CO_2 emissions since 2005,[1] and even larger reductions in criteria air pollutants such as 46% of carbon monoxide, 70% of sulfur dioxide, and 45% of nitrogen dioxide.[2] Natural gas has also helped the United States achieve the largest reduction in CO_2 emissions in the world.[3] Moreover, the American oil and natural gas industry has decreased methane emissions from production by 14%[4] over the last four decades at the same time it has increased production over 50%.[5]

Clean-burning natural gas can deliver similar reductions in emissions from large marine vessels. The PSE LNG Project would take advantage of the benefits of natural gas to reduce air pollutants and greenhouse gas emissions by replacing diesel fuel with natural gas. The Puget Sound Clean Air Agency (PSCAA) should approve the DSEIS and allow PSE to move forward with the project, but it should not seek to disadvantage American natural gas by dictating the use of gas sourced from British Columbia. As we detail below, the DSEIS contains flawed information that should be corrected and not used to prevent PSE from taking advantage of gas sourced from the United States.

Western Energy Alliance represents over 300 companies engaged in all aspects of environmentally responsible exploration and production of oil and natural gas in the West.

Alliance members are independents, the majority of which are small businesses with an average of fifteen employees.

DSEIS Deficiencies

The most glaring flaw in the DSEIS is the provision that British Columbia (BC) be the sole source of natural gas for the facility. While PSE may choose to purchase its fuel from any supplier it desires, as is foundational to the American free-market system, enshrining an initial supplier choice in an air permit would be an inappropriate encumbrance on PSE and would prevent the company from responding to future changes in gas pricing, availability and other market conditions.

Additionally, the claim that the project "would produce a net reduction in annual GHG emissions provided that the natural gas source for the plant was British Columbia" is simply incorrect.[6] The DSEIS contains flawed accounting of the greenhouse gases (GHG) associated with production in BC. It claims, using a spreadsheet called GHGenius, that BC gas production has a total leak rate of 0.32%.[7] However, the use of a 0.32% leakage rate compared to the 1.00% leak rate used in the DSEIS for American natural gas production is based on a flawed estimate. GHGenius contains leak estimations from the gas field sector, the processing sector, and the transmission and distribution (T&D) sectors combined for a total leak estimate. But the numbers in the DSEIS for each sector are simply not based on good data.

The gas field leak estimate is based on a single study of the facilities of just one company, Seven Generations Energy, operating in the province.[8] The facilities studied are among the newest in the province and as admitted in the DSEIS, "newer wells have distinctly lower emissions than older wells".[9] Extrapolating data from just the newest facilities is not representative of the entire province's leak rate. BC oil and natural gas production has a 125 year history, and there is a very wide temporal range of production equipment. Any study that purports to represent the production of the province overall should include recent as well as older wells. The *Atherton et al.* (2017) study of 1,600 wells operated by 50 different companies found leak rates almost three times higher than what was used in the DSEIS, and was remarkably similar to leak rates for U.S. production.[10] PSCAA should not assume that BC gas has better leakage rates than American gas based on the Brandt study when other studies such as the Atherton study show that the profiles are similar.

The processing leak estimate used for BC in the DSEIS is also flawed. GHGenius lists its source for gas processing leaks as the Alberta Energy Regulator report ST13.[11] ST13 is an

[6] *Draft Supplemental EIS Tacoma LNG*, PSCAA, pg. 192
[7] Id. pg. 70
[8] *Life Cycle Assessment of Natural Gas Production*, Brandt et al., 2017
[9] *Draft Supplemental EIS Tacoma LNG*, PSCAA, pg. 193
[10] Atmos. Chem. Phys. Discuss., doi:10.5194/acp-2017-109, 2017
[11] GHGenius 5.0c, Natural Gas Supply tab, Cell A217

annual account of processing plant receipts and lists gas volumes flared or vented. The glaring error is that GHGenius does not account for fugitive leaks or other unaccounted leaks in the processing equipment. It simply assumes the reported volumes vented and flared are the only losses in the processing stream. The proper method to determine processing losses is to use the "difference and others" row in the ST13 report in addition to the vented and flared rows.[12] This accounts for any difference in the gas volumes from the inlet to the outlet of the plant. Properly accounting for those factors increases the leak estimate by at least a multiple of 10. The differences between BC and U.S. leak estimates disappear if using the same methods as those used in studies from the United States.

Another discrepancy in the BC upstream emission calculations is found in the transmission and distribution sector. The source for the T&D losses in BC is the Canadian Energy Partnership for Environmental Innovation (CEPEI).[13] CEPEI uses self-reported values from members of the Canadian Gas Association to calculate T&D losses. The estimate for U.S. T&D losses is double the value used for BC, but since it comes from a much more comprehensive national inventory which includes all operators, it avoids the selection bias inherent in the CEPEI estimate.[14] The lack of national inventory numbers from a regulatory agency with access to all downstream operators makes the two leak estimates incompatible with each other.

The leak rate for BC gas assumed in the DSEIS is a clear outlier and not directly comparable to other leak estimations. Each individual component of the total leak rate is flawed in a way that dramatically understates the potential leak rates in BC oil and natural gas operations. There is simply no sound factual basis for assuming that BC natural gas is environmentally superior to U.S. gas. Therefore, the PSCAA should remove the flawed information that advantages BC gas over U.S. gas, and the air permit issued under the SEIS should not contain any restrictions on the use of American natural gas.

Regulatory Comparison

The DSEIS also contains the claim that the province has "better management practices and emission controls" than the United States.[15] EPA has comprehensive rules that regulate methane emissions from the oil and natural gas sector,[16] and even more stringent regulations to prevent hazardous air pollution from the natural gas processing and transportation sectors.[17] Individual states also have stringent environmental regulations and emission controls. For instance, Colorado implements a comprehensive suite of methane regulations for all types of exploration and production equipment.[18] North

1288-4 cont'd 13. LCA Inputs and Assumptions - Natural Gas Source
1288-5 13. LCA Inputs and Assumptions - Natural Gas Source
1288-6 13. LCA Inputs and Assumptions - Natural Gas Source
1288-7 5. Regulatory Framework

Dakota similarly limits gas flaring and has requirements for controlling the emissions from production facilities.[19] British Colombia has province specific rules on the oil and natural gas industry, but they are not more protective of the environment than U.S. oil and natural gas regulations.[20]

Exploration and production in both Canada and the United States is done utilizing the same advanced, environmentally protective methods and well pad designs touted in the DSEIS. To assume that Canadian oil and natural gas companies utilize better or more advanced technology and equipment is simply incorrect. PSCAA is wrong to assume that Canadian natural gas is produced in a better, more environmentally protective manner. The DSEIS should not limit PSE to using natural gas from BC to the detriment of American natural gas which has an equal if not better environmental profile.

Interstate Commerce Clause

Finally, PSCAA could be in violation of the interstate commerce clause of the U.S. constitution if it attempts to restrict the source of natural gas to Canada and disadvantages other states in the Union. A similar attempt to limit facilities' fuel sources in Oregon faced Commerce Clause lawsuits, leading to a ruling that this practice was impermissibly discriminatory. In *American Fuel Petrochemical Manufacturers vs. O'Keeffe*, an Oregon state agency attempted to treat fuels from other states with higher carbon intensities, such as Midwest ethanol, in a discriminatory manner.[21] PSCAA is attempting the same maneuver, and could easily face a similar legal challenge.

In short, the PSCAA should approve PSE's LNG project because replacing diesel transportation fuel with natural gas carries obvious and significant benefits. Clean-burning natural gas decreases criteria pollutants as well as greenhouse gases from marine transportation. However, in the DSEIS, PSCAA is attempting to perversely limit, through an air permit, the source of PSE's LNG to Canadian natural gas using flawed assumptions that underestimate the GHG emissions from BC and overestimate emissions from the United States. The PSEIS arrives at a flawed conclusion that BC gas has a better environmental profile than U.S. sourced gas. The final Record of Decision should correct the deficiencies in the studies as noted above and should not dictate the sourcing of PSE's natural gas from BC, thereby enabling PSE to source its natural gas from the United States as well as BC. PSCAA should approve the project because it enables the displacement of diesel fueled transportation for clean-burning natural gas, but should not dictate the sourcing of that natural gas from British Columbia.

Re: Comments on PUGET SOUND ENERGY'S LIQUIFIED NATURAL GAS ("LNG") PROJECT

The Alliance of Western Energy Consumers ("AWEC") appreciates the opportunity to provide these comments on the draft Supplemental Environmental Impact Statement on Puget Sound Energy's ("PSE") Liquified Natural Gas Project in the Tacoma Tide Flats ("Project'). AWEC is a trade association representing commercial energy consumers in the Pacific Northwest. AWEC members include diverse commercial and industrial interests, including universities, food processing, pulp and paper, wood products, electric generation, aluminum, steel, chemicals, electronics, aerospace, and healthcare providers. The association provides an informational service to its members and participates in various regulatory matters that affect member interests.

AWEC urges the Puget Sound Clean Air Agency ("Agency") to proceed expeditiously to a Final Supplemental Environmental Impact Statement so that the Agency can recommence processing PSE's Notice of Construction. AWEC supports the Project as the least cost and least environmentally impactful way to meet growing peak day natural gas delivery needs of PSE's customers. Specifically, the Project would have the ability to vaporize LNG so that it can be used in PSE's natural gas distribution system during periods of high usage and demand (commonly known as "Peak Shaving"). AWEC also supports the Project's ability to produce LNG that will be used as a marine fuel.

AWEC was a party to an in-depth analysis of the Project as part of a regulatory proceeding before the Washington Utilities and Transportation Commission ("WUTC"). While environmental issues were not the focus of that proceeding, there was a great deal of time spent looking at other feasible alternatives, and whether the Project is the best interest of PSE's natural

gas customers. In the end, all stakeholders in that proceeding were able to reach a settlement of the issues, and the WUTC approved the settlement.[1]

The ability of the Project to meet natural gas demand on cold winter days without the need for more interstate pipeline capacity would be a tremendous resource for PSE's customers, especially when the capital costs are being shared with the TOTE Maritime fleet. If this Project is not approved, PSE will need to pursue a stand-alone natural gas Peak Shaving facility or an expansion of the Williams Northwest Pipeline system through the I-5 corridor to meet current and future customer loads. In the no action alternatives analysis, during periods of peak demand, natural gas would be diverted for use for residential, commercial, and industrial customers and duel fuel turbines generating electricity would be required to run on diesel fuel. While the no action alternative could be relied upon from time to time, it is not a long-term solution because PSE will not be able to rely on diesel back up for extended cold snaps when both gas and electric demand is at its highest.

Thank you for considering our comments.

Sincerely,

Chad M. Stokes

"Zero Incidents Everyday"

Puget Sound Clean Air Agency

We wish to express our support for Puget Sound Energy's (PSE) liquefied natural gas (LNG) facility. This specifically includes our concurrence with the conclusion about the environmental benefit of replacing transportation diesel fuel with clean burning LNG contained in the October 8, 2018 Draft SEIS issued by the Puget Sound Clean Air Agency (PSCAA) and our support for the agency in issuing the necessary permit(s) for the project to proceed.

The Washington Department of Ecology's State Environmental Policy Act (SEPA) regulations recognize that air quality is a part of the environment. It's hard to ignore the significant environmental and air quality benefits of replacing diesel or bunker fuel currently used by the maritime industry with LNG fuel.

Potelco is very familiar with the switch of fuel from diesel to natural gas. We purchased our first LNG truck in 2013 and currently have a fleet of 220 vehicles that run using LNG as fuel with additional units being placed in service. These vehicles range from Ford F550 trucks to Freightliner bucket and line trucks as well as dump trucks.

Potelco was recognized with an award for our efforts in displacing the use of diesel along with our contribution to reducing the regions greenhouse gas emissions in 2016 by Western Washington Clean Cities. Last year Potelco offset 339,457 gallons of diesel being consumed and reduced GHG emissions from our fleet by 341 tons, in addition to the constituent air quality benefits that come with the use of natural gas as a vehicle fuel.

Currently Potelco sources its LNG from locations outside of the state. We are excited to have PSE building a LNG plant within the state to support our continued use of LNG fuel within our fleet. With PSE providing us a local reliable source of fuel it will further reduce our GHG footprint with the shorter supply chain from source to end use.

The LNG facility will also generate important economic benefits for all South Sound residents. In addition to helping local employers like ourselves and TOTE remain competitive, it will create at least 250 construction jobs and over 300 indirect jobs due to the construction. After the construction, the economic activity from the project will create another 125 permanent jobs.

The draft SEIS, prepared by Ecology and Environment, Inc. and released by PSCAA on October 8, 2018, stated "When evaluating direct, upstream, and end use GHG emissions, replacing a diesel propulsion engine with a pure LNG propulsion engine results in reduced life-cycle GHG emissions."

Since the draft SEIS independently prepared for and published by PSCAA has confirmed the environmental benefits and overall reduction in GHG emissions from use of LNG as a replacement for diesel, we fully support PSCAA promptly finalizing its October 8, 2018 draft SEIS and granting the necessary permit(s) so the LNG facility can be completed as soon as possible.

Sincerely,

Mark Swanson
Executive Vice President

November 21, 2018

Puget Sound Clean Air Agency
ATTN: Public Comment on DSEIS, Tacoma LNG Project
1904 Third Ave.; Suite 105
Seattle, WA 98101
(publiccomment@pscleanair.org)

To the Puget Sound Clean Air Agency:

On behalf of TOTE Maritime Alaska, we offer our feedback regarding the draft Supplemental Environmental Impact Statement. This document is intended to respond directly to the technical information in the DSEIS and the resulting modeling looking at the greenhouse gas lifecycle of the project.

We are appreciative of the effort put forth by the Puget Sound Clean Air Agency (PSCAA). The environmental and health benefits of converting to liquefied natural gas have always been the primary reason for seeking out LNG. Your review of the greenhouse gas emissions life cycle and resulting emissions reductions that are derived from the project reinforce the benefits of this transition for the communities we serve and the environments in which we work.

Below please find information and commentary regarding some specific areas within the DSEIS that we wish to draw your attention to.

I. Fuel Specifications – MDO vs. MGO

Included within information provided to the PSCAA earlier this year, TOTE indicated that it is currently using Marine Gas Oil (MGO) containing 0.1% or less sulfur content in its Orca Class vessels – fuel that is compliant with the North American Emissions Control Area. Throughout the DSEIS and associated spreadsheets, notably in the No Action Alternative, TOTE's fuel was referred to as Marine Diesel Oil (MDO). MDO is different from MGO (although both can be low sulfur distillates). The use of a consistent term is an important verbiage change to provide clarity in the final SEIS.

II. Fuel Specifications – Bunker Fuel vs. Low Sulfur Diesel

In addition to the verbiage changes, we would like to note that the fuel specifications used to assess TOTE's emissions factors and resulting greenhouse gas emissions are incorrect.

Specifically, in calculating the Fuel Consumption Factors (found on the EF Marine Vessels spec. TOTE tab in the excel files), the fuel specifications for "bunker fuel for an ocean tanker" were used. However, these fuel specifications reflect a carbon percentage by weight for a fuel containing 2.8% sulfur.

This sulfur content is similar to the sulfur found in heavier, residual blend marine fuels not fuel which, as noted in section I, TOTE is currently using in its vessels. Specifically, the calculations should use the fuel specifications associated with low sulfur diesel on the fuel specs tab in the spreadsheets.

It is worth noting that, since the North American Emissions Control Area (ECA) controls went into effect in 2015, no ships sailing within 200 nautical miles of North America has been permitted to burn fuel with sulfur content over 0.1% unless given special exception from the Environmental Protection Agency or have had exhaust gas scrubbers installed to remove sufur from the exhaust. TOTE is in compliance with the ECA and burns 0.1% sulfur fuel.

Using the fuel specifications for low sulfur diesel when calculating Fuel Consumption Factors and other related data will decrease the amount of marine gas oil (MGO) used per trip by TOTE's vessels resulting in fewer greenhouse gas emissions. We would request that you use the data for marine gas oil or low sulfur diesel in the final environmental impact statement which will not result in a change to the conclusion provided in the draft SEIS, but will provide a more accurate assessment of the impact of converting a vessel from MGO to LNG and increase the overall greenhouse gas emissions reductions.

III. Methane Emission Rates for TOTE's LNG Engines

In the DSEIS, it was noted within the data regarding the emissions factors for TOTE's specific vessels that methane emissions factor for the low-pressure DF LNG engine is 5.3 g/kW-hr.

TOTE has been working closely with MAN, the original engine manufacturer who currently has the converted engine on a test bed. Through this testing, MAN has been able to determine some initial numbers with regards to methane slip. Based on initial testing, MAN has provided data noting that the methane emission rates from the converted engine are in line with the 5.3g/kw-hr (please see Appendix 1).

Noting that this is the first conversion of its kind in the world, TOTE anticipates that MAN will continue to refine the engines while on the test bed. MAN has a strong commitment to providing the most efficient and environmentally friendly engines. As reference, MAN built the engines currently being used in TOTE's Marlin Class vessels, the world's first LNG powered containerships. When these were introduced to the Puerto Rico trade, they experienced minor methane slip. With time, MAN worked closely with the TOTE engineers to completely eliminate methane slip from these engines.

While this will not be possible with TOTE's Alaska vessels because of the engine configuration, MAN will strive to ensure minimal methane slip and engine efficiency.

IV. Using Internationally Accepted Climate Change Data

TOTE supports the use of the International Panel on Climate Change's Fourth Assessment report (AR4) and the 100 year average for Global Warming Potentials as done in the DSEIS. In doing so, the PSCAA is in line with Washington State as well as the U.S. Environmental Protection Agency (EPA). To date, the State of Washington, the US EPA and PSCAA have not adopted the Fifth Assessment Report (AR5) as the scientific standard. TOTE is regulated at both the state and national levels and follows the accepted standards of these bodies when making business and operational decisions. These regulations have been one of the driving

forces for our decision to convert our vessels to LNG. When we began this process, LNG was and remains the cleanest most environmentally friendly commercially available fuel that allows us to meet and exceed the EPA's air emissions standards.

In addition, the use of LNG as a maritime fuel is both an accepted and recommended pathway globally to address greenhouse gas emissions in the maritime sector. Ships throughout the world have been using LNG and natural gas for years, resulting in cleaner air and lower greenhouse gas emissions. In addition, recent decisions by the International Maritime Organization to drive greenhouse gas emissions reductions in the short and long term identify LNG as a key strategy to achieving the short term goals which are in keeping with the United Nations' Paris Accord which also uses the scientific standards put forth in AR4.

Using the same data that is being used by other state, regional, national and international bodies is key in order to ensure consistency and understand the different impacts of each project with regards to greenhouse gas emissions. Therefore, we support the continued use of accepted scientific standards in this DSEIS.

V. Public Health Benefits

Since the early days of this project, the public health benefits of the project have been clear. The use of LNG as a fuel significantly reduces SOx, NOx, and particulate matter, each of which contribute to respiratory problems, asthma, and in some cases premature death.

It is undeniable that the use of LNG as a fuel will drastically decrease these air emissions from TOTE's vessels. In addition, as noted in your report, the establishment of a facility in the Tideflats that could provide LNG to other ships and modes of transportation will allow other transportation companies to lower their emissions. The use of LNG throughout the transportation sector would have significant benefit on the health of Tacoma, Pierce County and south Sound residents.

For decades Pierce county has struggled with particulate matter pollution. Through significant investment, particulate emissions have been reduced. The use of LNG would further reduce particulate matter in the region.

Simply put, the use of LNG in the maritime and transportation sectors result in significant air benefits for the local community including a healthier workplace for both TOTE's employees and our labor partners in Tacoma and Alaska.

TOTE Maritime

VI. Environmental and Ecological Benefits

Finally, this project has a number of environmental and ecological benefits that we believe are worth noting.

First, the use of LNG will reduce the possibility of fuel oil spills in Commencement Bay, Puget Sound, the Gulf of Alaska and everywhere in between.

Second, TOTE's shift from diesel to LNG will eliminate diesel particulates as well as black carbon. Black carbon is a byproduct of diesel and a significant portion of particulate matter (2.5). It is also a major component of soot. More specifically, black carbon has a detrimental impact on glaciers, ice and snow fields. The dark nature of this product reduces reflectivity and speeds melting of ice and glaciers in Alaska and around the world degrading this environment.

The benefits of the black carbon reduction that results from our transition to LNG from diesel will have significant short and long-term benefits on Alaska and the Arctic.

We are appreciative of the opportunity to provide feedback and comments related to the DSEIS put forth by the PSCAA. This DSEIS provides more insight and clarity regarding the impacts of both TOTE's conversion and the construction of Puget Sound Energy's (PSE) LNG facility in Tacoma.

Following the completion of the DSEIS, we look forward to the issuance of the permit for PSE's facility to ensure that our vessels will have the necessary fuel once the conversion is complete. Please do not hesitate to be in touch with TOTE should you have additional questions regarding our vessels, operations or any of the commentary provided here.

Sincerely,

Phil Morrell

Carole: Thank you. The next group of five is Joe Vincenzo, Margo Rolf, Marilyn Kimmerling, Chris Chapin, I think we already heard from Chris Chapin, and Steve Sewell. So, Joe Vincenzo is first.

Joe: Respectful of all of the diversity of opinion represented here today, thank you for the opportunity to stand with other trade unionists, on behalf of our membership and share our position today. I am the port agent for the Seafarers' International Union located here in Tacoma Washington.

[02:01:01] I represent Merchant Marines, and I am a Merchant Marine myself. Seafood processors, fisheries observers totaling roughly 3,000 members, not including their families. Many of them make their homes right here in Tacoma. Maybe you've heard of them through their partnership with Paint Tacoma-Pierce Beautiful rehabilitating homes here in the community. They are good community members. They have been here, many of them, for decades, most of them, all of their lives. We've been training mariners, the SIU, in liquified gas operations off and on since 1974. SIU members have sailed safely aboard LNG vessels since 1977.

Our school, The Harry Lumberg School of Seamanship located at Piney Point, Maryland, is a trusted agent of the Coast Guard and has launched an LNG recertification program in 1997. And after a dormant period, the school relaunched a Coast Guard approved, comprehensive liquified gas course training in 2015.

[02:02:07] Why do we do this? We do this because our philosophy has always been to anticipate and stay ahead of the curve or the wave of the future. And however one defines that, I think, in principle, we all share this in common, what our future is going to be. And where the shipping industry is clearly headed is, I think, where our differences come into play. Unless ports have access to LNG, and unless the Port of Tacoma has access to LNG, ships will not be able to handle the commerce that underpins the wealth and job base in the region and right here in Tacoma.

Seafarers have been crewing TOTE ships for decades and have raise their families and supported their families here in Tacoma on the good paying union jobs with benefits for themselves and their families with vessel operators such as TOTE and others who are headquartered here and operate here in the Port of Tacoma.

[02:03:06] It's with this in mind that the SIU supports the conclusion of the supplemental EIS, and we urge you to finalize the permitting for

Puget Sound Energy Clean Energy Facility without delay. Thank you.

Address or email deadeyemark@comcast.net

UA Local 26 Plumbers and Pipefitters fully supports the LNG Plant as a clean source of energy.
We also support the economic benefit this facility will generate locally.
Furthermore, we recognize that switching from diesel to LNG is a big step in the right direction toward cleaner air and water in the Pacific Northwest.

Carole: Thank you. The next group of five, again, was Mark Wells, Steve Gilbert, Kevin Jones, Jori Adkins, and Todd Hay. So, Mark Wells?

[01:07:00]

Mark: Good afternoon. Mark Wells, business agent, Western Washington Local Plumbers, Pipefitters, and Welders. The red shirt, it was the next clean shirt in my closet. I'll keep this short and sweet, but I wanted to hit on a few numbers, most of these have already been touched on. Local 26 fully supports the LNG plant facility in Tacoma. The jobs create are going to be close to 1,000, initially. And that's not counting the indirect jobs that are going to be created. Carbon emissions, right now, we're looking at 43% of the carbon emissions in this state coming from transportation and 17% from the energy created by PSE. Very minimal.

We're also looking at a 50% reduction in PSE's energy production by the year 2040.

[01:08:00] And this is a big step, in that direction. I'm going to skip most of these figures because they've already been repeated a couple of times. But, from a personal standpoint, from a hunter/fisherman/kayaker/backpacker/climber, I spent 51 weekends out in the woods last year on the water doing all of the above. I don't think there's a person, in this room, that cares more about clean air, clean water, clean environment than an avid hunter and fisherman. Thank you for the opportunity.

October 22, 2018

Puget Sound Clean Air Agency
1904 3rd Ave #105
Seattle WA 98101
Re: Tacoma LNG Facility

Puget Sound Clean Air Agency;

*I am the President of the **Whatcom Business Alliance.** We are a membership organization in Whatcom County that has business members from every industry that do business all over the state and world. We also have municipalities and our local Port of Bellingham as members. I am writing on behalf of our organization to provide comments and express support for the Puget Sound Clean Air Agency (PSCAA) to issue the necessary permit(s) for Puget Sound Energy (PSE) to continue construction of its liquefied natural gas (LNG) facility at the Port of Tacoma.*

The Port of Tacoma is the right place for a facility like this. The Port is an established industrial area, and this project is consistent with the types of uses and aesthetic appearance of other marine-related industrial activities in the area. In accordance with Washington's Growth Management Act, cities and towns must first study the environmental effects of, and then zone land for industrial use in appropriate locations. The land within the Port has been reviewed by the City of Tacoma and zoned for precisely this type of industrial facility.

Port districts exist to promote economic activity and vitality. The Port has long been a substantial economic engine in Tacoma, in alignment with the purpose for which Washington laws authorize the formation of ports. The building and operation of the LNG facility represents hundreds of millions of dollars of private investment on a state-of-the-art facility. It will help local business remain competitive by providing a needed supply of LNG for its soon-to-be-reconfigured marine vessels. The siting of this facility in the Port of Tacoma, within the city of Tacoma, will be a competitive advantage for the NW Seaport Alliance and the State of Washington.

The Tacoma LNG facility will create at least 250 construction jobs and 18 permanent jobs directly within the Port, along with the economic activity from the project creating another 125 permanent jobs in the region. The facility is consistent with the on-going efforts by the Port, the City and region to encourage a healthy local business climate and help retain and grow companies who call Pierce County home. As the FEIS for the proposal demonstrated, it will also contribute millions of dollars in new tax revenues to benefit local schools, city services, and other state and local government services by making more public funds available to meet road and public safety needs.

2423 E. Bakerview Rd., Bellingham WA 98226
360.746.0418 www.WhatcomBusinessAlliance.com

WBA
Whatcom Business Alliance
Facilitating Business Success & Community Prosperity

The environmental and health benefits of LNG are also very important. LNG is a cleaner alternative to conventional fuels such as diesel. The PSCAA's Draft SEIS, published on October 8, 2018, confirms this. ***Switching to LNG reduces greenhouse gas emissions by nearly 15% and eliminates visible particulate emissions produced by ships by more than 85%.*** *This helps improve air quality and reduce health risks, while helping local employers like TOTE comply with new stricter low-sulfur emission standards.*

PSCAA, by preparing the draft SEIS, has confirmed the environmental benefits and overall reduction in greenhouse gas emissions which should allow the finalization of environmental review so that the project permit(s) can be issued. We fully support this project and are confident it will provide great benefits to the residents and businesses of Pierce County and the Puget Sound region for years to come.

I thank you on behalf of our membership for your consideration of this important issue.

Sincerely,

Tony Larson, President
Whatcom Business Alliance

- **The Draft SEIS is Incomplete** – The current version of the draft SEIS does not contain all the information we, the public, need to fully assess the accuracy of this study and the predicted impact of the LNG facility. There are at least 10 places in the study that have "placeholder" values instead of actual data. We request that the PSCAA complete the draft SEIS, re-issue it, and then reset the public comment period so that we may better formulate our questions about this project.
- **SEIS is Using Outdated Methane Global Warming Potential Value** – They did not use the best available science for the Global Warming Potential (GWP) value for methane. GWP is a measure of potency for a greenhouse gas and it is measured against carbon dioxide (CO2). CO2 has a GWP value of 1. Methane, however has a much larger GWP value. They are using the 2007 value of 25 for the 100-year number (i.e. the value average over 100 years), whereas they should be using the 2016 value of 32. Everything else being equal, making this one modification in their models makes the LNG plant dirtier from a greenhouse gas emissions perspective than staying with the heavy fuel oil.

Report	20-year GWP	100-year GWP
2007 IPCC AR4	72	25
2013 IPCC AR5	86	28
2016 Scientific Study (authors include lead from 2013 study)	96	32

- **Analysis is based on 100-year, not 20-year, global warming potential (GWP) values** – They base all of their analysis on the 100-year GWP of methane, whereas, given the IPCC report that was released on Monday indicating that we must change our energy fuel mix in the next 12 years or face dire consequences in 22 years, they should be using the 20-year numbers, as that is the timeframe where action is needed. Using the most recent 20-year value of 96 makes the LNG plant 150% dirtier than the current capability.
- **Questionable claims that B.C. fracked gas is as clean as they claim –** They indicate that the fracked gas from B.C. has a much smaller leakage rate. However they fail to incorporate 2017 and 2018 analyses showing that a large percentage of the fracked gas wells are underreporting their methane leakages.
- **What assurances do we have that all of the fracked gas would come from BC?** They claim that all of the natural gas will be coming to the plant from British Columbia. However, just as we saw on Wednesday with the natural gas pipeline explosion in BC, they

1605-5 cont'd 13. LCA Inputs and Assumptions - Natural Gas Source
1605-6 19. LCA Inputs and Assumptions - End Use
1605-7 14. LCA Inputs and Assumptions - Leakage/Slippage
1605-8 16. LCA Inputs and Assumptions - Hydraulic Fracturing

were able to use natural gas from North Dakota. The methane leak estimates from North Dakota are noticeably higher than those reported from B.C. We have no guarantees that the gas used would come from BC. Of note, per their 2017 10K filing with the Securities and Exchange Commision (SEC), in 2017 they obtained gas from British Columbia (54.8%), Alberta (19.1%) and the United States (26.1%).

- **Analysis assumes credit for extra maritime customers that currently do not exist –** The analysis appears to assume that Puget LNG (the for-profit arm of this venture that will be selling the LNG to maritime customers) already has additional maritime customers, and so is claiming greenhouse gas emissions reduction credit for them. They have no such customers and so cannot legitimately claim such credit.
- **Questionable Methane Slippage Rates for TOTE Vessels –** It appears that they are using smaller methane slippage rates (the amount of unburned methane that will escape into the atmosphere through the exhaust system) for the TOTE maritime vessels that will be burning the LNG. In fact, even in PSE's own greenhouse gas life cycle analysis that they completed and is provided as part of this report, their external peer reviewer questioned PSE's assumption on their methane slippage rate indicating that they should be using the higher rate as that is considered best practice.
- **Analysis does not incorporate diesel emissions for transporting sand/water to the fracked wells** – Fracking requires large consumption of water and sand for its operations, however GHG emissions from these diesel trucks were not included in the analysis

Sound Clean Air Agency. Public comments will be accepted from Oct 8 to Nov 21, and a public hearing will take place on Oct 30 from 2-5 pm & 6:30-10 pm at the Rialto Theater in Tacoma

PSCAA
Attn: Public Comment
1904 3rd Ave
Suite 105
Seattle, WA 98101

To Whom It May Concern:

We are writing you today to urge you to complete your Supplemental Environmental Impact Statement (SEIS) and issue all the necessary air quality permits for Puget Sound Energy's proposed LNG facility and TOTE Maritime's conversion to LNG. In the greater Tacoma area, business, labor, and many others in the community have come together to support TOTE's conversion to LNG for their ORCA vessels. We believe it is important to speak up in support of TOTE's environmental leadership and their commitment to improving local air quality.

While the Puget Sound Clean Air Agency's (PSCAA) job is to fairly evaluate the impacts of the proposed LNG plant and TOTE's conversion to LNG fueled ships, it is business and labor's responsibility to ensure that vital cargo is moved safely and swiftly to Alaska and parts around the world. This benefits the customers and the communities they serve. We collectively represent businesses that supply their cargo, the dedicated employees that work on their ships, and those that work on the docks of the Port of Tacoma.

While PSCAA's analysis is extensive, it does not address the issues we face as workers or the greater business community in the local area. The men and women working on the docks and ships currently breathe diesel fumes throughout their day. We hope you consider all of us who work day to day with diesel. There is simply no doubt that LNG is a cleaner burning fuel and better for our health.

As the local business community, we embrace innovation and a healthy environment. Tacoma has transitioned to a community that promotes sustainable economic and environmentally responsible development. We believe the benefits of this project to our local air quality are immense. We project it will reduce sulfur oxides, particulate matter, nitrogen oxides anywhere from 90%-100%. PSCAA's own SEIS documents a reduction of 13.5% in greenhouse gasses.

Another tangible benefit of TOTE's conversion to LNG are the short and long-term economic stimuli to the local area. Many ports around the world are developing maritime LNG infrastructure and without LNG, many shippers will be forced to choose somewhere else. TOTE and the Port of Tacoma must stay competitive in a world market and this LNG facility would be the first of its kind in the Northwest, positioning Tacoma and the Northwest Seaport Alliance to retain existing business and compete for new opportunities. Tacoma cannot prosper without remaining competitive and investing in this cleaner fuel

upgrade will strengthen our ability to effectively compete for the world's shipping business.

We hope you remember those of us who work within the marine environment when you make your final decision. Please approve the LNG facility and TOTE's LNG conversion. It will improve our local air quality and environmental conditions down at the docks.

Sincerely,

Business Manager IUOE Local #612

Ironworkers #86

RCS IUOE Local #612

Dear Puget Sound Clean Air Agency,

As a [redacted] resident of Tacoma for the past 16 years, I have become increasingly aware of, and concerned by issues of environmental injustice in our region. I stand with the Puyallup Tribe in opposing Puget Sound Energy's LNG plant at the Port of Tacoma, where a fracked gas refinery is being built in one of the most important & sacred places for the Tribe — and being built in clear violation of their treaty rights. What is truly heart breaking is that the

Please include this in the final supplemental environmental impact statement.

I wish to express my support for Puget Sound Energy's (PSE) liquefied natural gas (LNG) facility. This specifically includes my concurrence with the conclusion about the environmental benefit of replacing transportation diesel fuel with clean burning LNG contained in the October 8, 2018 Draft SEIS issued by the Puget Sound Clean Air Agency (PSCAA) and my support for the agency in issuing the necessary permit(s) for the project to proceed.

The Washington Department of Ecology's State Environmental Policy Act (SEPA) regulations recognize that air quality is a part of the environment. It's hard to ignore the significant environmental and air quality benefits of replacing diesel or bunker fuel currently used by the maritime industry with LNG fuel. Switching from diesel to LNG reduces greenhouse gas emissions by nearly 15%, sulfur dioxide (SOx) emissions by over 99% percent, and nitrogen oxide (NOx) emissions by nearly 85% while eliminating visible particulate matter (PM) produced by ships by more than 85%. It is these particulate emissions that are extremely harmful to the lung health of anyone breathing them in.

It is also important to note that LNG powered ships will substantially exceed the North American Emission Control Area requirements established by the International Marine Organization's (IMO). The IMO regulations have required a reduction in the fuel sulfur content from 3.5 percent to 0.5 percent. Both US EPA and the Coast Guard are enforcing these fuel regulations which have been estimated by EPA to reduce mortality by as much as 30,000 people per year. TOTE has made the commitment to use LNG fuel, which provides substantially greater benefits than even the IMO regulations mandate.

Another important environmental advantage of LNG as fuel is that in the unlikely event of a spill, LNG turns into vapor and dissipates with no lasting effects on water or marine life.

The LNG facility will also generate important economic benefits for all South Sound residents. In addition to helping local employers like TOTE remain competitive, it will create at least 250 construction jobs and over 300 indirect jobs due to the construction. After the construction, the economic activity from the project will create another 125 permanent jobs.

The draft SEIS, prepared by Ecology and Environment, Inc. and released by PSCAA on October 8, 2018, stated "When evaluating direct, upstream, and end use GHG emissions, replacing a diesel propulsion engine with a pure LNG propulsion engine results in reduced life-cycle GHG emissions."

Since the draft SEIS independently prepared for and published by PSCAA has confirmed the environmental benefits and overall reduction in GHG emissions from use of LNG as a replacement for diesel, I fully support PSCAA promptly finalizing its October 8, 2018 draft SEIS and granting the necessary permit(s) so the LNG facility can be completed as soon as possible.

0740-1 12. LCA Inputs and Assumptions - Global Warming Potential Value

RECEIVED
NOV 14 2018
Puget Sound

-United Nations blog October 8th 2018

INCHEON, Republic of Korea, 8 Oct – Limiting global warming to 1.5ºC would require rapid, far-reaching and unprecedented changes in all aspects of society, the IPCC said in a new assessment. With clear benefits to people and natural ecosystems, limiting global warming to 1.5ºC compared to 2ºC could go hand in hand with ensuring a more sustainable and equitable society, the Intergovernmental Panel on Climate Change (IPCC) said on Monday.

The Special Report on Global Warming of 1.5ºCwas approved by the IPCC on Saturday in Incheon, Republic of Korea. It will be a key scientific input into the Katowice Climate Change Conference in Poland in December, when governments review the Paris Agreement to tackle climate change.

"With more than 6,000 scientific references cited and the dedicated contribution of thousands of expert and government reviewers worldwide, this important report testifies to the breadth and policy relevance of the IPCC," said Hoesung Lee, Chair of the IPCC.

Ninety-one authors and review editors from 40 countries prepared the IPCC report in response to an invitation from the United Nations Framework Convention on Climate Change (UNFCCC) when it adopted the Paris Agreement in 2015.

The report's full name is Global Warming of 1.5°C, an IPCC special report on the impacts of global warming of 1.5°C above pre-industrial levels and related global greenhouse gas emission pathways, in the context of strengthening the global response to the threat of climate change, sustainable development, and efforts to eradicate poverty.

"One of the key messages that comes out very strongly from this report is that we are already seeing the consequences of 1°C of global warming through more extreme weather, rising sea levels and diminishing Arctic sea ice, among other changes," said Panmao Zhai, Co-Chair of IPCC Working Group I.

Limiting global warming

The report highlights a number of climate change impacts that could be avoided by limiting global warming to 1.5ºC compared to 2ºC, or more. For instance, by 2100, global sea level rise would be 10 cm lower with global warming of 1.5°C compared with 2°C. The likelihood of an Arctic Ocean free of sea ice in summer would be once per century with global warming of 1.5°C, compared with at least once per decade with 2°C. Coral reefs would decline by 70-90 percent with global warming of 1.5°C, whereas virtually all (> 99 percent) would be lost with 2ºC.

"Every extra bit of warming matters, especially since warming of 1.5ºC or higher increases the risk associated with long-lasting or irreversible changes, such as the loss of some ecosystems," said Hans-Otto Pörtner, Co-Chair of IPCC Working Group II.

Limiting global warming would also give people and ecosystems more room to adapt and remain below relevant risk thresholds, added Pörtner. The report also examines pathways available to limit warming to 1.5ºC, what it would take to achieve them and what the consequences could be.

"The good news is that some of the kinds of actions that would be needed to limit global warming to 1.5ºC are already underway around the world, but they would need to accelerate."

said Valerie Masson-Delmotte, Co-Chair of Working Group I.

The report finds that limiting global warming to 1.5°C would require "rapid and far-reaching" transitions in land, energy, industry, buildings, transport, and cities. Global net human-caused emissions of carbon dioxide (CO2) would need to fall by about 45 percent from 2010 levels by 2030, reaching 'net zero' around 2050. This means that any remaining emissions would need to be balanced by removing CO2 from the air.

"Limiting warming to 1.5ºC is possible within the laws of chemistry and physics but doing so would require unprecedented changes," said Jim Skea, Co-Chair of IPCC Working Group III.

Allowing the global temperature to temporarily exceed or 'overshoot' 1.5ºC would mean a greater reliance on techniques that remove CO2from the air to return global temperature to below 1.5ºC by 2100. The effectiveness of such techniques are unproven at large scale and some may carry significant risks for sustainable development, the report notes.

"Limiting global warming to 1.5°C compared with 2°C would reduce challenging impacts on ecosystems, human health and well-being, making it easier to achieve the United Nations Sustainable Development Goals," said Priyardarshi Shukla, Co-Chair of IPCC Working Group III.

The decisions we make today are critical in ensuring a safe and sustainable world for everyone, both now and in the future, said Debra Roberts, Co-Chair of IPCC Working Group II.

"This report gives policymakers and practitioners the information they need to make decisions that tackle climate change while considering local context and people's needs. The next few years are probably the most important in our history," she said.

Special Report

The Report was prepared under the scientific leadership of all three IPCC working groups. Working Group I assesses the physical science basis of climate change; Working Group II addresses impacts, adaptation and vulnerability; and Working Group III deals with the mitigation of climate change.The IPCC is the leading world body for assessing the science related to climate change, its impacts and potential future risks, and possible response options.

The Paris Agreement adopted by 195 nations at the 21st Conference of the Parties to the UNFCCC in December 2015 included the aim of strengthening the global response to the threat of climate change by "holding the increase in the global average temperature to well below 2°C above pre- industrial levels and pursuing efforts to limit the temperature increase to 1.5°C above pre-industrial levels."

As part of the decision to adopt the Paris Agreement, the IPCC was invited to produce, in 2018, a Special Report on global warming of 1.5°C above pre-industrial levels and related global greenhouse gas emission pathways. The IPCC accepted the invitation, adding that the Special Report would look at these issues in the context of strengthening the global response to the threat of climate change, sustainable development, and efforts to eradicate poverty.

Global Warming of 1.5ºC is the first in a series of Special Reports to be produced in the IPCC's Sixth Assessment Cycle. Next year the IPCC will release the Special Report on the Ocean and Cryosphere in a Changing Climate, and Climate Change and Land, which looks at how climate

change affects land use.

The Summary for Policymakers (SPM) presents the key findings of the Special Report, based on the assessment of the available scientific, technical and socio-economic literature relevant to global warming of 1.5°C.

Key statistics of the Special Report on Global Warming of 1.5ºC

91 authors from 44 citizenships and 40 countries of residence

14 Coordinating Lead Authors (CLAs)60 Lead authors (LAs)17 Review Editors (REs)133 Contributing authors (CAs) Over 6,000 cited referencesA total of 42,001 expert and government review comments

Notes for editors

The Special Report on Global Warming of 1.5 ºC , known as SR15, is being prepared in response to an invitation from the 21st Conference of the Parties (COP21) to the United Nations Framework Convention on Climate Change in December 2015, when they reached the Paris Agreement, and will inform the Talanoa Dialogue at the 24th Conference of the Parties (COP24). The Talanoa Dialogue will take stock of the collective efforts of Parties in relation to progress towards the long- term goal of the Paris Agreement, and to inform the preparation of nationally determined contributions. Details of the report, including the approved outline, can be found on the report page. The report was prepared under the joint scientific leadership of all three IPCC Working Groups, with support from the Working Group I Technical Support Unit.

What is the IPCC?

The Intergovernmental Panel on Climate Change (IPCC) is the UN body for assessing the science related to climate change. It was established by the United Nations Environment Programme (UN Environment) and the World Meteorological Organization (WMO) in 1988 to provide policymakers with regular scientific assessments concerning climate change, its implications and potential future risks, as well as to put forward adaptation and mitigation strategies. It has 195 member states.

IPCC assessments provide governments, at all levels, with scientific information that they can use to develop climate policies. IPCC assessments are a key input into the international negotiations to tackle climate change. IPCC reports are drafted and reviewed in several stages, thus guaranteeing objectivity and transparency.

The IPCC assesses the thousands of scientific papers published each year to tell policymakers what we know and don't know about the risks related to climate change. The IPCC identifies where there is agreement in the scientific community, where there are differences of opinion, and where further research is needed. It does not conduct its own research.

To produce its reports, the IPCC mobilizes hundreds of scientists. These scientists and officials are drawn from diverse backgrounds. Only a dozen permanent staff work in the IPCC's Secretariat.

The IPCC has three working groups: Working Group I, dealing with the physical science basis of climate change; Working Group II, dealing with impacts, adaptation and vulnerability; and Working Group III, dealing with the mitigation of climate change. It also has a Task Force on National Greenhouse Gas Inventories that develops methodologies for measuring emissions and removals.

IPCC Assessment Reports consist of contributions from each of the three working groups and a Synthesis Report. Special Reports undertake an assessment of cross-disciplinary issues that span more than one working group and are shorter and more focused than the main assessments.

Sixth Assessment Cycle

At its 41st Session in February 2015, the IPCC decided to produce a Sixth Assessment Report (AR6). At its 42nd Session in October 2015 it elected a new Bureau that would oversee the work on this report and Special Reports to be produced in the assessment cycle. At its 43rd Session in April 2016, it decided to produce three Special Reports, a Methodology Report and AR6.

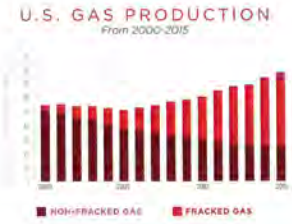
The Methodology Report to refine the 2006 IPCC Guidelines for National Greenhouse Gas Inventories will be delivered in 2019. Besides Global Warming of 1.5ºC, the IPCC will finalize two further special reports in 2019: the Special Report on the Ocean and Cryosphere in a Changing Climate and Climate Change and Land: an IPCC special report on climate change, desertification, land degradation, sustainable land management, food security, and greenhouse gas fluxes in terrestrial ecosystems. The AR6 Synthesis Report will be finalized in the first half of 2022, following the three working group contributions to AR6 in 2021.

SECTION 3: METHANE'S DEADLY RISE

A 2016 Harvard study found that methane emissions in the United States increased by over 30 percent between 2002 and 2014.[4] This domestic increase accounted for a substantial share—by some estimates, a majority or more—of the total growth in methane emissions that occurred worldwide over that time period.

An academic study adopted by the United Nations predicts that without an immediate reduction in methane and other carbon emissions, we are in grave jeopardy of reaching a 1.5 degree (Celsius) warming by the year 2030 and continuing to a 2 degree increase soon after.[5] These are considered the thresholds above which the worst effects of climate change are likely to occur.

With this warming trend, we will not meet the goals set under the Paris Climate Agreement, the landmark climate plan signed by every country but the United States. The Paris Agreement has been upheld by thousands of U.S. cities, states and businesses despite the Trump Administration's stated intention to abandon the agreement in 2020.[6]



Washington's climate future with current emission trends:[7]

- *38 to 46 percent less snow than 1916-2006 by the 2040s*
- *Up to 400 percent increase in wildfire size with 1 more degree (Celsius) of warming[8]*
- *Up to 109 percent increase in ocean acidity compared to before 2005*

SECTION 4: THE GAS INDUSTRY'S ROLE IN METHANE EMISSIONS

Fracking has increased dramatically in recent years. The Energy Information Administration reports that about two-thirds of all natural gas production in the United States now comes from fracked wells, compared to less than 10 percent in 2000.[9] During that time, the average daily gas production from fracking has increased by about 1,200 percent. And according to the Environmental Protection Agency's (EPA's) 2017 U.S. Greenhouse Gas Emissions Inventory, the oil and gas industry is the second-largest source of methane emissions in the United States, contributing over 30 percent of all domestic methane pollution.[10]

SECTION 5: HOW MUCH METHANE IS LEAKING?

"Natural gas is not a bridge—it's a gang plank"

—Michael Brune, Sierra Club executive director

Just how bad is gas for the climate? That depends on how much methane is leaked before it is burned. Researchers have concluded that at leakage rates exceeding 3.2 percent of total production, the lifecycle climate impacts of burning gas are the same as those of burning coal.[11] So are leakage rates actually this high?

Studies indicate that the upstream methane leakage rates in the gas industry vary significantly from one production site to the next, as well as from one geological basin to the next, making it difficult to settle on a single average number. To the extent that researchers *have* calculated average emission rates from gas production, the most common global estimate is about 3 percent.[12] Although not all geologic formations in the United States necessarily reflect this estimated global average, studies of gas-producing basins in the West,[13] such as the Denver-Julesberg Basin, the San Juan Basin, the Uintah Basin, and the Los Angeles Basin,[14] indicate some of the highest leak rates in the country, often exceeding the global 3 percent average.

Furthermore, these figures only account for leakage that occurs between initial production and delivery to local distribution systems. Therefore, they don't capture leaks that occur while the gas is being moved *within* those distribution systems or at end-use facilities, implying that a 3 percent estimate may be conservative in many cases.

A 2016 study by the Environmental Defense Fund of 65 large oil and gas companies found that only:

- Only 14 percent of companies reported their methane leakage rate
- Zero companies had methane emission reduction targets
- One company thoroughly addressed how it planned to prevent leaks

Although Exxon recently announced plans to reduce methane voluntarily, the vast majority of gas companies have not taken active steps to address emissions from existing equipment and show no indication that they intend to do so soon.

EPA's Greenhouse Gas Reporting Program requires companies to report their methane pollution. However, companies are able to exploit numerous loopholes that cause under-reporting of these emissions. These loopholes include:

- Completely excluding facilities under a certain size from the Program's requirements
- Exempting certain kinds of equipment, activities, and practices in the oil and gas industry from the Program's requirements, even though we know they emit methane
- Frequently relying on estimates rather than direct measurement

Making matters worse, one of Scott Pruitt's first orders of business when President Trump selected him to lead EPA was to cancel the agency's request for more information on opportunities for reducing methane emissions and to reconsider important safeguards against methane emissions from new oil and gas equipment, which the Obama Administration put in place last year.

SECTION 6: THE GAS INDUSTRY'S BURDEN OF PROOF

To the extent that there is uncertainty about the level of upstream emissions, the evidence points in one direction only: emissions are higher than industry currently estimates. The only way to quickly ensure accountability for the true magnitude of fracked gas's impact on the climate is to shift the burden of proof onto the gas industry. Fair yet minimal standards need to be established immediately. If the gas industry disagrees, then they can prove otherwise. Unless and until we shift the burden of proof, we will not know just how bad the problem truly is.

WHERE FRACKED GAS COMES FROM

SECTION 7: FRACKED GAS POLICY RECOMMENDATION

Due to the extreme climate harm caused by methane emissions and the current lack of general accountability, proactive measures are needed.

As noted above, while the estimated global average emission rate for gas production is 3 percent, studies show that leakage rates at production sites in the West—where Washington sources most of its gas—may exceed this figure. To begin addressing this under-recognized climate threat, **we recommend four essential steps to address the gas problem.**

(1) As a baseline matter, projects in Washington State should assume a 3 percent overall leakage rate of methane. This modest standard reflects the global average leak rate, and is conservative in light of high average leak rates in the West and the additional losses that occur within distribution systems or at end-use facilities.

(2) This 3 percent standard should be applied **unless each company with a gas project can provide clear evidence that the leakage rate associated with that particular project is, in fact, below this 3 percent standard** (for instance, if it sources gas from a geologic basin with valid evidence of lower rates). The burden of proof for adopting a project-specific

Washington Current Proposed Projects

- *Kalama methanol refinery*
- *Tacoma liquefied natural gas facility*
- *Puget Sound Energy and Avista proposed gas plants*

RECEIVED

Puget Sound Clean Air Agency

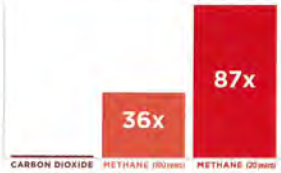
SECTION 1: THE TRUE CLIMATE DAMAGE OF FRACKED GAS

There's nothing "natural" about natural gas. The introduction of fracking has transformed the industry and made fracked gas into one of the largest threats to our climate. Although fracked gas produces less carbon emissions than coal when burned, the production, processing, storage, transmission, and distribution of fracked gas leaks into the atmosphere immense amounts of methane, which is a much more destructive pollutant for our climate than carbon dioxide. **When accounting for methane leaks, fracked gas has climate impacts that rival those of coal.**

Two-thirds of all gas produced in the U.S. is fracked. In this report, we refer to all gas as "fracked" gas because any increase in gas infrastructure will also lead to a sustained increase in the harmful practice of fracking.

CLIMATE IMPACTS OF GAS VS. COAL

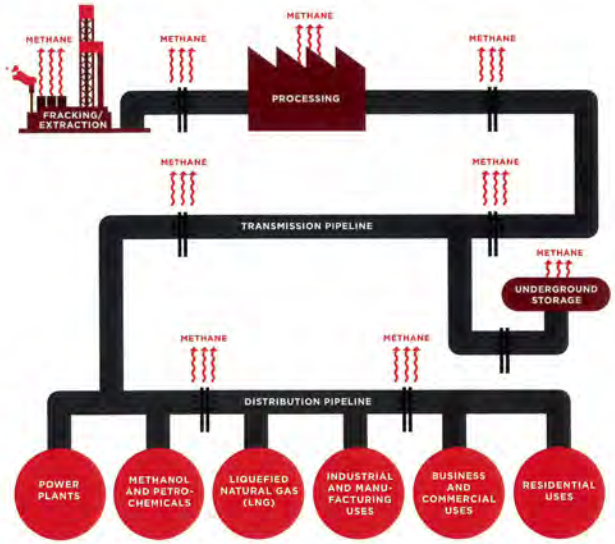
To meet our long-term climate reduction goals, we must first stop making the problem worse by halting all new or expanded uses of fracked gas, including new power plants, the Kalama methanol refinery, and the Tacoma liquefied natural gas facility. Then we must systematically retire all existing gas plants.



To address other climate emissions, we also must electrify as many vehicles as possible and replace gas appliances such as hot water heaters and furnaces with devices that are powered by a clean electricity grid. To that end, a truly clean electricity grid becomes an essential anchor for addressing global warming.

SECTION 2: WHY FRACKED GAS IS SO DAMAGING

When burned at the power plant, fracked gas emits about half as much carbon dioxide as a typical coal plant to generate the same amount of energy.[1] However, unburned fracked gas consists primarily of methane. While carbon dioxide remains in the atmosphere for longer than methane, methane has a much stronger climate warming effect. **When methane is leaked directly into the atmosphere, it is 36 times more powerful at trapping heat than carbon dioxide when its impact is averaged over a 100-year period. Over a 20-year period, methane's heat-trapping impact is 87 times more powerful than that of carbon dioxide.[2,3]**



METHANE VS CARBON DIOXIDE

Global Warming Potential (GWP)

LIFECYCLE FLOW OF FRACKED GAS

Methane Leaks from Beginning to End

Coal, oil, and natural gas are the primary sources of human-caused climate change. Coal use has seen a dramatic decline in recent years and rapid advances in electric vehicle technology offer the promise of reduced oil use. However, natural gas—which, in the United States, comes primarily from the environmentally-destructive practice of hydraulic fracturing, or "fracking"—is on the rise. **Fracked gas is the next big climate fight in Washington State.**

standard should be on the project proponent, because the gas industry is the keeper of all crucial information about leakage rates. As such, if the proponent is confident that the 3 percent standard is inaccurate, it is in the strongest position to disprove this standard.

(3) State and local agencies use the more urgent 20-year Global Warming Potential, at which the climate-disrupting impact of methane is 87 times greater than that of carbon dioxide. Not only does the 20-year potential more accurately correspond to the average 12-year atmospheric lifetime of methane molecules than the 100-year potential, the urgency of climate impacts is with us now which merits using nearer-term impacts as the standard.

(4) All state and local agencies, including but not limited to those listed below, should include this 3 percent methane leakage rate and the 20-year Global Warming Potential when assessing the climate impacts of all fracked gas power plants, methanol refineries, LNG facilities, and all other projects and infrastructure in Washington State.

- The State Legislature
- The Utilities and Transportation Commission
- The Department of Ecology
- The Department of Natural Resources
- State and local government siting and permitting agencies
- State and local air agencies

SECTION 8: FRACKED GAS: A BRIDGE TO NOWHERE

As coal plants are shuttered across the United States, our decisions for energy replacement options will affect our climate, our health, and our security for years to come.

The fossil fuel industry has long touted gas as a "bridge" to a carbon-free energy mix, asserting reductions in climate pollution while clean energy technology develops. The truth is that our clean energy future is here now, creating jobs and cutting pollution through solar, wind, and energy efficiency projects. The gas plants we build now will likely be with us for decades to come. We must more rapidly reduce our reliance on fossil fuels and replace them with truly clean alternatives, such as wind, solar, and energy efficiency, not build a new fossil fuel backbone for our energy grid at a time when clean energy is cheap and plentiful.

SECTION 9: BIG PROBLEMS BEYOND CLIMATE

Climate impacts from fracked gas are one aspect of a larger problem; concerns about this dirty fuel run much deeper and deserve intense scrutiny. Many of these additional impacts are of primary concerns for communities living on the frontlines where these impacts occur. They include (but are not limited to):

- Contaminated groundwater from fracking
- Earthquakes from fracking
- Explosions due to leaking pipelines and storage facilities
- Nitrogen oxides and other air pollutants from smokestacks at end-use facilities
- Upstream emissions of traditional air pollutants, such as smog- and soot-forming volatile organic compounds and air toxins such as benzene, a known carcinogen

ATTN: Public Comment on DSEIS, PSE LNG Project
Dear Puget Sound Clean Air Agency,
I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to deny the permit because the Draft Supplemental Environmental Impact Statement does not accurately represent the true greenhouse gas emission profile of the project. I have the following specific concerns:

The Puyallup tribe doesn't want it. We have done enough bad things to the Indians.
Liquified natural gas is also dangerous, as it can leak and also explode. Actually we should not help in any way. TO→

(Check here to continue comments on the other side.)

In addition, a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required and adequate consultation with the Puyallup Tribe and other neighbors of the project should be conducted.

Puget Sound Clean Air Agency (PSCAA)

ATTN: Public Comment on DSEIS, PSE LNG PROJECT

Hello,

My name is Carmela Micheli. I am a lifelong resident of Tacoma & Pierce County. I have owned & operated a Montessori School & Child Care in the North End of Tacoma for 41 years. My personal stake in this issue is for my students, their families, my family & all my ties to the community.

The LNG facility is dangerous & poses unacceptable risks for our environment, our health & the health of Commencement Bay & Tacoma.

The SEIS uses the GWP (global warming potential) of methane emissions for 100 years in its analysis. The world as we know it will not exist 100 years from now, we are in crisis now. The honest impacts of the whole project should be a 20year model. Because methane has a shorter life time in the atmosphere, its potency is at its highest in this time frame. The number the SEIS is using is misleading.

Global warming & climate change are real & backed by science. We must cut greenhouse gas emissions globally & locally. This project does just the opposite. We must change our mindset to clean energy projects. We must show ourselves to be an intelligent society, not one based on short term greed.

As a community & caretakers of our planet we cannot be bullied by big oil & gas companies with the constant threat of loss of jobs. We MUST invest in clean energy jobs & companies that can provide them, and we want our port to be a place for these jobs. What we should be worried about is loss of lives

which is happening now & will only get worse by turning a blind eye to the truth of how we are ruining our environment.

PSE is not telling the truth. They are giving us inaccurate & unreliable assessment of the impacts of methane & nitrous oxide as well as using a ridiculous time frame of 100 years to measure the result.

Please stop this project before we all pay too high a price.

Thank you,

Carmela Micheli

1109-1 16. LCA Inputs and Assumptions - Hydraulic Fracturing
1109-2 13. LCA Inputs and Assumptions - Natural Gas Source

Carole: And Bill Adams.

Bill: Thank you for allowing me to testify today. My name is Bill Adams. I'm a member of the Salt Water Unitarian Church Climate Action team in Des Moines.

[00:26:04] If you allow this facility to go forward, you should give it a special name. You should call it the great enabler. Why that name, the great enabler? It will enable two things, both of them bad. 1) It will enable more fossil fuel extraction to support a production of 250,000 gallons, that's 33,400 cubic feet, of LNG daily. More extraction delays the transition to a clean, renewable energy economy. I'm sure you know that 97% of our world's climate scientists are in full agreement that we need to get off of fossil fuels and move to clean, renewable energy.

[00:27:12] That transition won't happen overnight, but it has to happen, if we're going to pass on a livable, sustainable planet to future generations. 2) The so-called natural gas coming from British Columbia to support this facility will be approximately 60% fracked gas. Fracking, as you know, has some very nasty side effects. Ground water contamination, excess water consumption, but worst of all, methane leakage. Methane traps has 80 times the trapping ability over a 20 year period over other fossil fuels.

[00:28:04] According to the Scientific Journal Atmospheric Chemistry and Physics, methane leakage from British Columbia gas extraction is 2.5 times more than what the province had estimated. I don't know what BC's leakage rate is, but in Montana and North Dakota, it's been documented as 10%. So, if you let this facility go forward, you're anchoring Tacoma's legacy in more fossil fuels. More fossil fuels are not going to get us to the livable planet that we can pass on to future generations. Please do the responsible thing and reject this facility. Thank you.

Carole: Thank you.

Subject: Tacoma LNG SEIS
Date: Wednesday, November 21, 2018 6:09:44 PM

Puget Sound Clean Air,

Thank you for providing the opportunity to review and comment on the PSE Tacoma LNG project.
I am a South King County resident concerned about climate change and what we need to do to combat global warming.
I lived in Tacoma for 13 years in the 50s and 60s and I still remember the "aroma of Tacoma". Part of what makes Tacoma so special now is its story of moving from a legacy of pollution to a community that can take pride in its cleaner industry and improved environment. This is why Tacoma should not go back to the past with another dirty fossil fuel project. Doing so will only delay the transition to a clean, renewable energy economy. If we're going to have a livable, sustainable planet to pass on to future generations we need to make that transition happen now. The longer we wait, the situation will only get worse. Tacoma can set an example for the rest of the nation to follow if they say "NO" to a facility that would only slow down the transition to fossil-free clean energy. If we and our future generations are to survive, we need to speed this transition up, not slow it down. Please say "NO" to this project. Thank you,

Bill Adams
badams6456@aol.com

Des Moines, Washington 98198

Carole: Thank you. Jori Adkins?

[01:12:00]

Jori: I'm going to just say my conclusion first.

Carole: And you are Jori Adkins, right?

Jori: Yes, I am. I'm Jori Adkins. I'm supposed to say that first. The PSCAA must require PSE to revise and update their supplemental EIS using real and relevant facts and data. And then, they need to reissue a full and complete document for public comment. And I'm saying that because of a lot of the things you've been hearing tonight, and what the fellow just before me said, so I don't need to repeat a lot of that stuff. But I do want to, after other things I've heard, I want to say a little story. And that has the fact that my husband and I live in the same zip code as the entire tide flats. It's 98421.

And we are really concerned about this plant doing in the dome district, which is an area that we have been trying, for the last 18 years, to develop as a transit oriented district, a TOD.

[01:13:09] And that's because of all of the transportation we have, they're expected to be one of the most densely populated residential areas in the city. So, people can use less cars to reduce that 43% that they're saying that we have, in the way of air pollutants because so much of it comes from cars. And so, I just wanted to say that the one thing that happened that really brings to the fore for us for air is the fact that there was a fire in September, I think it was, where it was burning the metal recycle plant out on the tide flats. And that flowed right toward the dome district and the downtown.

These are areas that we are trying to densify, so people are not having to use their cars so much. Rather than most of these people that you're hearing tonight, I believe I can say do not live in the downtown of Tacoma.

[01:14:04] This plant should not be put this close to an area that has this density and is planning on having a greater density of people. Thank you.

I am very concerned about the bad air of Tacoma as it is (high particulate) w/o adding more especially greenhouse gases. I live in the same zip code as the Tide flats we expect to be the densist neighborhood of the city of Tacoma we are the hive TOD Transit Oriented District, the Dome District. We have been working hard to create a neighborhood where cars (one of the most polluting factors here) are not needed. Yet here we are with a huge polluting plant coming in within blocks of us! Please do not approve this permit to add air polluting plant, when we work so hard to clean

Puget Sound Clean Air Agency
ATTN: Public Comment on DSEIS, PSE LNG Project
1904 Third Avenue, Suite 105
Seattle, WA 98101

To Whom It May Concern;

The Economic Development Board for Tacoma-Pierce County is in the business of helping companies create and retain family wage jobs for our residents. As a fifth-generation resident of the City of Tacoma, I grew up in the shadow of the ASARCO copper smelter. Tacoma's polluted past is the one in which I spent the entirety of my childhood. Thanks to a lot of hard work, Tacoma is far cleaner than the city of my parents and grandparents. The LNG facility will allow us to take it another step forward.

As much as I enjoy my work, what matters most to me is raising my son, a sixth-generation Tacoman. He is the reason I am writing to express my support for Puget Sound Energy's liquefied natural gas facility. Replacing transportation diesel fuel with clean burning LNG has strong environmental benefit. Every person in the region, people who live or work near industrial areas, and yes, my own child, will live in a healthier environment when LNG replaces diesel.

In addition to the environmental benefits of LNG, our community relies on a reliable supply of natural gas 365 days a year. Like many others, I use it to heat my home, wash my clothes, and cook food for my family. Pierce County is among the fastest growing counties in the country, and new residents add to the demand for natural gas.

The solutions to meet the future demand are pipeline expansion or storage. Natural gas storage at Tacoma LNG helps ensure that natural gas remains available all year long, for residents and businesses, even in the times when demand and usage peak, such as cold winter days.

I urge you to act promptly to complete your environmental review and issue the air permit so that this project can move forward. It's better for the environment, it's good for jobs, and it allows us to give our children a better Tacoma than the city that was passed along to us.

Sincerely,

Jennifer Adrien

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

The draft SEIS does not account for the full climate impacts of fracked gas. The analysis is incredibly flawed and unacceptable, and we need the Air Agency to do better before they decide on the air permit for the facility.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

The Puget Sound Clean Air Agency has promised these commitments on their website: -Be good and wise stewards of the resources you give us
-Defend the future
-Prevent and reduce risk to you by upholding and enforcing the law
-Protect you from air pollution
-Tell you what's in the air you are breathing
There is no way for the Agency to uphold these commitments unless they deny the air permit for this facility.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

RE: Puget Sound Energy trying to build a Liquefied Natural Gas (LNG) refinery, storage and distribution facility in the Tideflats area of Tacoma, which is sited on Puyallup Tribal lands and is being built without their consent. It is unconscionable that indigenous people are still being ignored, dominated, and harmed by the state and by business interests.
I find it disgusting that corporations are engaging in this type of white supremacist disregard for native Americans rights even in 2018. They will bear the brunt of negative impacts, but those impacts will not be isolated to them. Everyone in the region will suffer the consequences of detrimental business endeavors.

ATTN: Public Comment on DSEIS, PSE LNG Project
Dear Puget Sound Clean Air Agency,
I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to ~~deny the permit~~ because the Draft Supplemental Environmental Impact Statement does not accurately represent the true greenhouse gas emission profile of the project. I have the following specific concerns:

- We need to use the best evidence, most recent IPCC Global Warming Potential (GWP) values for methane: 96 is the accurate 20-year GWP number!

(Check here to continue comments on the other side).

In addition, a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required and adequate consultation with the Puyallup Tribe and other neighbors of the project should be conducted.

Subject: Tacoma LNG Facility Application Comments
Date: Tuesday, October 30, 2018 2:29:02 PM

I have the following comments regarding the application for a new liquefied natural gas (LNG) facility in the Tacoma Tide Flats.

1. LNG spills can unleash explosive vapor clouds. What will be the impact to the surrounding communities from this?

2. What will be the impact of a major earthquake to the LNG facility? Will there be explosive vapor clouds created? What will be the impact to surrounding communities?

3. What is the impact of a "processing vessel" (as happened at the Williams facility near the small town of Plymouth, Washington) exploding, spraying chunks of heavy shrapnel (i.e. 250 pounds as far as 300 yards) piercing the double walls of LNG tanks on site, causing leaks? What is the risk and impact to communities that vapors from the leaks could trigger a more devastating, second explosion and create a large "lethal zone" around the plant?

4. Various studies have confirmed a large amount of hazardous wastes underneath Commencement Bay (from Hooker Chemical now Occidental Chemical), including under the LNG facility. What is the risk to surrounding communities from from building an LNG facility under these hazardous wastes?

5. What are the risks and impact from an explosion from the natural gas pipelines, trucks, rail cars, and other means of providing the natural gas? What would the impact to communities be from the vapors, fires, smoke, and other things released from an accident of this nature?

6. What are the risks and impact from an explosion from the ships with the liquefied natural gas? What would the impact to communities be from the vapors, fires, smoke, and other things released from an accident of this nature?

Thank you.

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

Thank you for letting the public speak. Democracy needs such opportunities.

I STRONGLY OPPOSE PSE's Liquefied Natural Gas project in Tacoma.

It is a HORRIBLE idea in many ways!

Your agency -- PSCAA -- should be PROTECTING AIR QUALITY, but the LNG project would hurt air quality.

The world's top climate scientists express ALARM at the rapidly worsening climate crisis, and they URGE VERY STRONG IMMEDIATE ACTIONS to reduce the use of fossil fuels. That includes LNG.

THE WHOLE WORLD IS IN SERIOUS DANGER, so I implore you to REJECT PSE's LNG project!!!!!!

Local water, public health, and other factors are seriously at risk.

The Puyallup Tribe -- a sovereign nation -- strongly opposes this project.

In any case, this draft SEIS is not complete. Other people who are familiar with the scientific and procedural matters are telling you about those fatal flaws.

MY MOST SERIOUS CONCERN IS AT THE LARGER LEVEL about the damage to the local environment and public health and the whole world's climate.

PSE's LNG project is suicidal for planet earth.

I IMPLORE you to PROTECT AIR QUALITY.

I IMPLORE you to PROTECT EARTH'S CLIMATE.

Thank you.

Subject: PSE Tacoma LNG Facility
Date: Tuesday, October 30, 2018 12:51:48 PM

Dear Puget Sound Clean Air Agency,

I am requesting that you move forward and grant the Air Quality Permit for the PSE Tacoma LNG facility.
I believe that converting ships, trucks, and other diesel-powered equipment to LNG will significantly reduce emissions and improve air quality in the Tacoma Tideflats and surrounding areas.
My business is located less than half a mile from the new PSE LNG facility, and I have absolutely no qualms about the safety of this facility, and wholeheartedly support its completion.

Sincerely,

Karl Anderson
Concrete Technology Corporation

1197-1 22. General Opposition

Carole: Thank you. Our next group of five is Neal Anderson, Dominic Petoud, Andrea Scott-Murray, Jenn Adrien, and Terry Sullivan. And Neal Anderson is first.

Neal: Other people here have argued that the methane leaks a lot more than the SEIS claims. And they're right. The best science and all of the field measurements back that up. But let's pretend that the claim is true. That Canada has some magic fracking process that doesn't leak methane and that they have perfect seals o all of their pipelines.

[00:54:02] If methane weren't a factor, then, it's true that natural gas would be a lot less harmful to the climate than the bunker fuel it's replacing. If you could eliminate all methane emissions from the entire process, it would only have about half as much global warming impact as other fossil fuels. But even if that were possible, at this point, it's too late for half measures. The UN report that just came out said that, if we start working towards a goal of zero emissions right now, in every sector, it still won't be enough to keep us below two degrees. Even then, we have to hope we can find a way to remove a lot of the CO_2 that's already in the air.

All of our energy investment, right now, needs to be in carbon free sources. This $310 million could buy hundreds of megawatts of clean energy rather than a dirty LNG plant, which is a lateral move at best. You have an obligation to protect the air and to acknowledge that it's already dangerously over polluted with greenhouse gases and that it's now an impending health crisis. Don't issue a permit to an energy company that's trying to lock us deeper into fossil fuels.

[00:55:00] And if I can add one other thing. The gentleman before had said that we need this LNG plant for reliability, as evidenced by the recent pipeline explosion in BC. I would instead take that as a reason not to keep building up more fracked gas infrastructure. Thank you.

lear Port of Kalama, and Cowlitz County,
lear Puget Sound Clean Air Agency,

2071-1 22. General Opposition

I am concerned about the proposal to construct additional fossil fuel infrastructure at a time when the climate crisis requires that we move to clean energy as soon as possible. Let the ships burn low-sulfur diesel for now and take that money for investment is truly sustainable solutions.

Please include this impact in the Final Supplemental Environmental Impact Statement.

Subject: pollution
Date: Tuesday, November 6, 2018 10:31:00 AM

I am a member of the LWV-SC Natural Resources/Sustainable Agriculture Committee.
The proposed Tacoma LNG project violates Puyallup treaty rights and would lock us into decades of continued fossil fuel dependence. This LNG facility will cause health issues at British Columbia extraction sites, as well as from toxic facility emissions here in our local Salish Sea region. It poses a physical threat to thousands in the event of an accident or natural disaster, with a huge chunk of the bill being paid for by residential PSE customers even though the main stated purpose of the project is fueling commercial vessels. As a tax payer, senior citizen, voter, and member of the League I find the proposal for this project offensive to the citizens of WA and BC. Please end the progress of this project.

Subject: Puget Sound Energy LNG Project
Date: Tuesday, November 20, 2018 11:32:16 PM

Puget Sound Clean Air Agency,

Greetings! I am writing to urge this council NOT to approve the building of the LNG Project in Tacoma. Our planet is in a perilous state due to climate change. Investments now need to be made in the renewable energy sector and not continue down this dinosaur aged exploitation of fossil fuels to address our energy needs. We need civic leadership in this realm to prevent our environment continued degradation.

In addition there are several grounds that this project should not be approved. The SEIS appears to be incomplete. There are areas that should contain values that are blank. For this reason alone the SEIS should be completed and then resubmitted - extending the deadline for public comments to respond to the completed report.

The SEIS is using methane global warming potential banks that is outdated. Also values are being presented that do not coincide with the amount of years this plant would be in operation.

The report inaccurately reports the likely leakage that will be evidenced by this pipeline - not including data from the past 2 years in determining the amount concluding the leakage will be much less than what many experts predict.

The pipeline will need to be built through the Puyallup trial lands. The tribe does not approve having this pipeline on their territory.

For these reasons and many more, I urge that the Puget Sound LNG project not be approved.

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Please no fracking. The time is now to resist all fossil fuels.

Carole: Thank you. Oneida Arnold?

Oneida: Good afternoon. My name is Oneida Arnold. I'm a citizen of Tacoma. And I'm deeply concerned on so many levels about the flawed inaccurate SEIS that the Puget Sound Clean Air Agency has presented. And I request that you reissue another SEIS that has current and accurate data of the full impacts of fracked gas.

[01:43:00] First and foremost, we stand on Puyallup land. The proposed LNG project is a direct afront to the Puyallup Tribe. The city of Tacoma failed to fulfil its legal responsibility to meaningfully consult the Puyallup Tribe throughout the process putting their treaty rights, resources, and community at risk. I stand with the Puyallup Tribe in opposition to the LNG facility. I retired last year from teaching at McCarver Elementary school. McCarver is located in Hilltop, an under resourced community. My students and their families already suffer disproportionately from poor air quality drifting up from the fossil fuel industries on the tide flats.

The volatile organic compounds that the LNG facility would release have severe health consequences that have not been included in the SEIS.

[01:44:00] The United Nations Intergovernmental Panel on Climate Change, IPCC, which has been mentioned, has just released a comprehensive report warning that we must change our fuel mix away from fossil fuels in the next 12 years or face dire consequences. The PSCAA use already outdated methodology in calculating the greenhouse gas emissions and 100 year values rather than 20 year values. Please change your scenario to reflect an accurate representation of the impact on air quality and global warming. Again, the draft SEIS from PSCAA is very flawed, and I stand in opposition to this LNG project. Thank you.

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

NO fracking in WA !! Or in the United States!!! Stop all fracking! Next time there is a new utility to take over from PSE I guess I'll have to go with it. I didn't know PSE was doing that!

Sincerely,

Amy Aspell
aspella@comcast.net
98110

Dear Port of Kalama, and Cowlitz County,

Dear Puget Sound Clean Air Agency,

Fracking contaminates huge volumes of water, with known carcinogens

There are fracking-related air pollutants in the transport of fracked gas

Methane is 84x more potent a greenhouse gas than CO_2

I am concerned with increased pollution of water and air from these facilities and the transport of fracked materials relative to communities upwind and downwind from the facilities themselves

Please include this impact in the Final Supplemental Environmental Impact Statement.

Dear Port of Kalama, and Cowlitz County,
Dear Puget Sound Clean Air Agency,

I am very concerned by the risks of pipelines through indigenous communities and close to water sources. It seems that spills and explosions are inevitable.

The SEIS must include the impacts of methane leakage both at extraction sites and pipeline locations

There are social, health, and environmental impacts to consider

Please include this impact in the Final Supplemental Environmental Impact Statement.

Subject: Comment on SEIS for PSE LNG Plant
Date: Wednesday, November 21, 2018 6:45:30 PM

Dear Puget Sound Clean Energy Agency,

As a Puget Sound resident and PSE customer, I want to voice my opposition to the clean air permit for PSE's proposed Tacoma Tideflats LNG facility. Firstly, I find the analysis problematic for multiple reasons. It does not appear to adequately account for the higher initial impact of methane over the first several years after emission, assumes all supply from BC, which under circumstances like those currently could be infeasible, and assumes under the no action alternative no push for cleaner fuels. As a recent volunteer for both I-1631 and I-732, I believe this state needs to not merely reduce fossil emissions, but actively turn away from new fossil infrastructure and push for renewable fuel technologies as fast as they become viable. We must do this if we are to have any hope of meeting our Paris climate goals.

Secondly, the speed and opacity of this project concern me. Lack of consultation with local tribal leaders, major public safety concerns, and construction prior to permitting all make me worried about the safety, and integrity of the facility into the future, and do not inspire confidence in PSE's concern for public welfare around the project.

I believe if the Agency wants clean air and public health as priorities in our region, it should reject this permit, and allow local leaders to develop the tideflats in a way that better serve the climate and the public. Thank you.

Sincerely,
Sean Augustino

Puget Sound Clean Air Agency, 1904 Third Ave, Suite 105, Seattle, WA 98101
ATTN: Public Comment on DSEIS, PSE LNG Project
Dear Puget Sound Clean Air Agency,
I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to deny the permit because the Draft Supplemental Environmental Impact Statement does not accurately represent the true greenhouse gas emission profile of the project. I have the following specific concerns:

1. Using the 100-year Global Warming Potential (GWP) gives a falsely low estimate of the impact of the involved methane emissions. A better estimate comes by using the 20-year GWP figures.

2. There seems to be no way to verify the claim that BC fracked gas is as clean as it comes. NO FRACKED GAS IS CLEAN!

(Check here to continue comments on the other side).

In addition, a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required and adequate consultation with the Puyallup Tribe and other neighbors of the project should be conducted.

Subject: Tacoma LNG SEIS Project Comment
Date: Tuesday, October 23, 2018 10:55:55 AM

Dear Responsible Official,

Puget Sound Energy and Tote Marine seem to imagine that a clean energy future can be arrived at by digging the fossil fuel hole deeper. This proposed LNG project is another step toward climate chaos at a moment when the IPCC has given us a clear warning that we must urgently move away from fossil fuels.

Fracked gas is not a lesser evil. Scientists' understanding of methane's impact on the climate continues to evolve, and at every step along the way we learn that fracking allows more methane escapement than we had previously observed and that the impact of methane on the climate, particularly in the short term, is even more serious than had been previously understood.

I applaud your decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct this more rigorous analysis. Thank you.

I urge you to revise the analysis to account for the following:

1. Methane should be counted as 86 times more potent than CO2 based on the current IPCC analysis (AR5 rather than AR4) considering a 20 year timeframe (rather than the 100-year).

2. Revise the analysis of the impacts of fracking in British Columbia based on recent research(1) demonstrating that methane escapement has been dramatically under-estimated.

3. Revise the "no-action alternative" to include a clean energy alternative in which PSE provides electricity not with a different source of fracked gas, but with renewable energy and energy efficiency.

4. Revise the "no-action alternative" to include the assumption that Tote Marine will achieve a 50% GHG reduction, in line with the International Maritime Agency's established goals. This reduction might alternatively be achieved by a combination of fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion or many other alternatives besides fracked LNG.(2) For clean local emissions requirements, Tote Marine can achieve virtually all of the localized lower-particulate and lower SOx and NOx benefits claimed for LNG propulsion by opting for low-sulfur marine gas oil over heavy fuel oil, and installing selective catalytic reducers and diesel particulate filters.(3)

5. This more accurate analysis will show that the project has a significant and unmitigated impact on the global climate, which
should be seen as a sufficient basis for denial of the Notice of Construction application.

6. I am also concerned with just how much water it's going to be take to run this operation. Water is becoming a serious commodity whether we admit it or not. Where will the supply come from and how many gallons per day will be wasted on this project. The impact of water use on the local area really need to be a concern.

Thank you for your time and consideration of these comments.

To Whom It May Concern:

I worry that in today's society we tend to yell at each other and we have leaders who seek to divide us as opposed to bringing us together. From the outset, let me state that I respect those who oppose this LNG Facility and I can understand some of the concerns expressed. However, I support the LNG Facility and I support TOTE's decision to convert its ORCA fleet to LNG.

I come to this conclusion, because I see LNG as a less polluting fuel source for TOTE's Fleet that will actually reduce greenhouse gases. Many areas of the world are moving to LNG and the Port of Tacoma needs to invest in the future of cleaner burning fuels to stay competitive in the world trade market. Think of the worldwide environmental benefit if Ports around the world all convert to LNG instead of diesel fuel.

In the final analysis, we all breathe the same air. Saying no to LNG does not make environmental sense because as the SEIS says, the alternative is to use more polluting petroleum-based fuels.

For me the choice is simple. We are all facing the impacts of climate change and we all need to do our part to reduce our carbon footprint. TOTE's conversion to LNG allows us to build a cleaner maritime fleet that will benefit the Washington, Canada, and the Alaska coast.

While LNG is not perfect, it would be irresponsible stewardship if we did not approve this project. I urge the Air Agency to approve this air permit. We have a chance to do something good for the environment by approving this project and following science for a change.

Sincerely,

M. Bn

Subject: Tacoma LNG SEIS
Date: Tuesday, November 20, 2018 5:38:43 PM

Puget Sound Clean Air,

Thank you for providing the opportunity to review and comment on the PSE Tacoma LNG SEIS.

I am a Tacoma resident concerned about climate change and our contributions to global warming. Part of what makes Tacoma so special is its story of moving from a legacy of pollution to a community that can take pride in its industry and environment.

After reading the SEIS, it appears to use old information, and it's missing data. The SEIS should be using the latest IPCC numbers when determining the global warming potential of greenhouse gases. It should also use the 20-year numbers instead of the 100-year, since this plant will only be operational for 40, and we'll see big impacts from the very beginning. When the 20-year GWP from the 2013 IPCC report is used, it shows that emissions from the LNG facility are actually 30-31% worse than the No Action alternative.

The SEIS is also missing really important information, like the carbon content of the gas to be used. This data is needed for a complete study, and until it's there, this SEIS is incomplete.

How will PSCAA ensure that the methane gas comes from BC? The SEIS should also analyze the very likely scenario in which PSE will have to get its methane gas from the Unites States network.

Finally, the SEIS doesn't include smaller sources of emissions, like those from tearing the plant down. These smaller sources of emissions could add up to a big impact, and should be included in the analysis.

Because of these conclusions, I am opposed to the PSE Tacoma LNG project. Please update the SEIS, reissue it when it is complete and credible, and then re-open the comment period.

Subject: Earthquake Vulnerability of the LNG Facility
Date: Thursday, November 1, 2018 3:11:40 PM
Attachments: image.png

I am registered civil engineer in Washington residing in Dash Point. My area of expertise is earthquake engineering associated with buried utilities. I have worked for every major water utility along the west coast including Metro Vancouver BC, Seattle, Tacoma, Portland, San Francisco, Los Angeles, and San Diego.

My concern about the LNG facility is the vulnerability to the rupture of the Tacoma Fault. The Tacoma Fault, as mapped by the US Geological Survey, originates in the area just east of the tip of the Hood Canal, and runs easterly, splitting into three strands. The middle strand runs through the tide flats in Tacoma (see the figure below).

The fault has a relatively long recurrence interval, on the order of 6,000 years, which puts it beyond the envelope of normal planning as addressed in ASCE 7 and the International Building Code (IBC). However, it is standard practice in the United States to design high risk facilities to more stringent requirements. For example, dams are designed for a 10,000 year return earthquake when being subjected to a 10,000 year storm. Nuclear power plants are designed to one in one million probability hazards. These low probability high risk hazards events can not only result in extreme damage to the facility itself (such as a building collapse) but to the surrounding population. As such, I strongly believe that the LNG facility and all connecting piping should be designed to safely stop operation and retain all natural gas, in both liquid and gas form, for an earthquake event with a 10,000-year return period, including a event on the middle strand of the Tacoma Fault.

There are three very significant hazards that can result from an earthquake on the Tacoma Fault: ground shaking, fault displacement, and liquefaction and associated lateral spread. Ground shaking is likely to be very strong - the LNG plant and connecting pipelines, both supply and ship loading, should be designed to accommodate this shaking intensity. Of greater concern is fault displacement and liquefaction/lateral spreading. The above map shows the Tacoma Fault middle strand to be to the southwest of the LNG facility. However, there is little detailed information known about the exact location where faulting would occur. The fault movement would initiate 6 to 10 miles deep and could propagate to the surface at an angle resulting in surface faulting through the LNG facility and the connecting pipelines. The offset could be as much as tens of feet, (Seattle Fault offset of 22 feet in 900 AD event). Such an offset could result in heavy damage to the LNG facility/tank, and would be likely to shear off the connecting pipelines. There is no proven design of buried pipelines of any type to cross a fault rupture displacement of that magnitude. The entire tide flat area is highly vulnerable to liquefaction. When soil liquefies, it will "flow" towards a free face such as the bank of the Hylebos Waterway or the NW face of the tide flats facing Commencement Bay. Displacements can be may 10s of feet. Historically, steel pipelines buried in soils undergoing such displacements are heavily damaged, with the pipe barrels cracking, and welds failing, rapidly releasing the pipeline's contents. Severe liquefaction and lateral spreading is not only expected in a Tacoma Fault event on the middle strand, but with movement on any of the fault strands. In addition, severe liquefaction and lateral spreading is expected in the tide flats in earthquake events that occur on a much more regular basis such as the Cascadia Subduction Earthquake.

I strongly believe that if the regional decision makers want to approve construction and operation of the proposed LNG facility, they must

1310-4 cont'd 3. Outside of SEIS Scope

require the owner to design the LNG facility/tank and all connecting piping to withstand the earthquake hazards discussed herein. Anything short of that could result in loss of life and extensive damage.

Don Ballantyne

Steve: Thank you. Next up, Stephanie Barbee.

Stephanie: Hi. My name is Stephanie Barbee.

[06:23:00] I'm not sure what I'm going to say actually. Thank you for being here. It's been a long night. So, I'm from Vashon Island. And I want to say that Asarco mess is not cleaned up. I know it because – let me back up for a second and say I stand with the Puyallup People. And it's awkward because I live on land that's their land. And it's polluted. When we bought it, we had it tested. And it has elevated levels of lead and arsenic. It's beautiful woods. We have owls and frogs and deer. And it's not in such great shape. So, if you come to Vashon, it's quite beautiful.

Some of our traditions are, probably if you visit someone there, you'll take your shoes off at the house, and you'll leave them by the front door, so you don't track in the lead and arsenic.

[06:24:00] If you have small children playing there, or if you're a gardener, you will wash your hands immediately, after being in the soil. And if your child drops their Fig Newton on the playground or on your land, you might not do the three second rule. You might just say we'll just put it in the compost. I mention it because that problem started from air pollution that drifted across the Sound to our island to West Seattle, other parts of Tacoma. And the pollution is still there. And I'm concerned about hits LNG because it's not so easy to just wipe off your boots.

And you can't just recycle the Fig Newton, when it drops on the ground. It goes into the air. And it changes the climate. And it's also poisonous. It's also toxic just as is. And I want to believe that the people of TOTE Marine have good intentions. I feel that there's passion, when they speak about the environment. I feel like that's legitimate. I also think they started making plans to go to LNG, no thanks to PSE who is in the fossil fuel business.

[06:25:02] They made those plans during the Obama Administration. I have to check my facts. I'm guessing about this. But I know that administration was pro natural gas back then because we thought it was the good transition fuel. Turns out, now that we know about methane leaks, it is no longer the darling transition fuel. And now that we have the IPCC report out, we need to think fast about what we're going to do. So, I don't envy you guys at all. It's a giant task you have. You have all of those permits that have been gathered from the other agencies. And there is this permit left and maybe

another one.
And we can see they're already starting to transition their ships to take LNG before they even have the permits. It's kind of arrogant. I'll be thinking about you guys, as you make your decision. It's a big one. No one is going to be happy. Someone is going to be unhappy. If you're not sure what to do, maybe you can delay the process and have a fact finding process, so we can at least agree on the facts because, clearly, we don't.

[06:26:03] Thank you.

Dear Responsible Official,

I dont agree with fracking. It is all of our earth and I think it is wrong that just because a company has money they should be allowed to destroy it for all of us (animals, plants, ecosystems and humans!)!

Sincerely,
Hayley Barcia
San Francisco, CA 94121
hayleybarcia@gmail.com

Carole: Thank you. Charles Barnhart?

Charles: Hi.

[02:44:00] I'm Charles Barnhart. I have a PhD in physics. I'm an expert in energy analysis and lifecycle assessment, as evident by my post-doctoral fellowship at Stanford University and my present professorship at Western Washington University. I'm here to comment on the inadequacies of the DSEIS on behalf of myself using my own time and not on behalf of the aforementioned university of higher learning. Many of the points have already been brought up by previous commenters. The leakage rates are woefully inadequate.

The report uses black box, opaque calculations with units that are difficult to parse. They report leakages in grams per mega BTUs. It's difficult to back cast that into production leakage rates. I did my best. I got a value of 0.9%. The best practice in academia today is this report in the *Journal of Science* that came out in June 2018.

[02:45:03] Alvarez et al, the et al constitutes 24 other authors from prestigious areas of higher learning. And they identify a rate of 2.3% to 2.7%. This would put the climate impact of this project at par with coal, not with natural gas. Secondly, the report used out of date global warming potentials, as mentioned earlier, and inappropriate resonance atmospheric timeframes for methane. The no action alternative fails to consider shipping growth rates. And, among other reasons, is a false equivalence.

In conclusion, the draft Supplemental Environmental Impact Statement, while an admirable draft submission, and I certainly recognize the amount of work that went into it, is incomplete and uses outdated science. It simply would not pass peer review in academic journals. I review at least two journal articles a month.

[02:46:00] And, in closing, I'd like to mention that the natural gas was a bridge to renewable future 10 years ago. The bridge has been built. We can cross it, if we want to. I think it's pathological to walk and pace back and forth on the bridge rather than crossing to the greener present that's on the other side.

Carole: Thank you. So, this next group will be the last group that will have the opportunity to speak, during this afternoon's session. So, we still have quite a few that had signed up this session. So, if you still want to speak, you'll need to come back at 6:30. And you'll be

1122-1 14. LCA Inputs and Assumptions - Leakage/Slippage
1122-2 3. Outside of SEIS Scope

first in line there. Or, of course, we can always take your comments in writing as well. So, the next group is Alex Ramel, Cecile Gernez, Cathy Carruthers, Lloyd Madden, and Diane Martin.

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. Scientists make clear that we must not allow further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.

This draft SEIS is that it's not complete. There are several sections that are missing data and so we can not accurately assess the quality of the report and understand how certain conclusions are reached. Because of that, I request that you complete this report, reissue it, and then reset the public comment period so that we have time to review the completed report thoroughly.

I am aware of several issues with the current draft report you issued on October 8th. If these issues are given proper attention and addressed with best available science, it will show that the marginal improvements in emissions the study claims will disappear and the project will in fact be worse for the climate than doing nothing at all.

This proposed facility will not benefit the region and in fact will jeopardize efforts to promote clean, sustainable energy solutions. Thank you for initiating this crucially important review of this facility and I hope that you will take best available science into consideration when revising this draft SEIS.

Puget Sound Clean Air Agency

RE: TACOMA LNG PLANT

TOTE is a wholly owned subsidiary of Saltchuk. Saltchuk is a second generation family owned and managed Seattle based company. Our owners all grew up in the Pacific Northwest and are all strong environmentalists.

As an organization, we are extraordinarily proud of our multi-generational environmental stewardship. These are not words, these have been enormous financial commitments that surpass both private and public spending state wide. Here are a few examples just within our marine operations:

- In the mid-1990s, our subsidiary Foss Maritime made an $80 million investment and converted all of our California oil bunker barges to double hull seven years before required by law;
- In the early 2000s, our subsidiary TOTE constructed the Orca class vessels to serve Alaska with double hulls for fuel, redundant independent propulsion systems, leading to the receipt of numerous industry environmental awards;
- Foss converted to solely using ultra-low sulfur diesel in all of our West Coast harbors several years before required by law;
- TOTE was the first in Puget Sound to convert and install shore power for “cold iron” while at the dock, significantly reducing emissions while at the Port of Tacoma;
- TOTE was the first cargo terminal in Puget Sound to invest in and build a rain garden, leading to zero discharge into the waters;
- Foss was the first company in the United States to design, build and operate hybrid tugs, capable of motoring at 6 knots using battery power;

Our most recent investment eclipses all of these efforts. A decision was made to convert all of our domestic ship operations to use environmentally cleaner liquified natural gas at a total investment of over $700 million. While less expensive options were available, including installing scrubbers which could result in increased ocean pollution, our Company proudly pursued the most environmentally responsible course of LNG with President Obama’s EPA. We chose not to simply meet federal, state and

SALTCHUK

local emission requirements, we chose to exceed them. It was a significant stretch for us, but as a family owned company based here, we sought to make a generational commitment to the cleanest available fuel source.

We are well on our way to completing this commitment:

- We contracted and had built in San Diego, and now have in operation between Jacksonville and San Juan, Puerto Rico, the first two containerships in the world that use LNG as a fuel source;
- We have committed over $200 million to convert our Alaska ships to burn LNG.
- We contracted and had built in Texas the first US-built LNG Bunker Barge, further recognizing our commitment to the growth of LNG as a clean maritime fuel. The barge will support our Marlin vessels and has the capability of supporting other carriers as well.

The PSE LNG plant is being built based upon our company's anchor tenant commitment. Completing the plant is an essential part of our efforts of making a multi-generational shift to LNG. Just as ships went from coal to oil, we are pioneers of moving from oil to natural gas.

Worldwide, shipping is moving at a remarkable pace from burning the dirtiest fuel to some of the cleanest. Ports that have LNG bunkering capability will attract vessels that are LNG capable. Through our family business commitment, the Port of Jacksonville is today on that list. Once again, through our family business' commitment, we have the opportunity to put the Port of Tacoma on that list and join the worldwide shift to LNG to reduce greenhouse gases

In conclusion, on behalf of my family and the extended family of TOTE employees and customers, we would urge the Puget Sound Air Agency to follow the science and the data and issue the air permit in a timely manner so we can achieve at a minimum the 13.5% reduction of greenhouse gases the Draft Supplemental Environmental Impact Statement confirms.

Sincerely,

Mark Tabbutt

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

At some point we need to all stand up to industry and this current administration and make decisions for our children's future. And we should use the right science to acknowledge the real impacts on our environment.

It appears that the science used to help justify this facility is in place to try to sell it to the public, when we should really all be looking at it more from the perspective of what it means to our long-term future on this planet. We in the northwest have always been outspoken about the world we live in, and approving this project is a step backwards for the future of our children the northwest and our planet.

Please do not approve it.

Thanks,

From: Louisa Beal
To: Public Comment
Subject: Puget Sound Energy LNG Project
Date: Tuesday, November 20, 2018 4:58:43 PM

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

First of all, I want to thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. With our climate in grave peril, as emphatically stated in the latest IPCC report, your review of the greenhouse gas impacts of the natural gas used in this project couldn't be more important. Those scientists make clear that we cannot, and must not, allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.

My concerns regarding the fast-tracking of the LNG plant and other development in our community include:
• Inadequate environmental review.
• Harmful effects of further industrial development to local water, air, animals and people.
• Environmental waste from prior industrial use at the Port of Tacoma still has not been removed.
• Potential for catastrophe in event of earthquake or volcanic eruption.
• Impact of catastrophe near densely populated area.
• The safety of detainees at the nearby detention center.

My concern with this draft SEIS is that it's not complete. There are several sections that are missing data and so we can not accurately assess the quality of the report and understand how certain conclusions are reached. Because of that, I request that you complete this report, reissue it, and then reset the public comment period so that we have time to review the completed report thoroughly.

With that said, I am aware of several issues with the current draft report you issued on October 8th. It is my belief that if these issues are given proper attention and addressed with best available science, it will show that the marginal improvements in emissions the study claims will disappear and the project will in fact be worse for the climate than doing nothing at all.

Here are some of the issues as I understand them:

- The SEIS is not using the best available science for the Global Warming Potential (GWP) of methane. It uses the 100-year GWP of methane and not the 20-year value which is much more relevant given the urgency in addressing the climate crisis. The appropriate 20-year GWP value to use is 96.
- This facility is projected to have a 40 year lifespan, so why does the report project out to 100 years, which is 90 years beyond the time we need to have taken decisive action?

- The SEIS claims emissions benefits from customers that Puget Sound Energy simply does not have. According to PSE and the City of Tacoma, the only maritime customer is TOTE with its two vessels which have already delayed their conversion to consume LNG. Securing new customers (there are only just over 100 LNG ships in operation out of a worldwide fleet of 90,000) as well as the additional permitting could take years and is not guaranteed.
- The SEIS says that emissions will only be reduced if the natural gas comes from Canada, because leakage rates are reportedly lower there than in the US. Shockingly, most leakage rates were self-reported by the fossil fuel industry based on models and recent measurements taken in the field have shown that leakage rates are much much worse.
- How can it be guaranteed that PSE is sourcing its gas from BC anyway? Their recent filings show they relied on gas from BC, Alberta, and the US. And with the recent pipeline explosion in BC that interrupted PSE's supply, we know it's not always available.
- When ships use any fuel, a certain percentage of it escapes without combusting through the exhaust system and into the atmosphere. This is known as slippage and the SEIS uses a lower rate than is considered best practice.

Thanks again for initiating this crucially important review of this facility and I hope that you will take best available science into consideration when revising this draft SEIS.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Just read an article in Nation newspaper that fracking wastewater has been found in freshwater mussel shells. According to researchers from Penn State and Union College, elevated concentrations of strontium have accumulated in the shells of mussels located downstream from fracking wastewater disposal sites.

When the f*ck is all the human caused destruction to the planet/environment going to cease?!!?!?!??! When there is absolutely nothing left????? I'm so disgusted with this country and our government who only seem to be regressing instead of progressing in any positive way.

1689-1 3. Outside of SEIS Scope

From: 350 Seattle
To: Public Comment
Subject: Puget Sound Energy's LNG facility
Date: Wednesday, November 14, 2018 12:28:35 PM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

I am concerned about the project for a number of reasons. A few of these are as follows:

- Non-Renewable Reliance, Environmental Degradation, & Toxic Exposure
- Eco-Injustices
- Tacoma Tide-Flats Superfund Cleanup

Non-Renewable Reliance, Environmental Degradation, & Toxic Exposure: The development and use of fracked gas demonstrates an unsustainable reliance upon fossil fuel energy. While we know that this type of non-renewable resource is quickly being depleted (and alternatives must be sought), the extraction process itself further exacerbates environmental "instability," in that the pollutants discharged into the water and air are toxic to human and non-human species:

"PSE's LNG facility will emit toxins such as benzene, toluene and xylene - causing cancer, asthma, birth defects & other health problems for people living and working near the facility. People detained inside the NW Immigration Detention Center & people living on the Puyallup Reservation will be impacted first and worst by this toxic air pollution."

Herein, not only is the use of the product unsustainable, but the method of extraction is dangerous.

Eco-Injustices: There is also the likelihood of significant environmental injustices, as historically oppressed communities (specifically the Puyallup Nation) have voiced their concerns about the impacts to the water, air, and as such, their health, values, traditions, etc. The Puyallup Nation must be respectfully heard and their concerns addressed to their satisfaction.

Tacoma Tide Flats Superfund Cleanup: Over the past several years, those living in and around the Tacoma Community have spent an unprecedented amount of time and resources in order to to rectify and remediate industrial damage (caused by ASARCO Simpson Tacoma Craft, municipal wastewater, and others), entities who largely exploited and damaged the Commencement Bay water-systems, leaving toxins and pollution for taxpayers to address. Too, air and water quality concerns impact all within the Puget-Sound bio-Region, being interconnected.

Today, unfortunately, permitting practices have not effectively discouraged limiting the use of the water and air (by industrial polluters) for so-called "legal discharges," thus undermining the spirit and intent of clean air and clean water mandates. In response, I ask that you take into consideration the issues brought forth in this letter and others, and, if necessary, consider the

altogether rejection of permits for this process.

Sincerely,

Amy Belle

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

* This project would NOT displace dirtier methanol production. It would ADD its env. impacts to the other.

* Fracking should NOT BE ALLOWED. We need to REPLACE fossil fuels with efficiency and renewables.

* Export incurs transportation energy consumption and env. impacts, which could be avoided with methanol production at point of use.

* No VIABLE mitigation plan is guaranteed.

* FAR MORE BENEFICIAL alternative employment can be provided in the area through deep energy retrofit of existing buildings and installation of renewable energy facilities.

* Methanol should NOT be used as vehicle fuel. Electric vehicles should be used.

* Methane from vehicle fuel use is 87X MORE DESTRUCTIVE greenhouse gas than carbon dioxide.

Name Orion Benedict

Address or email o.rose.benedict@gmail.com

PSE's proposed LNG facility is directly at odds with community health and safety, Puyallup tribal sovereignty, and environmental well-being. The proximity of the plant to Tacoma communities, including the Puyallup reservation, poses dire health risks to those living in the plant's blast zone. Furthermore, the project planning process has violated the Medicine Creek Treaty and the Puyallup tribe has still not been adequately consulted by the agencies permitting this facility.

On a global level, fracked gas leaks methane into the atmosphere which is an extremely hazardous pollutant for our climate. Many in Tacoma are vulnerable to the threat of rising sea levels. We cannot afford to disregard the environmental damage associated

with fracked gas.

I stand in solidarity with the extensive work that Tacoma communities continue to do for social and environmental justice in our area and the agency of the Puyallup tribe. I urge the PSCAA to take to heart the well-being of our communities and the land.

1600-1 5. Regulatory Framework

From: Orion Benedict
To: Public Comment
Subject: No LNG Facility in Pierce County
Date: Tuesday, October 9, 2018 6:21:16 PM

Dear Puget Sound Clean Air Agency,

Puget Sound Energy's proposed LNG facility infringes on Puyallup Tribal land that is deeply important to the tribe. Scientific review has shown that fracked "natural" gas is dirty and has a dire climate impact, and the proximity of the plant's location to the Puyallup reservation and other communities of color would pose serious health and safety risks to folks who are already impacted by environmental racism on a daily basis. There are people living within the "blast zone" of the proposed plant, and if the gas were to combust their lives would be in grave danger.

An LNG plant is directly at odds with community health and safety, tribal sovereignty, and environmental well-being; fracked gas in general contributes to the global crisis of climate change. Along with many others in Tacoma, I stand in solidarity with the communities who would be most impacted by this decision. **Please produce a thorough and accurate environmental review that reflects the true impacts of fracked gas on our air, climate, and communities**. Your agency has an opportunity to use your power and influence in favor of social and environmental justice. Thank you for your consideration.

Sincerely,

Orion Benedict

Date: Wednesday, November 21, 2018 2:27:49 PM

Dear PSCAA,

I am writing in support of PSE's LNG facility in the Port of Tacoma. Just today, I was in the port and noticed thick, black smoke pouring out of a container ship's exhaust stack. The PSE project, by burning clean LNG, will help eliminate this particulate matter from the local environment and improve life for Washington residents. Please approve the Air Permit for the PSE LNG facility.

Sincerely,

Darren Bentley

1207-1 23. General Support

Steve: Thank you. So, next up is Phil Morrell.

Rich: He's not here. Rich Berkowitz is my name. I'm up next, I believe.

Steve: Okay. Rich Berkowitz.

Rich: Thank you. I'm a PSE rate payer and I also live and work next to the Port of Seattle. My role as Pacific Coast director of TI leads me to work on behalf of numerous US flag vessel operators on regulatory training, recruitment, safety, and legislative issues. This includes locally owned TOTE, a notable environmental award winner. I've worked with TOTE, the Obama administration, PSCA, and EPA to find the most environmentally sound response to ongoing interest in reducing harmful regional air emissions, since 2012.

[03:20:02] We support the findings and the draft SEIS of an LNG storage facility being the preferred option. Further, we urge PSCA and policy makers, do not let the perfect be the enemy of the good. In this case, the exceptionally good. If you heed the detractors here today and delay or deny TOTE access to LNG, you send the message to the entire maritime community that no good progressive turn goes unpunished. The LNG facility poses no environmental risk. Not using LNG in maritime vessels does create an environmental and human health risk.

Use of LNG reduces SOx and NOx and particulates of virtually zero. LNG eliminates the threat of oil spills to our salmon, shellfish, and diminishing orca. On freshwater bodies, we can maintain clean drinking water standards. The global environmental community embraces the science related to the 100 year impact standard modeling used by the respected research firm that evaluated the SEIS, a study that is complete, timely, and neutral.

[03:21:07] Despite the rancor shown today, we urge you to support it. There are, literally, hundreds of LNG storage facilities around the US with impeccable safety records. These facilities act as peak savers and ensure an uninterrupted supply of LNG. Thank you for your time. And I appreciate your efforts.

From: Jim Bernthal
To: Public Comment
Subject: Puget Sound Energy LNG Project
Date: Wednesday, November 21, 2018 5:10:31 PM

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

Following are several more serious issues that I feel are not adequately addressed in your Draft SEIS for the PSE LNG project:

Global warming:

Methane, the main component of fracked gas, is a greenhouse gas 86 times more powerful than carbon dioxide, when considered for a 20-year period. Out-of-date documents from the EPA and IPCC have used lower estimates for methane's impact as a greenhouse gas. As a critical permitting agency. PSCAA must use the most up-to-date global warming potential for methane, at 86 carbon dioxide equivalents.

Water Impacts from Fracking:

Given the record of water contamination as a result of the fracking process, the SEIS must also consider potential impact on water of
gas that is fracked for the PSE LNG facility, whether the gas is
extracted via fracking from sites in
the United States or from British Columbia.

Water effects in the Tacoma area:

The Tacoma LNG Facility would chill gas down to -260 degrees Fahrenheit, in order to liquefy it for use as a ship
fuel. If there is a spill, the liquefied gas would likely enter the harbor. The
SEIS must include analysis of impact on marine life of a spill.

Thank you for taking these concerns into consideration in modifying your Draft SEIS.

Subject: Puget Sound Energy LNG Project
Date: Wednesday, November 21, 2018 4:57:11 PM

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

Here are several serious issues that I feel are not adequately addressed in your Draft SEIS for the PSE LNG project:

Fracking:

By increasing the demand for natural gas in North America, this project will increase the demand for fracking. 2/3rds of all ‘natural’ gas in the US is fracked. Fracking damages public health, pollutes water, and contributes to climate change. The SEIS must include the environmental impacts associated with continued and increased fracking.

Displacing "Dirtier fuels":

The backers of the LNG facility have used the rationale that they are displacing coal, oil or bunker fuels; they are doing this as a platform for "greenwashing". There is no way to prove that other projects will be displaced by the LNG facility. Rather, it is more likely that this project will add more fossil fuel use.

We know that fracked gas is at least as devastating to the environment as coal, when lifecycle emissions are considered. The original justification for the LNG plant was to provide shipping fuel that would replace heavy fuel oil. However, since then the heavy fuel oil has been replaced with low-sulfur diesel to comply with new requirements. We need this SEIS document to focus on the added
environmental impacts of the proposals at hand, without assuming they will displace other proposals.

From: Mike Bird
To: Public Comment
Subject: Puget Sound Energy LNG Project
Date: Thursday, November 15, 2018 5:10:00 PM

Puget Sound Clean Air Agency,

Dear PSCAA,

I completely endorse the Puyallup Tribe's position regarding the serious errors in the draft SEIS.

But beyond this I oppose any such facilities in this location as the blast radius extends to tens of thousands of residences and much of downtown Tacoma.

Methane is more explosive than the hexane which destroyed 1000 residences in the village of Flixborough and 800 more in Scunthorpe three miles away. Fortunately that was a lightly populated rural area.

A small natural gas leak can easily destroy a house. Recently in the Merrimack Valley a slightly larger incident caused the evacuation of 30,000 in a 10-alarm fire. (Most people are unaware that fires can be more serious than 5-alarms.)

The Kinder Morgan explosion in 2017 shook houses sixty miles away.

Natural gas pipeline explosions occur about three times a year in the US.

The proposed Tacoma facility would require a large 24x7 staff of well-armed guards to protect against ground-based terrorist attacks. Nothing can protect Tacoma from drone attacks or from the most common cause - accidents.

Consider that a 7 ton thermobaric bomb - less 0.1% the size of this proposed facility - has a yield equivalent to 49 tons of TNT. A Tacoma explosion could be larger than Hiroshima. The notion of a half mile blast radius is a falsehood which might well have been deliberately chosen to fit the site. Much of downtown Tacoma is within the blast radius.

What you are considering is equivalent to a pile of TNT many times larger than the steel structure you see.

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

Sincerely,

Lucinda Blackburn

Subject: STOP THE PSE FRACKED LNG PROJECT
Date: Wednesday, November 21, 2018 11:50:34 PM

Fracked natural gas is NOT better for the environment, it's worse. The amount of super polluting methane the fracking industry is leaking into the atmosphere far outweighs any benefits of burning it. Don't believe PSE's hype. I've been an advertising copywriter for over 30 years. I know hype. If Tacoma wants to be in the "energy forefront" it needs to move away from fossil fuels and toward solar and wind energy.

Thanks you for your time and consideration.

Attn: Puget Sound Clean Air Agency

I am a life-long resident of Washington, retired scientist from the Washington Department of Fish and Wildlife and member of the Governor's Orca Task Force Working Group. I have a sense of urgency towards reversing the trend of our declining environment, especially the quality of our air and water. Endangered species like salmon and Southern Resident orca whales are local examples that are suffering from a degraded environment. Residents, businesses and governments must all meet the challenges of improving the environmental we have depredated. We owe this to future generations.

We need to reduce our dependence on fossil fuels as it is one of the major factors responsible for a declining environment. I believe a transition from the traditional diesel fuel powered maritime industry to liquefied natural gas (LNG) is an important step towards cleaner emissions. The use of LNG would significantly reduce harmful gases and particulate matter.

The proposed LNG facility at the Port of Tacoma would be a significant step in the right direction. I encourage PSCAA and the City of Tacoma to reward TOTE Marine for their actions towards a better environment for all of us.

Thanks for your consideration,

"Open letter to Puget Sound Clean Air Agency, regarding your draft report on the Tacoma LNG facility"

1. You need to go back and start over, using the best available CURRENT SCIENCE. Your draft does not account for the FULL climate impacts of fracked gas, as it is unacceptably flawed.
2. You must accept the historic treaty rights of the Puyallup Tribe.
3. I stand with the Puyallups in opposing this LNG facility for many reasons, some of which I present here:
   a) Climate impacts of leaked gas are 87 times worse than CO2 at warming the environment over a 20-year period of time. Leakage rates of 3% are very conservative estimates; consider the BC gas pipeline explosion a few weeks ago, which released natural gas into the environment.
   b) The emissions of ammonia, arsenic, cadmium, hydrogen sulfide, sulphur dioxide, and flared VOCs may include chemicals linked to birth defects, cause cancer, and damage the nervous system of humans.
   c) This facility will be subject to rising sea levels, lahars, earthquakes, and tsunamis, and in any of these incidents, is at great risk of spilling its contents of LNG.
4. This draft SEIS is incomplete in more than 10 locations in this report, where there is incomplete information, or where it is stated that there is more information needed from Puget Sound Energy Corporation. This incompleteness makes your draft report analysis unacceptable.

[03:46:00] So, before I call the next speaker, I'll just give you a heads up of the five after that. Todd Iverson, Virginia Lohr, Betsy Seaton, Mike O'Brien, and Carol Kindt. So, next up is Bethany Llewellyn. Bethany? Okay. June Bluespruce?

June: Hello. I'm June Bluespruce. I have a master's in public health from the University of Washington. And I offer this testimony. I dedicate my testimony to my only granddaughter, Alma, who turned 6 months old today. And I hope that, by the time she's an adult, the earth is still habitable for her. I'm going to sing my testimony. I'm going to need a little help from my friends.

[03:47:00]

[Singing] PSE defies the law their permit's not yet granted. Stop the LNG stop the LNG stop the LNG this plant should get arrested. Fossil Fuel's way out of date we're done with earth destruction. Stop this LNG, stop this LNG, stop this LNG and stop the plant's construction. Hey PSE the rule of law applies to corporations the US government holds a treaty with the sovereign people of the great Puyallup nation. All workers also need our earth to be here for their children, green jobs what we want, our green jobs what we want, our green jobs, we're ready for green futures we can build them. Fossil fuel's a losing game, everyone's divesting, give up fossil fuels, give up on fossil fuels, green power sources now that's where it's worth investing.

Subject: Puget Sound Energy"s Tacoma LNG
Date: Wednesday, November 21, 2018 2:29:28 PM

Dear PSCAA Board, Staff, Review Committee, and Decision Making Team;

Please let me know that you received this email and public comment.

Please re-open and further expand upon the SEIS for Puget Sound Energy's Fracked Gas/LNG facility.

We are counting on you to usher in the new paradigm that the Salish Sea and Puget Sound Regions and the world must embrace and move toward beginning yesterday. We can not continue in the current paradigm of big oil and fossil fuels throwing huge amounts of money at our communities to force through projects that ultimately have only their own best interests, including exorbitant profits, at heart.

We all know that despite their short term promises for jobs, jobs, jobs and economic growth from such projects, that the biggest motivating force for them are the exorbitant profits they can achieve for their shareholders and/or foreign owned parent companies.

For all practical purposes, it still occurs that business and industry wants to blindly and arrogantly go forward with business as usual. The fact that the 8 million gallon tank is built is one small example of that arrogance and blind momentum.

There are other significant, sustainable and healthy uses for that monstrous tank that has been built on our Port of Tacoma and on the land of The Puyallup Tribe. Puget Sound Energy, the Port of Tacoma and the City of Tacoma have NOT been able to present sufficient evidence to deny that the land this project has been built upon is not Tribal land alone. The fact that PSE and/or its subcontractors have continued building despite District and Superior Court rulings on that fact is utterly ridiculous and violates multiple Treaties of Washington State and the United States government.

As you know, if you do deny the permit, Puget Sound Energy will be able to write off their "losses" as a business expense over at least the next 7 years, if not longer. It is a calculated risk that they and their subcontractors have taken, knowing that they will benefit whether the project is seen to completion and fracked gas actually flows into it or not. They will keep paying their current employees. They will carry forward a business loss and reap tax benefits as allowed by the IRS.

Please use the most current (best) science, historical data, and air pollution measurement technology to perform a truly comprehensive SEIS before definitively and permanently denying the clear air permit for Puget Sound Energy's Fracked Gas LNG project in Tacoma. The partial science, half facts, and happy face green washing lies that PSE continues to uphold to "sell" the project is insufficient at best and criminal at worst.

It is up to you to make it whole and complete in determining the negative impact to our air quality both locally and between points of extraction of the fracking wells to final destination of the ships and other vehicles that may ultimately use that LNG. You must look from cradle

to grave - from its resting place within the earth to end use. We do not operate in a vacuum. The fact that LNG might burn cleaner at the point of use is completely ignorant of the fact that the entire life cycle from extraction to end use is dirtier that the bunker fuels currently used and pollution at any one point in the process is cumulative, not isolated to that one location.

Those bunker fuels are made cleaner through the "scrubbing" technology required on the ships and tugs as I am sure you are aware. Yet that is not discussed by the business and industry leaders - TOTE Maritime and PSE in particular have ignored the cradle to grave evaluation and comparisons in their greenwashed, prettified, window dressed multimillion dollar marketing campaigns being used to deceive local government, ratepayers and taxpayers in the Puget Sound Region and beyond.

The fact the PSE has blindly and arrogantly gone forward with the construction of this facility is no reason to rubberstamp it without a thorough, complete and comprehensive SEIS. The SEIS recently "completed" is not thorough and comprehensive and uses outdated methods for quantifying the air pollution and GHGs that will be created.

PSCAA is the last hope we may have to lead the Puget Sound Region into the new paradigm that we must create for business, industry, consumers and a truly renewable, clean energy future. We are all going to have to tighten our belts, become more disciplined, and poise up to the challenges that lie ahead for the impact we are undeniably having to accelerate climate change through global warming due to our excessive and unreasonable over-consumption of fossil fuels. We are not going to think or invent our way out of this mess using the same methods and ideology that got us into it in the first place. Thus, new ways of thinking are absolutely necessary. Profits will be reduced for business and industry, while consumers must simultaneously find the discipline to consume less. That consumption doesn't necessarily include food, although it very well could or should include some foods.

Denying this permit will send a clear message to the most financially rich industry and business leaders that they must redirect their investment dollars toward those truly renewable and sustainable energy technologies. Denying this permit will strongly persuade them NOT to continue to try and extract every last drop of fossil fuel and the associated profits possible from an industry that has quite possibly irreparably damaged this planet - our lands, waters, air and public health - that we all share unless we head in a completely different direction immediately.

The fossil fuel industry is well on its way to being a bankrupt, dead industry. What we are seeing with current efforts to proliferate the process of hydraulic fracturing to extract natural gas and create demand for LNG across the globe is nothing less than their futile attempts to "stay alive and relevant" when the fossil fuel industry should have been made irrelevant long ago. They are kicking, screaming and clawing - trying to crawl out of an inevitable grave.

I invite you to do research through the South African Department of Mineral Resources to see what they have experienced and what they have been compelled to do as big oil and gas has attempted and continues to try to infiltrate their lands. Again, sold by big oil and gas with lots of happy faces, partial science and facts, and ultimately with only greed and lust behind it. Still being window dressed to this day as a "benefit" to South African villages while their lands and water sources are or will be irreparably contaminated by the process of hydraulic fracturing (fracking) for "natural gas".

Please lead the way to that clean energy and truly clean air future.

Please uphold the motto imprinted on the cover page of your 2014 - 2020 Strategic Plan:
"Clean healthy air for everyone, everywhere, all the time."

Thank you for your time, consideration, and - in advance - for doing the right thing for current and future generations.

Please let me know that you received this email and public comment.

Subject: Tacoma/Puget Sound Energy LNG SEIS and Air Permit Denial
Date: Tuesday, November 6, 2018 11:34:50 AM
Importance: High

Dear PSCAA Board, Staff, Review Committee, and Decision Making Team;

Please re-open and further expand upon the SEIS for Puget Sound Energy's Fracked Gas/LNG facility. Also, please retract my previous email sent at 10:35 a.m. today and make this my most recent comment.

I did not take the opportunity to speak at the public hearing on Tuesday the 30th of October. Truthfully, I had to honor a family commitment and got back after my name had been called. I had originally signed up during the afternoon session but there was not sufficient time for me to talk during it.

Here is some and more of what I would have said:

We are counting on you to usher in the new paradigm that the Salish Sea and Puget Sound Regions and the world must embrace and move toward beginning yesterday. We can not continue in the current paradigm of big oil and fossil fuels throwing huge amounts of money at our communities to force through projects that ultimately have only their own best interests, including exorbitant profits, at heart.

We all know that despite their short term promises for jobs, jobs, jobs and economic growth from such projects, that the biggest motivating force for them are the exorbitant profits they can achieve for their shareholders and/or foreign owned parent companies.

For all practical purposes, it still occurs that business and industry wants to blindly and arrogantly go forward with business as usual. The fact that the 8 million gallon tank is built is one small example of that arrogance and blind momentum.

There are other significant, sustainable and healthy uses for that monstrous tank that has been built on our Port of Tacoma and on the land of The Puyallup Tribe. Puget Sound Energy, the Port of Tacoma nor the City of Tacoma have NOT been able to present sufficient evidence to deny that the land this project has been built upon is not Tribal land alone. The fact that PSE and/or its subcontractors have continued building despite District and Superior Court rulings on that fact is utterly ridiculous and violates multiple Treaties of Washington State and the United States government.

As you know, if you do deny the permit, Puget Sound Energy will be able to write off their "losses" as a business expense over at least the next 7 years, if not longer. It is a calculated risk that they and their subcontractors have taken, knowing that they will benefit whether the project is seen to completion and fracked gas actually flows into it or not. They will keep paying their current employees. They will carry forward a business loss and reap tax benefits as allowed by the IRS.

Please use the most current (best) science, historical data, and air pollution measurement technology to perform a truly comprehensive SEIS before definitively and permanently denying the clear air permit for Puget Sound Energy's Fracked Gas LNG project in Tacoma. The partial science, half facts, and happy face green washing lies that PSE continues to uphold to "sell" the

project is insufficient at best and criminal at worst.

It is up to you to make it whole and complete in determining the negative impact to our air quality both locally and between points of extraction of the fracking wells to final destination of the ships and other vehicles that may ultimately use that LNG. You must look from cradle to grave - from its resting place within the earth to end use. We do not operate in a vacuum. Date: Monday, October 22, 2018 5:26:07 AM

Dear Responsible Official,

Puget Sound Energy and Tote Marine's proposed LNG project is another step toward climate chaos. The IPCC has stated we must urgently move away from fossil fuels.

Fracked gas is not a lesser evil. Scientists' understanding of methane's impact on the climate continues shows fracking allows more methane escapement than we had previously observed. The impact of methane on the climate, particularly in the short term, is even more serious than imagined.

Please listen to the scientists:

Emmaline Atherton et alia, 'Mobile measurement of methane emissions from natural gas developments in northeastern British Columbia, Canada,' Atmospheric Chemistry and Physics, 17, 12405–12420, 2017.

https://www.researchgate.net/figure/CO-2-emission-reduction-potential-from-individual-measures-classified-in-5-main_fig2_315837106

https://en.nabu.de/imperia/md/content/nabude/verkehr/140702-nabu-backgroundpaper_containerships.pdf

Analyze the lifecycle of the greenhouse impacts of this project. Conduct more rigorous analysis. There is simply too much at stake not to.

Thank you for your time and consideration.

Emmaline Atherton et alia, 'Mobile measurement of methane emissions from natural gas developments in northeastern British Columbia, Canada,' Atmospheric Chemistry and Physics, 17, 12405–12420, 2017.

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,
I completely oppose this LNG plant.
It will extrude pollutants from processing, and I live downwind.
I will have to leave my home if this monstrosity goes in.
We cannot, and must not, allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.

This plant is far too big for domestic needs. Once the Methanol plant was defeated, this size plant was no longer needed. It is flat-out dumb to frack the countryside, then send the gas abroad.
Very very dumb thinking, this fracked gas.

Please listen to the tribes, they have not been consulted, and they must be!
Their lands are threatened by this plant.

Please do not give permission!

thank you,
Leah Boehm Brady

GUNNAR LUNDEBERG • PRESIDENT / SECRETARY-TREASURER

October 30, 2018

The Sailors' Union of the Pacific wishes to express our support for Puget Sound Energy's (PSE) liquefied natural gas (LNG) facility at the Port of Tacoma, as well as in support of the Puget Sound Clean Air Agency (PSCAA) finalizing its SEIS consistent with the draft it issued on October 8, 2018 and timely issuing PSE the necessary permit(s) to proceed.

There are many stakeholders in the effort to reduce emissions, and even more moving parts involved in the actual process of doing so. In the last five years alone, the Port of Tacoma, the Port of Seattle and the Vancouver Fraser [Canada] Port Authority have created an updated Northwest Ports Clean Air Strategy with the objectives of reducing port-related air quality impacts of diesel particulate matter, reducing greenhouse gas emissions, and meeting air quality standards and objectives for the airshed. The PSCAA itself is a partner in the implementation of this effort, along with agencies including the Environmental Protection Agency (EPA).

The PSE LNG facility is one part of the task of reducing diesel emissions. LNG fuel cuts particulate matter (PM) emissions produced by ships by more than 85%. These particulates are extremely harmful to the lung health of dock workers and those in the surrounding neighborhoods. According to dock workers, they not only see the black diesel particulates floating in the air, but they breathe them in while ships (still burning diesel) are waiting to dock. Besides eliminating the PM emissions, LNG fuel also reduces greenhouse gas emissions by nearly 15%, sulfur dioxide (SOx) emissions by over 99% and nitrogen oxide (NOx) emissions by nearly 85%. Another important environmental advantage of the utilization of LNG as a fuel is that in the unlikely event of a spill, LNG turns into vapor and dissipates with no lasting effects on water or marine life.

Reducing these real-time emissions is a matter of social justice. Sailors & port workers should not be subjected to this polluted air just for doing their jobs. Workers across the West Coast ports have been vocal about the need to reduce these emissions in their work place, and they have played an integral role in supporting ports' efforts such as the Northwest Ports Clean Air Strategy to reduce emissions. Locating the Tacoma LNG facility within the Port of Tacoma advances the effort to reduce emissions at their source.

Beyond emissions affecting ports and immediately adjacent neighborhoods, the United States has staked out the position that vessels must control emissions when travelling America's coastlines up and down the Pacific Ocean. Annex 6 to the MARPOL Treaty, for which the EPA is the enforcing agency, requires Jones Act-flagged ships that travel near to shore to significantly reduce their emissions by using cleaner fuels. TOTE's use of fuel from Tacoma LNG to power its fast-transit, near-shore ships allows the company to substantially exceed its regulatory commitment to the EPA. By using LNG, TOTE will provide major emissions reductions benefitting public health for all communities and residents along its West Coast route, which transits nearly all of Puget Sound and ends in Anchorage, Alaska. Furthermore, US flag vessels engaged in International commerce are faced with ever increasing emission regulations in foreign ports. Vessels are consistently being called upon to be cutting edge and to be within compliance of often more stringent international standards than we face in the United States. Non-compliance with International emission reduction standards will create further disadvantages and barriers to US shipping and industry.

The draft SEIS, prepared by Ecology and Environment, Inc. and released by PSCAA on October 8, 2018, stated "When evaluating direct, upstream, and end use GHG emissions, replacing a diesel propulsion engine with a pure LNG propulsion engine result in reduced life-cycle GHG emissions."

Taking into consideration the overall reduction in greenhouse gas emissions confirmed by the draft SEIS for Tacoma LNG, and the human and environmental benefits of such reductions, I fully support PSCAA finalizing its SEPA review and granting the necessary permit(s) so this important addition to our region can be completed within its new scheduled timeframe.

The Tacoma LNG facility is a project that allows multiple stakeholders – Washington coastal communities, the Port of Tacoma, adjacent neighborhoods, PSCAA, EPA and TOTE - to affirmatively advance their interests in emissions reductions. Speaking for the US Merchant Mariners serving in the ports of the Pacific Northwest, our health and economic well-being are substantially furthered by this project's timely environmental review and permit process conclusion. Please, support the creation of sustainable, family wage jobs at the Port of Tacoma, which also improve air quality and workers health.

Subject: Puget Sound Energy's LNG facility
Date: Thursday, November 15, 2018 1:14:08 PM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

PSE's fracked gas LNG facility is being built on Puyallup Tribal land without their consent. Honor the Treaties, and reject the Clean Air Permit for this dirty project!

As a lifelong member of the community, I one hundred percent oppose any development of fossil fuel projects. The proposed PSE Liquified Fracked Gas facility poses a great threat to our water and air on the Tacoma Tideflats and surrounding communities. Further, the horrific process of fracking natural gas from Mother Earth is abhorrent, and the transportation of that gas has shown to be inefficient in fiery explosions across the country; not to mention the leaking of gases into our air.

Energy derived from fossil fuels is dirty and finite, and with that in mind, I implore all companies engaged in that industry work toward redirecting their business plan to renewable energy. Otherwise, they too face extinction.

Sincerely,

Darlin Boudreau

To: Puget Sound Clean Air Agency,

I am a mathematician who lives in Tacoma and have raised my family here. Part of my work is with young children. I have become intensely concerned with the climate change that we are causing with the emissions of greenhouse gases. The latest report issued by the UN Intergovernmental Panel on Climate Change has made clear that we do not have the luxury to think in a 100 year time scale, but need to think in a 20 year time scale. In that time frame we need to rapidly reduce our emissions of greenhouse gases. The SEIS analysis uses emissions numbers based on the 100 year time scale, and uses old numbers instead of the most current numbers. Using the 20 year time scale those numbers are much higher for methane. Methane is the gas of concern in relation to the LNG plant. There is consensus that natural gas burns cleaner than marine fuel, but there is also the science that clearly shows over the lifecycle of natural gas from production to use as fuel, the GHG emissions is seriously high because of methane leakage. Letting this project move forward as is would increase Tacoma's GHG emissions instead of decreasing them. We need to bring them to zero and then go further to reduce what is already in the atmosphere. Adding to them at this point in time is entirely in the wrong direction and the consequences for us all will be disastrous with loss of land, loss of clean air, loss of livelihoods, loss of food production, loss of clean water, and shortening of life spans. The SEIS needs to be revisited including the latest numbers for GHG emissions in a 20 year time span, and the project cannot move forward until then. If a method is found to capture and monitor the capture of methane in real time publicly at the fracking site where the natural gas is being obtained, along the route the gas travels to the plant, and also account for any GHG emissions caused by the fracking process itself, so that it there is no doubt that total emissions is coming down over the lifecycle of the gas, then the project can be considered.

I continue to have concerns about the viability of where the plant is located with respect to flood zones given the expected sea level rise and storm surge expectations within the next 20 years. The safety concerns are real. As citizens we rely on you to be the watch dogs and use the best available data and science to determine whether a plant such as this one can be safe for our air, or whether it is time to no longer accept fossil fuel plants of any type. We are at a cross roads. It can't be business as usual, we need to change course.

I am looking for a decision that puts our air first, takes us on a course of reducing GHG emissions, and will help mitigate the impacts of climate change to come.

Thank you for your efforts.

Subject: Tacoma LNG SEIS
Date: Tuesday, November 20, 2018 11:42:02 AM

Puget Sound Clean Air,

I'm a VAshon resident, just across the water. Like most educated citizens, I'm concerned that human-caused climate catastrophe is destroying our future, our civilization, and most life on earth.

Knowing what we know about climate change, investing in new fossil-fuel infrastructure is not just a bad idea, it's downright suicidal. If Tacoma is to have a future, it will require a massive effort to change our energy infrastructure, starting right now.

Building an LNG plant in the middle of Tacoma is nuts. The SEIS has been written to avoid the problem by fudging numbers. For example, it uses old information, and it's missing data. The SEIS should be using the latest IPCC numbers when determining the global warming potential of greenhouse gases. It should use the 20-year numbers instead of the 100-year, since this plant will be operational for only 40, and we'll see big impacts from the beginning. When the 20-year GWP from the 2013 IPCC report is used, it shows that emissions from the LNG facility are actually 30-31% worse than the No Action alternative.

The SEIS is also missing the carbon content of the gas to be used. This data is needed for a complete study, and until it's there, this SEIS is incomplete.

How will PSCAA ensure that the methane gas comes from BC? The SEIS should analyze the very likely scenario in which PSE will have to get its methane gas from the Unites States network.

Since I'd like to see civilization, and Tacoma, have a future, I'm obviously opposed to the PSE Tacoma LNG project. Please update the SEIS, reissue it when it is complete and credible, and then re-open the comment period.

We existing in a pivotal moment of human history; your actions have implications far beyond this moment of time.

Steve: Thank you. Carole Sue Braaten?

Carole: Carole Sue Braaten, quickly. This environmental impact statement supplement is inadequate, totally and completely.

[05:34:00] I've read it. And, in fact, it was hard to get and hard to obtain. First of all, it says that it does not address the state environmental impact policy. And it also says it was addressed in the final environmental impact statement. It was not. I read that seven to eight times through or more al eight hundred pages. It's totally and completely inadequate. It does not follow the RCW4321C Safety, Air Quality, and Others. It's inadequate, and it's substantially deficient. It's missing the maps in here, so that you can see where the air travels. It's missing other statements in here that are talking about the flaring.

It didn't tell us that it was an import because you may not have jurisdiction. FERC may, Federal Energy Regulatory Commission. And we need to find that out. That's important.

[05:35:00] They're not telling you everything you need to know. These people are not completely up front with you. And they aren't up front with POC either. I'm sorry to say this. They want everybody's money. They left out RCW3670A, which is part of it. They left out the WAC. They left out that natural gas, in this state, is qualified by two different things. 1) From a garbage dump and a waste water treatment plant that is clean natural gas, that's what the legislature said. That's not what I said and the state attorney general says. And for petroleum based products. You need to know that. And they need to know that.

And it needs to be up front, so they know that they can only operate one to two days a month, if that, every two months. So, the whole thing is shut down. It doesn't even matter whether it's a geological hazard or not, which it is.

[05:36:00] And you need to consider the mass destruction or rather the Tacoma Fire Department's actual explosion that they had, it uses the action of the 1949 earthquake. And it will liquify. I took soil science. I majored in agricultural science. And I will tell you that it will liquify. It will crash, and the whole thing will go. And then, you're going to have a lot of up emissions. And there's a lot more. But I'm concerned. Thank you.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

The Puget Sound Clean Air Agency should go back to the drawing board - The draft SEIS does not account for the full climate impacts of fracked gas. The analysis is incredibly flawed and unacceptable, and we need the Air Agency to do better before they decide on the air permit for the facility.
The draft SEIS uses an outdated methane global warming potential (GWP) value - GWP is a measure of potency for a greenhouse gas and it is measured against carbon dioxide (CO2). CO2 has a GWP value of 1. Methane has a much larger GWP value, especially over the short term. The draft SEIS uses the United Nations' 2007 value of 25 for the 100-year number (i.e. the methane average GWP over 100 years), whereas they should be using the 2016 value of 32. This single modification in SEIS GHG model makes the LNG plant dirtier from a greenhouse gas emissions perspective than if the LNG plant were not built.

Report
20-year GWP
100-year GWP
2007 IPCC AR4
72
25
2013 IPCC AR5
84
28
2016 Scientific Study (authors include lead from 2013 study)
96

32
Methane is significantly more potent in the near-term, yet the SEIS analysis only looks at the long term impact - Methane is a significantly more potent greenhouse gas than carbon dioxide, especially in the short term. The draft SEIS analysis is based on the 100-year GWP of methane. The IPCC report released a report on October 8th, indicating that we must change our energy fuel mix in the next 12 years or face dire consequences in 22 years. Therefore, the SEIS should use the 20-year numbers, as that is the timeframe where action is needed. Using the most recent 20-year value of 96 makes the LNG plant 50% dirtier than the current capability.
Lack of evidence that BC fracked gas is as clean as they claim - The draft incorrectly assumes

that B.C. fracked gas would result in a significant GHG emission reduction. The reports used to justify such conclusion were models or self reported by industry. The three B.C. based reports all require further analysis to determine if they can even be extrapolated to B.C.-wide fracking wells. One of the reports, states that
recent 2017 and 2018 reports, that use empirical, independent physical studies at well sites. The 2018 report found that 85 percent of active wells are
directly venting methane daily, and that those leakages have been historically underreported. The same report found that methane emissions in BC are 2.5 times higher than reported.
No guarantee that all of the fracked gas would come from BC - The draft claims that all of the natural gas will be coming to the facility from British Columbia. During the recent natural gas pipeline explosion in B.C. on October 10th, it is our understanding that PSE was able to use natural gas from North Dakota. The methane leak estimates from North Dakota are noticeably higher than those reported from B.C. PSE's own 2017 10K filing with the Securities and Exchange Commission (SEC) shows that in 2017 they obtained gas from British Columbia (54.8%), Alberta (19.1%) and the United States (26.1%). How will the Air Agency hold PSE accountable to bringing in only B.C. gas?

Carole: Thank you. Holly Brewer?

Holly: Wow, it's bright up here. I'm Holly Brewer. I've lived in Washington State for 22 years. And I need to breathe, and my children need to breathe. We need the factual data in the report before it could even be reviewed and approved. So, this process feels kind of null and void.

[01:36:00] And once LNG is the default fuel, it's liable to continue to be. So, I believe the research has defined better sources, cleaner alternatives. That won't be encouraged because it won't be necessary, at that point, because there will be an option. Also, there are only just over 100 ships powered by LNG in operation out of a worldwide fleet of 90,000. And getting permits for their conversions could take years and is not guaranteed. So, this is not necessarily necessary. And the PSE say that they will use liquid natural gas from BC, but recent filings show that they have relied on gas from BC, Alberta, and parts of the United States.

And with the recent pipeline explosion in BC that people keep talking about that interrupted PSE's supply, we also know that it wouldn't always be available because accidents happen. And we know that its transportation, over long distances, and its storage is potentially extremely dangerous.

[01:37:00] And it's a terrible site for it. In addition, the Puyallup Tribe needs to be properly consulted because of the environmental impacts, which could be very, very frightening. Thank you.

Steve: Next up, Kenra Brewer.

Kenra: Yes, I am the Kenra. I live on the east side.

[04:43:00] A man died beneath my hands once. I was riding the train to Portland, when there was a call overhead for a medical professional. When I arrives at the scene, the middle aged passenger was already unconscious. The seat next to him was littered with inhalers. A nebulizer sat still on spewing mist. These were his final attempts to bring air to his struggling body. Despite our best efforts at resuscitation and manic pleas, he was gone. The need for air, particularly clean air, is something humans cannot get around. We have allowed the fossil fuel industry to decide the limits of what's possible for far too long.

They say that asthma attacks in infants are normal, that cancer in midlife just happens, that COPD is okay because you can live many years with it. When babies are born with birth defects, it's unfortunate. When people are killed by pipeline explosions, it's a sad accident.

[04:44:00] They preach that fossil fuels are the only way and, certainly, won't take any responsibility for any of the aforementioned health threats. If we shake off this hand me down lie of a paradigm, we can begin to imagine and build a better world. It is possible. As a nurse, I am committed to reducing suffering, supporting health, and advocating for justice. I stand with 350 Tacoma, Washington Physicians for Social Responsibility, and the Puyallup Tribe in opposition to PSE's LNG facility. While I appreciate your decision to assess lifetime greenhouse gas emissions for this project and the work put into this SEIS, it is, unfortunately, incomplete, inaccurate, and based on hypothetical scenarios and assumptions.

In light of the recent and alarming IPCC report forecasting a painful climate crisis sooner than expected, allowing further development of fossil fuel infrastructure and unnecessarily increasing demand for fracked gas is unacceptable. Permitting this facility deepens our dependence on fossil fuels, at a time when we must urgently and justly transition to renewable and sustainable energy.

[04:45:04] I'm asking you to revise the SEIS with the latest science, based on here and now reality and remove any overreach into possible futures that you have no way of enforcing. Thank you.

Subject: Public Comments on DSEIS, PSE LNG Project

The Draft Supplemental Environmental Impact Statement's treatment of fugitive methane emissions is inadequate both in terms of the clarity of presentation and the assumptions used. Work presented in this fashion would not pass muster in a referred scientific publication, and there is no reason why the PSCAA should accept work this weak as the basis for an important energy infrastructure decision.

As a retired scientist familiar with the literature on fugitive methane emissions, I expected to find in the document clear statements of the assumptions used with respect to methane leakage rates in each stage of the life-cycle and the assumed global warming potential for methane. These are the key values that will determine whether study findings conclude that Tacoma LNG will mitigate or exacerbate global warming.

The nearest I have found in the DSEIS to a statement of what assumptions were used for these pivotal values occurs on page 8, Table 2.1 for GWP and on page 100, Table B.1 for fugitive emissions rate. I believe that in both cases the study authors selected erroneous values.

The discussion on page 8 attempts to justify the use of the AR4 GWP_{100} value. As anyone familiar with the *Special Report on Global Warming of 1.5 °C (SR15)* [1] issued on October 8 would understand, the need to reduce greenhouse gas emissions is near-term and urgent. This analysis should use the GWP_{20} value for fossil methane of 85 from Table 8.A.1 [2] Diluting the impact of near-term decisions by averaging them over 100 years makes no sense in the current context in which scientist tell us we may have only 12 years to drastically alter course.

The DSEIS does not state what fugitive methane emissions rate was assumed in the study. I have inferred that the values of 135.4 and 6.8 g/mmBtu, LHV shown for recovery and processing, respectively in Table B.1 where the values used, although this is unclear in the text. It is odd and puzzling that the authors present this crucial information in nonstandard and cryptic units, that aggregate leakage rate, energy content, and GWP. The units make it difficult for anyone, including scientists with relevant expertise, to determine what was assumed in the analysis or to compare the values to those presented in Table B.3, which shows some recent estimates from the scientific literature.

Table B.3 presents gas leakage in the logical and customary fashion; i.e., as a percentage of gas delivered. I note that a recent study appearing in Atmospheric Chemistry and Physics using sophisticated, on-ground, gas-detection instruments in gas fields in Northeast British Columbia found fugitive emission rates to be 2.5 times higher than the provinces estimates but was [3] not included in the table. This seems like an important omission to correct, otherwise it gives the appearance that the data were cherry-picked.

Also, missing from the discussion is any mention of the high rates of methane leakage from abandoned gas wells. There is ample empirical evidence that the gas industry has not properly capped abandoned gas wells, and I don't see that this issue has been addressed in the DSEIS life-cycle assessment. Unless there is both regulation and bonding requirements to ensure the industry has the resources to properly decommission gas wells, it seems unreasonable to assume that these emissions will not continue in the future. This fact should be included explicitly in this analysis.

Table C.2 embeds assumptions about unburned methane from using LNG in marine engines. Apparently, this flows from default assumptions within the GREET model. Yet it appears from the values in Table C.2 that it would require only a slightly larger amount of unburned methane to be released by these engines than assumed for the LNG $CO2_{equivalent}$ emissions benefit to reverse and become a liability, even using the low and incorrect GWP for methane. What assumptions were used on unburned methane, so called "methane slip" in this analysis? I infer from Table C.2, that the value was about 1.2%.

I note that methane slip is a very big issue, and that any greenhouse gas benefit from LNG may be negated by the particular engine design and combustion conditions. A recent study by the European Commission found methane slip as high as 3.6% [4] under low-load conditions. Has PSCAA evaluated TOTE's proposed engine replacements/modifications to verify that they will produce lower $CO2_{equivalent}$ emissions than with bunker fuel, and have test results been reviewed? There are tradeoffs between unburned methane, formaldehyde and NO_X emissions and efficiency that are particularly problematic in [5] large bore engines. The current documentation provides no evidence that this issue has been examined, and is likely a more problematic issue if the engines are to be retrofit for LNG rather than replaced.

The DSEIS conclusion that Tacoma LNG will reduce greenhouse emissions, even though only marginally, is clearly dependent on assumptions on which there is high uncertainty and substantial controversy. It is customary in such circumstances to perform sensitivity studies. Ecology and Environment, Inc., should be tasked with adding sensitivity studies that indicate how their key conclusion regarding greenhouse gas emissions would be affected by alternative assumptions for these uncertain parameters. Sensitivity studies should be performed to assess the impact of using the appropriate GWP_{20} values for methane and nitrous oxide, for using fugitive methane leakage rates that reflect the range of recent research findings, and for alternative assumptions on methane slip, if definitive data are not available from TOTE. The same issue applies to other future marine, rail, and highway users of LNG. PSCAA should not abrogate its authority to regulate greenhouse gas emissions by granting approval for Tacoma LNG and as a result become powerless to prevent counterproductive LNG conversions.

On page 4-13, DSEIS authors recommend that a required condition of an NOC Order of Approval be that the gas be sourced from British Columbia and that terms be included in the order to ensure that this condition is met on a continuous basis. I strongly support the intent of this recommendation, although a better solution would be to require all gas sources to be periodically tested by a credible entity, so that domestic producers see an incentive for low emission operations rather than be automatically barred from this market.

Similarly, because PSE proposes specific uses for the LNG and requests approval based on benefits resulting from those uses, an additional condition for the facility's approval should be that the LNG produced not be available for export. While fracked gas has been touted as a bridge fuel, it's actual role has been to stifle development of renewable energy. It is not in the interest of citizens of our region to have our ports used for fossil fuel commerce between Canada and other nations. Such commerce would have the effect of stifling renewable energy development in those importing countries and increasing global greenhouse gas emissions, which would in turn contribute to deteriorating air quality for the Puget Sound from forest fires and other consequences of climate change.

The Tacoma LNG project imposes risks on Tacoma and its inhabitants. The plant's tank when filled to capacity would contain the energy equivalent of 12 Hiroshima-sized nuclear bombs. This presents an accident risk as well as creating an easy target for acts of terrorism. Clearly, this facility imposes cost and risks on our community, and it should only be permitted if it also offers real benefits to our region and not just to foreign investors.

PSE's claimed benefit of peak shaving is illusory. PSE can meet its peak needs more easily and more cheaply by simply not taking on new gas customers and deploying cost-effective gas conservation, thereby putting greenhouse gas emission from the gas sector on a controlled downward path. There are no uses for gas—residential, commercial, or industrial—that cannot be met with renewable electricity. Phasing out fossil methane is imperative if we are to meet any of our climate goals, and

doing so will improve air quality, and will ensure the safety of our community, at the lowest possible cost.

The study authors were tasked with comparing Tacoma LNG only to the no-action alternative. This leaves unaddressed the question of what alternatives to bunker fuel exist for ocean shipping. Several commenters at the October 30 public hearing claimed that there were no alternatives the could clean our air and cut greenhouse gas emissions. But Tacoma LNG commits us to an unsustainable path at a time when carbon-free alternatives are close at hand.

There are several energy carriers that can be produced using renewable electricity and have the potential to replace bunker fuel in marine power systems, while clearing the air and cutting carbon emissions. These include dimethyl ether (DME), alkane blends synthesized from renewable electricity using the Fischer-Tropsch process, methanol, ammonia, and others. Deploying LNG in this unsafe location will commit us to a technology and fuel that must be curtailed if we are to preserve a livable planet. Doing so will preclude the deployment of the clean sustainable energy systems that are now or soon will be available to us as a consequence of the plummeting cost for renewable electricity.

Respectfully submitted,

Robert S. Briggs

ATTN: Public Comment on DSEIS,

PSE LNG Project,

1904 Third Ave, Suite 105

Seattle, WA 98101 November 18, 2018

To PSCAA:

My name is Roger Martin. I am a retired Air Force combat pilot. Subsequent to that retirement, I worked as a training developer and instructor for the B-2 stealth bomber's initial cadre of pilots, then a systems engineer for military systems, and then a manager specializing in proposals for major defense contracts. I hold a BA in Biology and Oceanography from San Jose State College and an MS in Systems Management from the University of Southern California. I am currently the coordinator for my church's Greening Activity Group at United Church in University Place.

I am strongly opposed to acceptance of the 2018 Supplemental Environmental Impact Statement (SEIS) for, and to the installation of, the LNG facility proposed for the Tacoma Tide Flats. This is for several reasons.

1. First, the location.

   We have learned that this construction location is in a) a known earthquake-fault area; b) a tsunami hazard zone; c) on land fill; and d) adjacent to Native American tribal land. For an installation that is to contain pressurized flammable gases, mixed with toxic, volatile organic compounds, in an installation that will reportedly stand 16 stories tall that is near highly populated urban areas, and be an installation and within a few miles of the West Coast's primary north-south roadway is pretty-near insane. In my lifetime, I have observed from a distance, and among other events related to manmade facilities (not in order): a) the Three Mile Island nuclear meltdown; b) the Chernobyl nuclear meltdown; c) the Exxon Valdez grounding and oil spill; d) the Deep Water Horizon explosion and oil spill; e) the Fukushima Daiichi earthquake and tsunami nuclear disaster; f) numerous railcar de-railings, chemical and petroleum leaks, fires, and explosions; g) the Shell Oil Kulluk floating oil-rig disaster (twice in one trip!) between Alaska and Washington State; h) leaks of natural-gas storage facilities (most notably Porter

Ranch in Southern California); i) numerous leaks along existing oil pipelines, including the Keystone XL and feeder pipelines; and j) one I will recount in more detail here, based on my eyewitness observation.

I was married in a full military wedding on February 2, 1969 in Santa Clara, California. Not having a lot of money, we decided to honeymoon on the beach in Southern California, complete with a drive in our two-seat, red, British TR-4 convertible, along California Highway 1. Our first night of the trip was going to be in Carmel by the Sea. Our second night was going to be in Santa Barbara, where we had dinner reservations at the end of the pier. So, on February 4, 1969, we went to that restaurant and saw oil-soaked pelicans and seagulls bobbing around in the water under the restaurant--from the Santa Barbara oil spill. 'Heck of a honeymoon, but a real lesson for a freshly graduated biology/oceanography major and newly commissioned military officer.

Although I am likely to come back to some of these issues later, I wanted to lay down some markers here. I will proceed to other matters below before coming back to detailed reflection. The big point here is that in every case, when these projects and facilities were proposed, each was going to be using the latest, greatest, most-foolproof-possible safety measures to prevent any possible accident that could ever occur, and that if one ever did occur (which we are told simply *can't* happen), it would be resolved quickly and without any damage or loss of life, because we had thought of everything and prepared for every contingency, and the government would make sure every rule and promise would be followed and kept.

2. Indian treaties

- (Quoted from the *Advisory Council on Historic Preservation Handbook* [ACHP]:) "The National Historic Preservation Act (NHPA), (16 U.S.C. Section 470f) Section 106, requires federal agencies to take into account the effects of their undertakings on historic properties and provide the Advisory Council on Historic Preservation (ACHP) a reasonable opportunity to comment on those undertakings. communication that may include written correspondence, meetings, telephone conferences, site visits, and e-mails." And, "Consultation constitutes more than simply notifying an Indian tribe about a planned undertaking."
- In addition, the Environmental Review Toolkit, published by the Federal Government, says, "The National Environmental Policy Act of 1969 (NEPA) requires the preparation of an environmental impact statement (EIS) for any proposed major Federal action that may significantly affect the quality of the human environment. The statutory language of NEPA does not mention Indian tribes. However, the Council on Environmental Quality regulations do require agencies to contact Indian tribes and provide them with opportunities to participate in various stages of preparation of an EIS."

- According to several speakers at the recent Tacoma public hearings on the proposed SEIS for the LNG facility, these consultation requirements have not even been minimally met.

3. Data are not current or accurate

   As was reported by numerous speakers at the Tacoma SEIS public hearings, the original, proposed EIS had incomplete and inaccurate data for computations used to support the Study's findings. The data in the former EIS relied heavily on information that had been available in 2007. "Placeholder" data were used in that study, based either on best-available values from studies up to that time, or estimates based on best guesses. More-accurate data were understood to be inserted as time went on and real studies were done with ever-improving and -widening information became available from better equipment and additional sampling and trend analysis. Reportedly, such data became updated in 2009, and later in 2013. Fortunately, there was an additional full IPCC report very close to submittal of this SEIS. And, although available, none of the latest data were used in the proposed SEIS. Indeed, many of the original best-guess placeholders from 2007 are still in the new document, even though new, and real, data are available.

   The Tacoma SEIS public hearings provided clear and consistent insight into how inclusion of best current data would affect the findings of the proposed SEIS. Environmental impact and possible damage from gas leakage and accidents are grossly underestimated in the current study, based on the outdated information contained in there. One witness—a college teacher (he claimed)—stated that greenhouse-gas leakage, by his quick calculations using new, accurate numbers, were roughly 2.5 times as great as those presented in the proposed SEIS.

I would like to get back to some of my earlier reflections. Specifically, I'd like to get back to some of the nuclear-plant lessons. At least, three nuclear power plants were somehow built right next to the open ocean: Diablo Canyon and San Onofre in California, and Fukushima Daiichi in Japan. At that time, several people who studied oceanography (I was an oceanography student back then) had already warned that predicted greenhouse gases would raise the sea level. But they built these plants there anyway. Brilliant, eh? The movie *The China Syndrome* was, fascinatingly, shot largely at Diablo Canyon. This was not one of the plants that did melt down. One of those that did was in Ukraine (then part of the Soviet Union), and the other was in the middle of a river in Pennsylvania.

The worst nuclear-plant disaster can be disputed as either Chernobyl or Fukushima. Again, promises were made that the safety designs were impeccable. At Fukushima, nothing could happen that could not be overcome by the wonderful safety standards that

Japan had put into place. (Apparently, nobody noticed the big ocean outside, even after all the movie monsters that had come out of it going back decades before.) People were allowed to build residences and businesses ever closer to the reactor as time went on—after all, what could happen? Other nuclear plants had been around, and hadn't blown up or been overwhelmed by a tsunami. So, why should this one? And it had been built to handle earthquakes, anyway, right? And *to government safety standards! Right?*

Then, the earthquake and the tsunami hit in 2011. In that accident, there were three nuclear meltdowns, multiple hydrogen explosions, and an estimated 1600 deaths, from a "safe" nuclear plant, because somebody had studied all the possibilities and nothing could happen that existing designs and safety procedures couldn't handle.

San Onofre was the first of the two, aforementioned US coastal plants identified for decommissioning. For a while, talk was that they could re-start it after an attempt to repair and replace parts that wore out before their initial studies had said they would (What? Overoptimistic estimates?). They also looked at what happened at Fukushima two years earlier, and perhaps started to notice that the sea-level rise predicted when they originally designed the plant was a bit underestimated (Gee, do you think so?). So, in 2013, they shut it down, never to be opened again.

Now, folks have decided it might be smart to pull the plug on Diablo Canyon too. There seems to be a trend here: Building facilities with stuff that can blow up and also contaminate a populated an area near where there are earthquakes and possible tsunamis might not be the indication of high intelligence.

So, for building on fill: San Francisco has some experience with that. In 1906, they had an earthquake. After the quake, they decided to use rubble from the earthquake and some dredging from the Bay to build a location for the Panama-Pacific International Exhibition, which then became the Marina District. In 1989, the Loma Prieta Earthquake hit at the very summit of Highway 17 between San Jose and Santa Cruz, and the land fill in the San Francisco Marina District liquified from the vibrations. In addition to water mains breaking, natural-gas (hmmm) lines broke, and fires broke out. Because of the broken water lines, water from the Bay had to be used to extinguish the fires. Land fill and gas lines have a history of being a bad idea then, don't they?

In San Francisco, there are two other buildings that were subsequently built on land fill. They are the Millennium Tower luxury high-rise, and the new bus terminal, built closely to each other. The Tower is sinking and has been discussed on several TV shows, including *60 Minutes*, and the other is the new bus terminal, which has shown structural cracking before it has even opened for regular business. How much is that all going to cost to make safe…or not? Furthermore, the entire area known as Foster City, just south of San Francisco International Airport, is sinking, at the same time the sea level is rising.

Foster City was built on land fill. And PSE (an Australian company, by the way) thinks it is just fine to build a 16-story-tall container of explosive and toxic gas onto land fill in an earthquake and tsunami zone. Brilliant!

As somebody who was college-trained as a scientist, flew in combat, authored training and technical publications both at the Air Force's Headquarters Strategic Air Command, and later, for the most-expensive combat airplane ever built, and in the defense industry was the principal manager responsible for the Technical Volumes of several DoD multi-million-dollar contract proposals, I am absolutely appalled at what was presented in this official government SEIS. It clearly needs to be re-written using current, accurate, and complete data, and with actual consultation with Indian tribes.

Disregard for federal law in consulting with native tribes, *knowingly* using outdated and misleading data on which to base conclusions that can result in disasters similar to what we have witnessed in documented events ranging from the Santa Barbara oil spill up until the immediately recent fires caused by faulty power lines in California, accepting this widely disproven SEIS would be insane, and hopefully prosecutable as a crime of fraud for which anybody who signs off on this currently proposed SEIS would be culpable.

Sincerely,

Roger T. Mart

Subject: Puget Sound Energy's LNG facility
Date: Sunday, November 18, 2018 5:42:46 AM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

While some may believe this is not an impactful project to risk the environment it is. And far too risky to weigh against future generations

Sincerely,

CL Brooke

PSCAA PSE LNG SEIS COMMENTS-10/30/2018 Thank you for allowing this opportunity to comment. I'm employed as the Director of Risk Management for a large local employer, but am very concerned about PSE's proposed LNG refinery and its negative impacts as a resident of Pierce County.

The SEIS shows the refinery will release an unacceptable amount of global-warming pollution into the atmosphere, when the planet's best scientists are urging humanity to drastically eliminate emissions to avoid the catastrophic impacts in our lifetimes.

The SEIS uses incorrect science and fuzzy math to conceal the actual impacts of the refinery, then analyzes the global-warming impacts of the refinery 100-years from now, even though the refinery will only be in operation for 40 years. .

In order for the project to result in a reduction in greenhouse gas, PSE represents all of the fracked gas must come from British Columbia, where well and pipeline leaks may actually be up to 6 times worse than originally reported, rendering fracked gas & LNG a worse alternative to even oil or coal. These requirements are also unenforceable & contradict PSE's business model.

The SEIS is incomplete, missing actual carbon content reports from PSE, and intentionally omitted emissions sources, which could be significant, while excluding consideration of several best in class & already in use alternatives to LNG in the maritime industry.

Over the last 3 years, I've watched teams of PSE lawyers & relationship managers run circles around local and state officials. First, PSE pushed the lead agency all the way down to a public entity with zero experience with LNG. Then PSE created a selective & shoddy EIS. Then PSE sold the UTC on a different story to allow them to create a shell corporation and violate super critical terms of their monopoly agreement protecting a million Washingtonians, while walking away with $140 million in taxpayer and ratepayer money. Then PSE sent team after team of lawyers to court to seal critical safety documents from public view. During this entire time, PSE has spent $70,000 a month to maintain a sophisticated greenwashing campaign of ads, push polls, censored telephone talks & political action committees. PSE has yet to hold a meaningful public forum or have an adult conversation with the community.

I would request at a very minimum, the SEIS be updated with complete and accurate information, then reissued and re-opened for a new public comment period.

Thank you! -Phil Brooke oldbrickhousefarm@yahoo.com 253.531.3353

Mr. Brooke,

I'm sorry we did not get through all of the cards for those signed up to speak at the hearing. I am forwarding this message, which includes your original e-mail message (sent to our executive director), in with the e-mails submitted as a comment on the Draft SEIS. I would also encourage you to submit any additional comments or questions you have on the Draft SEIS to our comment e-mail address (publiccomment@pscleanair.org) as the comment period is open through November 21st. As we indicated at the hearing, oral comments and written comments have equal weight. Thank you for your interest and engagement in this process.

Sincerely,
Steve

Subject: Re: PSE LNG SEIS

Hi Director Kenworthy:

1569-1 5. Regulatory Framework

I hope this finds you well! I have a couple of concerns I wanted to bring to your attention regarding the draft SEIS process underway at the PSCAA:

First, the Tribal and Environmental Justice vacancies on the 5 member panel. This in itself could completely alter the outcome of the SEIS process.

Second, public testimony was cut off at 10 pm sharp at the Tacoma hearing on 10/30/2018, even though the panel had a stack of speakers still in hand and prior speakers weren't limited to 2 minutes (I was one who worked at 10 hour day, then sat for 4 hours in the cramped auditorium very badly wanting to speak--fossil fuel industry members were there on company time & showed up en-masse during work hours!), and there had to be at least 100 opponents still in the auditorium, many who had come from their jobs after work to testify. I've been to a few of these hearings in the past with SEPA lead agencies, and they have always always allowed an opportunity for everyone to speak who wanted to speak.

It would be wonderful to maintain the integrity of this SEIS process by allowing another public opportunity for comment, including an extension of the comment period, as well as get those 2 positions filled, so the panel reviewing this SEIS has a full body of knowledge to draw on. As you know, the power monopoly, PSE, is a very very wealthy, powerful & sophisticated organization, and these opportunities to move through the SEPA process legally and intentionally are one of the public's only tools to counter this power, money, and the green washing campaigns accompanying it.

Most sincerely and respectfully.

I strongly protest the proposed PSE LNG project in Tacoma.
It is utterly irresponsible and reckless to place a volatile storage project in the middle of a highly populated urban area, and on the shore of the Salish Sea.
PSE should be investing in renewable energy like solar and wind, not fracked gas.
Thank you
Barbara Brown

Subject: Tacoma LNG SEIS Project Comment
Date: Tuesday, October 23, 2018 8:07:49 PM

Dear Responsible Official,

I strongly oppose the ongoing construction of PSE's fracked gas tank. It is too close to where people live, including people who have no choice (at the NW Detention Center), will cause pollution, will not be good for the environment, and will have negligible positive impact economically.

Puget Sound Energy and Tote Marine seem to imagine that a clean energy future can be arrived at by digging the fossil fuel hole deeper. This proposed LNG project is another step toward climate chaos at a moment when the IPCC has given us a clear warning that we must urgently move away from fossil fuels.

Fracked gas is not a lesser evil. Scientists' understanding of methane's impact on the climate continues to evolve, and at every step along the way we learn that fracking allows more methane escapement than we had previously observed and that the impact of methane on the climate, particularly in the short term, is even more serious than had been previously understood.

I applaud your decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct this more rigorous analysis. Thank you.

I urge you to revise the analysis to account for the following:

1. Methane should be counted as 86 times more potent than CO2 based on the current IPCC analysis (AR5 rather than AR4) considering a 20 year timeframe (rather than the 100-year).

2. Revise the analysis of the impacts of fracking in British Columbia based on recent research(1) demonstrating that methane escapement has been dramatically under-estimated.

3. Revise the "no-action alternative" to include a clean energy alternative in which PSE provides electricity not with a different source of fracked gas, but with renewable energy and energy efficiency.

4. Revise the "no-action alternative" to include the assumption that Tote Marine will achieve a 50% GHG reduction, in line with the International Maritime Agency's established goals. This reduction might alternatively be achieved by a combination of fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion or many other alternatives besides fracked LNG.(2) For clean local emissions requirements, Tote Marine can achieve virtually all of the localized lower-particulate and lower SOx and NOx benefits claimed for LNG propulsion by opting for low-sulfur marine gas oil over heavy fuel oil, and installing selective catalytic reducers and diesel particulate filters.(3)

5. This more accurate analysis will show that the project has a significant and unmitigated impact on the global climate, which
should be seen as a sufficient basis for denial of the Notice of Construction application.

Thank you for your time and consideration of these comments.

1903-1 12. LCA Inputs and Assumptions - Global Warming Potential Value

Name Anne Bryant

CO_2 has a GWP value of 1 (one). Methane has a much higher GWP value. SE IS using the 2007 value of (25) for the 100 yr number. They should be using the 2016 value of (32). This makes the proposed LNG plant dirtier from a greenhouse gas emissions perspective than staying with the heavy fuel oil.

ATTN: Public Comment on DSEIS, PSE LNG Project
Dear Puget Sound Clean Air Agency,
I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to deny the permit because the Draft Supplemental Environmental Impact Statement does not accurately represent the true greenhouse gas emission profile of the project. I have the following specific concerns:

SEIS is using outdated methane global warming potential value. They didn't use the best available science for the Global Warming Potential (GWP) value for methane. GWP is a measure of potency for a greenhouse gas and it measured against CO_2.

-over (Check here to continue comments on the other side.)

In addition, a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required and adequate consultation with the Puyallup Tribe and other neighbors of the project should be conducted.

I am in support of Building the LNG Facility which will Allow TOTE to Fuel their ships with LNG, rather than Bunker Fuel. It's been clearly demonstrated that there will be a net improvement in Air quality And reduction in harmful emissions. While I understand the desire to transfer away from fossil fuels, LNG is the best choice at this time to bridge the need as new technology is developed. I'd also like to point out that Building projects in WA state where best practices are expected + employed makes more sense than chasing industry to other areas that may not maintain such standards.

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

I am a 70 year old woman who has had aortic valve replacement, two brain aneurysms and I have asthma. Allowing fracking would harm me and others like myself, seniors, healthy and sick people including vulnerable babies and children.
When will we stand up to big Ass Oil and coal greed? When will we stop them from murdering mankind? When will we punish them for harming mankind and the planet?

No LNG -------- fracked gas makes us and the planet sick!

PSE's LNG project increases our greenhouse gas emissions and fuels climate change - which means more wildfires and smoke for our region. The resulting air pollution makes us sick and leads to higher rates of asthma attacks, heart problems and cancer in our communities.

Joyce Bunch

Subject: SEIS for Tacoma LNG facility
Date: Tuesday, November 20, 2018 5:05:24 PM

November 20, 2017

Dear PSCAA:

I am writing to express my profuse and far-reaching concerns with regard to the Supplemental Environment Impact Statement (SEIS) pertaining to the proposed Tacoma LNG facility.

> It ain't what you don't know that gets you into trouble.
> It's what you know for sure that just ain't so.
>
> Apocryphal Aphorism of Mark Twain

This pithy epigraph encapsulates the gravamen of the SEIS's shortcomings. The PSCAA should not grant a permit for the Tacoma LNG facility because the potential for serious environmental impacts are being swept under the rug.

I have composed this letter with no illusions. The proponent of this LNG facility, Puget Sound Energy (PSE), is owned by a multi-billion dollar foreign entity. It has filled the airwaves with pablum extolling the benefits of this project. Its sycophants are cheerleaders for the "good" life that will be ushered in with the arrival of a new LNG facility. How do I fight the pack of mendacities that PSE pumps out daily? This task is daunting. I hope that you will carefully consider the arguments delineated below and will not treat my observations as the ramblings of a nebbish curmudgeon.

For at least the last 45 years, numerous scientists have warned about the dangers of greenhouse gases. In the 1970s I remember the groundswell of effort that sought to fix the ozone problem by banning CFCs. Concerted action by many groups has ameliorated the ozone threat. Today the focus has shifted to excessive levels of carbon dioxide and methane.

Unfortunately, the SEIS contains omissions and not-so-subtle biases that undercut the efficacy of the environmental review of the methane impacts that this proposal will produce. Let me briefly identify some of the deficiencies.

First of all, in assessing the environmental effects of methane, the SEIS refers to data provided by the United Nations Intergovernmental Panel on Climate Change (IPCC). The SEIS mentions the Fourth Assessment that was published in 2007 and the Fifth Assessment that was published in 2013. [The IPCC currently is conducting a Sixth Assessment.] Curiously, the SEIS uses the "old" 2007 data and does not address why the 2013 data are inapplicable. The SEIS merely states that greenhouse gas "emissions are weighted based on the 100-year time horizon from United Nations Governmental Panel on Climate Change Fourth Assessment Report (IPCC, 2007)…." SEIS, Appendix B, p. 8. The 2007 Assessment cited by the SEIS states that the global warming potential (GWP) of methane is 25, i.e., over a 100-year period methane warms the atmosphere 25 times as much as carbon dioxide. Correspondingly, the 2013 Assessment states that the GWP of methane is 34 when one considers climate-carbon feedbacks. Unless one can provide a cogent reason for using the "old" data, the cornerstone of the SEIS analysis is

severely compromised. This is especially so since scientists historically have raised the GWP of methane as better data have become available. In using 2007 data, the SEIS appears to be putting its thumb on the scale in order to make the methane emissions of this proposed project seem less onerous.

More importantly, the SEIS blithely uses a 100-year time period to assess the effects of methane emissions. To justify the 100-year time frame, the SEIS simply states that this time frame is consistent with Washington State policy initiatives and "the long term goals of the Paris agreement." SEIS, Appendix B, p. 8. This assertion is disingenuous because a shorter time period is also consistent with environmental goals, particularly when one recognizes that methane has a half life of about a decade. In other words, the impacts of methane become less severe as one goes out in time. Thus, the use of a 100-year time frame significantly underestimates methane's negative impacts. The IPCC's 2013 report assigns methane a 20-year GWP of 86 when one considers climate-carbon feedbacks. Would the SEIS's analysis be the same if a 20-year GWP of 86 were used rather than a 100-year GWP of 25? I think not. This point is critically important because many scientists envision a "tipping point" in the next 20 years which could precipitate runaway global warming and make a 100-year time frame obsolete.

The upshot of these observations can be stated succinctly: nothing is sacrosanct about a 100-year time frame. There is no scientific reason to prefer a 100-year time horizon over a 20-year time horizon; the decision to use a 100-year period is simply a matter of convention. And convention is not a sufficient justification when the deleterious effects of methane emissions largely occur within a short time frame.

The failure of the SEIS to even mention the possibility of using a 20-year time horizon provides strong evidence that the SEIS is skewed in favor of making the statistical analysis benign. I am reminded of the quip by Disraeli that there are "lies, damned lies, and statistics." It appears that the SEIS is trying to greenwash this proposed project by using "cherry-picked" data to justify this proposed industrial project.

To be fair, the SEIS does contain a modicum of information about the impacts of methane emissions. And one can point to industry flimflam in the past that is worse. For example, the SEIS is not as one-sided as the effort by the oil industry in the 1960s and 1970s to justify the use of leaded gasoline in automobiles. In that instance, the indefatigable efforts of Dr. Clair Patterson ultimately prevailed in banning leaded gas. While I am not suggesting that the impacts of methane gas can be equated directly with the poisonous effects of leaded gasoline, I am urging the PSCAA not to settle for anything less than the use of best available science.

I now want to turn to regulatory difficulties associated with this proposed project that appear to be insoluble. The SEIS essentially states that if the proposed project uses natural gas produced in the United States, the negative environmental effects cannot be ameliorated. Hence, the SEIS proposes that the issuance of a project permit should require PSE to use natural gas from British Columbia. The SEIS cites data which

1280-1 cont'd 12. LCA Inputs and Assumptions - Global Warming Potential Value
1280-2 12. LCA Inputs and Assumptions - Global Warming Potential Value
1280-3 12. LCA Inputs and Assumptions - Global Warming Potential Value
1280-4 13. LCA Inputs and Assumptions - Natural Gas Source

1280-4 cont'd 13. LCA Inputs and Assumptions - Natural Gas Source
1280-5 13. LCA Inputs and Assumptions - Natural Gas Source
1280-6 11. LCA Inputs and Assumptions - General

claim that Canadian natural gas has a “low” leakage rate. The SEIS assumes that the leakage rate will remain fixed into the future. Alas, there is no way to verify this assumption. In this regard, several recent studies pertaining to Canadian natural gas call into question the “low emissions” thesis. See Matthew R. Johnson, et al., “Comparisons of Airborne Measurements and Inventory Estimates of Methane Emissions in the Alberta Upstream Oil and Gas Sector,” Envirn. Sci. Tech., 2017, 51 (21), pp. 13008-13017; and Daniel Zavala-Araiza et al., “Methane Emissions from Oil and Gas Production Sites in Alberta, Canada,” Elem. Sci. Anth., 2018, 6 (1), p. 27.

Obviously, one should not read too much into the analyses of just two studies. Nevertheless, the “low emissions” contention can be no more than an hypothesis. Extraction methodologies could change. Regulatory strictures could be lessened. Compliance checks could become desultory. In short, one cannot have certainty with regard to the regulatory standards or the efficacy of compliance protocols when dealing with a foreign country. Furthermore, if suspected problems arise, how does one force a foreign government to act with more diligence? Only a crackpot realist would definitely say that natural gas coming from British Columbia inevitably will be “low emissions” gas over the long haul. Thus, the SEIS might as well endorse the buying of a pig in a poke. Similarly, if the proposed project is approved with “geographic” conditions, it still will be a nontrivial exercise for regulators to identify exactly from where the natural gas is being extracted and to what extent the natural gas is being vented into the atmosphere. Monitoring possible shipping problems also could prove to be problematic.

To continue, the SEIS suffers from data omissions. SEIS makes no effort to assess the cumulative impacts of small emission sources. Also, the SEIS does not discuss the significance of the carbon content of the gas that will be used. Finally, because modern science uses statistical methodologies to assess impacts, the SEIS could be improved if, among other things, confidence intervals were used to reflect statistical uncertainties. As it stands, the SEIS gives the illusion of certainty in cranking out fixed numbers that don't reflect the imprecision of measurement techniques associated with methane data collection and the complexity of modeling methane's short and long-term impacts.

Before closing, I want to urge the PSCAA to review the proposed Tacoma LNG facility in a light that focuses on the public interest. This proposal should be analyzed in a context that goes beyond mere scientific jibber jabber. For example, I wonder about the possibility of a truck loaded with LNG getting into a traffic accident and exploding on the Tacoma freeway. I have driven the Tacoma freeway for decades and the prospect of traveling next to a large LNG truck makes me

queasy. Also, unlike Sarah Palin who, according to Tina Fey, could see Russia from her house, I really can see the proposed LNG site from my home. This proposed LNG project causes me to experience dyspepsia, because any accident could affect me directly. And let's be clear. Accidents can happen; e.g., the 2014 explosion in Plymouth, WA. However, even with this personal angst, my opposition to the PSE proposal is not based on a narrow NIMBY perspective. Many sagacious scientists have lugubriously noted that we are living at the start of the sixth great extinction event in the earth's history. [The last extinction cataclysm occurred 65 million years ago with the demise of the dinosaurs.] The dire warnings of scientists should be taken seriously. The PSCAA needs to reject any proposal that will make climate warming worse.

Although the PSCAA should undertake an exhaustive review of the latest scientific studies pertaining to methane pollution, you really don't need to look any further than the general prohibition against air contaminants that is contained within Section 9.11(a) of your regulations. PSE's current justification for their proposed LNG facility has the solidity of pure wind. You should not allow PSE to sell you a bill of goods.

Sincerely,

Sally Burke

Dear Carole J. Cenci,

Natural gas is an extremely potent green house gas, so that life cycle leakage can often exceed it CO2 equivalent. This must be recognized in any EIS, along with the fact that the cumulative effects of global green house gas emissions are already altering our climate in ways that are increasingly damaging to human societies and ecosystems that are critical for our survival.

The Chamber
Fife • Milton • Edgewood

Puget Sound Clean Air Agency
ATTN: Public Comment on DSEIS, PSE LNG Project
1904 Third Ave, Suite 105
Seattle, WA 98101

To whom it may concern:

I write on behalf of the Fife Milton Edgewood Chamber of Commerce to provide the organization's comments and to express support for the Puget Sound Clean Air Agency (PSCAA) to issue the necessary permit(s) for Puget Sound Energy (PSE) to continue construction of its liquefied natural gas (LNG) facility at the Port of Tacoma.

The Port of Tacoma is the right place for a facility such as this. The Port is an established industrial area, and this project is consistent with the types of uses and aesthetic appearance of other marine-related industrial activities in the area. In accordance with Washington's Growth Management Act, cities and towns must first study the environmental effects of, and then zone, land for industrial use in appropriate locations. The land within the Port has been reviewed by the City of Tacoma and zoned for precisely this type of industrial facility.

Port districts exist to promote economic activity and vitality. The Port has long been a substantial economic engine in Tacoma, in alignment with the purpose for which Washington laws authorize the formation of ports. The building and operation of the LNG facility represents hundreds of millions of dollars of private investment on a state-of-the-art facility. It will help local business remain competitive by providing a needed supply of LNG for its soon-to-be-reconfigured marine vessels. The siting of this facility in the Port of Tacoma, within the city of Tacoma, will be a competitive advantage for the NW Seaport Alliance and the State of Washington.

The Tacoma LNG facility will create at least 250 construction jobs and 18 permanent jobs directly within the Port, along with the economic activity from the project creating another 125 permanent jobs in the region. The facility is consistent with the on-going efforts by the Port, the City and region to encourage a healthy local business climate and help retain and grow companies who call Pierce County home. As the FEIS for the proposal demonstrated, it will also contribute millions of dollars in new tax revenues to benefit local schools, city services, and

other state and local government services by making more public funds available to meet road and public safety needs.

The environmental and health benefits of LNG are also very important. LNG is a cleaner alternative to conventional fuels such as diesel. The PSCAA's Draft SEIS, published on October 8, 2018, confirms this. Switching to LNG reduces greenhouse gas emissions by nearly 15% and eliminates visible particulate emissions produced by ships by more than 85%. This helps improve air quality and reduce health risks, while helping local employers like TOTE comply with new stricter low-sulfur emission standards.

PSCAA, by preparing the draft SEIS, has confirmed the environmental benefits and overall reduction in greenhouse gas emissions which should allow the finalization of environmental review so that the project permit(s) can be issued. We fully support this project and are confident it will provide great benefits to the residents and businesses of Pierce County and the Puget Sound region for years to come.

Sincerely,

Lora Butterfield, President/CEO

The LNG permit must be denied. This is immoral and unjust. This project will disproportionately affect the most vulnerable in our community and presents an extreme threat to the health and safety of [redacted] the place we call home. This project is being pushed forward without regard for the wellbeing of Tacoma's residents by a [redacted] business that stands to gain millions. [redacted] At the very least, the SEIS must be redone with better data and evaluation models and the Puyallup Tribe must be consulted and put at the forefront of this process.

Developing a competitive global LNG value chain for cleaner maritime shipping by 2020

SEA LNG

Pugent Sound Clean Air Agency **October 16, 2018**
1904 Third Avenue, Suite 105
Seattle, Washington 98101
Subject: "Comment on SEIS for PSE LNG Facility"

To the Puget Sound Clean Air Agency:

I am writing regarding the draft SEIS you recently released regarding the LNG facility at the Port of Tacoma and its use as a maritime fuel. I am writing as the Chief Operating Officer of SEA\LNG and this letter is being on behalf of the organization.

To begin, I would like to provide you with a brief introduction of SEA\LNG. SEA\LNG is a not for profit membership association that brings together key players from across the supply chain, including shipping companies, classification societies, ports, financial institutions, major LNG suppliers, downstream companies, infrastructure providers and OEMs (original equipment manufacturers) to address the need for cleaner shipping through the expanded use of LNG as a marine fuel.

I would like to provide some insights to the national and international importance of shipping, the maritime Industry's effort to reduce its environmental impact and the role Liquified Natural Gas (LNG) plays in helping to clean the air we all breathe. Many do not realize that roughly 90 percent of global trade is transported by ships nor that ships provide the most cost and energy efficient means of transport. Due to the scale of their carriage capacity, there is no better transport solution from an efficiency or an environmental standpoint. The maritime industry's efforts to further reduce the environmental impact of their operations has been led by the International Maritime Organization, an arm of the United Nations, and supported for years by the United States and the vast majority of countries around the world.

LNG offers the shipping industry a credible, safe, competitive and environmentally beneficial fuel. Compared to existing alternatives and other unproven technologies, LNG provides the only currently available means to address key environmental issues today. LNG far outperforms conventional marine fuels in terms of minimizing harmful local air pollution and can reduce GHG emissions. LNG emits zero Sulphur oxides (SOx) and virtually zero particulate matter (PM) and black carbon. Compared to existing heavy marine fuel oils, LNG emits 90 percent less nitrogen oxides (NOx). LNG provides major air quality benefits which are highly relevant and especially important for port communities such as Seattle and Tacoma.

Further, LNG's greenhouse gas (GHG) performance represents a step forward when compared with traditional marine fuels. Utilizing best practices and appropriate technologies can result in realistic reductions of GHG of about 20 percent with even greater potential as technologies mature and future use of renewable natural gas. As the SEIS notes, the use of LNG will "result in an overall decrease in GHG emissions in the Puget Sound Region" and "the greater the replacement with petroleum-based fuels with LNG, the greater the overall reductions in GHG emissions". Combined with the superior air quality benefits LNG is known to deliver, the proposed action is a highly beneficial step forward for the Puget Sound region.

The environmental benefits of LNG as a marine fuel are increasingly being recognized by the shipping industry, ports and port communities world-wide. Of the world's top ten bunkering ports, nine either already offer LNG bunkering or have firm plans to do so by 2020. For example, Singapore, which accounts for the biggest volume of marine fuel bunkers, is piloting LNG bunkering and has a goal of being fully LNG bunker-ready by 2020. In Rotterdam, the world's second biggest bunker port, LNG ship to ship bunkering is already available with 10 LNG bunker vessels expected to be operating there in the coming years. This progressive Port and others are also working to explore the use of renewable natural gas as part of its LNG bunkering service offering and strategy.

In the U.S., the Port of Jacksonville has pioneered LNG bunkering in support of the world's first dual-fueled container vessels which entered service in late 2015 in the trade between the U.S. and Puerto Rico. To date, these innovative and environmentally superior vessels have completed hundreds of safe bunkering operations. Other operators have made significant investments and are on track to deploy additional LNG fueled vessels and bunkering in Jacksonville in the coming months. Barge to ship, truck to ship and pipeline to ship are all operating in Jacksonville.

Many other U.S. and Canadian ports have well advanced plans to provide LNG bunkering. Vancouver is already offering LNG fueling. In addition to these individual developments, working arrangements have been set up between various international ports such as the Port of Rotterdam, Yokohama Kawasaki International Port, MPA of Singapore, Port of Vancouver, Port of Ningbo-Zhoushan and many others to collaborate on the development of LNG as a marine fuel in their respective ports.

One of the Port of Seattle's major clients, CMA-CGM of France recently announced a commitment to 9 new 22,000 TEU LNG powered vessels. The Cruise sector, important to the economy of the Pacific Northwest has firmly embraced LNG as a fuel of the immediate future. The Port of Tacoma is heavily committed to the International automobile market and indications are that future new builds of Roll on Roll off vessels will also embrace LNG as a clean safe, environmentally superior fuel.

Without an LNG fuel source for these maritime vessels, air pollution issues will continue to impact the health of the region's citizens, and important Port business opportunities will be missed to the detriment and loss of high paying and important jobs throughout the community. Seattle and Tacoma have a significant opportunity to be among some of the world' best ports and to offer their key stakeholders the environmental benefits that LNG can bring today.

Thank you for your time and energy to review this important matter.

Sincerely,

Stephen Cadden
Chief Operating Officer
SEA\LNG, Ltd.

Steve: Thanks. Next up is Joy Caddock.

Joy: Joy Caddock. I'm Joy. And I grew up in this area on Puyallup land. And I've benefited from the love and the care that they've given this place. I pulled crab traps with my grandma, until she was 88. My brothers and I crabbed as well. And we grew up on Colvos Passage. My dad would yank us out of school to go see the orca pods go by and see how big their eyes are and how wonderful these creatures are.

[05:55:00] I went to Western Bellingham for school, and I was present in town, when those three boys were killed, in the Olympic pipeline explosion that devastated Whatcom Creek. I was outside in a field, when it happened, and I saw a big plume rise about 5 miles away looming large. The air was thick and not breathable. I chose to make my home here 12 years ago, and it was a gut feeling, and I wasn't wrong. I love it here. I work on an organic farm in Puyallup and spend my time in the shadow of our epic and living mountain. I'm proud to raise my kid, Shell, here. He's 4.

He's seen whales in his young life and had the privilege to breathe clean water and air. He'll be 16 in 12 years. So, the deadline for transitioning is coming up. I'm worried. I'm worried what the world is going to be like for him. So, when I was preparing for this, I realized that the SEIS and the project itself were just dissolving in my hands in ifs.

[05:56:00] There's like if we measure the global warming potential at 100 years, if we use data that's over 10 years outdated, if we get the gas from BC exclusively, if we use data from this one BC fracking site that's potentially underreported, if we don't have an overdue earthquake, if that earthquake doesn't cause liquefaction in the plant because it's on infill, if our expectant mountain doesn't erupt, if there aren't unforeseen leaks. It goes on and on and on. I know some things that are, and those are the things I mentioned in the beginning. And I'm not willing to change the things that are for those ifs.

And won't waste 12 years we have to transfer to renewable energy, if it's all ifs. I will not trade something I have, our lovely alien home for ifs.

[05:57:02] Please stand by your commitment to defend our future. Tell us what's in our air, and be good and wise stewards of our home. Please either deny the air permit or submit an accurate SEIS, based

1161-3 22. General Opposition
1161-3 12. LCA Inputs and Assumptions - Global Warming Potential Value
1161-3 5. Regulatory Framework

on the most current data that reflects the more applicable potency of methane at 20 years. And when you do this, I urge you to involve the Puyallup Tribe, as their input is paramount, and fill those vacant seats that Carlo mentioned, on the panel. Thanks very much.

From: Joy Caddock
To: Public Comment
Subject: Please deny PSE"s LNG air permit
Date: Tuesday, November 20, 2018 10:39:59 PM

Members of PSCAA,

To start, I appreciate we are on Puyallup land as we decide things that their nation is adamantly opposed to. Even just this reason should help you decide to deny the permit. They should be meaningfully consulted.

Most recent UN climate report put together by the intergovernmental Panel on Climate Change and hundreds of climate scientist say that in 2030, 12 years from now is a critical deadline to make "rapid and far-reaching changes" in order to keep global sea levels from rising and ensuring a more sustainable and equitable society.

These rapid transitions need to happen in land, energy, industry, buildings, transport and in habitual and perceptual changes about our society. Global net human-caused emissions of Carbon Dioxide would need to fall by about 45%---reaching net-zero by around 2050. Methane (LNG) would need to fall faster than that because it's even more effective at trapping heat than Co2. We don't have time for LNG. We should be spending these next 12 years changing course.

Co-chair of the IPCC, Jim Skea says, "limiting warming to 1.5 degrees Celsius is possible within the laws of chemistry and physics, but doing so would require unprecedented changes." Another co-chair, Debra Roberts says, **"This report gives policy makers and practitioners information they need to make decisions and tackle climate change while considering local context and people's needs. The next few years are probably the most important in our history."**

Which brings us to this moment in time in my dear Tacoma. My son took his first breath here, in a house that was built in 1896 by Weyerhaeuser. About 50 years before that house was built the first mill was built, establishing Tacoma as a logging town. The industry stuck and the Salish Sea was lost to greed. Such a beautiful place in the shadow of the mountain used so transactionally. But I wonder what the air was like then before so much industry had destroyed it's quality. I wonder what the water was like---so related to the air, I bet it was teaming with everything living. Orcas, Salmon, starfish. I've been in this area 40 years and I can see a drastic change. The wisdom of the Puyallup and Nisqually Nations was what helped keep this land so balanced.

This moment in time gives me a feeling of panic as I read these reports and try each day to make a life and future for my 4 year old. He'll be 16 in 12 years. I want him to have the best chance possible of seeing Orcas, breathing fresh air, drinking fresh water and not getting killed or injured by dangerous port projects. You know, what most mother's dream. I work on a farm in Puyallup near Chief Leschi School and Riverside Elementary and the most recent scrap metal yard fire was so toxic to us---more toxic still to the people detained at NWDC. There were no precautions taken within the facility. My throat was sore for a week after and since

1610-2 12. LCA Inputs and Assumptions - Global Warming Potential Value

I'm working there I'm more susceptible to colds and sinus infections. That air is already heavy with pollutants, adding a heavy hitter of a pollutant like methane into the mix that has a global warming potential of 96 times that of Carbon Dioxide at 20 years is suicide.

I urge you to please consider the most recent data on methane put out by the IPCC and develop another SEIS that reflects a time period closer to that 12 year period. That is a true cost calculation of air quality. Please don't waste the time we have to correct our course by letting a project go through that we have no possible way to come back from.

Thanks for your time and consideration,

Joy Caddock
817 N. I St.
Tacoma, WA
98403
253.970.3018

Steve: Thank you.

[06:17:00] So, the next group of names I'll call up here. Caitlin Calnan, Andy Wopler, Todd Mitchell, and Sarah Smith. So, Caitlin Calnan?

Caitlin: Good evening. My name is Caitlyn Calnan. I actually grew up down in Olympia, and I grew up driving through Tacoma all of the time. I never had the desire or want to grow up here, but I did make the move here four years ago for my career. and I've grown to love Tacoma, to embrace it. I'm excited to grow roots here and, eventually, grow a family here. And I'm here to add my voice to support for TOTE Maritime's conversion to LNG. I'd strongly urge the Air Agency to issue the required air permit to continue to document the environmental benefits.

This project did start under President Obama's EPA and has undergone the following independent environmental reviews, which speak for themselves. The Department of Transportation, the US Army Corps of Engineers, the US Coast Guard, National Marine Fishery Service, the list goes on from the Port of Tacoma to the Washington Department of Fish and Wildlife, the Washington Department of Ecology.

[06:18:06] The list goes on. All in all, what this data says to me and what do these studies conclude? Well, 1) building LNG facility is not only safe, but it's great for the environment. 2) LNG is a cleaner fuel than diesel. And 3) it concludes that that TOTE's conversion to LNG will reduce greenhouse gases by a lot, by 13.5%. I think this project has been poked, prodded, analyzed, and re-analyzed to death. As a resident here, I would encourage and strongly encourage the Air Agency to stay true to your mission. Stay to the science. Stay to the data, the facts and issue the air permit. I think there's a lot of emotion and a lot of opinions in the room.

So, again, I do encourage you to stay to the facts. And we'll never save this planet from climate change, unless we take major steps like TOTE's conversation to LNG. Thank you.

From: Alexa Camilleri
To: Public Comment
Subject: Public Comment: Fracking in Tacoma
Date: Monday, October 29, 2018 8:12:51 AM

Pugent Sound Clean Air Agency,

Fracking comes with a host of adverse health and environmental effects including (but not limited to) contamination of the groundwater, methane pollution (which contributes to climate change), air pollution, toxic chemical exposure, gas explosions, water shortages, and fracking-induced earthquakes. Fracking companies have tried to silence those who point out the harmfulness of the fracking process for a long time. Thousands of people will be in the refinery's "blast zone" and will suffer tremendous negative health effects. Even low exposure to the chemicals involved in fracking can harm the extremely sensitive endocrine system.

In addition, the draft Supplemental Environmental Impact Statement (SEIS) is incomplete and does not include all the data to successfully assess the impact of a LNG facility in the area. The draft should be completed, re-issued, and reopened to public comment. The SEIS is also using outdated Global Warming Potential (GWP) values for methane from 2007 instead of the 2016 numbers, making the LNG plant dirtier from an emissions perspective than staying with oil. All of the analysis on this facility uses the 100 year values for GWP emissions, but a recent report stated that we must change our energy fuel mix in the next 20 years or face catastrophic consequences. According to 350 Tacoma "using the most recent 20-year value of 96 makes the LNG plant 150% dirtier than the current capability." The draft also claimed that fracked gas from British Columbia has low leakage rates, but recent analyses show that fracking facilities tend to underreport their leakage rates, suggesting that the SEIS claim is questionable and needs further study. Furthermore, the analysis left out emissions data for diesel trucks that will need to be used for the transportation of water and sand necessary for fracking. All these points suggest that the SEIS draft is unfit to be taken at face value as an environmental assessment, as it leaves out vital information and ignores current science.

Lastly, I stand with the Puyallup tribe, whose treaty rights must be honored. Too long has this country ignored the treaties it has made with indigenous tribes, always to the detriment of the tribes' health and culture. The Puyallup people are closely tied to the Salish Sea, especially to the salmon they make their living on, which stands to become heavily polluted if a fracking refinery is built. The Treaty of Medicine Creek granted 2.24 million acres of land to the Puyallup and others in addition to protecting their fishing rights. As of 1974, the tribes named in that treaty were recognized as having the right to half of all fish caught on traditional lands. The LNG refinery that is being proposed sits directly on land legally owned by the Puyallup people and therefore cannot be built without the tribe's input.

Best,
Alexa Camilleri

Puget Sound Clean Air,

Thank you for providing the opportunity to review and comment on the PSE Tacoma LNG SEIS. It concerns me that, on one hand, the construction is already underway and, on the other hand, we haven't satisfactorily addressed critical elements of this project – not the least of which is whether the LNG approach proposed will actually reduce greenhouse gases.

I am a Tacoma resident concerned about climate change and our contributions to global warming. I'm also concerned about contributing to LNG demand and burgeoning hydraulic fracturing with its attendant ground water contamination and earthquakes.

Part of what makes Tacoma so special is its story of moving from a legacy of pollution to a community that can take pride in its industry and environment. While LNG is couched in terms of a 'bridge fuel' – it may be that the bridge is too short to be a true step away from 'dirty fossil fuels'.

After reading the SEIS, it appears to use old information, and it is missing data. The SEIS should be using the latest IPCC numbers when determining the global warming potential of greenhouse gases. It should also use the 20-year numbers instead of the 100-year, since this plant will only be operational for 40, and we'll see big impacts from the very beginning. When the 20-year GWP from the 2013 IPCC report is used, it shows that emissions from the LNG facility are actually 30-31% worse than the No Action alternative.

The SEIS is also missing really important information, like the carbon content of the gas to be used. This data is needed for a complete study, and until it's there, this SEIS is incomplete.

How will PSCAA ensure that the methane gas comes from British Columbia? And, is this an effort to keep the damages from fracking "not in our backyard?" If so, this is a short-sighted approach to environmental stewardship. The SEIS should also analyze the very likely scenario in which PSE will have to get its methane gas from the Unites States network – increasing demand for fracking and the attendant environmental damage in our nation.

Finally, the SEIS doesn't include smaller sources of emissions, like those from tearing the plant down. These smaller sources of emissions could add up to a big impact, and should be included in the analysis.

Because of these conclusions, I am opposed to the PSE Tacoma LNG project. Please update the SEIS, reissue it when it is complete and credible, and then re-open the comment period.

Thank you.

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

If the methane is accidentally released in the air, there is no way to recapture it and it is a greenhouse gas much stronger than carbon dioxide. We cannot risk polluting the air when there is no remedy available for clean-up. The location of this plant, next to superfund site and so close to residential area, is also a big concern, especially in case of fire. I strongly oppose the construction of this plant.

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

PSE's LNG project increases our greenhouse gas emissions and fuels climate change - which means more wildfires and smoke for our region. The resulting air pollution makes us sick and leads to higher rates of asthma attacks, heart problems and cancer in our communities. This is a terrible and toxic idea. Please do better.

Sincerely,

Rachel Carey

Subject: PSE LNG
Date: Wednesday, November 21, 2018 4:07:26 PM

Hello!

I did not make it to public comment on Oct 30.
28 years before, Oct 30 was also on a Tuesday, the Tuesday my life changed forever.
That morn I woke to my infant daughter deceased of SIDS.

Since that time I had a son, a young man plagued with respiratory issues.
I was going to show up and speak with you Oct 30 about Clean Air - and how I don't want to bury another child.

I was also going to approach the subject of "as above, so below", what affects our air also affects our water.
And as you know, our bodies are comprised of roughly 70% water. Literally, Water Is Life.
Everything on Mother is connected. We must consider impacts to the Big picture. If I thought the Big Picture would benefit from LNG I would accept the risks of living near a Plant that will annihilate me if there is an earthquake or storm big enough to cause power outage and explosion from lack of cooling. The fact this is being considered on a fault line in a lahar zone and residential area continues to astound me. Is there no common sense left?! At any rate, I see no reason to prepare for earthquakes as I am in the blast zone and will not need supplies.
Since there is no global benefit I wonder why we are being exposed to the risks?

I am not always tearful about my daughter - but as I processed what I would say to you that day I found myself unable to think or speak without tears. Had I made it there I doubt I could have relayed much beyond the tears.
If you want to get that full impact, just consider a short older woman with tears streaming and a big lump in her throat, perhaps enough heartbreak that others including you would have felt tears welling up.
Just be grateful I didn't do that to you!

And Please, Please, Please, Do The Right Thing and consider All the impacts
Thank You
Cheri Carlson

Dear Puget Sound Clean Energy Agency,
Thank you for allowing citizens another look at the Puget Sound Fracked Gas Project. As someone who has been actively engaged in environmental issues since reading an article on air pollution in Newsweek in 1968, I know well the need to move toward clean, renewable, energy. Continuing down the fossil fuel path is insanity in action. What else do we need to see to convince us that abating climate change should be out top priority?

I have children and grandchildren who are inheriting the the mess we have created by ignoring the facts and bowing to the profiteers who make millions on the backs of all living creatures.

Do not move forward with a report that is flawed as your basis of truth. Use the best data available, bravely speak the truth, and spare further degradation of planet earth --not to mention the ocean and coastline of the beautiful coastal sound you are responsible for.

Sincerely,
Darlene Carlson

November 21, 2018

Dear PSCAA,

I have been following this project for over three years now, and appreciate the efforts of PSCAA to evaluate the GHG emissions of its upstream and downstream sources via an SEIS. There are many problems with this facility: violation of indigenous people's treaty rights, potentially catastrophic risks, inadequate public notification, unfair public financial costs, corrupt tax breaks, local toxic refinery emissions, the environmental effects of fracking, (to name a few) but I will focus my questions on the GHG problem, which is the focus of the SEIS.

The first thing that I would like to address is: shouldn't the "no action alternative" analysis include more than just comparing LNG with just bunker diesel? Why no mention of electric or other alternative fuel options? Note: WA state ferries were targeted as being PSE LNG powered by this facility (noted in the FEIS) but have since been determined to go electric instead. Should not alternative fuels have been also compared, as this is being analyzed for effects over a forty year period? Electricity will surely become a greater source of power in the very near future in the shipping industry. And other sources of power, like ethanol, hydrogen, electric, wind, etc. These should have also been a part of the comparison. Please, incorporate these fuels in the comparison.

In regards to bunker diesel: what about cleaner diesel, like ultra light diesel or low sulfur diesel? It seems that comparing LNG use with diesel needs to be more carefully parsed out. Why were current diesel standards the sole comparison, especially over 40 years? To limit the comparison of GHG emissions solely to current worst case diesel standards while assuming best case methane leak containment (via Canadian gas) is not a fair comparison. What if the diesel was used via more controlled methods of "scrubbing"? What about other sources for diesel?

Which leads me to: what if Canada lowers emission containment standards (like the EPA just did in the USA)? Shouldn't there be higher, more controlled standards than just the vagueness of future Canadian fracking regs? Why limit the methane to be solely from Canada? Aren't there even better, less GHG leaking methods of gathering methane than Canadian fracking? Also, why do you accept the assertion that natural gas from BC is cleaner? Is this rooted in scientific evidence or based on self-reports from industry? "According to Natural Resources Canada, about 50 percent of Canadian gas was derived from fracking in 2014, and the figure is expected to increase to 80 percent by 2035." (Powell, Tarika. Is Your "Natural" Gas Actually Fracked? Sightline Institute. Web. 30 October 2017. www.sightline.org.)

LNG "hybrid" powered ships will still use diesel… what if it becomes price beneficial for the shipping industry to burn more diesel, less gas? They are not required to use the lng produced at this facility, so if they do not the GHG cost of the extraction, piping and refining will be in addition to the diesel. What are the GHG emissions that will be created as a result of the LNG not being used but still acquired and potentially sold for other uses?

1331-3 17. LCA Inputs and Assumptions - Peak Shaving
1331-4 12. LCA Inputs and Assumptions - Global Warming Potential Value

What about GHG emissions from catastrophic accidents, like the pipeline explosion on BC last month. Shouldn't events like that be analyzed and included in the study?

PSE has stated that the use of "peak shaving" gas from this facility will be used not only for residential gas customers, but also as a fuel to generate electricity. Should not there have been a comparison of other methods of generating electricity, like sustainable sources like wind, solar, tidal, etc.? Methane is not the only way to generate electricity. Other methods should have been compared in the analysis, no?

Building the facility in Tacoma will (and has already) incorporated the use of large amounts of sand, concrete and steel. What are the GHG costs of this construction? Also, GHG emissions will be produced in the fracking process itself, not only via leaks, but also via the construction, production and maintenance of the site. Those emissions were not a part of the SEIS analysis and should be.

The SEIS analyzed the facility as producing 250,000 gallons of LNG per day, but the FEIS states clearly that PSE intends to produce up to 500,000 gallons per day. The SEIS should take this into account.

Also, a relatively small portion of the LNG is likely to be used for ship bunker fuel and peak shaving. PSE intends to tanker truck, pipe and (potentially) tanker rail it out for other uses, which cannot be compared to diesel GHG emissions, as methane may be used as a fuel in production for many things, not just diesel powered industry. LNG has become a fuel for vehicles . (An LNG gas station for vehicles recently opened in Fife.) Yet, electricity is already a fuel for automobiles and trucks. The GHG cost of this facility should also consider its use as a vehicle fuel, replacing not just diesel, but gasoline and electricity. Also, the FEIS of this project states that it intends to fuel locomotives, but no analysis of how that would compare with other energy sources (like electricity) are considered.

LNG has become a valuable export commodity and it is being shipped overseas, burning fuel to distribute it. What would the GHG effect be if LNG is exported from this facility? The Trump administration has made it clear they intend to beef up its "energy dominance" agenda by fast-tracking the permitting of small-scale liquefied natural gas exports. Despite PSE's claim that they do not intend to export it, if the feds give them the green light, this may well become the way this LNG is being used. Shouldn't the SEIS consider the other possible uses of LNG than just bunker fuel and peak shaving?

My final point and question is this: The SEIS compares GHG emissions of LNG vs. diesel over a hundred year period, but the effects of GHG as methane are much worse in the short term. We are facing the tragic effects of GHG emissions NOW, not just in 100 years. Why did the SEIS analysis not weigh the IMMEDIATE effect of this LNG facility on GHG emissions? I think for this reason alone the SEIS needs substantial re-analysis.

Thank you,
John Carlton
Tacoma Resident

Carole: Thank you. Cathy Carruthers? Lloyd Madden?

Cathy: Hi. I'm Cathy Carruthers.

Carole: Oh, I'm sorry. I can't see back there.

Cathy: It's squealing when I talk. Can we stop the squeal, or should I just keep going? I'm losing my time. The LNG plant permit does not preclude uses beyond the diesel displacement and heating. It, therefore, will increase total natural gas use, in this area. The LNG plant can actually generate more throughput than your estimated calculations.

[02:53:00] That means that, in addition to the numbers that have been suggested by environmentalists, you need to increase the amount of natural gas throughput. Second, a mini split heat pump is more cost effective than natural gas. As people discover this, the winter demand for natural gas will decline, creating more excess throughput, which could be used for exports. What the first two points mean is the LNG plant will, eventually, have sufficient natural gas to sell for use beyond the current stated uses. It will, therefore, increase greenhouse gases generated by exporting LNG.

Please revise your GHG estimates based on the maximum throughput. Please revise the job estimates based on job loss from exporting LNG outside of the United States.

[02:54:00] Thank you.

Subject: Puget Sound Energy's LNG facility
Date: Monday, November 19, 2018 5:24:24 PM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

These are the many reasons I oppose the LNG Plant in Tacoma:

1. The Puyallup Tribe has not given its consent to PSE's project and has filed lawsuits against its construction, based on its significant threat to Treaty-protected fishing rights, and has subsequently garnered significant and broad support from both local community members and the Affiliated Tribes of Northwest Indians.

2. Reducing pollution from greenhouse gases is a critical policy objective of the State of Washington and Governor Inslee has affirmed his commitment to supporting the Paris Climate Accords.

3. Natural gas is now recognized as a powerful contributor to climate change, peer-reviewed studies having overwhelmingly found that emissions from fracking, and leaks along the supply chain effectively override the otherwise lesser environmental impacts of gas usage.

4. The PSE plant would require an ongoing supply of fracked gas from offsite wells, exposing communities near those wells to deadly toxins and carcinogens used in the fracking process, and to permanent pollution of their local waters.

5. The proposed plant includes an 8 million gallon LNG storage tank, equivalent of 4.8 billion gallons of natural gas in vapor form, with catastrophic explosive potential in a metropolitan area.

6. Siting of the facility in the Cascadia fault zone, a region at high risk of earthquakes and tsunamis, and in an area that will be regularly flooded by 2050 due to sea-level rise and seasonal inundation, would pose an extreme and unacceptable hazard to local residents.

7. The facility is sited adjacent to EPA Superfund sites and overlaps a Washington Department of Ecology Hazardous site, exposing thousands of people within a 3-mile radius to toxins and carcinogens during construction, in violation of federal law, leading to an increased risk of cancer, neurological disorders, birth defects, respiratory issues and other chronic health issues.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Dear Friends at Puget Sound Energy: I believe your environmental impact statement only refers to the Co2 emissions produced by the extraction and transportation of fracked liquid natural gas. As anyone can understand, these two steps are only the first in a string of developments that have a very bad impact on the environment. When we start trying to balance our trade bottom line with Asian or other countries that would purchase this LNG, we imply that conversion to green energy can still be left to some vague future, and the green energy systems that these countries can begin creating can also be put off-at least until all nations have made as much money from fracked products as possible. I believe that we must start the ambitious conversion right now, and I'm sure there are many others here in the North West who feel the same.

Dear Puget Sound Clean Air,
Having read the Coalition Letter to PSCAA (signed by Todd Hay, 350 Tacoma and many other local concerned citizens and organizations), I am very concerned that PSCAA may be using outdated and inappropriate science in its Supplemental Environmental Impact Statement (SEIS) for greenhouse gas emission for the Puget Sound Energy liquefied natural gas facility in the Port of Tacoma.

At this time, when we know that the consequences of global warming are dire, it is essential to use the most current science when evaluating potential new infrastructure. I urge PSCAA to address the technical concerns raised in the letter noted above. Additionally, I urge PSCAA to ensure that a revised and reissued update of the SEIS that is consistent, includes all relevant data, and uses correct units of measure be publically posted with adequate time for review and a new period for public comment.

Thank you,
Rebecca Chaney

Carole: Thank you, Ms. Shimeall. Chris Chapin.

Chris: Hello. My name is Chris Chapin. Thank you for holding the hearing today and taking the time to listen to us. I'm a resident of Redman, Washington, and I'm an athlete. I go out into the mountains every single weekend. I'm a skier. I'm a hiker. I'm a camper. I'm a rock climber. And I see the impact that putting more carbon into the atmosphere, putting more methane into the atmosphere is having on our mountains here in Washington.

[00:12:00] Think about when you were a child, and you went to the playground. You probably had a good time. You probably had a lot of fun. I'm 37 years old. I'm still a child. Every weekend, I go out into my playground, into the mountains. And what we experienced this August, record levels of smoke, it's not new, right. It happened the year before that, the year before that. It's happened the last five years. I'm losing my playground. We're all going to lose our playground, if we don't stop putting pollution from burning fossil fuels into the atmosphere.

We've reached a point, in civilization, where we can power everybody's home with clean, renewable energy, with solar panels, with wind, with hydro. The fact that we're even having a discussion about burning more fossil fuels and putting more pollution into the air is outrageous to me.

[00:13:00] We don't need to do that anymore. I'm glad you came up with this plan, and you want to see some profits from it. I'm glad it's moving a lot on the right timeline. But we have new information just released two weeks ago that we've got 10 years before climate catastrophe. So, it's time to table these plans and think about how we can preserve our playground, how we can keep going outside, enjoying our life because, if we don't, you know what you can do with all of that money that we make out of it?

Yeah, you can wipe your tush with it because that's about all it's going to be good for. I appreciate your time. Thank you.

Carole: Thank you. So, the next group of five is Councilmember Annette Bryan, Lou Paulsen, Erin Dilworth, Jason Hagey, and Bill Adams.

Subject: Puget Sound Energy's LNG facility
Date: Friday, November 16, 2018 10:50:18 AM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

The Draft SEIS is Incomplete – There are at least 10 places in the study that have "placeholder" values instead of actual data. We request that the Clean Air Agency complete the draft SEIS, re-issue it, and then reset the public comment period so that we may better formulate our questions about this project.
I do not believe that the LNG facility is in this state's best interest and cannot condone its contribution to climate change that will have major negative effects on all of us.

Sincerely,

Hannah ChapmanDutton

Subject: Request to speak at the Public Hearing about PSE's Tacoma LNG Plant
Date: Sunday, October 28, 2018 6:49:06 PM

I am a life-long resident in the Puget Sound Area. I am an Energy Engineer so I can provide interesting details on the plant. I would like to speak at the 2:00 PM session October 30 at the Rialto Theater.

Please call or e-mail if there are any question for me.

Thank You.

Puget Sound Clean Air Agency - PSCAA
ATTN: Public Comment on DSEIS, PSE LNG Project
1904 Third Ave, Suite 105
Seattle, WA 98101

As a life-long resident of the Puget Sound area, with an energy engineering background, I am supporting PSE'S LNG facility at the Port of Tacoma.

As To The Comments Against the Project That I Heard At The Public Hearing at the Rialto Theater on October 30, 2018:

In my opinion most of the opinions against the project were not based on science or energy engineering principles. As an example:

I. Several people used the 'firecracker' analogy that the LNG facility that it could explode like a gigantic firecracker, putting residents living near the Tacoma Waterfront in fear the LNG plant exploding like a nuclear bomb. Science tell us that is physically impossible.

II. The gentleman that spoke from the very back of the theater, claimed LNG causes Tuberculosis is an incorrect statement. The opinions from organizations such as the Mayo Clinic (https: //www. mayoclinic.org/diseases-conditions/tuberculosis/causes state that the bacteria that the cause of tuberculosis are spread from one person to another through tiny droplets released into the air via coughs and sneezes, and not from the presence and usage of LNG.

III. The opposing opinion that natural gas sourced from Canada via the fracking process will be dangerous to people living in the Tacoma and the Puget Sound region is not factual. Using the fracking process has been approved by many government agencies, as a safe natural gas. The small amount of natural gas sourced from Canada with traces of natural gas created by the fracking process will not have any significant impact when burned by ships, trucks, and busses using LNG as the fuel source.

IV. I recall only one person speaking against the project having any engineering degree (but not a degree in energy sciences).

V. Since the many permitting agencies have approved the many stages of the LNG projects construction, it seems to me that those experts have determined this is a very safe facility.

VI. In closing, from my performing due diligence for published data on any dangers of LNG, e.g. Risk Factor of Liquefied Natural Gas, https:// www. Researchgate .net, I could not locate supporting data to back up opposing the LNG facility listed.

Benefits of Puget Sound Energy's Tacoma LNG Facility:

In my opinion, the major benefits this facility will provide, **to all of us**, will be:

1. It will provide PSE's residential and commercial customers with natural gas reserves to assure us an adequate natural gas supply **in case of a major emergency.**

This is significant due to the recent natural gas pipeline explosion in British Columbia and resulting pipeline shut down, which impacted the Northwest Region, in mid. October, of this year. Utilizing e-mail and local media, PSE asked customers to temporarily reduce hot water usage and lower furnace thermostat temperature settings to conserve natural gas supplies.

If the rupture would have occurred in very cold weather, like January or February, this would have been a major impact to our personal comfort; and may require businesses with high natural gas usage to reduce their usage or possibly suspend operations.

The British Columbia pipeline and other natural-gas pipelines serving PSE, are always vulnerable to interruptions. Hence, **natural gas reserves are very important**.

2. The Tacoma facility will provide local transportation companies, like TOTE Maritime's Alaska cargo vessels, with a significantly cleaner fuel alternative. We will have the cleanest shipping fleet on the West Coast.

3. Reduces the risk of cargo ship's diesel or bunker fuel spillage in both Commencement Bay and in Puget Sound, particularly during ship refueling.

4. We all wish for cleaner air and water here in the Northwest for ours and our family's health.

LNG significantly reduces:

- Virtually all particulate emissions from the many ships traveling through Puget Sound. By switching to LNG fuel, we can reduce 85% of harmful particulate emissions.

- Reduces Green House Gases by 15%.

- Reduces Sulfur dioxide emissions by over 99%.

- And reduces Nitrogen oxide emissions by nearly 85%.

These pollutants also impact marine life

5. Since the use of LNG is forecasted to increase, the Tacoma facility will meet the new needs of LNG powered trucks, busses, and hopefully cruise ships in the near future.

To me, this is a, 'What came first, the chicken or the egg' example. If there is an LNG facility, LNG usage will increase, since there is a refueling facility close by to serve new LNG customers more LNG vehicles come to the Puget Sound region.

6. PSE's LNG facility will create 125 permanent, well paying, full-time employment positions.

7. PSE's LNG facility will help local employers like TOTE remain competitive in the Northwest. LNG users may pay lower emission taxes and fees and face lower costs of meeting emission regulations.

8. LNG usage is not new technology. The LNG industry has had an exceptional safety record for the past 50 years. PSE has safely operated the LNG facility in Gig Harbor for nearly 14 years, without an incident.

9. Many of the speakers in favor of the LNG Facility were business people and well recognized local organizations, and not owned by PSE, spoke about the many advantages of the facility and what it meant to them.

10. My last item: From the positive facts I heard at the Public Hearing, I believe the risks are minute small vs. **all the advantages of LNG**. We travel in cars and airliners, feeling safe, **knowing the risks are also very small.**

Thank You

Puget Sound Clean Air Agency - PSCAA
ATTN: Public Comment on DSEIS, PSE LNG Project
1904 Third Ave, Suite 105
Seattle, WA 98101

As a life-long resident of the Puget Sound area, with an energy engineering background, I am supporting PSE'S LNG facility at the Port of Tacoma.

At The Public Hearing at the Rialto Theater on October 30, 2018:

Several paid consultants for the Puyallup Tribe testified at the hearing that "The Puyallup Tribe opposes the siting of this facility".

They stated the tribe was not meaningfully consulted about the project by PSE. The Tribe considers PSE's Tacoma LNG facility a "threat to its lands, waters and people"; and also "poses significant and potentially catastrophic threats not just to their fishing rights and resources, but to their homeland, people and neighbors".

In my opinion:

1. In my opinion, just stating that LNG facility is a "threat to its lands, waters and people to me is an emotional statement without any facts being offered.

2. The consultants did not specify specific threats in engineering terms to adequately explain the threats. Fifteen government agencies have granted permits before and during construction, so that means to me this is a safe project.

3. If the issue that PSE did not meaningfully consult the Tribe about the project could cause a delay for the latest permit, I feel the Tribe's consultants should send to PSE a complete list of their concerns and questions, to enable PSE to respond back in engineering terms, so PSE's report can be properly reviewed by the Puget Sound Clean Air Agency and the other permitting agencies.

Thank You

Steve: Thank you. Next up, Carolyn DeFord. Juan Jose Chavez?

Juan: Good evening. Sorry, you guys have to put up with all of this all night, but you signed up for it. The last time I was here, I had my young daughters dancing ballet on this stage. And that's why I'm here tonight. I'm not here for me. My time is limited on this earth, just like a lot of people.

[06:27:00] But I'm trying to speak for the people who haven't come here in several generations. Somebody mentioned the south. You guys know that the south is known for a polluted area. Some things got shoved down their throat, without having educated crowds speaking against it. Another thing that I was thinking about today, I was trying to see what I had to say. In 1933, doctors were giving people cigarettes as a healthy option. And we all know that cigarettes are bad for you. But they didn't know that back then. They were like hey, it's a new thing. Once they added their chemicals to it, it became addictive.

It took 20 years for people to figure out they created cancer. Same thing here, people. They have a 50 year option because they know this is a long term thing.

[06:28:00] Now, I hate for you to make those decisions, but I don't want to find out 50 years from now that what your decision was was bad. I think, to me, the best option for this is that, just like cigarettes, we agree that we don't know. Nobody is rushing us. The president, the first thing he did was kill the EPA. Think about that. Corporations are people. And they benefit. But I don't want them to benefit in my children's fish, my children's trees.

I don't want them to benefit on the fact that because we think that they're going to know what our air is going to be like – they're claiming that they know how they're going to clean up our air in 90 years from now or 50 years from now because they don't even know. Thank you.

Date: Wednesday, October 24, 2018 1:40:24 PM

Dear Responsible Official,

I am relieved this huge project - and environmental disaster - has been halted. Hooray for careful analysis and measured thinking. Please choose to make our world cleaner, not sicker. No good has come from fracking; it has only prolonged our dependence on oil and sped the way to rising temperatures. It's frightening, truly.

Please stop the project.

From: Barbara Church
To: Public Comment
Subject: Tacoma LNG SEIS
Date: Friday, November 16, 2018 3:39:10 PM

Puget Sound Clean Air,

Thank you for providing the opportunity to review and comment on the PSE Tacoma LNG SEIS.

I am a Tacoma resident concerned about climate change and our contributions to global warming. Part of what makes Tacoma so special is its story of moving from a legacy of pollution to a community that can take pride in its industry and environment.

After reading the SEIS, it appears to use old information, and it's missing data. The SEIS should be using the latest IPCC numbers when determining the global warming potential of greenhouse gases. It should also use the 20-year numbers instead of the 100-year, since this plant will only be operational for 40, and we'll see big impacts from the very beginning. When the 20-year GWP from the 2013 IPCC report is used, it shows that emissions from the LNG facility are actually 30-31% worse than the No Action alternative.

The SEIS is also missing really important information, like the carbon content of the gas to be used. This data is needed for a complete study, and until it's there, this SEIS is incomplete.

How will PSCAA ensure that the methane gas comes from BC? The SEIS should also analyze the very likely scenario in which PSE will have to get its methane gas from the Unites States network.

Finally, the SEIS doesn't include smaller sources of emissions, like those from tearing the plant down. These smaller sources of emissions could add up to a big impact, and should be included in the analysis.

Because of these conclusions, I am opposed to the PSE Tacoma LNG project. Please update the SEIS, reissue it when it is complete and credible, and then re-open the comment period.

I am a retired educator and private sector data analyst/consultant. I have spent 37 years working with data and research. I was trained to look at studies and models with a critical eye toward reliability and validity. It is well known in the industry that there is a research study to support any stand. Looking at the DSEIS studies concerns me. The GWP values are extremely outdated. A 2007 IPCC AR4 report looks out to 100 years showing a GWP value of 25. Many would like you to look no further. I not only encourage all decision makers to look to the 20 year GWP number which is nearly three times that of 100 years, but to

(over)

look to the most recent scientific study which is currently 2016 showing the GWP values at 96 for 20 years and 32 for 100 years.

I plan to be still living here in 20 years and the quality of my life will greatly depend on the quality of our air, land and water.

Look to current studies! Pay attention to the data that will impact residents for years to come. You will all be remembered for your thoughts and actions.

Sincerely,
Jim Chmiel

Dear Puget Sound Clean Air Agency,

I have lived here all my life. I have taken environmental stands for my family and communities. I have seen big money side steps regulations in order to bring in a project with an LLC at the end with minimal accountability. PSE has a bad track record of disregarding proper process, blatant disregard for public process, and poor emergency related care of impacted communities. No trust.

Please include this in the final supplemental environmental impact statement.

1831-1 12. LCA Inputs and Assumptions - Global Warming Potential Value

From: fireangel@everyactioncustom.com on behalf of Leslie Cirigliano
To: Public Comment
Subject: Tacoma LNG SEIS Project Comment
Date: Sunday, October 21, 2018 10:13:48 AM

Dear Responsible Official,

Thank you for your decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct this more rigorous analysis.

Scientists' are learning daily of methane's impact on the climate. Incrementally, they learn that fracking allows a higher amount of methane to escape than previously thought. They are also discovering more negative impacts of methane on the environment. Short term is even more serious than had been previously understood.

This project has a serious impact on the global climate. If the following points are taken into consideration, it should be grounds to deny the Notice of Construction application.

Based on current IPCC analysis (AR5), Methane should be counted as 86 times more potent than CO2. Also, consider what it will do in 20 years, not 100. In 100 years, none of us will be here so we really don't need to worry about it. No urgency. But in 20 years, it will impact us all.

In British Columbia, (according to recent research which offered more realistic results), the impact of fracking and of methane in our atmosphere has, up to now, been dramatically under-estimated.

Only if Tote Marne were to use low-sulfur marine gas oil over heavy fuel oil, and install selective catalytic reducers and diesel particulate filters, (which is not part of the plan) can they lower SOx and NOx emissions.

Fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion or many other alternatives besides fracked can be used by Tote Marine to achieve a 50% GHG reduction, which is what they can realistically accomplish. None of this is part of the plan either.

In short, IPSE should provide electricity using renewable energy, not fracked gas, for cleaner energy efficiency.

Thank you for the opportunity to comment.

Sincerely,
Leslie Cirigliano

1838-1 12. LCA Inputs and Assumptions - Global Warming Potential Value

From: Jeremy Clark
To: Public Comment
Subject: Tacoma LNG SEIS
Date: Wednesday, November 21, 2018 3:38:41 PM

Puget Sound Clean Air,

Thank you for providing the opportunity to review and comment on the PSE Tacoma LNG SEIS.

I'm writing to you because I'm extremely concerned about the global climate crisis, and the immense challenges it presents to my generation. My name is Jeremy Clark, I'm 14 years old, and I'm a freshman at Cleveland High School in Portland, Oregon. I'm writing because the Supplemental Environmental Impact Statement (SEIS) you've conducted for the Tacoma LNG facility has major flaws, and doesn't provide the accurate or contextualized knowledge needed to make this decision. For example, the SEIS considers the impact of methane in the span of 100 years, despite the fact that methane does far more damage in the first 20 years of its life in the stratosphere than the 100-year span the SEIS provides. The impact it provides also comes from data from 2007, which is unacceptable considering that more recent data exists. With the recent and dire Intergovernmental Panel on Climate Change (IPCC) projecting that we have just 12 years to dramatically reduce our greenhouse gas emissions, it only makes sense to examine the effects of methane during the time it matters the most: right now. The SEIS also fails to acknowledge any emission sources that produce less than 1% of the total emissions of the project. The cumulative impact of these emissions is actually quite substantial, and thus should be included in the statement. For these reasons, and for the sake of my generation's future, I strongly urge that the PSCAA revise the SEIS and include information that allows us to see the full picture.

Because of these conclusions, I am opposed to the PSE Tacoma LNG project. Please update the SEIS, reissue it when it is complete and credible, and then re-open the comment period.
Sincerely,
Jeremy Clark

Portland, Oregon 97202

Carole: Thank you. Bliss Moore? William S. Clark?

[01:29:00]

William: I am 91 years of age. I was brought to Tacoma Washington, when I was 7 years old. I stayed in the Cushman Indian Hospital. I had tuberculosis. I spent three years there. At that time, there was a lot of plague of the Native people. Many of them died and buried over in that graveyard from tuberculosis. They don't know where it came from, who they are. Also, I have experience watching a tanker blow up down here near Atlas Foundry. We saw big smoke in the air, a man was killed. I also was in a hotel over in Port Angeles, when I was young, about 1973, with a new car. I was traveling around the coast, around the circle.

And I thought I'd been traveling long enough, and I wanted to stop overnight. So, I stayed in a hotel over there. First, I walked around the city to find a hotel I could stay in. And I finally decided I liked this hotel, so I went back there. I'm sitting in my room on the third floor reading my paper deciding whether I wanted to go to the restaurant, the bar downstairs to have something to eat or something to drink.

[01:30:01] It's getting late at night. I'm sitting and reading my paper. And I'm reading the paper, and I figured I'll read the paper and go downstairs. Then, I hear a big explosion, a whopping, big explosion. And the building shook. The floor sunk. The walls tipped. People were running all over the place, flames flying up in the street. It went dark, dust flying down out of the building. Dirt and dust flying all over the place. A tremendous explosion. I heard something about a bomb. I had natural gas in my house for many years. It's very volatile. It can blow up at any time. If you have it, you've got to have it under pressure.

You've got to have a technician to handle that stuff. It's very volatile. Even a spark can set it off. Electrical current can set it off. We're talking about we had a smelter down here one time. What did they put the smelter down here for? A big stack 450 or 550 feet in the air. Polluted the air, killed vegetation all over the country. The good thing is we got industry, jobs, jobs, jobs.

[01:31:02] We had a gas pipe down here one time, originally on the tide flats. I've been around here since about 7 years of age. They had a plant down here that manufactured gas on what is now this little inland waterway where it dug in. That place is the most polluted part of

the country yet. I don't think they ever got rid of the pollution down there. It was tremendously polluted. Tacoma seems to have a problem gathering crap, industries that put out crap. Burn all electricity, tons of electricity that they use for something that could be used for homes and people just for jobs.

I'm a little tired of this. I think Tacoma should start throwing away all of these people with these ideas. There's other ways of powering ships. I've seen ships out at sea blowing smoke out their stacks, tremendous black smoke. And I can understand maybe you need a cleaner way of doing it. That's absolutely true. However, we don't need to collect more industry putting people's health to risk.

[01:32:03] It's a dangerous situation you're talking about. You want to die? Put that gas plant down here. Who is going to guarantee that million ton, whatever it is, that 90 foot power down there isn't going to blow up? Thank you.

Name Josh Clearman

Address or email 3621 South L St, Tacoma WA 98418

Please approve the permit for the LNG plant. I am a tacoma resident ~~which~~ who wants greater energy security and no more bunker fuel.

I encourge you to recomend to PSE to buy gas from producers that limit methane leaks and emissions.

Thank you

Steve: Thank you. Next up is Rene Cournoyer. Josh Clearman?

Josh: Thank you all. And thank you for hearing us today.

[04:58:00] And thank you to my fellow folks here. And welcome to everyone from out of town. My name is Josh Clearman. I live in Tacoma. And I've lived here for six years with my kids. And before this, I lived in Key West, Florida where I was the co-author of the Climate Action Plan. My students and I installed the first wind tide grid tide turbine in the Florida Keys. We installed a 25,000 watt solar array. And I'm coming before you to fully support the LNG project. It is natural gas, as people have said, definitely has its problems. But I want to give another number out there, and it's 365.

That's the number of days that myself and my co-workers on Hilltop and my kids breathe bunker air. As you and your authority for Puget Sound air quality, I ask you to get the bunker fuel air out of the Puget Sound. Thank you.

[04:59:00]

Steve: So, before I get to the next five, just a heads up, the group after that will be LaDonna Robertson, Joanna Shoetler, Bret Stein, Dave Gering, and Norma Ramirez. So, next up, and I'm probably not going to do this justice. Saiyare Refaei. Sorry, if you'd state your name, so we can get it right.

Saiyare: Saiyare Refaei. Thank you for the opportunity to speak. Thank you for those who sacrificed to be here today. I send gratitude to the Puyallup Tribe of Indians whose land we currently occupy as a product of colonization and genocide.

[05:00:02] They continue to lead our justice work today. I would also like to lift up the immigrant detainees in the northwest detention center in Tacoma tide flats who do not get a say or maybe even know about the LNG plant that could have overtly harmful effects, given that their current emergency protocol is to stay place. My name is Saiyare Refaei, and I work at the Diversity Center at Pacific Lutheran University as the coordinator for sustainability integration. I am also a community artist. And this year, I was appointed to the city of Tacoma's Commission on Immigrant and Refugee Affairs.

Yet, I come to you today as a concerned, exhausted but not defeated, Tacoma resident. I want to share a memory. The evening

on July 18, 2017, I joined friends in the Tacoma tide flats to stand with the Puyallup People and community members, elders, families, and children. We held space unarmed peacefully and delayed unlawful construction for three hours through marching, song, and prayer.

[05:01:03] I was also taking pictures to share with those who were unable to attend. By the third hour, I remember Puyallup Tribal member, Dakota Case, coming to the large group and telling us the police are starting to get hostile. To please not do anything disrespectful. We held space long enough today, and we can come back tomorrow. As a couple of my friends and I were returning to where we had parked, we noticed a tinted, unmarked minibus that an officer entered suited in riot gear. My friend overheard the officer say, "Not today, guys."

I, frantically, messaged a couple of friends who were still in the larger group to make sure that they knew about the militarized presence that was there and hoped that they would get home safe. In the coming days, I learned that PSE was paying Fife police to be out there. Not for the protection of concerned community members, but to protect their profits and project that they were unlawfully constructing.

[05:02:02] Every time I see a PSE logo or greenwashed LNG ad, I think of that moment when PSE chose to invest in militarized force over hearing and respecting the wishes of the community they are supposed to be serving. They could have put all of our lives at risk. And I'm grateful to be standing here in front of you today. I truly hope the supplemental environmental impact statement is redone properly before denying the LNG permit. Our community has already experienced enough trauma over the last year because of this project. Thank you.

Subject: Puget Sound Energy's LNG facility
Date: Thursday, November 15, 2018 7:20:22 AM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

PSE's LNG facility will emit toxins such as benzene, toluene and xylene - causing cancer, asthma, birth defects & other health problems for people living and working near the facility. People detained inside the NW Immigration Detention Center & people living on the Puyallup Reservation will be impacted first and worst by this toxic air pollution.

Sincerely,

Heidi Cody

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. Scientists make clear that we cannot, and must not, allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.

I have a numbers concern with this draft SEIS:
1. It is incomplete. There are several sections that are missing data and so we can not accurately assess the quality of the report and understand how certain conclusions are reached. Because of that, I request that you complete this report, reissue it, and then reset the public comment period so that we have time to review the completed report thoroughly.

2. Even in the existing incomplete report, I do not see credible evidence of that emissions will disappear.
To the contrary:
- The SEIS is not using the best available science for the Global Warming Potential (GWP) of methane. It uses the 100-year GWP of methane and not the 20-year value which is much more relevant given the urgency in addressing the climate crisis. The appropriate 20-year GWP value to use is 96.
- This facility is projected to have a 40 year lifespan, so why does the report project out to 100 years, which is 90 years beyond the time we need to have taken decisive action?
- The SEIS claims emissions benefits from customers that Puget Sound Energy simply does not have. According to PSE and the City of Tacoma, the only maritime customer is TOTE with its two vessels which have already delayed their conversion to consume LNG. Securing new customers (there are only just over 100 LNG ships in operation out of a worldwide fleet of 90,000) as well as the additional permitting could take years and is not guaranteed.
- The SEIS says that emissions will only be reduced if the natural gas comes from Canada, because leakage rates are reportedly lower there than in the US. Shockingly, most leakage rates were self-reported by the fossil fuel industry based on models and recent measurements taken in the field have shown that leakage rates are much much worse.
- How can it be guaranteed that PSE is sourcing its gas from BC anyway? Their recent filings show they relied on gas from BC, Alberta, and the US. And with the recent pipeline explosion in BC that interrupted PSE's supply, we know it's not always available.
- When ships use any fuel, a certain percentage of it escapes without combusting through the exhaust system and into the atmosphere. This is known as slippage and the SEIS uses a lower rate than is considered best practice.

2557-1 10. LCA Calculations
2557-2 12. LCA Inputs and Assumptions - Global Warming Potential Value
2557-3 12. LCA Inputs and Assumptions - Global Warming Potential Value
2557-4 19. LCA Inputs and Assumptions - End Use
2557-5 14. LCA Inputs and Assumptions - Leakage/Slippage
2557-6 13. LCA Inputs and Assumptions - Natural Gas Source
2557-7 14. LCA Inputs and Assumptions - Leakage/Slippage

Thanks again for initiating this crucially important review of this facility and I hope that you will take best available science into consideration when revising this draft SEIS.

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

I promise you that lawsuits will be filed if this committee votes against public safety. Assurances are meaningless.

Sincerely,

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

The risks taken with the project will not be worth the lawsuits to come. And come they will. I have family in Tacoma, and I do not want them exposed to more hazards than they already. They rent a house for 2,000.00 per month, but cannot trust their water supply, or have a sense of safety with that LNG tank looming in the port. I sense that hundreds of residents oppose any further development of fosoil fuel based industries ! When will enough be enough ? We urge you to please study impacts carefully before you vote.
Thank you.

Sincerely,

Lissa Coleman

Dear Responsible Official,

How does the world stand a chance at a clean, safe future if we allow projects like the Puget Sound Energy and Tote Marine to proceed.

Fracked gas is not a lesser evil, as science has shown it allows MORE methane escapement than previously observed and the impact of methane on the climate is even more serious than previously understood.

Thanks for the decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct this more rigorous analysis. Any analysis should reflect pertinent facts:

1.Methane is 86 times more potent than CO2;

2.The estimate amount release volume should AR5 not AR4 and reflect 20 not 100 years;

3. Replace the “no-action alternative” with a clean, renewable, efficient source e.g. electricity;

4. Revise the “no-action alternative” to include that Tote Marine must achieve a 50% GHG reduction, in line with the International Maritime Agency’s established goals.

5. Agree the project will not move ahead without the approval of the local Puyallup Tribe.

I believe incorporating the revisions above will result in a more accurate analysis.

It will also demonstrate the project has a significant and unmitigated negative impact on global climate than can be tolerated for the Earth to survive, which is a solid basis for denial of the Notice of Construction application.

Thank you for your time and consideration of these comments.

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

I am appalled at the draft analysis!
Common sense coupled with the reality that clean renewable energy is a more ecological AND profitable solution makes it absurd to even need an analysis. Isn't the recent IGCC report enough? Aren't the heightened California fires enough? It is time to say No more fossil fuel infrastructure and let's get on with healing and restoring the health of our planet and our economic system. Thank you. And I highly recommend you read Drawdown, edited by Paul Hawken, and go to his website to identify the kinds of projects we need to invest in!

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

I am only a 'pass through' visitor to Tacoma. However, I had the opportunity a year or so ago to go to Vashon Island. Since I had never seen the ferry part of the city I arrived early to explore. I was pleasantly surprised by my drive along the bay...walking trails, businesses and homes looked very inviting.

Because I had heard about the potential LNG site I visited the area around TOTE. I was saddened by the state of the bay in that area and my son informed me it was a superfund site. I saw areas where remediation through planting was being undertaken.

It seems ironic to be developing one part of the citiy's waterfront for residential and recreational opportunities while trying to build a major climate exacerbating facility closeby.

Unless you truly believe climate change is a hoax, one can only conclude that allowing industry to capitalize on the glut of fracked gas by permitting the continued expansion of fossil fuel facilities is a cynical disregard of the increasing awareness of what lies ahead if we continued down this path of willfully abetting climate disruption.

I urge you to reconsider the science that makes this project untenable and do not permit more nails in our environmental coffin.

Attachments: Tacoma LNG.pdf

Hi there,

Attached are my comments on the proposed Liquefied Natural Gas facility in the Port of Tacoma.

Thank you,
Logan Cornwell

11/20/2018

Public comment regarding the Draft Supplemental Environmental Impact Statement for the Tacoma Liquefied Natural Gas (LNG) facility.

I attended the evening portion of the public comment event at the Rialto Theater on the October 30th There were a couple of points that were brought up that I want to review again.

First, the disrespect for each other was unacceptable and I am sorry we couldn't have a respectful debate. I would like to point out that the Big Oil companies paid employees to attend the hearing when everyday workers took the time out of their day to attend. The everyday workers included Nurses, Scientists, Tribal Members, Teachers, Students, Parents, and concerned citizens. The residents of Tacoma came to voice their opposition to this project. Younger generations have limited say on the future but still teens showed up for the public comment event. I am a 16 year old and with the direction our world is going, we can't afford a 40 year commitment to fossil fuels. Tacoma needs to be a leader in the fight against climate change.

TOTE Maritime already meets the International Maritime Organization's standards for clean emissions, LNG would just be a way for them to shave down the cost. There was a 2.9 earthquake in Tacoma the very same day as the hearing. This presents a danger to the residents of Tacoma, we face many potential threats including an active volcano, earthquakes, tsunamis, fires, the list goes on.

There have been several fires in the Port of Tacoma this year, we could smell the smoke from our home miles away. This would quite literally be adding fuel to the fire. This would seriously hurt the residents of East Side as well as the detainees at the Northwest Detention Center since their emergency plan is to shelter in place.

The native Puyallup Tribe made it clear that they were not meaningfully consulted before the start of this project. We need to respect their input and not let the past repeat itself.

I urge you to reject this proposal, this SEIS is missing key information as pointed out at the public comment event.

I appreciate you taking the time to listen to our concerns,
Logan Cornwell

[01:40:00]

Carole: Thank you. Michael Cox?

Michael: Hello. My name is Michael Cox. I work for the US Environmental Protection Agency for 25 years in Washington DC and EPA Seattle office. My last job prior to retirement, I was a climate change advisor for EPA, and my job was to help governments, business, industry reduce their greenhouse gases and adapt climate change. So, I first want to thank you for doing this EIS. I think it shows that you place an understanding on the project's climate impacts and the importance of it.

However, after reading the draft environmental EIS, I believe it does not accurately capture the climate impacts from the project and ask that you revise the draft and then provide an opportunity for public review and comment prior to making a final decision on the air permit.

[01:41:03] As you know, the assumptions that are made in this type of analysis drive the results. Based on my experience, which I have some working int his field for many years, an understanding of the project. I believe the current assumptions used in this analysis underestimate the greenhouse gas emissions. And I'm not going to go into the details of those. You've already heard those. So, in conclusion, I want to remind you of your organization's long term vision for the region's air quality and climate that was so well articulated in your 2014/2020 strategic plan. The vision included three aspirations.

First, all of the people and natural systems in our region benefit from clean air and healthy air, at all times, regardless of socioeconomic status or geographic location. Second, our region does its part and more to protect the environment.

[01:42:03] And finally, everyone in the region must play an active role in achieving this vision. In my judgment, to honor this vision, I think you must modify the draft EIS to better characterize the climate impacts from this project and then, provide an opportunity for public review and comment prior to making a final decision on the air permit. Thank you for the opportunity to comment, on this important topic.

1894-1 22. General Opposition

Name

Puget Sound Clean Air Agency, 1904 Third Ave, Suite 105, Seattle, WA 98101
ATTN: Public Comment on DSEIS, PSE LNG Project
Dear Puget Sound Clean Air Agency,
I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to deny the permit because the Draft Supplemental Environmental Impact Statement does not accurately represent the true greenhouse gas emission profile of the project. I have the following specific concerns:

RECEIVED
NOV 19 2018
Puget Sound Clean Air Agency

The IPCC report tells us that we have only 10 years to stop using fossil fuels. This infra-structure would lock in this use of gas for 40 years. We can not do business as usual.

_____(Check here to continue comments on the other side).

In addition, a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required and adequate consultation with the Puyallup Tribe and other neighbors of the project should be conducted.

Name: Linda Craig Email: linda@quimbyclub.org

Address: 3433 NW Quimby St., Portland, OR 97210

Date: Saturday, October 27, 2018 9:19:38 AM

My family lives on the south end of Vashon. Our island directly faces and is often downwind of the proposed site for the Tacoma LNG facility. To my knowledge, this next door neighboring community has not been directly consulted or considered in your review.

The people of Vashon have long been familiar with airborne threats from Tacoma. For many years, our soils as well as the Puget Sound waters were showered with deadly poisons from the Asarco smelter plume. Today, ocean-going freighters frequently anchor close to our shores. Some nights I can smell their exhaust, hear their engines.

The proposed project worries me. It sounds like Tacoma could become an international LNG distribution hub. Will the proposed facility bring more freighter traffic, more fouled, even toxic air? How can I know there won't be leaks or a major accident?

I need reassurance that my community's air and health will be kept safe. The current DSEIS fails to provide that reassurance and does not answer my questions (see above). Accordingly, I strongly object to permitting the PSE LNG project as proposed.

Thank you for considering my comment.

Puget Sound Clean Air,

Thank you for providing the opportunity to review and comment on the PSE Tacoma LNG SEIS.

I am a Tacoma resident concerned about climate change and our contributions to global warming. Part of what makes Tacoma so special is its story of moving from a legacy of pollution to a community that can take pride in its industry and environment.

After reading the SEIS, it appears to use old information, and it's missing data. The SEIS should be using the latest IPCC numbers when determining the global warming potential of greenhouse gases. It should also use the 20-year numbers instead of the 100-year, since this plant will only be operational for 40, and we'll see big impacts from the very beginning. When the 20-year GWP from the 2013 IPCC report is used, it shows that emissions from the LNG facility are actually 30-31% worse than the No Action alternative.

The SEIS is also missing really important information, like the carbon content of the gas to be used. This data is needed for a complete study, and until it's there, this SEIS is incomplete.

How will PSCAA ensure that the methane gas comes from BC? The SEIS should also analyze the very likely scenario in which PSE will have to get its methane gas from the Unites States network.

Finally, the SEIS doesn't include smaller sources of emissions, like those from tearing the plant down. These smaller sources of emissions could add up to a big impact, and should be included in the analysis.

Because of these conclusions, I am opposed to the PSE Tacoma LNG project. Please update the SEIS, reissue it when it is complete and credible, and then re-open the comment period.

Steve: Thank you. Michael Foster? Jessica Lee? Bill Crawford?

Bill: Good evening. My name is Bill Crawford. I've worked for TOTE for 15 years. I wanted to just take this opportunity to thank you for being here tonight and giving me the opportunity to speak.

[06:10:05] I'd say it's been extremely humbling and sad, quite frankly, I think, listening to a lot of the comments tonight. We all want to do the right thing for the environment. Although I live in West Seattle now, I grew up here in Federal Way on the hill. I went to school up there, elementary, Illahee Junior High, Decatur High School. I spent my childhood passionately fishing Puget Sound and these waters. I still do a lot today, with my son. TOTE is committed to the environment. It's a part of our core values. And we have a proven track record to show that, to prove that.

And that's been expressed, I think, numerous times tonight, just in terms of what we've done with rain gardens, shore power, etc. The fact is that LNG is the cleanest available fuel source in the shipping industry.

[06:11:00] And we've been at the forefront of this for several years. And we're very, very proud about the work that we've done. And we're looking forward to completing what we've done. LNG is widely used and viewed as the best alternative to diesel because its uses directly reduces the emissions that were discussed tonight. CO_2, nitrogen oxide, particular matter, and carbon dioxide. Any and every delay that is made to this transition of burning cleaner fuel means that increased pollution will be caused by bunker fuel, which is the only other possible source, which was also mentioned.

So, this project is good for the environment. It's good for Tacoma and South Sound. It's good for labor. It's good for jobs. And it's safe. Because of these facts, we ask that the project move forward without delay.

[06:12:03] Thank you.

It is important and necessary to consult the Puyallup Tribe before building a facility such as the LNG plant on their treaty protected land, endangering sacred waters. This consultation never happened, that is NOT okay. A similar plant had an explosion in Canada recently. How is the PSE Fife LNG plant any safer than Canada's? Take the advice from the Puyallup Tribe. They've been here longer and know the land better than you. Do not put the Puget Sound / Puyallup River on danger!! Take all of our comments seriously and to heart. WE DO NOT CONDONE THE CONSTRUCTION OF LNG PLANT!

Puget Sound Clean Air,

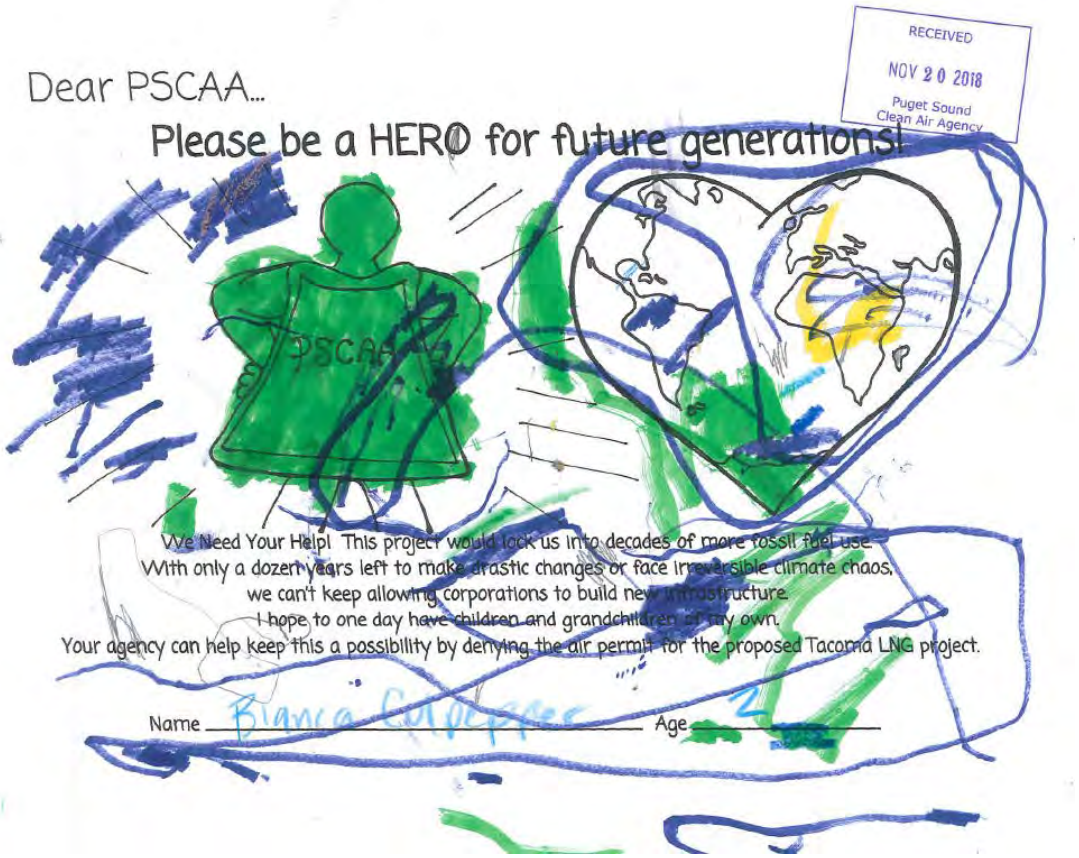
Thank you for providing the opportunity to review and comment on the PSE Tacoma LNG SEIS.

I am not a Tacoma resident. But I have family and many friends in Tacoma, and I visit regularly. And all of us are very concerned about the advent of an LNG facility on the Sound.

I have read the SEIS. It appears to purposely use old information, and my son, who is a biologist working in Tacoma pointed out significant missing information as well.

The SEIS should be using the latest IPCC numbers when determining the global warming potential of greenhouse gases. It should also use the 20-year numbers instead of the 100-year, since this plant will only be operational for 40, and we'll see big impacts from the very beginning. When the 20-year GWP from the 2013 IPCC report is used, it shows that emissions from the LNG facility are actually 30-31% worse than the No Action alternative.

The SEIS is also missing really important information, like the carbon content of the gas to be used. This data is needed for a complete study, and until it's there, this SEIS is incomplete.



How will PSCAA ensure that the methane gas comes from BC? The SEIS should also analyze the very likely scenario in which PSE will have to get its methane gas from the Unites States network.

Finally, the SEIS doesn't include smaller sources of emissions, like those from tearing the plant down. These smaller sources of emissions could add up to a big impact, and should be included in the analysis.

Because of these conclusions, I am opposed to the PSE Tacoma LNG project. Please update the SEIS, reissue it when it is complete and credible, and then re-open the comment period.

Dear Puget Sound Clean Air Agency,

I am a nurse, a mom, and wife to a firefighter. I'm also a former 911 operater and police/fire/medical dispatcher. I am VERY concerned about the safety of the proposed LNG plant. My children will be attending schools within the LNG plant's zones. My husband and I could be working within a zone. We could be injured ourselves, or caring for victims. There will be no response plan until the plant is operational! This shows a complete lack of concern for the safety and wellbeing of the residents of Tacoma. The plant is dangerous and the lack of a health assessment and ERP is extremely reckless.

Please include this in the final supplemental environmental impact statement.

To: Public Comment
Subject: please carefully reconsider negative health impacts of PSE"s proposed LNG plant.
Date: Wednesday, November 21, 2018 8:33:25 PM

Thank you for carefully reviewing testimony from local residents about PSE's proposed LNG plant in the Port of Tacoma. I am Rachael De Souza, and I live and work in Tacoma. I current work as a nurse in one of Tacoma's major hospitals. I've also worked at the Tacoma Pierce County Health Department's Environmental Health Division, in the asthma education and home health programs. I have a Masters degree in Community Health Nursing, with focus on Environmental and Occupational health, from UW Seattle. I also have a Masters degree in Public Health, again with a focus on occupational and environmental health. I've worked in and published peer reviewed research on programs addressing the negative impacts of air quality on human health, as well as worker safety programs.

I'm writing today to respectfully request you carefully reconsider the impacts on human and environmental health of PSE's proposed LNG facility in your SEIS process. I ask you for to consider the full impacts of harvesting, transporting, and burning LNG in our area, and also compare that to the other reasonable alternatives.

To many people, this project feels legitimately confusing, because LNG indeed burns cleaner at its point of use, and so in some senses "will clean up the port." Health professionals actually have supported LNG before. For example, there have been planning processes in Long Beach/LA, in which health professionals actually supported LNG, over diesel, because it "burns cleaner." In my experience as an occupational health professional, doing respirator fit testing for industrial workers, I understand how bad it is to be exposed to air contaminants day in and out. I also have worked with families who have kids with asthma living around the port of Seattle and also here in Tacoma, and so I understand wanting a cleaner burning fuel in the port.

Yet, while LNG may burn cleaner, it's still producing air contaminants, which port workers of all people will breathe in every day. That's why, with regard to worker health, I believe LNG is not "a step in the right direction," as industry says, but rather simply a smaller step continuing in the wrong direction. If we really want to move in the right direction, and protect worker health, we need to truly clean up the port, which means electrifying all operations. That would eliminate air pollution exposure. We can't pretend that we value health of workers and local folks and "cleaning up the port" if we don't push for electrification. Electrification is a real possibility in the port of Tacoma, presents job opportunities, and protects worker health and community health.

The only alternative considered in PSCAA's supplemental SEIS is "doing nothing/status quo." I ask that your organization consider, or at least acknowledge, the option of electrification of port activity. If we compared LNG to electricity as a port fuel source, we'd realize that LNG is not the best option for workers. Also, if we consider the best science available, we'd realize that harvesting, transporting, and burning LNG worsens air quality for workers and local residents more than simply keeping things they way they are (TOTE currently uses electricity when in our Port, producing zero emissions). I urge you to protect our health with true integrity, by comparing LNG for other reasonable alternatives in the port, including electrification.

{lease carefully reconsider the many negative health impacts of PSE's proposed LNG plant in Tacoma. After your careful review, I hope you learn that their dirty project does not have human health's best interests at heart, and you deny PSE the permits it seeks for this project. Thank you for your time and attention. I look forward to hearing from you.

Sincerely,
Rachael De Souza

Subject: Puget Sound Energy LNG Project
Date: Tuesday, November 20, 2018 9:18:42 AM

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

First of all, I want to thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. I am a member of the Oregon Nurses Association's (ONA) . In 2018 House of Delegate's Statewide Convention overwhelmingly voted in support of a resolution to say NO to the Jordan Cove Liquified Natural Gas (LNG) This project presents an extreme threat to individuals and communities, including indigenous lands.
ONA is a professional association for nurses in Oregon. A non-profit association with over 12,000 members, ONA is a constituent member of the American Nurses Association. One of ONA's mission is to use collective power to advocate for healthy communities.
This LNG project poses a risk to clean safe drinking water which is just one of many dangers it poses to public health in Oregon and our region. The proposed LNG Facility's starting point is fracked natural gas wells throughout North America, both in the U.S. and Canada. Fracking injects a deadly mixture of water, known toxic chemicals, and sand under extremely high pressure up to two miles underground. Some of this toxic fluid remains underground, seeps into ground water and can contaminate drinking water.

Thank you for letting my share what the largest nurses association in Oregon feels about LNG and fracked gas. What happens to Washington will affect Oregon and visa versa-especially its role in climate catastrophe like we are seeing, feeling and breathing from Paradise California right now.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Please stop the ridiculous plan to build a liquified natural gas refinery, storage and distribution center in the Tide flats area of Tacoma. This area is very prone to earthquakes and we all know the big one is coming, making this explosive facility a great danger to the community.
It is absurd to be adding such a fossil fuel emitter in this age of global warming catastrophe. WA people stayed indoors for 3-4 weeks this summer due to mega-fires caused by climate change. We do not need to be contributing to fossil fuel emissions by adding this LNG facility in Tacoma.
Please stop this LNG development as well as all future proposed LNG developments in WA for once and all.

Dear Port of Kalama, and Cowlitz County,
Dear Puget Sound Clean Air Agency,

The Kalama Methanol and Tacoma LNG projects must be stopped. A leak of gas on the Columbia River would create a dead zone killing wildlife and making the water dirty. As someone who loves to hike, swim, camp and Kayak, this would negatively impact my ability to enjoy the great outdoors.

Please include this impact in the Final Supplemental Environmental Impact Statement.

Dear Responsible Official,

Hi:

The IPCC has given us a clear warning that we must urgently STOP USING fossil fuels.

Fracked gas is BAD SCIENCE.

It pollutes throughout a watershed, and can have severe seismic repercussions.

Fracking allows unacceptable methane escapement.

The impact of methane on the climate is worse than previously thought.

Please revise the analysis to account for the following:

= Methane should be counted as 86 times more potent than CO2 based on the current IPCC analysis (AR5 rather than AR4) considering a 20 year timeframe (rather than the 100-year).

= Revise the analysis of the impacts of fracking in British Columbia based on recent research demonstrating that methane escapement has been dramatically under-estimated.

(Emmaline Atherton et alia, 'Mobile measurement of methane emissions from natural gas developments in northeastern British Columbia, Canada,' Atmospheric Chemistry and Physics, 17, 12405–12420, 2017.)

= Revise the "no-action alternative" to include a clean energy alternative in which PSE provides electricity not with a different source of fracked gas, but with renewable energy and energy efficiency.

= Revise the "no-action alternative" to include the assumption that Tote Marine will achieve a 50% GHG reduction, in line with the International Maritime Agency's established goals.

This reduction might alternatively be achieved by a combination of fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion or many other alternatives besides fracked LNG.

(https://researchgate.net/figure/CO-2-emission-reduction-potential-from-individual-measures-classified-in-5-main_fig2_315837106)

For clean local emissions requirements, Tote Marine can achieve virtually all of the localized lower-particulate and lower SOx and NOx benefits claimed for LNG propulsion by opting for low-sulfur marine gas oil over heavy fuel oil, and installing selective catalytic reducers and diesel particulate filters.

(https://en.nabu.de/imperia/md/content/nabude/verkehr/140702-nabu-backgroundpaper_containerships.pdf)

= This more accurate analysis will show that the project has a significant and unmitigated impact on the global climate, which
should be seen as a sufficient basis for denial of the Notice of Construction application.

Thank you for analyzing the life-cycle of the greenhouse impact of this project, and to conduct this more rigorous analysis.

Dr. Demian

Sincerely,
Dr. Demian

To whom it may concerns,

This is a public comment for Puget Sound Energy's disastrous LNG project. PSE has shown its incompetence and its history needs to be included in the FEIS. Here are a few examples:

-You (the PSCAA) issued a notice of violation because PSE started construction without going through the agency's process. These small penalties do not affect big polluters like PSE.
-PSE did not evaluate tank safety & risks, only looked at small pipeline leaks
-PSE "safety recommendation" to handle leaks are for staff to wrap towels around leaks. LNG is
minus 260 and causes cryogenic burns or even death when in contact with the human body
-In 2016, a PSE gas line exploded and destroyed the Greenwood neighborhood in Seattle. They were fined . PSE has not taken care of the community after the explosion. How will they manage a dangerous situation with the LNG facility? Since they are a Limited Liability Corporation, they will most likely pack up their things and leave since they won't be held liable.
-PSE has constructed the LNG without the proper permits. How can we trust them to uphold the conditions of the air permit? They have completely disregarded the public including the ratepayers.

I hope the PSCAA grows a spine and does not allow this to go on any longer.

I am a Tacoma resident and taxpayer.

Sincerely
Margaret Demick

Hi,
The below article went out to Tacoma Pierce County Chamber of Commerce subscribers.
I wanted to write to strongly suggest that for future communications or articles, please describe **any** acronyms at the beginning of the article, and then it is ok to use the abbreviation from that point on. It is very frustrating and exclusionary to make the assumption that everyone knows what you are talking about….please never assume.
In the below article you use LNG and Draft SEIS ? I want to understand.

Thank you for your time, I hope you will give my comments some consideration.
Warmest regards
Alexis

ADVOCATE
FOR SOUTH SOUND JOBS

Join the Chamber in advocating for jobs in our industrial and maritime community at the LNG Hearing **Tuesday October 30th, 2:00-5:00pm and 6:30-10pm at the Rialto Theater**.

We expect a large turnout of people who are misinformed about LNG.

We need your voice to talk about the benefits – LNG replaces bunker fuel; LNG is better for air quality, and our region's economic well being, including businesses that utilize manufacturing, shipping, and logistics, depends heavily on the presence of a deep-water port.

If you cannot attend, please contact Puget Sound Clean Air Agency by November 21st and share your thoughts.

Talking points are:

- Environmental benefits of the conversion to LNG for both local and global air quality include 99% reduction in particulate matter, 90% reduction in nitrogen oxides, and 13.5% reduction in greenhouse gases as cited in the Draft SEIS
- Non-approval of the air permit would lead to increased dependence on diesel bunker fuel, which sends high levels of particulate and sulfur into our local air quality.
- We need to keep our Puget Sound ports competitive since ports around the world are building LNG facilities and the maritime industry is converting to LNG as the best available fuel to power their ships.

Learn more about the LNG Project here.

The draft supplemental environmental impact statement must be completed and especially consider the environmental and cultural impacts to the Puyallup Tribe and other Tacoma residents. The Puyallup Tribe has fishing rights as well as land rights in the Port of Tacoma. Constructing a tank will allow leakage of greenhouse gases that will damage health already struggling salmon, shellfish and other water beings. Culturally, the land and salmon are an essential part of the Puyallup people. Killing the Puyallup culture is equal to genocide. This cannot be allowed. Also, LNG tanks and transportation of fracked gas leaks greenhouse gases! These gases and ~~that~~ its sheer quantity make LNG in the port of Tacoma worse than coal in terms of clean air contamination. Take into account the long-term greenhouse gas effects on global warming using peer reviewed science. How long do we have ~~before~~ the Port is underwater due to sea level rise? Please consider these points. Please consider Puyallup culture. The earth and life on earth is at stake.

A supplementary environmental impact statement is necessary for the proposed liquified "natural" gas storage tank that Puget Sound Energy wants to build in our port. I live a few miles from the proposed site (in the Lincoln Business District in South Tacoma) and I don't want gas fumes leaving into the air near me. It's our duty to protect the air around us, let alone all the air pollution caused by fracking to get the gas out of the earth. Fracked gas must be stopped! I am 38 years old and before I am old enough to retire from my job at the Tacoma School District the air in Tacoma will be too polluted for me to walk outside due to greenhouse gasses such as those loaded by fracked gas. We can't leave Tacoma residents and the Puyallup Tribe (who has title to the land under the proposed tank) pay the price for Puget Sound's corporate benefits. Please remember the children.

Subject: LNG SEIS
Date: Friday, November 16, 2018 12:57:05 PM

To The Puget Sound Clean Air Agency:

Regarding the recent Supplemental Environmental Impact Statement for the LNG plant proposed for the Tacoma Tideflats: I am concerned that the SEIS does not effectively calculate the impact of greenhouse gas emissions. Firstly, the statement calculates the impact over 100 years. However, methane's heat-trapping capacity is much greater in the short term and then diminishes. A very short window is left us to reduce GHG emissions and avoid the worst impacts of GHG-caused climate change. Therefore, a net reduction over 100 years is not a useful finding when it is the next 20 or 30 years that are critical for reducing GHG emissions. We also know that the heat-trapping capacity of methane is much greater than the 2007 figure the SEIS uses. This figure may indeed be the one used by government agencies as we await an EPA update to reflect the latest findings of the IPCC, but the urgency of our current situation demands that the environmental impact statement use the figure we know to best reflect reality rather than government protocol. And furthermore, on the assumption that BC wells have a good record in preventing methane emissions, the SEIS calculates a net reduction in methane emissions only if the natural gas is sourced from British Columbia. And yet recent research indicates that emissions from gas wells in BC are much greater than previously reported.

The overwhelming evidence is that the SEIS has greatly underestimated the increase in methane emissions that will be caused by the LNG plant. I ask the Puget Sound Clean Air Agency to issue another draft environmental impact statement for public comment that is based on the best information currently available.

Sincerely,

Felicity Devlin
2417 N Washington St.
Tacoma, WA 98406

Carole: Thank you. Erin Dilworth?

Erin: Hi. My name is Erin Dilworth. I am the policy and technical program manager at Citizens for a Healthy Bay. And I live here in Tacoma. CHB reviewed the SEIS and found it to be alarmingly incomplete and misleading. I will be sending a longer, more detailed comment letter but wanted to speak today to give a quick summary of our findings.

[00:20:02] The following is a list of just a few of the issues CHB found with SEIS. 1) The SEIS uses outdated information. Why use global warming potential numbers from 2007, when we have updated information from the intergovernmental panel on climate change? I understand that the Washington Administrative Code is delayed in getting updated with current IPCC science. That does not preclude the Clean Air Agency from exploring these avenues and its analysis. It's as easy as changing an equation in your protected Excel spreadsheet. 2) The SEIS ignores near term climate change impacts.

Using the 100 year GWP for methane grossly underestimates the amount of climate changing pollution that will enter the atmosphere during the life of the facility. The 100 year GWP has no real scientific significance and is only mandated under the RCW for consistency across agencies.

[00:21:00] And that's not good enough for us. Again, the Clean Air Agency is not precluded from exploring alternatives in its analysis. It requires just a couple of clicks of the mouse to show what the near term impacts will be. 3) The SEIS is still using placeholder values. It's incomplete. A very important passage from the SEIS states, "Note that the emissions from the LNG facility plus upstream emissions are higher than those for the no action alternative. However, the carbon content of LNG results in lower end use emissions, so the net life cycle greenhouse gas emissions are reduced under most circumstances.

So, the entire conclusion that using LNG will result in lower end use emissions rests on the carbon content of that LNG. Your own analysis states that placeholder values are being used for the carbon content because you're still waiting on that information from PSE. So, the analysis is incomplete. And what are the circumstances when the net greenhouse gas emissions aren't reduced?

[00:22:00] 4) The purported greenhouse gas emissions reduction from this

1138-1 12. LCA Inputs and Assumptions - Global Warming Potential Value
1138-2 12. LCA Inputs and Assumptions - Global Warming Potential Value
1138-3 10. LCA Calculations
1138-4 13. LCA Inputs and Assumptions - Natural Gas Source

project also rests on one other huge assumption. That all of the methane gas will come from British Columbia and that BC's gas supply system produces less fugitive emissions than the US's. How is the Clean Air Agency going to enforce that? And what happens, in a likely scenario, that PSE can't obtain all of its gas from BC? The SEIS left out any analysis of impacts that would occur, if the gas came from the US network. That needs to be included, so that the analysis is based in reality.

Because of the significant data emissions and analysis choices that obscured the real impacts of this project, CHB requests that the analysis be done again. Use the best available science, look at the impacts over a range of timeframes, explore more than one alternative. Once the SEIS is complete, it should then be re-released for public review, and a new comment period should be opened. Thank you for taking the time to hear us today.

Puget Sound Clean Air Agency

ATTN: Public Comment on DSEIS,

PSE LNG Project,

1904 Third Ave, Suite 105

Seattle, WA 98101

November 18, 2018

To PSCAA:

My name is Roger Martin. I am a retired Air Force combat pilot. Subsequent to that retirement, I worked as a training developer and instructor for the B-2 stealth bomber's initial cadre of pilots, then a systems engineer for military systems, and then a manager specializing in proposals for major defense contracts. I hold a BA in Biology and Oceanography from San Jose State College and an MS in Systems Management from the University of Southern California. I am currently the coordinator for my church's Greening Activity Group at United Church in University Place.

I am strongly opposed to acceptance of the 2018 Supplemental Environmental Impact Statement (SEIS) for, and to the installation of, the LNG facility proposed for the Tacoma Tide Flats. This is for several reasons.

1. First, the location.

   We have learned that this construction location is in a) a known earthquake-fault area; b) a tsunami hazard zone; c) on land fill; and d) adjacent to Native American tribal land. For an installation that is to contain pressurized flammable gases, mixed with toxic, volatile organic compounds, in an installation that will reportedly stand 16 stories tall that is near highly populated urban areas, and be an installation and within a few miles of the West Coast's primary north-south roadway is pretty-near insane. In my lifetime, I have observed from a distance, and among other events related to manmade facilities (not in order): a) the Three Mile Island nuclear meltdown; b) the Chernobyl nuclear meltdown; c) the Exxon Valdez grounding and oil spill; d) the Deep Water Horizon explosion and oil spill; e) the Fukushima Daiichi earthquake and tsunami nuclear disaster; f) numerous railcar de-railings, chemical and petroleum leaks, fires, and explosions; g) the Shell Oil Kulluk floating oil-rig disaster (twice in one trip!) between Alaska and Washington State; h) leaks of natural-gas storage facilities (most notably Porter

Ranch in Southern California); i) numerous leaks along existing oil pipelines, including the Keystone XL and feeder pipelines; and j) one I will recount in more detail here, based on my eyewitness observation.

I was married in a full military wedding on February 2, 1969 in Santa Clara, California. Not having a lot of money, we decided to honeymoon on the beach in Southern California, complete with a drive in our two-seat, red, British TR-4 convertible, along California Highway 1. Our first night of the trip was going to be in Carmel by the Sea. Our second night was going to be in Santa Barbara, where we had dinner reservations at the end of the pier. So, on February 4, 1969, we went to that restaurant and saw oil-soaked pelicans and seagulls bobbing around in the water under the restaurant--from the Santa Barbara oil spill. 'Heck of a honeymoon, but a real lesson for a freshly graduated biology/oceanography major and newly commissioned military officer.

Although I am likely to come back to some of these issues later, I wanted to lay down some markers here. I will proceed to other matters below before coming back to detailed reflection. The big point here is that in every case, when these projects and facilities were proposed, each was going to be using the latest, greatest, most-foolproof-possible safety measures to prevent any possible accident that could ever occur, and that if one ever did occur (which we are told simply *can't* happen), it would be resolved quickly and without any damage or loss of life, because we had thought of everything and prepared for every contingency, and the government would make sure every rule and promise would be followed and kept.

2. Indian treaties

- (Quoted from the *Advisory Council on Historic Preservation Handbook* [ACHP]:) "The National Historic Preservation Act (NHPA), (16 U.S.C. Section 470f) Section 106, requires federal agencies to take into account the effects of their undertakings on historic properties and provide the Advisory Council on Historic Preservation (ACHP) a reasonable opportunity to comment on those undertakings. communication that may include written correspondence, meetings, telephone conferences, site visits, and e-mails." And, "Consultation constitutes more than simply notifying an Indian tribe about a planned undertaking."
- In addition, the Environmental Review Toolkit, published by the Federal Government, says, "The National Environmental Policy Act of 1969 (NEPA) requires the preparation of an environmental impact statement (EIS) for any proposed major Federal action that may significantly affect the quality of the human environment. The statutory language of NEPA does not mention Indian tribes. However, the Council on Environmental Quality regulations do require agencies to contact Indian tribes and provide them with opportunities to participate in various stages of preparation of an EIS."

- According to several speakers at the recent Tacoma public hearings on the proposed SEIS for the LNG facility, these consultation requirements have not even been minimally met.

3. Data are not current or accurate

   As was reported by numerous speakers at the Tacoma SEIS public hearings, the original, proposed EIS had incomplete and inaccurate data for computations used to support the Study's findings. The data in the former EIS relied heavily on information that had been available in 2007. "Placeholder" data were used in that study, based either on best-available values from studies up to that time, or estimates based on best guesses. More-accurate data were understood to be inserted as time went on and real studies were done with ever-improving and -widening information became available from better equipment and additional sampling and trend analysis. Reportedly, such data became updated in 2009, and later in 2013. Fortunately, there was an additional full IPCC report very close to submittal of this SEIS. And, although available, none of the latest data were used in the proposed SEIS. Indeed, many of the original best-guess placeholders from 2007 are still in the new document, even though new, and real, data are available.

   The Tacoma SEIS public hearings provided clear and consistent insight into how inclusion of best current data would affect the findings of the proposed SEIS. Environmental impact and possible damage from gas leakage and accidents are grossly underestimated in the current study, based on the outdated information contained in there. One witness—a college teacher (he claimed)—stated that greenhouse-gas leakage, by his quick calculations using new, accurate numbers, were roughly 2.5 times as great as those presented in the proposed SEIS.

I would like to get back to some of my earlier reflections. Specifically, I'd like to get back to some of the nuclear-plant lessons. At least, three nuclear power plants were somehow built right next to the open ocean: Diablo Canyon and San Onofre in California, and Fukushima Daiichi in Japan. At that time, several people who studied oceanography (I was an oceanography student back then) had already warned that predicted greenhouse gases would raise the sea level. But they built these plants there anyway. Brilliant, eh? The movie *The China Syndrome* was, fascinatingly, shot largely at Diablo Canyon. This was not one of the plants that did melt down. One of those that did was in Ukraine (then part of the Soviet Union), and the other was in the middle of a river in Pennsylvania.

The worst nuclear-plant disaster can be disputed as either Chernobyl or Fukushima. Again, promises were made that the safety designs were impeccable. At Fukushima, nothing could happen that could not be overcome by the wonderful safety standards that

Japan had put into place. (Apparently, nobody noticed the big ocean outside, even after all the movie monsters that had come out of it going back decades before.) People were allowed to build residences and businesses ever closer to the reactor as time went on—after all, what could happen? Other nuclear plants had been around, and hadn't blown up or been overwhelmed by a tsunami. So, why should this one? And it had been built to handle earthquakes, anyway, right? And *to government safety standards! Right?*

Then, the earthquake and the tsunami hit in 2011. In that accident, there were three nuclear meltdowns, multiple hydrogen explosions, and an estimated 1600 deaths, from a "safe" nuclear plant, because somebody had studied all the possibilities and nothing could happen that existing designs and safety procedures couldn't handle.

San Onofre was the first of the two, aforementioned US coastal plants identified for decommissioning. For a while, talk was that they could re-start it after an attempt to repair and replace parts that wore out before their initial studies had said they would (What? Overoptimistic estimates?). They also looked at what happened at Fukushima two years earlier, and perhaps started to notice that the sea-level rise predicted when they originally designed the plant was a bit underestimated (Gee, do you think so?). So, in 2013, they shut it down, never to be opened again.

Now, folks have decided it might be smart to pull the plug on Diablo Canyon too. There seems to be a trend here: Building facilities with stuff that can blow up and also contaminate a populated an area near where there are earthquakes and possible tsunamis might not be the indication of high intelligence.

So, for building on fill: San Francisco has some experience with that. In 1906, they had an earthquake. After the quake, they decided to use rubble from the earthquake and some dredging from the Bay to build a location for the Panama-Pacific International Exhibition, which then became the Marina District. In 1989, the Loma Prieta Earthquake hit at the very summit of Highway 17 between San Jose and Santa Cruz, and the land fill in the San Francisco Marina District liquified from the vibrations. In addition to water mains breaking, natural-gas (hmmm) lines broke, and fires broke out. Because of the broken water lines, water from the Bay had to be used to extinguish the fires. Land fill and gas lines have a history of being a bad idea then, don't they?

In San Francisco, there are two other buildings that were subsequently built on land fill. They are the Millennium Tower luxury high-rise, and the new bus terminal, built closely to each other. The Tower is sinking and has been discussed on several TV shows, including *60 Minutes*, and the other is the new bus terminal, which has shown structural cracking before it has even opened for regular business. How much is that all going to cost to make safe…or not? Furthermore, the entire area known as Foster City, just south of San Francisco International Airport, is sinking, at the same time the sea level is rising.

Foster City was built on land fill. And PSE (an Australian company, by the way) thinks it is just fine to build a 16-story-tall container of explosive and toxic gas onto land fill in an earthquake and tsunami zone. Brilliant!

As somebody who was college-trained as a scientist, flew in combat, authored training and technical publications both at the Air Force's Headquarters Strategic Air Command, and later, for the most-expensive combat airplane ever built, and in the defense industry was the principal manager responsible for the Technical Volumes of several DoD multi-million-dollar contract proposals, I am absolutely appalled at what was presented in this official government SEIS. It clearly needs to be re-written using current, accurate, and complete data, and with actual consultation with Indian tribes.

Disregard for federal law in consulting with native tribes, *knowingly* using outdated and misleading data on which to base conclusions that can result in disasters similar to what we have witnessed in documented events ranging from the Santa Barbara oil spill up until the immediately recent fires caused by faulty power lines in California, accepting this widely disproven SEIS would be insane, and hopefully prosecutable as a crime of fraud for which anybody who signs off on this currently proposed SEIS would be culpable.

Sincerely,

Roger T. Mart

Besides being anti-pollution, besides not wanting more fuel-related industries in the Tideflats, I'm really concerned about the local government entities who let PSE build w/o permits in place! That certainly undermines our confidence in the democratic process. Rules apply to everyone?

Thank you,

Lynn Di Nino

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

I heard that if you tell a big enough lie, people are more likely to believe. I'm astounded. Fracked gas uses fossil fuel in it's extraction, pipe-building, all forms of movement. It leaks at all the points. Relaxed regulations coming to permit more flaring and leaking. Environments are destroyed.
Corrupt politicians will like your headline. The rest of us know better, but we have no vote.

No new fossil fuel infrastructure! We have an emergency to attend to.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Dear Puget Sound Clean Air Agency,
First of all, I want to thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. With our climate in grave peril, as emphatically stated in the latest IPCC report, your review of the greenhouse gas impacts of the natural gas used in this project couldn't be more important. Those scientists make clear that we cannot, and must not, allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.
With that said, I am aware of several issues with the draft report you issued on October 8th. It is my belief that if these issues are given proper attention and addressed with best available science, it will show that the marginal improvements in emissions the study claims will disappear and the project will in fact be worse for the climate than doing nothing at all.

1722-1 14. LCA Inputs and Assumptions - Leakage/Slippage

From: 350 Seattle
To: Public Comment
Subject: Puget Sound Energy's LNG facility
Date: Monday, November 19, 2018 10:45:30 AM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

The SEIS says that emissions will only be reduced if the natural gas comes from Canada, because leakage rates are reportedly lower there than in the US. Shockingly, most leakage rates were self-reported by the fossil fuel industry based on models - independent analyses from show that fracked gas leakage rates are much, much worse.

Sincerely,

Desiree Douglass

Subject: Puget Sound Energy's LNG facility
Date: Sunday, November 18, 2018 10:07:12 PM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

The Clean Air Agency's analysis is based on 100-year, not 20-year, global warming potential (GWP) values. Given the IPCC report that was released last month indicating that we have 12 years to avoid climate catastrophe, the Clean Air Agency should be using the 20-year numbers, as that is the timeframe where action is needed. Using the most recent 20-year value of 96 makes LNG 150% dirtier than the "dirty fuel" it's supposed to replace.

Sincerely,

Desiree Douglass

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

PSE's LNG project increases our greenhouse gas emissions and fuels climate change - which means more wildfires and smoke for our region. The resulting air pollution makes us sick and leads to higher rates of asthma attacks, heart problems and cancer in our communities.

Sincerely,

Desiree Douglass

Importance:	High

Dear Puget Sound Clean Air Agency,

I want to thank you for the Supplement EIS review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. With our climate in grave peril, as emphatically stated in the latest IPCC report, your review of the greenhouse gas impacts of the natural gas used in this project is critical. Those scientists make clear that we cannot, and must not, allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.

As an environmental planner who has written EIS's and numerous EA's and SEPA Checklists over 20+ years, my first concern and comment on the Draft SEIS is that is that the No Action Alternative presented in the Draft SEIS is fictional. The No Action Alternative analyzed in the Draft SEIS represents the conditions at the site in 2016, not the current condition. This glaring flaw immediately invalidates the analyses and conclusions of the Draft SEIS because SEPA law requires a minimum of two valid alternatives, with one of them being a No Action Alternative. Let me explain. The Draft SEIS analyzes a No Action Alternative based on NO construction of PSE's proposed facility on the site. Yet PSE started construction at the site in 2016, despite not having a required "Notice of Construction" (NOC) permit from PSCAA.

PSCAA became aware of this violation in early 2017 and issued a Notice of Violation to PSE on April 12, 2017. PSE submitted a NOC application but did not stop construction. PSCAA did not issue PSE a NOC approval, yet apparently also did not take any further investigative or enforcement action on their Notice of Violation, despite repeated requests from the Puyallup Tribe to PSCAA to issue a Stop Work Order. PSCAA did accept PSE's NOC application and undertook this supplemental SEPA process. The result is that at the time of this draft SEIS being prepared, PSE has constructed an 8-million gallon concrete tank with massive subsurface supports at the site and related pipelines through the City to connect to the tank. This is NOT the condition that the Draft SEIS analyzes in the No Action Alternative.

To meet the minimum standard of SEPA law, PSCAA needs to analyze the environmental impacts and benefits of a variety of options in the No Action Alternative that address what to do with the 8 million gallon tank and infrastructure in the event that PSE's project does not become operational. This would have to include: demolition and repurposing of the tank, as these are the only reasonable "No Action Alternatives".

I have to tell you that in all my years of environmental permitting in Washington State, Texas, and California, I have never had a client permitted to continue construction without permits. If any client were to attempt something this rash, the agency in charge of the permit would shut construction down immediately. My most memorable experience was with Enron as they built their fiberoptic cable through Austin, Texas. Enron did not bother to get their local permits and the Austin City Environmental Department shut them down for weeks. The cost to the project was huge. It is the incentive and disincentive that keeps large corporations such as Enron from flagrantly ignoring local, state, and federal laws.

1908-1 8. No Action Alternative
1908-2 8. No Action Alternative
1908-3 8. No Action Alternative

My second Concern with the draft SEIS is that PSCAA did not engage in meaningful consultation with the Puyallup Tribe during the preparation of the SEIS. PSCAA is authorized to enact their permits through the EPA, a federal agency. With the authorization to implement EPA's laws and codes comes the responsibility to meet federal Treaty Law. The draft SEIS cannot be valid without this critical consultation between PSCAA and the Puyallup Tribe taking place. PSCAA needs to initiate consultation immediately and then prepare the Draft SEIS again.

My third concern with this draft SEIS is that it's not complete. There are several sections that are missing data and so we can not accurately assess the quality of the report and understand how certain conclusions are reached. Because of that, I request that you complete this report, reissue it, and then reset the public comment period so that we have time to review the completed report thoroughly.

With that said, I am aware of several issues with the current draft report you issued on October 8th. It is my belief that if these issues are given proper attention and addressed with best available science, it will show that the marginal improvements in emissions the study claims will disappear and the project will in fact be worse for the climate than doing nothing at all.

Here are some of the issues as I understand them:

- The SEIS is not using the best available science for the Global Warming Potential (GWP) of methane. It uses the 100-year GWP of methane and not the 20-year value which is much more relevant given the urgency in addressing the climate crisis. The appropriate 20-year GWP value to use is 96.
- This facility is projected to have a 40 year lifespan, so why does the report project out to 100 years, which is 90 years beyond the time we need to have taken decisive action?
- The SEIS claims emissions benefits from customers that Puget Sound Energy simply does not have. According to PSE and the City of Tacoma, the only maritime customer is TOTE with its two vessels which have already delayed their conversion to consume LNG. Securing new customers (there are only just over 100 LNG ships in operation out of a worldwide fleet of 90,000) as well as the additional permitting could take years and is not guaranteed.
- The SEIS says that emissions will only be reduced if the natural gas comes from Canada, because leakage rates are reportedly lower there than in the US. Shockingly, most leakage rates were self-reported by the fossil fuel industry based on models and recent measurements taken in the field have shown that leakage rates are much much worse.
- How can it be guaranteed that PSE is sourcing its gas from BC anyway? Their recent filings show they relied on gas from BC, Alberta, and the US. And with the recent pipeline explosion in BC that interrupted PSE's supply, we know it's not always available.
- When ships use any fuel, a certain percentage of it escapes without combusting through the exhaust system and into the atmosphere. This is known as slippage and the SEIS uses a lower rate than is considered best practice.

If you do this process correctly, consult with the Puyallup Tribe, analyze a valid No Action Alternative, and use the correct horizons and most current best available science, you will have a valid Draft SEIS. Then you should hold new public hearings, comment period before making any decision on PSE's application for an operating permit.

Sincerely,

1908-4 5. Regulatory Framework

most low sulfur fuel
requirements.

~~pollute, permit it~~

The proposal is not being taken accurately shown by the many flaws in the SEIS analysis, such as PSE's own reports that document that some of their produced, a substantial 25%+, comes from US source while the analysis accepts that assertion that they will use only Canadian gas, the assumption that recent regulations will be implemented and enforced completely almost immediately, and that it doesn't appear to undervalue the LNG shipping industry, meeting current quarantine assumptions about how ships may

RECEIVED
NOV 19 2018
Puget Sound Clean Air Agency

Puget Sound Clean Air Agency, 1904 Third Ave, Suite 105, Seattle, WA 98101
ATTN: Public Comment on DSEIS, PSE LNG Project
Dear Puget Sound Clean Air Agency,
I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to deny the permit because the Draft Supplemental Environmental Impact Statement does not accurately represent the true greenhouse gas emission profile of the project. I have the following specific concerns:

I have learned a lot from the Jordan Cove, OR, proposal and arguments, and know that if built, it would become the largest air polluter with C in Oregon. The Tacoma proposal shares many of the same features. I am therefore concened that it will be a major (Check here to continue comments on the other side). ✓ →

In addition a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required, and consultation with the Puyallup Tribe and other neighbors of the proje must be done.

By signing this comment card you agree to receive updates about the project.

Name Barbara Dow

Both the facility operator and the PS Clean Air Agency agree that the project would emit (besides methane & CO_2) potentially dangerous compounds into the air, like cadmium, arsenic, SO_2. The community must not be impacted with more than one hazardously dangerous target community.

ATTN: Public Comment on DSEIS, PSE LNG Project

RECEIVED
NOV 19 2018
Puget Sound Clean Air Agency

Dear Puget Sound Clean Air Agency,

I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to deny the permit because the Draft Supplemental Environmental Impact Statement does not accurately represent the true greenhouse gas emission profile of the project. I have the following specific concerns:

Treaty rights cannot be ignored or downplayed - in recent cases, they have been both legally & morally strong. Water, and even sand, needed for project, are already becoming scarcer. Water, especially, is too valuable a resource for such use. (Check here to continue comments on the other side). ✓

In addition a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required, and consultation with the Puyallup Tribe and other neighbors of the proje must be done.

Name: Barbara Dow Email: bdowpdx@gmail.com

Address: 4914 NE 24th Ave, Portland, OR 97211

Please count on my support of the LNG Plant in the Port of Tacoma. The Port of Tacoma needs LNG fuel to stay competitive. It will save our Port, our economy and our jobs.

Dawn Doyle

1225-1 23. General Support

Steve: Thank you.

[05:48:00] So, next is Tara Doyle-Ennekin.

Tara: Good evening and thank you so much for this opportunity. My name is Tara Doyle-Ennekin. I'm a long time Salmon Beach resident and a business owner. After 17 years doing business in Tacoma, I have been simultaneously pleased and disappointed in the actions of some local leaders and community organizations, when it comes to the construction of an LNG facility, at the Port of Tacoma. The recently released draft SEIS confirmed my expectation that the use of LNG for the maritime sector would result in better air quality for those of us who live and work around here.

Also, expected, but still frustrating, is the refusal of local activists to embrace scientific study, not just the studies they like and acknowledge.

[05:49:00] But while they might not yet have their preferred answer to transportation fuels on the scale required for today's global economy, there is a step in the right direction that has real meaningful benefits. And here in Tacoma, the rest of us would like to get it started. I'm a professional and a responsible member of this community. It is disheartening to be assumed to be anti-environment because I support the construction of the LNG facility.

Frankly, it isn't right that a small minority of people can out shout a reasonable majority who are also concerned about clean air, safe water, and preserving habitat but also recognize that, in the spirit of making progress, you cannot sacrifice the good for the sake of the perfect. If all of our cars ran on garbage and ships could operate on solar batteries starting tomorrow that would be wonderful. But it isn't reality. Furthermore, I am frustrated by the fantasy that everyone will, ultimately be satisfied without controversy.

If we just continue to delay construction and conduct more studies, the reality is every day we spend talking about this, instead of moving forward, is another day we could have reduced emissions and didn't.

[05:50:10] For this project, delay equals reduced air quality. Will activists ever acknowledge that their challenges increase harmful emissions

by impeding progress? No. They only take credit for stopping something offering no equal realistic alternative in its place. We are told repeatedly that the clock is ticking on environmental health and safety, and yet, it is so-called environmentalists who have barred the door towards making a step in the right direction. I hope that the decision makers, on this project, recognize that no matter what they say, it is green activists who are upholding decreased air quality in our city, not science.

As a community, we either support the engineers, scientists, and biologists who evaluate projects and move forward based on their findings, or we allow ourselves to spiral based on conspiracy theories and non-science base gossip.

[05:51:00] I support the professionals who have applied their expertise to this project and who have found environmental benefit in the form of better air quality and reduced greenhouse gas emissions. For the love of this place where I live and work, I want you to get started. In close, I hope you see past the red tape, move this project and our healthier environment forward. Thank you so much.

Subject: Tacoma LNG SEIS Project Comment
Date: Saturday, November 3, 2018 1:32:11 PM

Dear Responsible Official,

This proposed LNG project is another step toward climate chaos at a moment when we must urgently move away from fossil fuels.

I applaud your decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct this more rigorous analysis. Thank you.

Accurate analysis will show that the project has a significant and unmitigated impact on the global climate, which should be sufficient basis for denial of the Notice of Construction application.

In addition, please consider the location adjacent to a precious waterway as well as residences and other activities of the urban area surrounding it. Besides potential to foul air and water, in case of accidents Immediate potential harm to people and property should be the reason for denial. Innocent people need to be protected from this kind of industry in their neighborhood.

Thank you for your time and consideration of these comments.

Sincerely,
Rebecca Durr

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Please stop this project! For so many reasons this pipeline should not built. Built in fragile ecosystem, contamination of soil, air, and ground water is inevitable. It is dangerous and does not support a better plan for addressing climate change. Most importantly, this illegal pipeline does not have permission to be built on land owned by the Puyallup Tribe. This is not a better solution.

To: Public Comment
Subject: Tacoma LNG SEIS Project Comment
Date: Sunday, October 21, 2018 3:54:38 PM

Dear Responsible Official,

I am a daily victim of PSE, being a "customer" (hostage, really) of PSE's monopoly electric service. While PSE spends our ratepayers' payments to tout its greenwashed image, it actually generates nearly 60% of its electricity from fossil fuels. Not very green. Most of the balance comes from hydro, which is damaging our salmon. There are alternatives, but PSE is less than interested. Instead, it is moving forward with construction of its Tacoma LNG project even before review and permits. After all, better to ask forgiveness than permission, right?

Puget Sound Energy and Tote Marine seem to imagine that a clean energy future can be arrived at by digging the fossil fuel hole deeper. This proposed LNG project is another step toward climate chaos at a moment when the IPCC has given us a clear warning that we must urgently move away from fossil fuels.

Fracked gas is not a lesser evil. Scientists' understanding of methane's impact on the climate continues to evolve, and at every step along the way we learn that fracking allows more methane escapement than we had previously observed and that the impact of methane on the climate, particularly in the short term, is even more serious than had been previously understood.

I applaud your decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct this more rigorous analysis. Thank you.

I urge you to revise the analysis to account for the following:

1. Methane should be counted as 86 times more potent than CO2 based on the current IPCC analysis (AR5 rather than AR4) considering a 20 year timeframe (rather than the 100-year).

2. Revise the analysis of the impacts of fracking in British Columbia based on recent research(1) demonstrating that methane escapement has been dramatically under-estimated.

3. Revise the "no-action alternative" to include a clean energy alternative in which PSE provides electricity not with a different source of fracked gas, but with renewable energy and energy efficiency. There is now clear evidence, a provided by Snohomish PUD, that solar installations and home retrofitting are in fact reducing the need for more electricity.

4. Revise the "no-action alternative" to include the assumption that Tote Marine will achieve a 50% GHG reduction, in line with the International Maritime Agency's established goals. This reduction might alternatively be achieved by a combination of fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion or many other alternatives besides fracked LNG.(2) For clean local emissions requirements, Tote Marine can achieve virtually all of the localized lower-particulate and lower SOx and NOx benefits claimed for LNG propulsion by opting for low-sulfur marine gas oil over heavy fuel oil, and installing selective catalytic reducers and diesel particulate filters.(3)

5. This more accurate analysis will show that the project has a significant and unmitigated impact on the global climate, which should be seen as a sufficient basis for denial of the Notice of Construction application.

Thank you for your time and consideration of these comments.

From:	Kristin Edmark
To:	Public Comment
Subject:	Puget Sound Energy LNG Project
Date:	Wednesday, November 21, 2018 2:55:10 PM

Thank you for the opportunity to comment on the draft SEIS for the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. I feel that the report should be reissued after better assessing scientific data.

1) Data now reveals the gravity of greenhouse emissions. These emissions must be taken seriously. LNG is primarily methane which is a potent greenhouse gas. The 100 year life of methane is incorrect in this study for 2 reasons. First, it has become clear that 100 years are not available to prevent massive species die off, but more importantly, because the decrease in potency of methane is not linear, mathematically the use of the 100 year value is incorrect and skews values. The 20 year values of methane would be more closely reflect actual impact.

2) It cannot be assumed that the LNG will always come from Canada. I do not believe that the pipelines in Canada have a different leakage than in the US. Values provided by the oil and gas industry or by pipeline companies should not be trusted unless corroborated by independent sources without bias. Most values are listed for new well functioning pipes. Ruptures happen. A realistic rupture value should be included for pipelines. Methane is a very small molecule which escapes easily especially when pressurized. Leakage at pumping stations should be considered in the totals.

3) I am very concerned about the disruption caused by pipeline paths. Clear cutting of trees is necessary everywhere the pipeline crosses forests. Trees absorb greenhouse gasses. Everywhere a pipeline crosses a natural waterway, there is increased chance of breakage, clear cutting disrupts wild life, erosion muddies water affecting marine life, there is a risk of water contamination, etc.

4) I am very concerned about diesel particulate and compounds from fracking going into the air in Tacoma, during transport and at the fracking sites. These heavy metals, diesel particulates and sometimes radioactive compounds are unhealthy especially for children and elderly.

5) This project encourages fracking which has been shown to leak dangerous compounds into water supplies. As fracking sites age they are more likely to leak. It is common for fracking sites to be sold to smaller producers which decide not to even cap them properly releasing methane continuously into the air and allowing easier flow into water tables as drilling sites erode.

6) Sea level is rising. The site is low and will have an ever increasing chance of unwanted flooding or run off.

7) It is wrong not to allow the Puyallup voice over their lands.

8) The shipping unburned exhaust slippage rate should reflect currently accepted values. Present draft SEIS values are not aligned with current research.

1668-1 19. LCA Inputs and Assumptions - End Use
1668-2 12. LCA Inputs and Assumptions - Global Warming Potential Value
1668-3 13. LCA Inputs and Assumptions - Natural Gas Source
1668-4 3. Outside of SEIS Scope
1668-5 3. Outside of SEIS Scope
1668-6 3. Outside of SEIS Scope
1668-7 3. Outside of SEIS Scope
1668-8 5. Regulatory Framework
1668-9 14. LCA Inputs and Assumptions - Leakage/Slippage

9) Environmental impact of end use of the product should also be considered. This project does not exist in isolation. Final use impact affect climate and emissions as much as the site itself.

In this time when Washington should be striving to decrease it's greenhouse gas emissions and working toward 100% renewable energy, this massive new fossil fuel infrastructure is not aligned to state goals and is not appropriate for Washington State. The impacts of accelerating climate change are important from massive wildfires to protecting fragile ecosystems vulnerable to accelerated climate change. Clean energy projects produce more jobs benefits more individuals and keeps more money inside Washington State. Please rewrite the draft SEIS to better reflect true impacts.

Sincerely submitted,
Kristin Edmark MPH RD

Dear Responsible Official,

First this thing is a giant bomb waiting to go off if there is a mistake by the under trained, under paid and over worked people you are going to have running the place.

Second this is not how to slow down Climate Change by embracing just another form of Fossil Fuel. We must stop this push to extract, sell and burn as much fossil fuel as possible as fast as we can plan.

Fracked gas is not a lesser evil. Scientists' understanding of methane's impact on the climate continues to evolve, and at every step along the way we learn that fracking allows more methane escapement than we had previously observed and that the impact of methane on the climate, particularly in the short term, is even more serious than had been previously understood.

I applaud your decision to analyze the lifecycle of the greenhouse impacts of this project and to conduct this more rigorous analysis. Thank you.

I urge you to revise the analysis to account for the following:

1. Methane should be counted as 86 times more potent than CO2 based on the current IPCC analysis (AR5 rather than AR4) considering a 20 year timeframe (rather than the 100-year).

2. Revise the analysis of the impacts of fracking in British Columbia based on recent research(1) demonstrating that methane escapement has been dramatically under-estimated.

3. Revise the "no-action alternative" to include a clean energy alternative in which PSE provides electricity not with a different source of fracked gas, but with renewable energy and energy efficiency.

4. Revise the "no-action alternative" to include the assumption that Tote Marine will achieve a 50% GHG reduction, in line with the International Maritime Agency's established goals. This reduction might alternatively be achieved by a combination of fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion or many other alternatives besides fracked LNG.(2) For clean local emissions requirements, Tote Marine can achieve virtually all of the localized lower-particulate and lower SOx and NOx benefits claimed for LNG propulsion by opting for low-sulfur marine gas oil over heavy fuel oil, and installing selective catalytic reducers and diesel particulate filters.(3)

5. This more accurate analysis will show that the project has a significant and unmitigated impact on the global climate, which
should be seen as a sufficient basis for denial of the Notice of Construction application.

Thank you for your time and consideration of these comments.

ATTN: Public Comment on DSEIS,

PSE LNG Project,

1904 Third Ave, Suite 105

Seattle, WA 98101

November 18, 2018

To PSCAA:

My name is Roger Martin. I am a retired Air Force combat pilot. Subsequent to that retirement, I worked as a training developer and instructor for the B-2 stealth bomber's initial cadre of pilots, then a systems engineer for military systems, and then a manager specializing in proposals for major defense contracts. I hold a BA in Biology and Oceanography from San Jose State College and an MS in Systems Management from the University of Southern California. I am currently the coordinator for my church's Greening Activity Group at United Church in University Place.

I am strongly opposed to acceptance of the 2018 Supplemental Environmental Impact Statement (SEIS) for, and to the installation of, the LNG facility proposed for the Tacoma Tide Flats. This is for several reasons.

1. First, the location.

   We have learned that this construction location is in a) a known earthquake-fault area; b) a tsunami hazard zone; c) on land fill; and d) adjacent to Native American tribal land. For an installation that is to contain pressurized flammable gases, mixed with toxic, volatile organic compounds, in an installation that will reportedly stand 16 stories tall that is near highly populated urban areas, and be an installation and within a few miles of the West Coast's primary north-south roadway is pretty-near insane. In my lifetime, I have observed from a distance, and among other events related to manmade facilities (not in order): a) the Three Mile Island nuclear meltdown; b) the Chernobyl nuclear meltdown; c) the Exxon Valdez grounding and oil spill; d) the Deep Water Horizon explosion and oil spill; e) the Fukushima Daiichi earthquake and tsunami nuclear disaster; f) numerous railcar de-railings, chemical and petroleum leaks, fires, and explosions; g) the Shell Oil Kulluk floating oil-rig disaster (twice in one trip!) between Alaska and Washington State; h) leaks of natural-gas storage facilities (most notably Porter

Ranch in Southern California); i) numerous leaks along existing oil pipelines, including the Keystone XL and feeder pipelines; and j) one I will recount in more detail here, based on my eyewitness observation.

I was married in a full military wedding on February 2, 1969 in Santa Clara, California. Not having a lot of money, we decided to honeymoon on the beach in Southern California, complete with a drive in our two-seat, red, British TR-4 convertible, along California Highway 1. Our first night of the trip was going to be in Carmel by the Sea. Our second night was going to be in Santa Barbara, where we had dinner reservations at the end of the pier. So, on February 4, 1969, we went to that restaurant and saw oil-soaked pelicans and seagulls bobbing around in the water under the restaurant--from the Santa Barbara oil spill. 'Heck of a honeymoon, but a real lesson for a freshly graduated biology/oceanography major and newly commissioned military officer.

Although I am likely to come back to some of these issues later, I wanted to lay down some markers here. I will proceed to other matters below before coming back to detailed reflection. The big point here is that in every case, when these projects and facilities were proposed, each was going to be using the latest, greatest, most-foolproof-possible safety measures to prevent any possible accident that could ever occur, and that if one ever did occur (which we are told simply *can't* happen), it would be resolved quickly and without any damage or loss of life, because we had thought of everything and prepared for every contingency, and the government would make sure every rule and promise would be followed and kept.

2. Indian treaties

- (Quoted from the *Advisory Council on Historic Preservation Handbook* [ACHP]:) "The National Historic Preservation Act (NHPA), (16 U.S.C. Section 470f) Section 106, requires federal agencies to take into account the effects of their undertakings on historic properties and provide the Advisory Council on Historic Preservation (ACHP) a reasonable opportunity to comment on those undertakings. communication that may include written correspondence, meetings, telephone conferences, site visits, and e-mails." And, "Consultation constitutes more than simply notifying an Indian tribe about a planned undertaking."
- In addition, the Environmental Review Toolkit, published by the Federal Government, says, "The National Environmental Policy Act of 1969 (NEPA) requires the preparation of an environmental impact statement (EIS) for any proposed major Federal action that may significantly affect the quality of the human environment. The statutory language of NEPA does not mention Indian tribes. However, the Council on Environmental Quality regulations do require agencies to contact Indian tribes and provide them with opportunities to participate in various stages of preparation of an EIS."

- According to several speakers at the recent Tacoma public hearings on the proposed SEIS for the LNG facility, these consultation requirements have not even been minimally met.

3. Data are not current or accurate

   As was reported by numerous speakers at the Tacoma SEIS public hearings, the original, proposed EIS had incomplete and inaccurate data for computations used to support the Study's findings. The data in the former EIS relied heavily on information that had been available in 2007. "Placeholder" data were used in that study, based either on best-available values from studies up to that time, or estimates based on best guesses. More-accurate data were understood to be inserted as time went on and real studies were done with ever-improving and -widening information became available from better equipment and additional sampling and trend analysis. Reportedly, such data became updated in 2009, and later in 2013. Fortunately, there was an additional full IPCC report very close to submittal of this SEIS. And, although available, none of the latest data were used in the proposed SEIS. Indeed, many of the original best-guess placeholders from 2007 are still in the new document, even though new, and real, data are available.

   The Tacoma SEIS public hearings provided clear and consistent insight into how inclusion of best current data would affect the findings of the proposed SEIS. Environmental impact and possible damage from gas leakage and accidents are grossly underestimated in the current study, based on the outdated information contained in there. One witness—a college teacher (he claimed)—stated that greenhouse-gas leakage, by his quick calculations using new, accurate numbers, were roughly 2.5 times as great as those presented in the proposed SEIS.

I would like to get back to some of my earlier reflections. Specifically, I'd like to get back to some of the nuclear-plant lessons. At least, three nuclear power plants were somehow built right next to the open ocean: Diablo Canyon and San Onofre in California, and Fukushima Daiichi in Japan. At that time, several people who studied oceanography (I was an oceanography student back then) had already warned that predicted greenhouse gases would raise the sea level. But they built these plants there anyway. Brilliant, eh? The movie *The China Syndrome* was, fascinatingly, shot largely at Diablo Canyon. This was not one of the plants that did melt down. One of those that did was in Ukraine (then part of the Soviet Union), and the other was in the middle of a river in Pennsylvania.

The worst nuclear-plant disaster can be disputed as either Chernobyl or Fukushima. Again, promises were made that the safety designs were impeccable. At Fukushima, nothing could happen that could not be overcome by the wonderful safety standards that

Japan had put into place. (Apparently, nobody noticed the big ocean outside, even after all the movie monsters that had come out of it going back decades before.) People were allowed to build residences and businesses ever closer to the reactor as time went on—after all, what could happen? Other nuclear plants had been around, and hadn't blown up or been overwhelmed by a tsunami. So, why should this one? And it had been built to handle earthquakes, anyway, right? And *to government safety standards! Right?*

Then, the earthquake and the tsunami hit in 2011. In that accident, there were three nuclear meltdowns, multiple hydrogen explosions, and an estimated 1600 deaths, from a "safe" nuclear plant, because somebody had studied all the possibilities and nothing could happen that existing designs and safety procedures couldn't handle.

San Onofre was the first of the two, aforementioned US coastal plants identified for decommissioning. For a while, talk was that they could re-start it after an attempt to repair and replace parts that wore out before their initial studies had said they would (What? Overoptimistic estimates?). They also looked at what happened at Fukushima two years earlier, and perhaps started to notice that the sea-level rise predicted when they originally designed the plant was a bit underestimated (Gee, do you think so?). So, in 2013, they shut it down, never to be opened again.

Now, folks have decided it might be smart to pull the plug on Diablo Canyon too. There seems to be a trend here: Building facilities with stuff that can blow up and also contaminate a populated an area near where there are earthquakes and possible tsunamis might not be the indication of high intelligence.

So, for building on fill: San Francisco has some experience with that. In 1906, they had an earthquake. After the quake, they decided to use rubble from the earthquake and some dredging from the Bay to build a location for the Panama-Pacific International Exhibition, which then became the Marina District. In 1989, the Loma Prieta Earthquake hit at the very summit of Highway 17 between San Jose and Santa Cruz, and the land fill in the San Francisco Marina District liquified from the vibrations. In addition to water mains breaking, natural-gas (hmmm) lines broke, and fires broke out. Because of the broken water lines, water from the Bay had to be used to extinguish the fires. Land fill and gas lines have a history of being a bad idea then, don't they?

In San Francisco, there are two other buildings that were subsequently built on land fill. They are the Millennium Tower luxury high-rise, and the new bus terminal, built closely to each other. The Tower is sinking and has been discussed on several TV shows, including *60 Minutes*, and the other is the new bus terminal, which has shown structural cracking before it has even opened for regular business. How much is that all going to cost to make safe…or not? Furthermore, the entire area known as Foster City, just south of San Francisco International Airport, is sinking, at the same time the sea level is rising.

Foster City was built on land fill. And PSE (an Australian company, by the way) thinks it is just fine to build a 16-story-tall container of explosive and toxic gas onto land fill in an earthquake and tsunami zone. Brilliant!

As somebody who was college-trained as a scientist, flew in combat, authored training and technical publications both at the Air Force's Headquarters Strategic Air Command, and later, for the most-expensive combat airplane ever built, and in the defense industry was the principal manager responsible for the Technical Volumes of several DoD multi-million-dollar contract proposals, I am absolutely appalled at what was presented in this official government SEIS. It clearly needs to be re-written using current, accurate, and complete data, and with actual consultation with Indian tribes.

Disregard for federal law in consulting with native tribes, *knowingly* using outdated and misleading data on which to base conclusions that can result in disasters similar to what we have witnessed in documented events ranging from the Santa Barbara oil spill up until the immediately recent fires caused by faulty power lines in California, accepting this widely disproven SEIS would be insane, and hopefully prosecutable as a crime of fraud for which anybody who signs off on this currently proposed SEIS would be culpable.

Sincerely,

Roger T. Mart

Subject: Comments against Tacoma LNG SEIS Project
Date: Sunday, October 21, 2018 3:59:46 PM

Dear Responsible Official,

First, why has construction on such a clearly controversial project been allowed to start without an environmental review? Better late than never in the case of considering environmental impacts, I suppose.

Our planet and country, and most especially the beautiful Puget Sound area, will be harmed by this project. As the very recent UN report emphasized, we need to take big steps immediately to reduce greenhouse gas emissions and shift to clean energy sources if we wish to avoid major threats from climate change. Apparently, Puget Sound Energy and Tote Marine either have not heard of this report or are ignoring it, because their proposed project would be the exact opposite of what we all need. Indeed, the LNG project would instead be another step toward climate chaos. This is not a local issue; it is a global one. All agencies with power such as you have must begin now to act accordingly.

And that does not even consider the water pollution and public health concerns that surround fracking around the sites where it occurs and that have caused some locales to ban the process.

Even if fracked gas were a "lesser evil" (which it is not due to methane release, as science has been revealing), evil is still evil. And undesirable.

While I appreciate that you are assessing the the greenhouse impacts of this project over its life, I call upon you to revise the analysis to account for additional factors. These include:
*That methane gas should be considered 86 times more potent than carbon dioxide based on the current IPCC analysis (AR5 rather than AR4) over a 20-year timeframe (rather than the 100-year.
*That recent research has shown that methane escapement in fracking has been dramatically under-estimated, which requires modification of the analysis of the effects of fracking in British Columbia.
*Including a "clean energy alternative" that calls for PSE to provide electricity from renewable sources and with improved energy efficiency rather than from a different fracked gas source.
* Revising the “no-action alternative” to assume that Tote Marine will reduce greenhouse gas release by 50% in keeping with the International Maritime Agency’s established goals. Such a reduction might also be reached through a combination of fuel efficiency, slow steaming, propulsion improvements, biofuels, battery electric propulsion, or other alternatives besides fracked LNG. Tote Marine can also achieve essentially all of the localized lower-particulate and lower SOx and NOx benefits claimed for LNG propulsion by opting for low-sulfur marine gas oil over heavy fuel oil, and installing selective catalytic reducers and diesel particulate filters.

I believe that this more rigorous and accurate analysis will indicate that the project would have a significant and unmitigated impact on our global climate. That fact alone should be sufficient to justify denial of the Notice of Construction application.

Thank you for considering my comments.

Sincerely,
Wallace Elton

Puget Sound Clean Air Agency
ATTN: Public Comment on DSEIS, PSE LNG Project
publiccomment@pscleanair.org

November 20, 2018 (via email)

To Whom it May Concern:

I am writing concerning the Draft SEIS for the proposed Tacoma LNG Project.

In particular, I am writing to comment on the assumptions used for the assessment of greenhouse gas emissions – especially fugitive methane (CH_4) -- associated with production of the natural gas to be used by the Project.

Appendix C to the SEIS is titled "PSE Tacoma LNG Project GHG Analysis Report", and contains a report by Life Cycle Associates titled "PSE Tacoma LNG Project GHG Analysis Report", dated September 20, 2018. All references to table numbers or page numbers in my comments here refer to that Life Cycle Associates report.

As described in Table 3.6 (page 56) of the Life Cycle Associates report, their upstream GHG analysis for natural gas relies on three data sources: GHGenius for their "baseline" case, a BC Inventory for their "lower" case, and the GREET model for their "Upper" case.

All three of these data sources are flawed for the purpose of accurately assessing the upstream GHG emissions associated with provision of natural gas.

The most critical flaw in all three of the estimates used in the SEIS is that they rely on "bottom-up" estimates of methane loss drawn from measurements or default assumptions of specific pieces of equipment, rather than from "top-down" or hybrid approaches that take into account all methane releases, especially those releases that occur during abnormal operating conditions.

As reported in the literature in both the United States and Canada, measurements of methane leakage that capture the entire range of operating conditions – not just the ideal conditions often observed in bottom-up studies – find rates of fugitive CH_4 loss that can be many times higher than those from bottom-up studies.[1–3] In particular, a recent comprehensive assessment published in the journal *Science* finds that upstream methane emissions across all U.S. gas and oil supply average 2.3% of gross U.S. gas production.[1] I see little reason why emissions from Canadian operations can yet be found to be confidently below this value.

In the table below, I provide further commentary on the three methane loss rates used in the Life Cycle Associates assessment.

SEIS Scenario	**Data Source reported for methane loss rate**	**Methane loss rate reported by Life Cycle Associates in Table B.3**	**Primary source of that leakage rate**	**Problems with that leakage rate**
Baseline	GHGenius 4.03	0.32%	Canadian Association of Petroleum Producers inventory from the year 2000[4]	An industry-reported methane loss rate from 18 years ago is inappropriate because research since has demonstrated that actual fugitive methane loss rates have consistently been many times higher than bottom-up estimates from industry. The "G7 Study", cited to further justify this low methane loss rate, is inappropriate because the authors of this unpublished study, which took place in Alberta (not BC as claimed), report that those were "unique conditions" that "cannot be extrapolated to any other operator or region" (personal communication with the authors).
Lower	BC Inventory	0.4%	British Columbia's greenhouse gas inventory	BC's inventory is a bottom-up approach that misses large quantities of fugitive methane[5]
Upper	GREET 2017	1.0%	U.S. EPA national greenhouse gas inventory	The US EPA inventory is known to underestimate fugitive CH_4 losses. A better estimate would be 2.3% from Alvarez et al.[1]

Please contact me if I can provide further details regarding methane loss rates, including any of the studies referenced here.

Sincerely,

Peter Erickson
Senior Scientist
Stockholm Environment Institute (SEI)

Re: Opposition to PSE's construction of an LNG plant on the Tacoma waterfront

Dear Smart People,

Have you seen the floods in the Philippines, the floods in Louisiana, the flooding in Houston? Or the flooding and hurricanes in Georgia and South Carolina? Or the flooding and hurricanes in Florida? Or the devastation of the entire Island of ~~the~~ Puerto Rico? With these facts, it doesn't take a very smart person to figure out that we don't need anymore of this crap... especially methane.

Please do the right thing and get out of your ergonomic chairs and don't permit this climate-killer LNG be functional. Think of your kids and your cute, little grandchildren. Give them a chance. Please, please, please. Be on the right side of God's creation. You know what's right.

TO: The Commissioners of the Puget Sound Clean Air Agency

Request for denial of air quality permit for PSE LNG Project.

Considering the serious environmental hazards in the production, transportation, and storage of methane, the central component of LNG; and, considering your report does not incorporate the best available Global Warming Potential science on methane, the report's conclusions are, at best, incomplete. In actuality, the report has grossly misrepresented and underestimated the staggering climate pollution the PSE LNG project would create. Please deny any air quality permit.

Thank you for your diligence.

Subject: Fracking
Date: Thursday, November 15, 2018 4:04:29 PM

We here in Tacoma believe another future is possible - one powered by renewable energy and providing a safe environment and climate for all. We also believe in truth and transparency. That is why we are opposing Puget Sound Energy's Liquefied Natural Gas refinery, storage and distribution facility being built in our port. They tried to sneak it in, but when that failed they hit us with an avalanche of green washing and misleading information. But we know the truth - it is bad for us, bad for Tacoma, and bad for the climate.

The Puget Sound Clean Air Agency (PSCAA) is reviewing the climate impacts of this project and have released their draft study (an SEIS, or Supplement Environmental Impact Statement) on its climate impacts. **It is our duty now to ask the right questions** to strengthen this study and make sure the PSCAA never issues an operating permit to Puget Sound Energy.

Puget Sound Clean Air Agency

Dear Puget Sound Clean Air Agency,
I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to deny the permit because the Draft Supplemental Environmental Impact Statement does not accurately represent the true greenhouse gas emission profile of the project. I have the following specific concerns:

PSE – If you haven't noticed, the electric grid does not leak. And ocean-going vessels are excellent candidates for battery ballast electric drive. Think of submarines from 1930. You really don't need the methane grief, its only going to get worse.

(Check here to continue comments on the other side).

In addition, a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required and adequate consultation with the Puyallup Tribe and other neighbors of the project should be conducted.

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Please do not contribute further to our crisis in climate change by approving the Tacoma LNG Project. The Supplemental Environmental Impact Statement is in error as it uses outmoded assumptions of the dangers of methane. This project is a terrible idea, particularly coming after the recently-released report of the UN Climate Science group. Please do the responsible thing of turning down this project.
Thank you.
George Feldman, M.D.

Subject: Draft SEIS - LNG Facility comment
Date: Monday, November 19, 2018 10:29:09 PM

To: Puget Sound Clean Air Agency

I am a 30 year resident of Browns Point. While I was unable to attend your recent Citizen Forum, I have attended several other PSCAA Citizen meetings in NE Tacoma. I appreciate those meetings and regret that I was unable to attend the LNG 'public comment' opportunity.

As I continue to read and inform myself about the impact of the LNG facility in the Port, which is just a few miles from my home, I was disturbed to receive notification from the Dept. of Ecology regarding public input on a West Rock request for an increase in the use of natural gas at their Tideflats plant. I continue to have grave concerns that PSCAA is only measuring individual emissions at Port manufacturing sites and is not monitoring the cumulative effects of these emissions in Port air. As all proximate Port residents know, the Port occupies a small footprint, surrounded by residential communities on 3 of its 4 sides. It is not an isolated Port amidst only manufacturing plants. Furthermore, it is in area subject to weather inversions that can trap emissions for a period of days. The very poor air quality during these times is of health concern to area residents and Port employees who work outside. The Simon Metals Lithium battery fire on September 17, 2018 was a prime example of the harm that can be caused. I live just upslope from Caledonia Bay and across from the Asarco smelter site. When I woke that morning, I immediately smelled something inside my home and was concerned that I might have an electrical problem of some kind. While it was a relief to find it smelled much worse outside, the air that I inhaled almost immediately caused discomfort in my nose and throat. That fire took a number of hours to extinguish and many residents and outside Port workers were in harms way that day, with little to no public notice of what the situation was. While this was an unexpected incident, it does speak to the fact that on any given day, additional pollutants can be added to the Port's normal daily 'brew' and only an environmental scientist can advise how all the components react when mixed together.

Following are my concerns regarding the Draft SEIS for Puget LNG's LNG facility. The current version of the draft SEIS does not contain all the information needed to fully assess the accuracy of the analysis and the predicted impact of the LNG facility. There are at least 10 places in the study that have “placeholder” values instead of actual data. I request that PSCAA complete the draft SEIS, re-issue it, and then reset the public comment period to provide feedback on more current and relevant data regarding the project.

I remain equally concerned regarding the use of 'reporting agencies' references to studies, models, etc. that are simply outdated or are under reported. The SEIS's 2007's values must not be those referenced, rather 2016 Global Warming Potential values must be those used in an LNG SEIS. The Bakken oil field fracking boom did not begin until 2008. A 2015 Brookings Institute study states that increased fracking operations outpaced data collection on the environmental impacts of fracking. The authors wrote "In conclusion, scientists remain concerned about a number of environmental damages caused by fracking. Unfortunately, data collection has not kept pace with the boom in extraction, and a great deal of uncertainty remains regarding pollution from fracking. This uncertainty has limited the ability of regulators to target those areas of greatest concern; it has also limited their ability to regulate in a cost-effective way. Higher quality comprehensive data on baseline levels of environmental quality as well as on emissions from individual producers would go a long way. In the absence of such data, regulatory options remain limited and are unlikely to be cost-effective." https://www.brookings.edu/wp-content/uploads/2015/03/2015a_hausman.pdf

Furthermore, based on proliferation of fracking in the last 10 years, a 100 year GWP is not sufficient. A 20 year GWP value must be used due to the urgency of the climate change that is now being experienced globally. From a 2016 Guardian article "Emissions of the powerful greenhouse gas methane have surged in the past decade, threatening to thwart global attempts to combat climate change. Scientists have been surprised by the surge, which began just over 10 years ago in 2007 and then was boosted even further in 2014 and 2015. Concentrations of methane in the atmosphere over those two

years alone rose by more than 20 parts per billion, bringing the total to 1,830ppb. https://www.theguardian.com/environment/2016/dec/12/rapid-rise-methane-emissions-10-years-surprises-scientists

Methane leak data must be reanalyzed in light of under or non-reporting. As the Port's now defunct Methane facility was being considered, there was an explosion at the Plymouth LNG facility in Eastern Washington. At the time, there was circular reasoning going on that the incident could not be categorized as an explosion of Methane, because it was coming to temperature from its frozen LNG state - - and vice versa. I would hope that this is indeed being reported as the Methane leak that it was and that this incident's data is reported in leak statistics. BC reporting fails to incorporate 2017 and 2018 analyses that show a large percentage of the fracked gas wells are under reporting their methane leakages.

What investigation has assured that all Puget LNG will actually come from British Columbia? While there is a claim that all of the natural gas will be coming to the plant from British Columbia, a recent natural gas pipeline explosion in BC used natural gas from North Dakota. The methane leak estimates from North Dakota are noticeably higher than those reported from B.C. Per PSE's 2017 10K filing with the Securities and Exchange Commission (SEC), in 2017 they obtained gas from British Columbia (54.8%), Alberta (19.1%) and the United States (26.1%).

Other questionable data in the current Draft SEIS relates to Puget LNG's customers. At this time, there is a claim for greenhouse gas emissions reduction credits for maritime customers that Puget LNG does not currently have. This credit cannot be legitimately be claimed. Further, in respect to TOTE, PSE’s assumption on their methane slippage rate has been questioned by a reviewer, who indicated that they should be using the higher rate as that is considered best practice.

My final concern regards the inclusion of start-up, shut down and 'incident' emissions that I understand are not required to be reported by Port industries. I find this practice quite bizarre and a very big 'gimme' when it comes to airborne pollutants in the Port. A family member worked outside in the Port of Tacoma where he, and the warehoused cars that he handled, were often 'rained on' by an unexpected US Oil 'burp.' The spew was an oily, smelly 'rain' that had to be quickly removed from the new cars to avoid damage to the exteriors. Willa Subra, a Louisiana chemist and environmentalist, stated in her local public appearances regarding the proposed Methane facility that start-ups and shutdowns were often the most dangerous of times at a plant. How can any emission that a facility exudes not be measured and tabulated as real data? Start-ups and shutdowns are certainly routine, if not calendared, procedures for maintenance, inspection, etc. at commercial facilities. While 'yikes' incidences are just that, facilities still are aware that things might go wrong and formulate measures, plans and trainings to be as 'ready' as possible when that time arises. Allowing major industry to have 'passes' on any of their emissions and/or emissions procedures is wrong and irresponsible. Any emission that leaves their facility should be monitored and reported. I would urge you to require Puget LNG to reveal and include all information relating to emissions in the start-up, shutdown and 'worst case incident' phases.

Thank you for your consideration of my thoughts and concerns regarding the Puget LNG facility and its emissions. I am not a NIMBY regarding the LNG facility. I don't believe that it should be built in anyone's backyard at this stage of the game, as I believe that Puget LNG has been duplicitous in much of its reporting and paid advertisements.

I have numerous additional concerns regarding the LNG site include taxpayer and ratepayer subsidization, safety issues, and the legality of the exclusion of the Puyallup Tribe in this process. I'll be addressing these concerns, if necessary, with the appropriate agencies down the road.

Thank you.

We live here. So do all the other animals and plants. You are destroying our habitat and bringing down doom on us all. For what? More money? Don't you have enough freaking useless stuff? We don't want your dirty oil. Please, please, please find a way to create sustainable and renewable energy. Please stop fracking the planet.

There are a lot of scientific reasons you should not move forward with fracking. I'm sure you are reading about them in other emails and letters. There is also a central, irrefutable moral reason. It's wrong. You know it. Listen to your heart and soul. Please stop.

Subject: Tacoma LNG Facility
Date: Wednesday, November 21, 2018 1:21:28 PM

I am opposed to building the proposed LNG Facility in Tacoma, or anywhere in the Puget Sound. The great challenge of our lives is addressing climate change. Any increase in emissions in our area is a step backwards in that fight.

There is no need for LNG. PSE claims that the fuel will be used to meet high demand for natural gas, but it would be preferable for customers to reduce their usage or identify alternative, cleaner fuel options (e.g., solar). Every home using natural gas for heat also has electricity, and electric heating may be used as a supplement should any shortage of gas occur. I have lived in Washington for 30 years, and in California before that (with gas heating) and have never heard of a gas shortage affecting the availability of home heating gas.

TOTE Marine is also identified as a potential user of LNG, but there are better options for marine fuels as well. The Washington State Ferries are moving to electric power as a cleaner alternative to current fuels. That means that electric power for large ships will be available in our area, and there will be local expertise for installing and maintaining equipment.

Given recent reports about the imminent impacts of warming and climate change, it would be irresponsible to approve any increase in emissions in the Puget Sound region unless there is a compelling need. There is no compelling need for LNG

I urge you to deny the air quality permit.

Subject: Comments on Tacoma LNG Proposal
Date: Tuesday, November 20, 2018 6:15:32 AM

Comments on Tacoma LNG Proposal:

I am a resource economist and environmental risk analyst. Since 1975 I have worked on dozens of assessments similar in scope to the proposed Tacoma LNG facility.

Simply stated, all developments have impacts – some positive some negative. Most importantly, it has been my experience that when decisions are made in the absence of quantitative evidence, that most such decisions are poor ones. Emotion should never be allowed to trump reasoned judgment.

In risk analysis natural trade-offs exist between contraindications and indications. Perhaps you might consider the health benefits of LNG in the maritime industry, and Asian trucking as well as other experimental attempts to reduce the negative environmental/health side-effects of conventional fuels. A quick look at real time air quality data (https://waqi.info/) will shed some light on where LNG demand is likely to be greatest.

Focusing on shipping related heavy bunker fuel only, conversion to LNG delivers:

- 100% reduction in SOx emissions
- 85-90% reduction in NOx emissions
- 15-20% reduction in CO2 emissions

CO_2 emissions from shipping are double those of aviation and increasing at an alarming rate which will have a serious impact on global warming.

Ironically, aviation related carbon dioxide emissions, estimated to be about 2% of the global total, have been at the forefront of the climate change debate because of the sharp increase in cheap flights; whereas shipping emissions have risen nearly as fast over the past 20 years but have been largely ignored.

Separate studies suggest that maritime carbon dioxide emissions are not only higher than previously thought, but could rise by as much as 75% in the next 15 to 20 years if world trade continues to grow and no action is taken. The figures from BP, which owns 50 tankers, and researchers at the Institute for Physics and Atmosphere in Wessling, Germany reveal that annual emissions from shipping range between 600 and 800m tonnes of carbon dioxide, or up to 5% of the global total or more than all African countries combined.

Unfortunately, CO_2 emissions from ships do not come under the Kyoto agreement or any proposed legislation and few studies have been made of them, even though they are set to increase.

An IMO study of greenhouse gas emissions has estimated that emissions from the global fleet would increase dramatically in the next 20 years as globalization leads to increased demand for bigger, faster ships. Without action the IMO predicts that by 2020, emissions from ships would increase up to 72%.

While shipping has maintained a clean image largely because water-based transport uses a fraction of the energy (per ton mile) as other carriers, significant environmental improvements can be made with cleaner burning LNG.

Admittedly real-world decisions are never perfect – involving health and environmental, as well as moral trade-offs particularly spatial ones. Preventing potential health risks in one area (Tacoma) should not be allowed to supersede the probable and much larger health benefits in many other areas.

We are part of a global community and these world-wide trade-offs should be considered suggesting that some serious science-based cost-benefit analysis would be in order.

Best Regards,

Bruce

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Dear Puget Sound Clean Air Agency,

Thank you for the opportunity to comment on the proposed Puget Sound Energy LNG facility.

The claim that this fracked gast facility (LNG) will produce LESS pollution if built than if NOT build is laughable. Best check the proponents' claim in great detail.
Your review of the greenhouse gas impacts of the natural gas used in this project couldn't be more important. The scientists who study GHG loading and its impact make clear that we cannot, and must not, allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.

The location of this LNG plant on tribal land ought to give them a veto right, in my opinion. Haven't we done enough damage?

Please, be prudent diligent and thoughtful in your review. I hope that you will take best available science into consideration when revising this draft SEIS.
Sincerely,
Inga Fisher Williams

Steve: What's your name?

Lynn: Lynn Fitz Hugh.

Steve: Go ahead.

Lynn: Okay. My name is Lynn Fitz Hugh. I'm the coordinator of the Faith Action Climate Team. Most children in this country have been taught two histories of the relationship of the US to Native Americans.

[03:56:07] They've been taught the truth, or they've been taught a prettified version. I was taught the version in which US military slaughtered Native women and children, where they were forcibly removed from their lands, where they were put onto reservations, where treaty rights were violated over and over and over again, where people were deliberately exposed to fatal diseases, where children were taken from their parents and put into boarding schools, and where deliberate cultural genocide took place. I have wanted to believe that that is a history that we've put behind us.

But over and over again, I see that it is still the history of colonization that's being carried out today. This LNG proposal is another example of it.

[03:57:00] It violates their treaty rights, in that there was no meaningful consultation. It perpetuates doing things to their land that they very clearly stated that they don't want to have happen. And as one Native person said to me, if it blows, the pollution will pollute all of Puget Sound. I'm not the only person in this room who finds this outrageous and unacceptable. Could I see a show of hands of everyone who finds these treaty violations unacceptable? So, let the record show that that's about 80% of the people. And regardless of what's decided, we will act on our outrage. Thank you.

Subject: Port of Tacoma LNG Facility
Date: Thursday, October 25, 2018 11:31:09 AM

As a resident of Western Washington, this project is important to me personally and my company for several reasons. American Fast Freight is a transportation provider moving food, retail, and assorted goods to the residents and businesses of Alaska. AFF's ability to service our customers relies on the Tote vessels sailing from Tacoma. We have many employees that live in Pierce and King counties.

The environmental benefits resulting from converting the Tote vessels to LNG are clear. Cleaner air and cleaner water are critically important to all of us living in and around Puget Sound. As concerns about climate change grow, this effort to reduce greenhouse gasses needs to be supported. Forcing Tote to continue to burn diesel fuel is less environmentally friendly, and fails to capitalize on technology improvements available.

It's important that the Port of Tacoma remain competitive with other ports around the world that are building LNG facilities by moving forward with this project. LNG is much cleaner burning fuel and is the best current option for reducing greenhouse gasses and reducing air and water pollution.

I'm disappointed by the delay to this project caused by the environmental review taking so long. As a fisherman, hiker, and outdoorsman that spends a lot of time outside in Washington, it's important to me to move forward quickly when there are opportunities available to improve air and water quality. Please move forward quickly with the necessary approvals to get this done.

Clean Air Agency Oct 30th Meeting

1. Dr. Linda Fortune, Tacoma resident since 1968
2. Thank you for giving us
   - This opportunity to share our concerns
   - And for taking a deeper look into the ramifications of the proposed LNG plant

     Its actual impact on our environment

     The scope of serious safety issues for people, animals and water sources

     The lack of truthfulness that has thus far contained in PSE disclosures

3. Personally, after exploring these issues, I have come to the awareness that
   - We have been sold a bill of goods since the early 1970's

     Apparently natural gas, methane, is only clearner at the moment of combustion

     In the long haul it is 80 x worse then coal and oil's environmental impact

     Methane directly raises the global temperature

     Besides, 70% of methane comes from the unclean process of fracking which has serious consequences for human and animal health and water is contaminated...whether in Canada or America

4. Serious safety concerns
   - For people and our environment
   - Inadequate pipe line maintenance was acknowledged as the cause of the explosion in Seattle's Greenwood neighborhood which resulted in a severe fine for PSE
   - LNG located on land fill, in the predicted future flood area of the Port, and on tribal fishing areas

5. Thank you
   - We need the foresight which you are making available
   - We need our community decisions based on truth, knowledge and facts.
   - We need agencies not to be 'glittered by the promise of money and jobs' at the expense to our people and our beautiful Northwest
   - We need you to make the hard, informed calls based on the truth

Dr. Linda Fortune

Subject: Tacoma LNG SEIS
Date: Friday, November 16, 2018 5:24:45 PM

Puget Sound Clean Air,

Thank you for providing the opportunity to review and comment on the PSE Tacoma LNG SEIS.

Now, I am strongly asking you to muster the courage and act with integrity and deep concern for protecting our air quality in Tacoma. We have been sold a bill of goods as to the cleanliness of natural gas and you are the probably the only ones who can correct the damaging decisions that have been made thus far.

I am a Tacoma resident concerned about climate change and our contributions to global warming. Part of what makes Tacoma so special is its story of moving from a legacy of pollution to a community that can take pride in its industry and environment.

After reading the SEIS, it appears to use old information, and it's missing data. The SEIS should be using the latest IPCC numbers when determining the global warming potential of greenhouse gases. It should also use the 20-year numbers instead of the 100-year, since this plant will only be operational for 40, and we'll see big impacts from the very beginning. When the 20-year GWP from the 2013 IPCC report is used, it shows that emissions from the LNG facility are actually 30-31% worse than the No Action alternative.

The SEIS is also missing really important information, like the carbon content of the gas to be used. This data is needed for a complete study, and until it's there, this SEIS is incomplete.

How will PSCAA ensure that the methane gas comes from BC? The SEIS should also analyze the very likely scenario in which PSE will have to get its methane gas from the Unites States network.

Finally, the SEIS doesn't include smaller sources of emissions, like those from tearing the plant down. These smaller sources of emissions could add up to a big impact, and should be included in the analysis.

Because of these conclusions, I am opposed to the PSE Tacoma LNG project. Please update the SEIS, reissue it when it is complete and credible, and then re-open the comment period.

Thank you,
Dr. Linda Fortune

Subject: an aspect of LNG I"m not hearing about
Date: Thursday, November 1, 2018 8:19:03 AM

To all whom this concerns,

Can someone explain to me why natural gas is being called "clean" when the method(s) to extract it have been shown to be harmful to people and to the environment. I'm not hearing that this has been part of the LNG discussion, and it very much needs to be.

For example:

- fracking has caused hundreds of earthquakes in Oklahoma where fracking is rife and earthquakes were apparently non-existent or quite rare prior to fracking activity.
-
- tap water in areas of high fracking were shown (e.g. in the film *Gasland*) as easily set aflame, yet we cannot know the chemicals in fracking compounds because they are kept secret.
-
- The Trump Administration has expressed interest in extracting oil and gas in Western states. The film *Dear President Obama* narrated by Mark Rufulo shows fracking rigs alongside children's playgrounds and elsewhere strewn about ordinary neighborhoods. This is a nightmare I do not want to see replicated in our beautiful Puget Sound region. Would you permit fracking here? It seems an LNG plant could be cited by an unreasonable Administration as additional reason to do so.

I urge PSE and the City of Tacoma to include reviews and evaluations of extraction methods as part of your decision-making process and as part of the community discussion about natural gas:

Sincerely, Linda Frank
9124 Portland Avenue E., Tacoma, WA 98445

Steve: Next up, Molly Frankel.

Molly: I stand before you tonight wearing the robe made for my father, Jacob Porter Frankel, who, as one of the scientists that started the Lawrence Livermore Lab in California, nuclear development facility, and was a scientist with the University of California Los Angeles, began a curriculum, the first in the world, to look at humanizing the technocracy. And he started working on this in the late '50s/early '60s. So, in honor of him, among others, I'm wearing his robe. I am a journalist.

[05:27:00] I have a master's in journalism. And one of the things journalists do is they look at documents. And this isn't your document, although you commissioned it. This is the document prepared by the Ecology and Environment Incorporated. And they start out with a SEPA fact sheet. And SEPA is the State Environmental Protection Association. And by calling it a fact sheet, they give it extra weight. And the fact sheet says that the proposed action is to construct and operate an LNG blah, blah, blah. But what we're talking about is a facility that's almost totally completed.

So, what we're, generally, talking about is will you guys approve actually getting it going. And the way the SEPA fact sheet expresses this is in terms of two alternatives.

[05:28:00] The no action alternative and the proposed action. As human beings, when we hear no action alternative or proposed action, proposed action is up here and no action is way down here. That's just the way humans hear things, in terms of linguistics. Let's look and see just two sentences how they describe the no action alternative. The no action alternative is construction of the Tacoma LNG facility, including upgrading of the natural gas distribution system would not occur. Existing levels of maritime petroleum fuels use would continue. Unfortunately, what they're doing is conflating two things.

It is possible for you guys to create an order of non-approval of this environmental impact draft. And what that would mean is that we wouldn't continue to construct the facility, and we wouldn't operate it.

[05:29:02] But that doesn't mean, ipso facto, that we would be using existing levels of maritime petroleum fuels. It's very interesting to me that this document lists 15 agencies as having responsibility at different stages of the process. The last three agencies listed are the

Puyallup Tribe of Indians, the Muckleshoot Tribe, and the Puget Sound Clean Air Agency. The Puyallup Tribe and the Muckleshoot Tribe have the responsibility for Section 106 Consultation. What is Section 106 Consultation? We see that it's National Historic Preservation Act. So, we're asking the –

Steve: Can I ask you to get close to wrapping up, so we can get to other commenters?

Molly: Yeah. What I want to say is we're looking to the tribes to look at the natural historical preservation, instead of looking at them as living government that has concerns for today and the future.

[05:30:00] And I think, instead, we should look at the maritime industry for historical and look what they did with the whales.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

do not trust a company that has already begun to build a facility that has not been permitted and supplies such a flawed report to ram it through. the site is not their land and they haven't considered or consulted with the first nations people WHOSE LAND IT IS. i completely oppose any building of these facilities for a future facing climate chaos and that flies in the face of science, logic and every breathing being for the greed of peak oil profiteers that are base in every way. the whole process from beginning to end is corrupt and dirty and the earth is not theirs to pillage for a future for generations to come oand that PSE doesn't deserve. PSE deserves to lose any investment they have put into the project, any taxpayer or customer subsidizing ever, and should be divesting from fossil fuels and investing in a future of solar if it wants to be in any kind of business. PSE should be denied any further access to the site and backed up with the national guard if necessary.
NO LNG, NO FOSSIL FUEL infrastructure, NO MORE INVESTMENT IN THE DEATH OF THE FUTURE: NO TO PSE, NO TO ANY OTHER THAT TRIES TO RUN ROUGHSHOD OVER THE EARTH!!!

To whom it may concern:

I ask you to have the PSCAA complete the draft SEIS, re-issue it, and then reset the public comment period. There are a number of places in the SEIS that are missing data. How can a good decision be made without this data?

In addition, I ask you to rectify the questionable assumptions about methane leakage. More realistic estimates of methane leakage from British Columbia and from TOTE maritime vessels would change the discussion of how viable this Puget Sound Energy Liquefied Natural Gas project is, in terms of protecting the environment, including Puget Sound.

Thank you.

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. I ask you to complete the SEIS. It is missing crucial data; a well-informed decision cannot be made without this data. Furthermore, some of the assumptions need close examination, such as the assumption that leakage rates will be reasonable. This assumption seems to based on self-reported data from the industry itself.

I thank you for the review process you have started and ask you to use the best possible science to complete the SEIS.

Dear Puget Sound Clean Air Agency,
I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to deny the permit because the Draft Supplemental Environmental Impact Statement does not accurately represent the true greenhouse gas emission profile of the project. I have the following specific concerns:

DEIS is using outdated methane global warming potential value. They did not use the best available science for the Global Warming Potential (GWP) value for methane.

(Check here to continue comments on the other side.)

In addition, a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required and adequate consultation with the Puyallup Tribe and other neighbors of the project should be conducted.

Subject: Tacoma LNG SEIS
Date: Friday, November 16, 2018 3:09:07 PM

Puget Sound Clean Air,

Thank you for providing the opportunity to review and comment on the PSE Tacoma LNG SEIS.

I am a Puget Sound resident concerned about climate change and our contributions to global warming. Part of what makes Tacoma so special is its story of moving from a legacy of pollution to a community that can take pride in its industry and environment.

After reading the SEIS, it appears to use old information, and it's missing data. The SEIS should be using the latest IPCC numbers when determining the global warming potential of greenhouse gases. It should also use the 20-year numbers instead of the 100-year, since this plant will only be operational for 40, and we'll see big impacts from the very beginning. When the 20-year GWP from the 2013 IPCC report is used, it shows that emissions from the LNG facility are actually 30-31% worse than the No Action alternative.

The SEIS is also missing really important information, like the carbon content of the gas to be used. This data is needed for a complete study, and until it's there, this SEIS is incomplete.

How will PSCAA ensure that the methane gas comes from BC? The SEIS should also analyze the very likely scenario in which PSE will have to get its methane gas from the Unites States network.

Finally, the SEIS doesn't include smaller sources of emissions, like those from tearing the plant down. These smaller sources of emissions could add up to a big impact, and should be included in the analysis.

Because of these conclusions, I am opposed to the PSE Tacoma LNG project. Please update the SEIS, reissue it when it is complete and credible, and then re-open the comment period.

Subject: Comment on Tacoma LNG SEIS
Date: Wednesday, November 14, 2018 10:32:28 AM

Dear Puget Sound Clean Air Agency,

As a person of faith, I believe we are called to care for both creation and communities. My values of stewardship, justice, and responsibility have compelled me to comment on this project.

I oppose this project and urge you to stop construction for the following reasons:

1. The Puyallup people oppose it and it is adjacent to their lands. They hold the sacred trust of protecting their lands, and the species that depend on them, for themselves and for future generations.

2. This facility will hold fracked gas. Fracked gas damages the earth when it is extracted, damages ground water, and leaks methane which is a potent greenhouse gas. Fracked gas is not a necessary bridge fuel. We should immediately transition to renewable energy. The gas, once burned, will pollute our atmosphere for centuries. We need to immediately cease construction of new fossil fuel infrastructure.

3. This facility is a time bomb. Should an earthquake, a tsunami, or volcanic eruption occur, it will explode into a huge blast zone causing environmental devastation. These events are endemic to our area. They are easily foreseeable. Be prudent and avoid tragedy.

Thank you for considering these comments.

Sincerely,

Deirdre Gabbay

Thank you for conducting a supplemental environmental review of the greenhouse gas emissions for PSE's proposed LNG facility on the Tacoma Tideflats.

As a member of Earth Ministry/Washington Interfaith Power & Light, which has been working closely with scientists and policy experts to review the SEIS, I am concerned that the document does not fully analyze the climate impacts of this project.

Please address the following in the Tacoma LNG SEIS:

1. Methane's impact on climate – The SEIS uses a dated value for the 100-year Global Warming Potential (GWP) for methane from 2007 when updated values were published 2013 and then again in 2016. Using the best available science shows the plant would have higher greenhouse gas emissions. Additionally, given the short timeframe required to address climate change as recently noted by the United Nations, the SEIS should use the 20-year GWP for methane, which shows that the plant will be more than 50% dirtier over the next two decades.

2. Source of fracked gas – It is a false assumption that British Columbia would be the only gas source for this facility and this requirement is not enforceable. In addition, the SEIS relies upon self-reported pollution data on BC gas from the fossil fuel industry. It also failed to incorporate multiple, recent independent studies showing methane pollution rates as much higher than those reported by the fossil fuel industry.

3. Lack of alternative options – TOTE is already using ultra-low sulfur diesel (ULSD) and other companies are

also using ULSD or scrubbers to meet emission requirements. The no action alternative assumes that LNG is required for TOTE to meet its emission requirement, when these alternatives already exist and are in use.

4. Alterations to the original proposal – Deviating from PSE's proposal, the SEIS included bunkering more than the two TOTE vessels on the Blair Waterway. The SEIS should instead provide an analysis using only secured customers.

5. Incomplete information – Use of placeholder values, incorrect units of measurement, and the stated need for more data from PSE makes the analysis incomplete and hard to follow. The draft SEIS should be thoroughly edited and released for a new full public comment period.

The Puyallup Tribe, citizens of Tacoma, and residents of the Salish Sea have a right to know the total local and global impacts of this proposal. With missing data and alterations to the project, this draft SEIS does not account for full climate impacts.

I ask that the PSCAA live into its self-proclaimed commitment to be good and wise stewards of our shared resources. Please re-start this review with complete information and additional opportunity for comment.

Thank you for caring for creation and our community.

Sincerely,
Mrs. Deirdre Gabbay

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

Fracking poisons groundwater which is vastly more important to life than gas. That groundwater may be the difference between life and death for humans or wildlife one day in the future. We have no right to permanently contaminate this precious resource. We need clean renewable energy right now.

Sincerely,

Deirdre Gabbay

Subject: Public Comment on DSEIS, PSE LNG Project

Dear Puget Sound Clean Air Agency,

Thank you for taking the time to listen to public comments on the draft SEIS on the PSE LNG Project. I arrived to make comment in person on Oct. 30 and was informed that over 100 people had already signed up for comment, so I decided to write instead. I stayed for 2.5 hours and heard 53 people: 43 opposed to a permit for the project and the DSEIS as written, 9 in favor of it, and 1 speaker who did not seem to have a clear position. In other words, there were almost five times as many people opposed to the project as in favor of it. Those opposed came from a broad range of life experiences, from medical professionals to Puyallup tribal members, from elder Christian women to young genderqueer people, from scientists to teachers, from port workers to musicians. I hope you will consider sheer numbers in your decision, and redo the draft SEIS and deny any permits for PSE's LNG Project.

We are living in unprecedented times. As I write this comment, the most destructive fire in California history is incinerating homes, life, and land, bringing to mind the heavy smoke we had this summer that reached "unhealthy for everyone" levels here in Washington State. Islands are disappearing under rising oceans, desertification and sea level rise is causing once fertile farmland to become barren, rising global temperatures are causing more extreme weather events, and species are going extinct at unprecedented rates. Human- and fossil-fuel-caused climate chaos is not a future possibility but has arrived now. This loss of life is guaranteed to increase unless we all come together to drastically change our way of life in a very short timeframe. There is absolutely no future for humanity unless we immediately stop all new fossil fuel production. (See the most recent U.N. Intergovernmental Panel on Climate Change report for more details.)

I am writing to you as a former union construction worker who requests a redo of the draft SEIS and denial of any permits to PSE's LNG Project. I believe in economic justice for my fellow workers and I also believe in a livable planet for us. It is a false choice between jobs and the environment—having a job when there's no clean air to breathe is irrelevant. We should be putting our tax dollars and collective intelligence towards a just transition to a new economy, one that is not based on the exploitation of fossil fuels or people. Furthermore, I am confused by the argument that fracked gas (LNG) is a "transition" fuel alongside the argument to use 100-year GWP values in the draft SEIS. If it's a transition fuel, then the draft SEIS should consider the 20-year GWP values. According to the recent U.N. Intergovernmental Panel on Climate Change report, we don't have 100 years to transition out of fossil fuels. We don't even have 20 years. Rather, we have 12 years to cut carbon emissions by 45%. In that case, it makes no sense to invest in any new fossil fuel infrastructure.

I am also writing to you as a non-indigenous person living on the stolen land we now call Washington State. I support the Puyallup Nation's knowledge and comments rejecting a fracked gas facility on their traditional land. Native people have thousands of years experience in maintaining sustainable practices specific to their area. It is only in the last 150 years of colonization that we settlers have managed to damage these ecosystems so badly. While we cannot control what our ancestors did in the past, we can take collective responsibility for the future by respective Puyallup's rights as a sovereign nation and by redoing the draft SEIS and denying any permits for PSE's LNG Project.

Finally, I write to you as a current youth counselor in a rural community mental health agency. The youth I see are understandably struggling with anxiety and depression, as they are terrified about the future. They love the trees and water and air where they live, and they are discouraged to see older generations continue to make decisions that lead to climate chaos. I would love to be able to tell them that there are adults at the Puget Sound Clean Air Agency who are taking a bold stand for a sustainable future.

It is time for each of us to notice what role we can play and decide to take decisive action. Those of you in charge of the draft SEIS and permitting for the PSE LNG project are in a wonderful position to play a courageous and protective role in history. There are so many amazing examples of people in decision-making positions taking a stand for a better future. For example, Chiune Sugihara (the Japanese man who ran the consulate in Lithuania during WWII) saved over 6,000 Jews from death camps by issuing visas for them against the orders of his supervisors. In comparison, you have the opportunity to save tens of thousands people from a deadly explosion in the short term and billions of people from climate chaos in the long run. And you would not even have to defy the law—current laws and science clearly give you the power to redo the draft SEIS and ultimately deny the permit to the PSE LNG Project. I hope you will take this opportunity to be your best selves and stand for the future by redoing the draft SEIS and denying all permits for new fossil fuel infrastructure.

Sincerely,
Julianne Gale

From: Maradel Gale
To: Public Comment
Subject: Public Comment Submission: PSE"s Liquified Natural Gas Project in Tacoma
Date: Friday, October 19, 2018 3:41:29 PM

Puget Sound Clean Air Agency:

As I will not be able to attend the October 30 hearing on the permits for the PSE LNG plant in Tacoma, please accept my written comments and enter them into the official record on this matter.

First and foremost, it is critical to use best available science when making such important decision regarding public and environmental health. For example, if the correct value for methane is used, it is clear that the LNG plant is actually dirtier than heavy fuel oil in terms of greenhouse gas emissions. That fact alone should end this discussion and rule out any permits for this installation based on clean air considerations.

We now know with certainty that we are facing grave and imminent challenges to reduce emissions that contribute to global warming. Therefore, the use of 100-year global warming potential values is flawed. We need to be looking at a much closer horizon, and the 20-year numbers are critical here. These numbers tell us that the LNG plant is much dirtier than what has been projected and will contribute dangerously to greenhouse gas emissions.

It's pretty obvious (see the campaign against I-1631) that we can't expect honesty from the fossil fuel industry, so extra diligence is required in analyzing data provided by them. For example, current fracked gas wells are under-reporting methane leakages, making the DSEIS figures suspect in this area. And the source of the fracked gas cannot be guaranteed to come from any particular plant, such as the one in British Columbia. These fossil fuel pipelines are all interconnected, and when one must shut down, another valve is opened to continue the flow of gas. So any reassurance that we are going to be using only BC fracked gas is a chimera.

Finally, pretending that there are additional maritime customers for this gas

which enables credits to be given for greenhouse gas reductions is another falsehood as there are no such customers, and thus the DSEIS should not give credence to this claim.

In this day and age when we are fighting for the survival of not only many aspects of our local environment, such as Puget Sound and the fauna that live there, but for the continued existence of the human race, it is ludicrous to consider granting permits for a LNG plant such as proposed by Puget Sound Energy. This company already contributes greatly to greenhouse gas emissions through its dirty coal plant in Montana. They should not be given permits to exacerbate the problems of climate change even more.

Sincerely,

Maradel K. Gale

"Open letter to Puget Sound Clean Air Agency, regarding your draft report on the Tacoma LNG facility"

1. You need to go back and start over, using the best available CURRENT SCIENCE. Your draft does not account for the FULL climate impacts of fracked gas, as it is unacceptably flawed.
2. You must accept the historic treaty rights of the Puyallup Tribe.
3. I stand with the Puyallups in opposing this LNG facility for many reasons, some of which I present here:
   a) Climate impacts of leaked gas are 87 times worse than CO2 at warming the environment over a 20-year period of time. Leakage rates of 3% are very conservative estimates; consider the BC gas pipeline explosion a few weeks ago, which released natural gas into the environment.
   b) The emissions of ammonia, arsenic, cadmium, hydrogen sulfide, sulphur dioxide, and flared VOCs may include chemicals linked to birth defects, cause cancer, and damage the nervous system of humans.
   c) This facility will be subject to rising sea levels, lahars, earthquakes, and tsunamis, and in any of these incidents, is at great risk of spilling its contents of LNG.
4. This draft SEIS is incomplete in more than 10 locations in this report, where there is incomplete information, or where it is stated that there is more information needed from Puget Sound Energy Corporation. This incompleteness makes your draft report analysis unacceptable.

Dear Port of Kalama, and Cowlitz County,
Dear Puget Sound Clean Air Agency,

2097-1 3. Outside of SEIS Scope

We are using the earth's resources at an unsustainable pace. When I look at the amount of plastic we use everyday - the amount of garbage we generate I have a pain in my gut - This can't go on much longer - We must stop using fossil fuels - We must change direction. I really fear for the generations to come.

Please include this impact in the Final Supplemental Environmental Impact Statement.

Dear PSCAA,

I am writing this brief comment to encourage you to redo your analysis of the climate impacts of Puget Sound Energy's Tacoma LNG facility. As Citizens for a Healthy Bay has noted, your analysis fails to look at the impacts of methane releases on a timeline relevant to the shorter-lived, more potent heat trapping effects of methane relative to carbon dioxide. Please address this analytical shortcoming in your final SEIS.

Also, please keep in mind that this project has been gamed by PSE to create pressure on regulators like yourselves to permit the project. As you know, construction has proceeded in the absence of full permitting (such as that from PSCAA) and opposition from the Puyallup Tribe and much of the rest of the local community.

While it is not your job to weigh in on all aspects of the LNG facility, it seems fair that you apply maximum scrutiny to a dangerous, poorly sited project that has been pushed on the community with a cynical blend of disrespect, deceptive claims, and a shoddy public process.

Thank you for your consideration.

Sincerely,
Michael Garrity

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Dear Puget Sound Clean Air Agency,

I greatly appreciate all who are involved in contesting the studies, that in my opinion are clearly designed to construe the facts and reality of the impact of the proposed LNG refinery. The long-term forecasting of the greenhouse gasses produced by this project obviously show different levels than the short-term. The SEIS is blatantly using whichever studies they pick and choose from to make the argument they want. Again, thank you for fighting the good fight against the corrupt manipulation of data for the profit of the already rich and powerful.
If I have any real input on how wrong this project is, it is that it is being built on Puyallup tribal land. The Native American community as a whole has suffered genocide and virtual genocide since the introduction of white settlers. The Native Americans have been reduced to small land ownership. The little land the many tribes do still “control” is being stolen by projects like this.
The Puyallup people do not want this on their land. They are not consenting. No means no!

Sincerely, Andrew Genung

DEAR P.S. Clean Air Agency:
I stand with the Pullayup in opposing the LNG facility.
Fossil fuels are on the way OUT, becoming more expensive in $ & as well as planetary deadly emissions.
And somehow the native communities always get the worst effects.
But it's coming for all of us - pipeline leaks, then weather disruptions, then ecosystem collapse.

This is down to a decade we can fix the structure of energy use! IPCC doesn't make it a, want to take the risk? ACT! DENY!

sincerely, Susan Gere

Name: Cecile Gerner	Email:
Address: 6057 6th AVE NE Seattle WA 98115	Phone:

Carole: Thank you. The next one was Cecile Gernez.

Cecile: Hi. My name is Cecile Gernez. I'm an organizer with the Sierra Club. I want to acknowledge, like many people already did, that we are on Puyallup land, and we incorporate, by reference, the comments of the Puyallup Tribe. I'm speaking to you today not just as an environmentalist but as a trans, nonbinary millennial. We're already seeing the impacts of climate change. The wildfires this summer and the summer before are becoming a new normal. We're seeing larger and larger storms and floods.

[02:50:00] And entire nations are disappearing underwater from sea level rise. So, let's talk about the fires. It was dangerous to breathe the air outside this summer. And experts say that climate change is making fires worse. Nearly half of all of the young people experiencing homelessness in this country are LGBTQI plus. They're living outside, in large part, because they have been rejected from families, based on who they are or who they love. While governmental agencies like yourselves were telling people to stay inside and avoid breathing the air, members of my community had no choice because they live outside.

Climate change is only going to get worse, and it's a big cause of my anxiety as a millennial. I want to be able to breathe the air. I don't want people to die in storms. And I don't want people to lose their homes and their entire nations due to sea level rise.

[02:51:00] I'm here to ask you to deny the air permit for PSE's LNG facility. The draft SEIS does not account for the full and very real climate impacts this facility will have. We need you to study the full impacts and then, deny this permit. Methane, the main component of fracked gas is 87 times as warming as carbon dioxide. Fracked gas leaks up to 11% from extraction, transportation, storage, and processing. We're asking you to use a very conservative estimate of 3%, which represents the national average. You're a clean air agency. It's your job to make sure that people can breathe the air outside.

You have hundreds of people, in this room, tell you to stop this project and that this project will make it harder to breathe. Please listen and please stop this project. I also want to voice my concerns about the format of this hearing.

[02:52:00] Many people have had a hard time getting here on time because they weren't given numbers. So, in the future, giving folks

1121-1 12. LCA Inputs and Assumptions - Global Warming Potential Value
1121-2 14. LCA Inputs and Assumptions - Leakage/Slippage

numbers in line will help us know how much time we've got to make sure we're available to actually give comment. Thank you.

The slow or sudden release of massive amounts of hydrocarbons into the atmosphere, where thousands of people live and work, makes the location of the LNG Facility Tacoma undesirable. No amount of mitigation, promises, or insurance money will make it a safe process.

Depending on another country for the basic raw material means that supply may be cut off at any time.

All pipelines and processes wear out over time and the pipelines available from US states are not clean or reliable now. Please deny this permit.

Date: Monday, November 19, 2018 11:48:59 PM

Hello as a concerned citizen I beg you to not allow this project! There is a mountain of scientific evidence that fracking is extremely detrimental to the environment in multiple ways. It is not fair to the people of the area, the people that you represent. Please do not let a select few benefit at the cost of the rest of us. I have done quite a lot of research on this and it is obvious that it will be a massive pollution if it is allowed to happen. I am not alone. Many other people feel as I do, even if they do not take the time to write an email. Humanity must move quickly towards a cleaner and safer environment if we are to survive, and approving this project is a clear step backwards. Please do not allow this to happen. WE BEG YOU TO PROTECT THIS LAND!!! sorry for being dramatic but this is really serious. Have a good day.

ATTN: Public Comment on DSEIS,

PSE LNG Project,

1904 Third Ave, Suite 105

Seattle, WA 98101

November 18, 2018

To PSCAA:

My name is Roger Martin. I am a retired Air Force combat pilot. Subsequent to that retirement, I worked as a training developer and instructor for the B-2 stealth bomber's initial cadre of pilots, then a systems engineer for military systems, and then a manager specializing in proposals for major defense contracts. I hold a BA in Biology and Oceanography from San Jose State College and an MS in Systems Management from the University of Southern California. I am currently the coordinator for my church's Greening Activity Group at United Church in University Place.

I am strongly opposed to acceptance of the 2018 Supplemental Environmental Impact Statement (SEIS) for, and to the installation of, the LNG facility proposed for the Tacoma Tide Flats. This is for several reasons.

1. First, the location.

   We have learned that this construction location is in a) a known earthquake-fault area; b) a tsunami hazard zone; c) on land fill; and d) adjacent to Native American tribal land. For an installation that is to contain pressurized flammable gases, mixed with toxic, volatile organic compounds, in an installation that will reportedly stand 16 stories tall that is near highly populated urban areas, and be an installation and within a few miles of the West Coast's primary north-south roadway is pretty-near insane. In my lifetime, I have observed from a distance, and among other events related to manmade facilities (not in order): a) the Three Mile Island nuclear meltdown; b) the Chernobyl nuclear meltdown; c) the Exxon Valdez grounding and oil spill; d) the Deep Water Horizon explosion and oil spill; e) the Fukushima Daiichi earthquake and tsunami nuclear disaster; f) numerous railcar de-railings, chemical and petroleum leaks, fires, and explosions; g) the Shell Oil Kulluk floating oil-rig disaster (twice in one trip!) between Alaska and Washington State; h) leaks of natural-gas storage facilities (most notably Porter

Ranch in Southern California); i) numerous leaks along existing oil pipelines, including the Keystone XL and feeder pipelines; and j) one I will recount in more detail here, based on my eyewitness observation.

I was married in a full military wedding on February 2, 1969 in Santa Clara, California. Not having a lot of money, we decided to honeymoon on the beach in Southern California, complete with a drive in our two-seat, red, British TR-4 convertible, along California Highway 1. Our first night of the trip was going to be in Carmel by the Sea. Our second night was going to be in Santa Barbara, where we had dinner reservations at the end of the pier. So, on February 4, 1969, we went to that restaurant and saw oil-soaked pelicans and seagulls bobbing around in the water under the restaurant--from the Santa Barbara oil spill. 'Heck of a honeymoon, but a real lesson for a freshly graduated biology/oceanography major and newly commissioned military officer.

Although I am likely to come back to some of these issues later, I wanted to lay down some markers here. I will proceed to other matters below before coming back to detailed reflection. The big point here is that in every case, when these projects and facilities were proposed, each was going to be using the latest, greatest, most-foolproof-possible safety measures to prevent any possible accident that could ever occur, and that if one ever did occur (which we are told simply *can't* happen), it would be resolved quickly and without any damage or loss of life, because we had thought of everything and prepared for every contingency, and the government would make sure every rule and promise would be followed and kept.

2. Indian treaties

- (Quoted from the *Advisory Council on Historic Preservation Handbook* [ACHP]:) "The National Historic Preservation Act (NHPA), (16 U.S.C. Section 470f) Section 106, requires federal agencies to take into account the effects of their undertakings on historic properties and provide the Advisory Council on Historic Preservation (ACHP) a reasonable opportunity to comment on those undertakings. communication that may include written correspondence, meetings, telephone conferences, site visits, and e-mails." And, "Consultation constitutes more than simply notifying an Indian tribe about a planned undertaking."
- In addition, the Environmental Review Toolkit, published by the Federal Government, says, "The National Environmental Policy Act of 1969 (NEPA) requires the preparation of an environmental impact statement (EIS) for any proposed major Federal action that may significantly affect the quality of the human environment. The statutory language of NEPA does not mention Indian tribes. However, the Council on Environmental Quality regulations do require agencies to contact Indian tribes and provide them with opportunities to participate in various stages of preparation of an EIS."

- According to several speakers at the recent Tacoma public hearings on the proposed SEIS for the LNG facility, these consultation requirements have not even been minimally met.

3. Data are not current or accurate

   As was reported by numerous speakers at the Tacoma SEIS public hearings, the original, proposed EIS had incomplete and inaccurate data for computations used to support the Study's findings. The data in the former EIS relied heavily on information that had been available in 2007. "Placeholder" data were used in that study, based either on best-available values from studies up to that time, or estimates based on best guesses. More-accurate data were understood to be inserted as time went on and real studies were done with ever-improving and -widening information became available from better equipment and additional sampling and trend analysis. Reportedly, such data became updated in 2009, and later in 2013. Fortunately, there was an additional full IPCC report very close to submittal of this SEIS. And, although available, none of the latest data were used in the proposed SEIS. Indeed, many of the original best-guess placeholders from 2007 are still in the new document, even though new, and real, data are available.

   The Tacoma SEIS public hearings provided clear and consistent insight into how inclusion of best current data would affect the findings of the proposed SEIS. Environmental impact and possible damage from gas leakage and accidents are grossly underestimated in the current study, based on the outdated information contained in there. One witness—a college teacher (he claimed)—stated that greenhouse-gas leakage, by his quick calculations using new, accurate numbers, were roughly 2.5 times as great as those presented in the proposed SEIS.

I would like to get back to some of my earlier reflections. Specifically, I'd like to get back to some of the nuclear-plant lessons. At least, three nuclear power plants were somehow built right next to the open ocean: Diablo Canyon and San Onofre in California, and Fukushima Daiichi in Japan. At that time, several people who studied oceanography (I was an oceanography student back then) had already warned that predicted greenhouse gases would raise the sea level. But they built these plants there anyway. Brilliant, eh? The movie *The China Syndrome* was, fascinatingly, shot largely at Diablo Canyon. This was not one of the plants that did melt down. One of those that did was in Ukraine (then part of the Soviet Union), and the other was in the middle of a river in Pennsylvania.

The worst nuclear-plant disaster can be disputed as either Chernobyl or Fukushima. Again, promises were made that the safety designs were impeccable. At Fukushima, nothing could happen that could not be overcome by the wonderful safety standards that

Japan had put into place. (Apparently, nobody noticed the big ocean outside, even after all the movie monsters that had come out of it going back decades before.) People were allowed to build residences and businesses ever closer to the reactor as time went on—after all, what could happen? Other nuclear plants had been around, and hadn't blown up or been overwhelmed by a tsunami. So, why should this one? And it had been built to handle earthquakes, anyway, right? And *to government safety standards! Right?*

Then, the earthquake and the tsunami hit in 2011. In that accident, there were three nuclear meltdowns, multiple hydrogen explosions, and an estimated 1600 deaths, from a "safe" nuclear plant, because somebody had studied all the possibilities and nothing could happen that existing designs and safety procedures couldn't handle.

San Onofre was the first of the two, aforementioned US coastal plants identified for decommissioning. For a while, talk was that they could re-start it after an attempt to repair and replace parts that wore out before their initial studies had said they would (What? Overoptimistic estimates?). They also looked at what happened at Fukushima two years earlier, and perhaps started to notice that the sea-level rise predicted when they originally designed the plant was a bit underestimated (Gee, do you think so?). So, in 2013, they shut it down, never to be opened again.

Now, folks have decided it might be smart to pull the plug on Diablo Canyon too. There seems to be a trend here: Building facilities with stuff that can blow up and also contaminate a populated an area near where there are earthquakes and possible tsunamis might not be the indication of high intelligence.

So, for building on fill: San Francisco has some experience with that. In 1906, they had an earthquake. After the quake, they decided to use rubble from the earthquake and some dredging from the Bay to build a location for the Panama-Pacific International Exhibition, which then became the Marina District. In 1989, the Loma Prieta Earthquake hit at the very summit of Highway 17 between San Jose and Santa Cruz, and the land fill in the San Francisco Marina District liquified from the vibrations. In addition to water mains breaking, natural-gas (hmmm) lines broke, and fires broke out. Because of the broken water lines, water from the Bay had to be used to extinguish the fires. Land fill and gas lines have a history of being a bad idea then, don't they?

In San Francisco, there are two other buildings that were subsequently built on land fill. They are the Millennium Tower luxury high-rise, and the new bus terminal, built closely to each other. The Tower is sinking and has been discussed on several TV shows, including *60 Minutes*, and the other is the new bus terminal, which has shown structural cracking before it has even opened for regular business. How much is that all going to cost to make safe…or not? Furthermore, the entire area known as Foster City, just south of San Francisco International Airport, is sinking, at the same time the sea level is rising.

Foster City was built on land fill. And PSE (an Australian company, by the way) thinks it is just fine to build a 16-story-tall container of explosive and toxic gas onto land fill in an earthquake and tsunami zone. Brilliant!

As somebody who was college-trained as a scientist, flew in combat, authored training and technical publications both at the Air Force's Headquarters Strategic Air Command, and later, for the most-expensive combat airplane ever built, and in the defense industry was the principal manager responsible for the Technical Volumes of several DoD multi-million-dollar contract proposals, I am absolutely appalled at what was presented in this official government SEIS. It clearly needs to be re-written using current, accurate, and complete data, and with actual consultation with Indian tribes.

Disregard for federal law in consulting with native tribes, *knowingly* using outdated and misleading data on which to base conclusions that can result in disasters similar to what we have witnessed in documented events ranging from the Santa Barbara oil spill up until the immediately recent fires caused by faulty power lines in California, accepting this widely disproven SEIS would be insane, and hopefully prosecutable as a crime of fraud for which anybody who signs off on this currently proposed SEIS would be culpable.

Sincerely,

Roger T. Mart

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

The idea of putting a natural gas refinery and distribution center in Tacoma is just insane. Consider just the past few months in this country- super charged storms in the SE US, alarming number of hungry and dead orcas in Washington state and historic and deadly fires in California. We must stop our dependence on these non renewable energy sources. Natural gas being slightly “better” than oil is not good enough. Never mind the damage to the immediate environment through any kind of accident. The Pacific Northwest could be a leader of responsible, clean energy. Not to mention the complete disrespect and disregard for Native people and their wishes. Do NOT approve this project

From: Will Golding
To: Public Comment
Subject: Puget Sound Energy-LNG Facility Tacoma: Draft Supplemental Environmental Impact Statement Comment
Date: Wednesday, November 21, 2018 3:56:04 PM

My name is William Golding. I am a 26-year-old Tacoma resident living at 246 South Stadium Way, where I overlook Commencement Bay and the unauthorized construction of Puget Sound Energy's (PSE's) "proposed" Liquid Natural Gas facility in the Port of Tacoma. I am currently a graduate student in the Evergreen State College's Master of Environmental Studies program where I focus on interdisciplinary climate change studies. I am completing a thesis research report assessing existing climate change action plans within Washington state by Indigenous nation governments, county, city, intergovernmental, and non-governmental plans. Nine Indigenous nation governments, including the Puyallup Tribe of Indians, have institutionalized climate change adaptation plans to address ongoing and future local climate impacts by recognizing that only mitigating current levels of greenhouse gas emissions will not be enough in and of itself to stop current and future climate changes both globally and locally. Four county governments, twelve city governments, and a host of intergovernmental collaborations and non-governmental organizations have also institutionalized climate action plans across just Washington state. All of these efforts will be negated if PSE is allowed to complete this ill-advised fossil fuel development project.

In light of this understanding, I strongly encourage the Puget Sound Clean Air Agency (PSCAA) to reject PSE's Notice of Construction permit application, and support significant diverse community desires from the Puyallup Tribe of Indians, Tacoma residents, and many other Washington state residents who collectively comprise the constituents for which PSCAA represents in this governmental permitting process. If PSCAA requires the contracted consulting firms Ecology and Environment, Inc. and Life Cycle Associates, LLC. to reassess this initial draft supplemental Environmental Impact Statement independently and fill in the many gaps in knowledge they will come to a much different conclusion than that presented in the current draft. This review is not adequate in assessing the initial values of greenhouse gas emissions implications presented by PSE and relies on incomplete leakage rates from fracked

1805-2 cont'd 14. LCA Inputs and Assumptions - Leakage/Slippage
1805-3 5. Regulatory Framework

methane source calculations to inform initial draft findings. As a concerned citizen and constituent of PSCAA, I feel this initial assessment effort does not uphold public trust, but instead relies on private economic interests of the subsidiary privately-owned transnational utility corporation PSE to benefit the interests of TOTE Marine for a cheaper fuel source. In light of the inadequate efforts put forth by the two initially contracted consulting firms, I feel it is in the public interest to hire new independent consulting agencies to cross reference the work completed to date and incorporate new research needs identified by the current public comment period. Having invested significant research efforts into related research I feel PSCAA would do well to consider contracting regional organizations such as Sightline Institute who have a number of research staff dedicated to similar LNG projects and can provide more targeted expert research to better inform decisions made in the name of public interests; or other consultants such as the Cascadia Consulting Group, Adaptation International, Earth Economics (a Tacoma based non-profit organization), Geos Institute, EcoTrust, or even the public academic institution of the University of Washington Climate Impacts Group. Below, I present a number of pointed concerns to the current draft SEIS report, and believe if these concerns are adequately answered that PSCAA will then come to the same conclusion that myself and many other passionate stakeholders have arrived at, which is to deny the Notice of Construction permit application for PSE's LNG processing plant.

I want to acknowledge that I am a guest living on the lands of the 1854 Medicine Creek Treaty and specifically for this local area the ancestral lands of the Puyallup Tribe of Indians. This statement is also true for PSE's connecting pipelines to the processing facility and metering station. The 1854 Medicine Creek Treaty established a nation-to-nation relationship between the sovereign nations of the United States of America and presently federally recognized tribal governments including the Puyallup Tribe of Indians, the Nisqually Indian Tribe, and the Squaxin Island Tribe, as well as the non-federally recognized Steilacoom Tribe and a host of other smaller bands of sovereign nations who have been forced to be conglomerated into the aforementioned federally recognized tribes. The signing of this treaty between sovereign

1805-3 cont'd 5. Regulatory Framework
1805-4 5. Regulatory Framework
1805-5 5. Regulatory Framework

nations reserved inherent rights by Indigenous nations and peoples while granting access rights to the United States of America and its peoples. Article III of this treaty reserved rights to fish, hunt, and gather foods and other culturally important natural resources on usual and accustomed areas throughout the ceded treaty territory. These rights were reaffirmed by the 1974 Boldt decision and upheld by the U.S. Supreme Court' 1979 ruling in *Washington v. Washington State Commercial Passenger Fishing Vessel Association et al*. These processes reaffirmed not only access to these areas and resources, but also co-management status between treaty tribes and the state of Washington as part of the nation-to-nation relationship established by treaty agreements.

These fundamental rights are directly impacted by PSE's unauthorized construction efforts of the LNG processing facility on illegally dumped fill over the Puyallup River estuary (this 'land' is technically outside of the Puyallup reservation), which violates the 1854 Treaty rights to usual and accustomed fishing and gathering areas that no longer exist due to significant development impacts and associated filing of the area. The installation of the facility's source pipeline has been installed illegally on the Puyallup Tribe of Indians reservation lands without their legally required consultation and approval of consent.

PSE's and other associated permitting agencies' actions are both illegal and in violation of treaty rights as well as PSE and any other state jurisdictions who failed to adequately and meaningfully consult with not only the Puyallup Tribe of Indians, whose reservation lands and peoples are impacts by this project, but also the other Medicine Creek Treaty Tribes who have co-management rights to these impacted lands and waters including the Nisqually Tribe of Indians, the Squaxin Island Tribe, and The Northwest Indian Fisheries Commission who act as an inter-tribal governmental representative for the waters of the Salish Sea (Puget Sound). These legal violations present extreme concerns with the construction and oversight to date of the entire planning, permitting, and unauthorized construction.

1805-6 5. Regulatory Framework
1805-7 5. Regulatory Framework

I have significant concerns with the draft SEIS presented by PSCAA because there is no recognition of the role that this agency, as a representative of Washington State, plays in the nation-to-nation relationship between sovereign Indigenous Nations and the sovereign states that comprise the federal government structure of the United States of America. Nowhere in this report is there a recognition of PSCAA's responsibility to consult the treaty tribes regarding what goes into consideration for deciding on the Notice of Construction permit application process. Further, this report presents a table of required agencies for approval of the project on pages III-IV but fails to recognize fellow Medicine Creek Treaty Tribes including Nisqually Indian Tribe and the Squaxin Island Tribe. I believe this error is the direct result of PSCAA failing to acknowledge the 1854 Medicine Creek Treaty in this report and the required responsibilities of this treaty agreement regarding co-management rights and requirements for consultation to determine sovereign Indigenous nations' consent on this project. This omission must be corrected for the final draft of the SEIS to provide a valid representation of the legal framework within which this decision is being evaluated.

Words acknowledging the Medicine Creek Treaty are vitally important, and also need to be displayed through visual representation in the form of maps. The two maps present at the end of Section 1 on unnumbered pages need to be enhanced to include missing data. The first map only lists the title of the Puyallup Reservation, but fails to recognize any political boundaries of the reservation lands; as well as is woefully too small, as a sub-map image, to be the only representation of this sovereign nation. Two additional full page maps need to be added to this report; one to document the extent of the Puyallup Reservation related to the LNG processing site and the currently omitted installed pipeline connection between the processing facility and the Frederickson Metering station where the gas is sourced from the Northwest Pipeline in conjunction with documentation of the predevelopment shoreline and boundaries of the Puyallup River estuary (as accurately as possible); the second added map needs to document the full geographic extent of the 1854 Medicine Creek Treaty territory and associated tribal governments in relation to this project so that all Tribal governments with co-

1805-7 cont'd 5. Regulatory Framework
1805-8 5. Regulatory Framework
1805-9 5. Regulatory Framework

management rights to these areas are represented and can be adequately and meaningfully informed regarding this project's impact.

The draft SEIS presents inherent concerns by the ways in which values and impacts have been determined as a result of solely viewing the proposal through a colonial/Western cultural lens of the world in relationship to this this project. It is important to recognize that colonial/Western culture is only one world view out of many others exist from different cultures, especially within the area of this project. A fundamentally different cultural/world view present within this area is that of Indigenous cultures, which have been documented above to have not been adequately engaged, and that these unique cultural concerns are not considered in this current draft of the SEIS. A model framework that PSCAA and the contracted consultants should apply to updates for this impact assessment comes from the Swinomish Indian Tribal Community's (based in the coastal area between Anacortes and La Conner, WA) 2010 Climate Adaptation Action Plan, on page 28 documenting health factors and associated indicators including:

Community Cohesion – participation & cooperation; roles; familiarity
Food Security- availability; access; sharing
Ceremonial use- gatherings & ceremonies; giving thanks; feeding the spirit
Knowledge Transmission- the teachings; elders; youth
Self Determination- healing; development; restoration

Considerations such as these, and similar work by Dr. Jamie Donatuto, need to be equitably addressed in the final draft SEIS to make an informed decision regarding the granting of the Notice of Construction permit. To assess how accurately these health factors and indicators are utilized, the updated drat of the SEIS needs to consider this as a process of decolonizing existing colonial structures like Environmental Impact Review processes, and instead seek to help these processes provide justice for Indigenous nations, peoples, and cultures. In 2016,

1805-9 cont'd 5. Regulatory Framework
1805-10 5. Regulatory Framework
1805-11 3. Outside of SEIS Scope

Julia Miller Cantzler PhD, JD from the University of San Diego and fellow researcher Megan Huynh at the University of Arizona analyzed how striving for environmental justice for Native American communities can also act as decolonization by applying a methodological approach that takes into account considerations of distributive justice, i.e. geographic proximity to environmental injustice sites; procedural justice; i.e. allowing all people to engage in a meaningful way in the process and take into account how cultural differences may dictate this process be carried out alternatively from status quo colonial government approaches; and justice as recognition, similar to topics covered earlier regarding recognizing the existing history of treaty rights.

As an environmental impact assessment, this draft SEIS is woefully inadequate throughout Section 4. There is a lack of recognition of GHG emissions reduction policies outside of Washington state goals and need to be expanded to include the City of Tacoma's 2008 Climate Action Plan's GHG emission reduction targets, Pierce County's Climate Resilience Strategy, and the Puyallup Tribe of Indians' Climate Change Impact Assessment and Adaptation Options report. Section 4.2 is woefully inadequate as not a single species or ecosystem type are considered in the assessment, let alone that these have already faced serious degradation from a history of polluting industrial development. Failing to account for environmental impacts on individual species including salmon, orca, shellfish, western red cedar trees, native berries, camas, and other culturally important species for food and traditional material use fails to adequately consider the rights and interests of Medicine Creel Treaty Tribes. Also, to adequately assess impacts to individual species, this report needs to also consider the various ecosystem types within which they exist for survival and how the functions of these ecosystems are impacted including open water and near shore marine ecosystems, aquatic freshwater ecosystems, various wetland types, estuaries, mudflats, forests, prairies, mountains and glaciers, and other critical ecosystems. Earth Economics should be consulted for financial assessments of these ecologically important areas to conduct ecosystem service valuations to include in a cost benefit analysis of this proposed project.

1805-12 3. Outside of SEIS Scope
1805-13 22. General Opposition

Section 4 of the draft SEIS also fails to consider ongoing and future climate change impacts occurring locally, and needs to be updated for the final draft. The singular reference to the global impact of climate change and a deference to acknowledge these impacts further in the current draft of the SEIS fails to recognize ongoing impacts and how these will be exacerbated at the local scale. Only talking about climate impacts at a global scale fails to address ongoing local impacts like rising sea levels, ocean acidification, rising air and water temperatures, greater extremes in precipitation patterns with more frequent and intense rainfall events in the winter and greater droughts in the summer, impacts on water quality and quantity at various points throughout the annual seasonal cycles, and increasingly more intense wildfire events. The final draft needs to include the most up to date science on these understandings locally presented by the University of Washington Climate Impact Group's 2015 State of the Knowledge report, the 4thNational Climate Assessment that represents climate science understandings by regions of the U.S., as well as the most recent 2018 Inter-governmental Panel on Climate Change (IPCC) report documenting the drastic need for action to address climate change impacts.

These updated environmental understandings can only be assessed properly if the most up to date and accurate projections of the GHG emissions are present in the assessment of this proposed project, which is currently not the case with the under reported internally assessed emissions values by PSE for the initial EIS report and have been taken at face value for this current draft of the SEIS by contracted consulting firms. I attended the public comment hearing on October 30thand heard many citizens advocate for not questioning the "sound science" presented in this draft SEIS, and feel the need to address those misguided sentiments that fail to recognize the misrepresentation of facts regarding the impacts of this project. Also, to not question "science" allows results found to not be verified accurately. The only way to distill accurate scientific findings is to check the validity of those findings, and if they are found to be wanting then it is the responsibility of scientific researchers to reassess the process until

1805-14 22. General Opposition
1805-15 13. LCA Inputs and Assumptions - Natural Gas Source
1805-16 12. LCA Inputs and Assumptions - Global Warming Potential Value
1805-17 3. Outside of SEIS Scope

sound results are documented, presented, and then verified upon scrutinizing review. PSCAA is in this process right now, and many of the current presented findings are missing significant validity and have not been verified.

The current utilized emissions calculations have not been independently researched, documented, and calculated to provide an accurate assessment. The presupposed leakage rates of methane during the fossil fuel extraction process (predominantly fracking) are well below the rates observed by independent research reviews by numerous research entities. It has also recently come to light that numerous British Columbia fracking operations have been grossly underreporting their own leakage rates (the same fuel sources proposed for this project).

In light of the knowledge that methane released directly into the atmosphere is a much more potent GHG, almost 80 times more potent as an equivalent to carbon dioxide, raises significant concerns for the utilized calculations and the conclusions that can be drawn regarding the climate impact of this proposed facility. With the current draft exclusively relying on the assumption that the vast majority of methane extracted will be captured and combusted to be emitted as carbon dioxide fails to adequately reflect the reality of the entire lifecycle processing methane into LNG for a marine shipping fuel source.

It is commendable that PSCAA is striving to account for upstream impacts associated throughout the lifecycle of LNG production as this approach is currently not widely practiced. However, as many new processes go, there is significant room for improvement and refinement to work towards a more holistic review of the lifecycle impacts of a project like the proposed LNG processing facility. Outside of the limited scope of emissions leakage rates of methane from upstream fracking extraction processes, this draft SEIS also fails to account for the environmental impacts to upstream local communities near these extraction areas. Similar sentiments expressed earlier in my statement related to the need for assessing impacts to a

1805-17 cont'd 3. Outside of SEIS Scope
1805-18 3. Outside of SEIS Scope

wide range of species and ecosystem types near the proposed processing facility also need to be reviewed for upstream impacts such as: significant fresh water extraction for fracking purposes; the impact of radioactive materials used by these operations leaking into the local environment and ground water; the effects of fracking processes contaminating drinking water sources for people, livestock, and many species in the environment from uncollected natural gases; extreme increases in cancer rates within surrounding communities; decreased air quality from increased heavy industrial traffic; significantly increased rates of traffic accidents and deaths in many rural areas that do not have roadways and law enforcement capacity to serve increased usage by large industrial vehicles; greater prevalence of harmful drug use brought in by the fossil fuel employees in the man camps who make lucrative amounts of money in short amounts of time and both use of illicit substance for the stimulating effects of various drugs to work long shifts as well as recreationally because they do not have much to do in these foreign areas outside of working hours, and associated with these worker man camps also comes significant increases in violence against women with increasing rates of sexual assaults and murders especially for Indigenous women who often lack legal protections from greater rates of predatory men who work in these fossil fuel industries, in some cases due to their past criminal history that limits their job opportunities in other fields of work .

A major oversight with the current draft SEIS is the lack of acknowledging impacts of environmental injustices existing both at the location of the LNG processing facility construction in the Port of Tacoma as well as upstream related to the topics mentioned in the paragraph above related to environmental pollution and the phenomena of violence against women that has resulted in the establishment of social movements like Missing and Murdered Indigenous Women (MMIW). The areas surrounding the Port of Tacoma face significant existing environmental injustices as documented by the U.S. EPA’s EJ SCREES Tool that maps various environmental justice factors of concern. This draft SEIS fails to acknowledge these already unacceptable levels of risk for local communities. Each variable present on this tool

1805-18 cont'd 3. Outside of SEIS Scope
1805-19 3. Outside of SEIS Scope
1805-20 3. Outside of SEIS Scope

should be mapped and added to this report so anyone reviewing the next draft SEIS is aware of existing environmental justice concerns related to this projected project's impact assessment.

Some people argue that establishing the use of LNG over diesel fuel will address local environmental justice concerns from diesel particulates matter produced in combustion leading to air pollution, but a shift to LNG will not create the benefits some may imagine related to TOTE Marine's current burning of diesel fuel. TOTE chooses to not currently use the cleanest burning diesel fuel options based purely on economic desires to minimize operating costs. TOTE also already utilizes tug towing into port and shore power while docked in Port, meaning they are not burning diesel fuel and adding to the local air quality concerns that derive from many other stationary industry operations in the Port of Tacoma area. These factors need to be present in an assessment of the environmental injustice impact related to the proposed construction and operation of the LNG processing facility.

I have fundamental concerns with the structuring of the draft SEIS where a dichotomy has been created in assessing the Proposed Alternative and the No Action Alternative. This view is deterministic in that it assumes if the Proposed Alternative is not approved then no other actions will be taken to reduce existing emissions from the burning of diesel fuel for marine shipping. A number of public comments were stated at the October 30thcommunity forum supporting the current draft SEIS and advocating for PSCAA to approve PSE's NOC permit application based on the grounds that the, in my opinion currently inadequate/ not truthful, emissions comparison shows implementing the LNG processing facility will achieve needed emissions reductions to mitigate climate change impacts. Even if these calculations were correct, which I believe them to not be, the reduction of emissions by about 13% is not enough to avoid climate catastrophe, and would lock in that emission level for at least the next 40 years because a public investment this large would not be shut down easily even if it is shown to have negative consequences after it becomes operational. Operators like TOTE

1805-20 cont'd 8. No Action Alternative
1805-21 7. SEPA Alternatives

Marine will also be less likely to adapt more innovative and efficient technology after converting their fleet of ships to run on LNG meaning innovation for more efficient actions will be limited to only meet the standards of a 'Band-Aid solution' like LNG.

A similar situation has occurred while moving towards shutting down the polluting coal power plant in Centralia, WA. This example shows that it is difficult to move away from significant infrastructure investments as well as the jobs that people have become intertwined with significant resistance to moving towards more sustainable alternatives because of the political, economic, and social opposition of corporations, workers, and their families. Washington state also has a legacy of allowing failed energy infrastructure project to be built with regards to the extensive nuclear power plant facilities built near Elma, WA and the Tri Cities area during the Washington Nuclear Projects costing taxpayers billions, and it appears history is set to repeat itself by having not stopped PSE from irresponsibly and recklessly constructing the facility without approval and wasting significant public tax dollars in the process.

I believe that in the span of the next 40 years more efficient and less dangerous technologies will be developed, especially if LNG sources are not publically subsidized for private gains. I believe a third alternative should be provided in the final draft SEIS that calculates the benefits achieved by going 100% renewable energy/ zero emissions within twenty years compared to the impact that operating LNG for at least 40 years. An alternative such as this will provide projections to show the costs and benefits of holding out from making this significant investment in a marginally better at best proposed alternative for LNG. This alternative instead recognizes that we as a society have the ability and will do much better in the future with incentives to achieve this needed change by not allowing false solutions like LNG as a 'green' fuel source to dictate a clean and renewable energy future. Approving this project locks our region and our planet into an unstable future that will be significantly altered by climate change. Approving LNG will not meet both 2020 or 2050 emissions reductions needs, as it will still produce significant emissions well past these important institutionally mandated

1805-21 cont'd 8. No Action Alternative
1805-22 3. Outside of SEIS Scope

target action dates. Even if it may be more efficient than current diesel fuel (which is highly debatable), the benefits for PSCAA constituents still remain highly skeptical at best.

One gentleman at the October 30th community forum stated how TOTE Marine provides a vital service of shipping food to Alaskans and that this service needs to continue but could be made more efficient. I want to address that this statement is grounded in a deficit mindset, believing that food does not exist in Alaska and it must be shipped in for people to continue living in this region. This thought process is grounded in the colonial maritime dominated paradigm believing goods need to be shipped around the world to meet needs that would otherwise go unfulfilled. This is a false assumption, as food and materials for subsistence have existed and continue to exist all around the world including Alaska, and that the only purpose of supporting a shipping industry is the ability it provides to concentrate gains of wealth and power by a select few operating that industry and associated supporting industries such as fossil fuel development. The emissions produced by TOTE Marine from burning diesel or LNG (as well as all other uses of fossil fuels) continue to fundamentally erode the ability of Alaskans to live and support themselves with available native foods because regions closer to the Earth's poles continue to be impacted the most by severe climate changes. Allowing for the development of expansive LNG use will do nothing to address these impacts, but only provide better profits for the shipping industry at the expense of Alaskan communities they claim to support.

Finally, I come to a topic that is central to this proposal that has not been adequately addressed in the draft SEIS or any other materials submitted by PSE regarding the safety of operating this facility and the pipelines that will feed it. Significant natural disasters are a reality living in this region ranging from major earthquakes, to volcanic eruptions, to tsunamis and more. Having massive quantities of a highly flammable and explosive substances proposed to be stored at unrealistic temperatures throughout the lifespan of this facility are unacceptable to all who live close to this facility or work within this area. No similar facility is

1805-22 cont'd 3. Outside of SEIS Scope
1805-23 3. Outside of SEIS Scope
1805-24 3. Outside of SEIS Scope

sited in such close proximity to a critical urban center, vital river estuary, critical regional interstate highways, a federal courthouse, a major local public transportation hub, a major international airport and several smaller airfields, numerous other highly explosive sources from numerous oil trains serving other operations in the Port, or the PraxAir processing facility directly adjacent to Interstate 5. The final draft SEIS needs to contain maps documenting the potential worst case scenario blast zone so all local residents and interested parties can be aware of the risks. The initial proposal by PSE vastly underestimates the range of a potential explosion and what would be impacted by such an event.

As this facility sits very close to sea level, the impacts of sea level rise present flooding concerns for critical components of the facility and if flooding results in loss of power the LNG fuel, requiring being kept at -260 °F, can rapidly expand leading to an explosion. The mapping of sea-level rise and flooding risks need to be present in the final SEIS draft to make an informed decision ruling on the permit application. All emissions scenarios for the proposal are incomplete unless they account for the potential emissions that would result in event of the LNG processing facility failure or points throughout the pipeline distribution system.

Another major concern that is not addressed in the draft SEIS or other permitting processes revolve around insurance concerns for this proposed project. There needs to be documented proof of insurance for this project that covers PSE, Puget LNG, and all other permitting entities including PSCAA and the City and Port of Tacoma because all will be liable if there is a major failure of the facility and subsequent explosion that puts many people, the local environment, numerous businesses, and many critical political systems institutions such as offices and courthouses at risk. Just having proof of insurance for this facility is not enough, because the ownership structure of both PSE and Puget LNG as owners and operators of this facility present numerous concerns as to the ability to hold these entities liable for a major disruption for this area. These entities are preemptively structured to be able file for bankruptcy and dissolve responsibility in the event of a catastrophic explosion and neglect their financial

1805-24 cont'd 3. Outside of SEIS Scope

responsibilities for these harms leaving the many public entities who have approved permitting for this project on the hook for these costs because an insurance company will most likely try to avoid paying on this impact due to the many fundamental problems inherent with this project. PSCAA must be able to ensure this is not the case so that taxpayers are not left paying for PSE and Puget LNG's mistakes while their parent companies are able to get away with the significant profits they will gain from this project.

In conclusion, the existing draft of PSCAA's SEIS remains significantly deficient and as a result incomplete and as such lacks the ability to make any type of informed decision based on presented findings in order to uphold public trust. If the permit application is approved upon a final draft similar in scope and analysis to the current draft then PSCAA will be responsible for violating Washington state residents' public trust, accepting liability for knowingly putting Tacoma residents in harm's way, and sanctioning the desecration of both the local environment and the entire planet by locking energy development into a fossil fuel dependent future at the exact moment we need the opposite in order to rapidly address runaway climate catastrophe. If PSCAA reassess the project and completes a fully informed final SEIS that takes into account the many missing pieces of information documented above, then I believe your organization will come to the same conclusions that many others and myself have come to regarding rejecting the application for PSE's Notice of Construction permit. A number of people did express opinions in support of approving this project at the October 30thpublic forum, as well as a number I would guess through online efforts, but more are opposed to this project. Some in support of the project may come to a different conclusion regarding their support for this proposal if they are able to receive a fully informed report for the SEIS to this permit application by addressing a number of the concerns that have been raised by myself and many other concerned people. PSE has already violated the public's trust by irresponsibly investing public funds into an unauthorized and widely opposed project and boldly constructed a facility without any oversight. Without following proper protocols, how well does anyone including the public know if the facility has been constructed up to proper safety

standards and independently verified by third party inspectors? Nothing about PSE's present actions are right or just, and they should not be rewarded with an approved permit just because they have already made a significant investment. PSE must be held accountable for their illegal actions. The lost funds already invested into this project should play no bearing in the review of the acceptability of this facility. PSCAA plays a critical role in ensuring justice for Washington state residents and our planet by rejecting this permit application to sop the impacts of this unauthorized disaster. Thank you for your public service to support the health and well-being of present and future generations of people and our shared planet.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

The dangerous LNG plan for Tacoma must be denied. Methane is much more potent in its damaging effects than has been acknowledged in this plan. It is also notoriously hard to contain and leaks at every step in its extraction, transmission and storage. This was not appropriately taken into account in the "environmental impact statement". Incursions onto tribal land against the wishes of tribal people should be prevented. Effects on ground water, air quality and destruction of invertebrate life are all consequences of this plan. We need your help to make a truly sound and careful examination of the risks including profound risks to our climate protection.

Dear Responsible Official,

It is time that we transition away from the antiquated technologies of fossil fuels. The scientific data is clear that we need to reduce our carbon foot print fast. The newest climate modeling is showing us that even the 2050 Carbon Neutral goal that the Paris Climate Accord calls for is not soon enough. Leading countries are setting carbon neutral goals as early as 2030. The writing is on the wall that we will be switching to carbon neutral and carbon free energy sources. The question is will the fossil fuel comoanies help in that transition or hinder it... The fate of most life on this planet hangs in the balance.

Sincerely,

Dear Manager of LNG Project:

Fracked gas is not as clean as was originally claimed & definitely not ~~as~~ cleaner than coal for energy production. We @ 350.org would like further study to determine how much methane actually leaks during production, storage, & transportation.

Thank You,
Anna Green

Steve: So, next is Suzanne Greenberg.

Suzanne: Hi. I'm Suzanne Greenberg from Vashon Island. And I'd first like to pay respect to the Puyallup Tribe because we are on their land. I'm not a scientist myself. But back in the '90s, I dated a climate scientist. Next best thing. And he used to do a program in schools, and I would tag along.

[04:16:00] And he would show all of the kids the different sources of greenhouse gases, greenhouse emissions. After going through the effects on the climate from driving, heating our homes, chopping down trees, he'd then throw up a picture of a field of cows. This was the kids' favorite slide in every school we went to because that's where they got to talk about cow farts and why methane from cows farting actually was a significant threat to the climate. The reason is because methane gas, while a substantially smaller contributor to the atmosphere, was a far more potent greenhouse gas.

As you've heard today, up to 87 times more potent than carbon dioxide. The cumulative effect of a field of cows farting actually does have an impact, as funny as that sounds and as much as he used this for their comic relief. For years, I heard about natural gas and what a clean fuel it was. It was touted as a transition fuel, even by environmental groups.

[04:17:00] And it seemed to be a promising alternative to oil. What I never knew, and I think many people don't know, is that the "natural" gas is mostly methane, the same highly potent greenhouse gas with such a huge impact from small quantities. The touting of "natural" gas, and I say natural in quotations because there's nothing really natural about it, has blown over a few essential truths. The first is that because the store of natural gas has been running lower, we're turning increasingly towards fracking for our source of this methane fuel. Fracking comes with more problems than I can list in this short statement.

And you've heard many people talk about all of the problems fracking causes. Contaminating the water tables, destabilizing the land, and even causing small earthquakes, in some places. What hasn't been accounted for, and maybe people have spoken tonight, is all of the leaks along the way.

[04:18:15] Now, if a cow fart can cause an effect on the climate, and it actually does, this is documented, each of those little leaks is

1224-4 22. General Opposition
1224-4 14. LCA Inputs and Assumptions - Leakage/Slippage
1224-4 13. LCA Inputs and Assumptions - Natural Gas Source
1224-4 5. Regulatory Framework

having a big impact. Recently, several studies have proven that the amount of methane leaks has been grossly underreported, especially up in BC, which is where our source would be, by an industry that, largely, is self-regulating and is more interested in profit than appropriate regulation. With only a small amount of leakage required to equal the climate destructive impact of coal, it's three percent, our clean burning, natural gas is quickly being shown to be anything but that.

To properly assess the environmental impacts of this project and whether it's better than not having the plant built at all, you must take all of the impacts from source to burning into account.

[04:19:06] Leaks at the wells, leaks in the pipelines, bringing it down from BC or other places, methane slippage from the ships themselves. It's clear that, to me, this application should be denied. Cow farts from source to plant, though seemingly benign, create a climate impact that we can't afford. Investing in this fossil fuel infrastructure will tie PSE rate payers, which I am one of, for years to come, and have us funding our own demise. It locks us into decades of a fossil fuel future, with no proven climate change benefits. Meanwhile, advances in future shipping emission reduction solutions will be held out of the market.

The UN recently published the results of their most current study on climate change. And the warnings were dire.

Steve: Could you wrap up?

Suzanne: Yes. I'm on the last paragraph. They unequivocally state that, unless we, as a society, turn things around in the next 12 years on a massive scale previously unimagined, we're headed towards planetary destruction on a scale never before seen. The message is simple and clear. We need, as a society, to stop using fossil fuels as soon as is humanly possible. And yet, we sit here and debate if we should add yet another fossil fuel plant to the land. The Puyallup Tribe, a sovereign nation whose land this plant is being built on have strongly and firmly said no. The earth says no. We're all saying no.

It's time to draw a line and do what's right for the planet, our future, and future generations. Please deny this permit.

Steve: Thank you. Next is Grace Greene.

Grace: Good evening. My name is Grace Greene. I live in Gig Harbor. I am a mother. I am an environmentalist. I am a fisherman. I am an outdoor enthusiast. I love clean air. I am grateful for a community that is passionate about our environment. I am also the president of TOTE Maritime Alaska. I am new to this role, but I have been with the business for the past five years as the general manager in Alaska.

[06:13:00] I know first hand the importance of our business to Alaskans, as without it, we would not enjoy the quality of life that we do today. We would simply just not have groceries that are fresh, the goods or services that we depend on every day. I also know that giving back to our communities is one of our core values. As a multigenerational business and one of the founding companies here in the Port of Tacoma, it is important to us that we leave an opportunity and a legacy for our children and for their children. By converting our ships to LNG, we are on the leading edge of the safest and most environmentally beneficial maritime fuel available today.

And I am proud to be at the helm of a company that is doing so much for our community. We use shore power here in Tacoma.

[06:14:00] We are one of the only companies to do so. We have robust rain gardens. And we donate millions of dollars annually in in kind donations to organizations like ALPAR in Alaska, so that Alaskans can recycle. We are supportive of the findings and methodologies of the SEIS, and we'll look forward to continuing to lead the way on LNG. I am not just okay with meeting the requirements set forth by the EPA. I am okay with exceeding those requirements. And by converting our ships to LNG, we are doing that. There is no better alternative. We look forward to the final SEIS and the permits to move forward with this plant.

I am excited to see where we go, and I am excited to lead the way and to lead our company in doing so. Thank you so much.

Subject: Puget Sound Energy LNG Project
Date: Sunday, November 18, 2018 6:44:47 PM

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

First of all, I want to thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. With our climate in grave peril, as emphatically stated in the latest IPCC report, your review of the greenhouse gas impacts of the natural gas used in this project couldn't be more important. Those scientists make clear that we cannot, and must not, allow ANY, REPEAT, ANY further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.

1] The very initiation of this UNPERMITTED project has been amoral and illegal, conspicuously lacking in due consent of the Puyallup Tribal Council upon whose estuary it would reside. Production of LNG, when begun, would forever expose their adjacent Reservation to toxic down gassing with unacceptable medical consequences.

2] Another gross neglect adversely impacting both the Tribe as well as the broader community has been a frank discussion of the potential blast zone which would have a radius of 5 miles. This would devastate the entireity of the Port, the downtown core, and obliterate I- 5, schools & hospitals. This unimaginable scenario could be triggered by a tsunami, seismic event (tank is located on a zone) or crippling power outage. LNG must at ALL TIMES be cooled below -200 degrees. In addition any number of on site accidents to include fracked gas leakages, tank car explosions, or cargo ship collisions all conspire to preclude any consideration of this project to this site as proposed: i.e. Even the SEIS is fatally flawed with respect to treaty rights.

ATTEND TO INDIGENOUS RIGHTS--then you will protect our Salish Sea, its endangered orcas, salmon, & yes, climate catastrophe.

Additionally my concerns with this draft SEIS follow the guidlines outlinded by 350 Tacomaa: There are several sections that are missing data and so we can not accurately assess the quality of the report and understand how certain conclusions are reached. Because of that, I request that you complete this report, reissue it, and then reset the public comment period so that we have time to review the completed report thoroughly.

3] Insufficient consideration has been given to subsequent phases of RIGOROUS EIS permitting of the fracting infrastructure for supply demands. Whether by pipelines or rail both have adverse consequences which Washington State by necessity must legally address PRIOR TO
With that said, I am aware of several issues with the current draft report you issued on October 8th. It is my belief that if these issues are given proper attention and addressed with best

available science, it will show that the marginal improvements in emissions the study claims will disappear and the project will in fact be worse for the climate than doing nothing at all.

Here are some of the issues as I understand them:

- The SEIS is not using the best available science for the Global Warming Potential (GWP) of methane. It uses the 100-year GWP of methane and not the 20-year value which is much more relevant given the urgency in addressing the climate crisis. The appropriate 20-year GWP value to use is 96.
- This facility is projected to have a 40 year lifespan, so why does the report project out to 100 years, which is 90 years beyond the time we need to have taken decisive action?
- The SEIS claims emissions benefits from customers that Puget Sound Energy simply does not have. According to PSE and the City of Tacoma, the only maritime customer is TOTE with its two vessels which have already delayed their conversion to consume LNG. Securing new customers (there are only just over 100 LNG ships in operation out of a worldwide fleet of 90,000) as well as the additional permitting could take years and is not guaranteed.
- The SEIS says that emissions will only be reduced if the natural gas comes from Canada, because leakage rates are reportedly lower there than in the US. Shockingly, most leakage rates were self-reported by the fossil fuel industry based on models and recent measurements taken in the field have shown that leakage rates are much much worse.
- How can it be guaranteed that PSE is sourcing its gas from BC anyway? Their recent filings show they relied on gas from BC, Alberta, and the US. And with the recent pipeline explosion in BC that interrupted PSE's supply, we know it's not always available.
- When ships use any fuel, a certain percentage of it escapes without combusting through the exhaust system and into the atmosphere. This is known as slippage and the SEIS uses a lower rate than is considered best practice.

Thanks again for initiating this crucially important review of this facility and I hope that you will take best available science into consideration when revising this draft SEIS.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

To: Puget Sound Clean Air Agency
Please deny permission to Puget Sound Energy to build a LNG refinery in the Tideflats of Tacoma.

1. The proposed project is a direct affront to the Puyallup Tribe, putting their treaty rights and community at risk.
2. The Medicine Creek Treaty is the law of the land and has been violated throughout the process for this facility.
3. I stand with the Puyallup in opposition to the LNG facility. The Puget Sound Clean Air Agency and all agencies involved in permitting this facility still need to consult with the Puyallup Tribe.

Thank you for your consideration.

Dear Responsible Official,

Stop another backward-looking wasteful energy boon doggle. This proposed LNG project is another step toward climate chaos at a moment when the IPCC has given us a clear warning that we must urgently move away from fossil fuels.

Reject it!

Sincerely,
Leanne Grossman
Oakland, CA 94602
leanne@portfolio-of-passions.com

Steve: Thank you. So, we're going to have time for two more comments, and then, we're going to have to close. Is Colleen Gray here? Art Chippendale? Rachel Gibbs?

[06:39:00] Matthew Gulick? Okay.

Matthew: So, thank you. Heads up, there's going to be some high flowing language coming in here. So, good evening. We're here commenting on the pragmatism of LNG's transitional fuel. While we continue to debate the facts on LNG, the severity of our climate situation doesn't have time for debate. Unfortunately, what corporate interests deem pragmatic and economically viable is not what's right, moral, or just. Colonialism was and continues to be a great for "economic growth". As I hope you've learned from indigenous peoples here tonight that doesn't make it good. It's not complicated.

We have to rise to and be better than our current moment in history. This is not an idealistic pursuit, but an existential necessity. As others have said, we have the power to change for the better right now.

[06:40:02] To break from the constraining systems we believe ourselves subservient to. What we lack collectively is an understanding of how fragile these systems really are. That understanding will come sooner or later. We will bear witness to that fragility either the easy way or the hard way. We don't need a transition. We can't afford it. This isn't an incremental step towards a better future. It's another path down the fossil fuel dependency. Please don't lock us in another pair of industry handcuffs just because they seem slightly more comfortable than our current pair. We need to remove the cuffs entirely.

In our accelerating climate of overwhelming information, consumption, and confusion, we don't need this LNG plant. We need perspective. Please review the draft Don't sell us out, and don't sell humanity short. We hope to do better than giving in to an economic system that limits our potential for incredible progress to pragmatism. Thank you.

Steve: Thank you.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

The Tacoma harbor and other waterways have experienced industry for at least a century now. It's already dirty water and shoreline. We should be cleaning it up, not bringing in more potential for disaster. Fracking is wasting water and chemicals to bring up more carbon. We already know that bringing up carbon is what causes and accelerates climate change. The project is flawed on principle. Ethics. And it is in the long run unwise. Besides, it's being developed on tribal land. I know this area. It belongs to the Puyalup Tribe. You're going to ruin good land that does not belong to you. How can this be construed as ethical?

To: Public Comment
Subject: PSELNG Permitting (GHG Lifecycle Clean Air SEIS)
Date: Tuesday, October 30, 2018 9:43:32 PM

I wish to encourage the Puget Sound Clean Air Agency to adopt the SEIS and permit the Tacoma LNG plant.

It was interesting and informative to learn that with sole sourcing of gas from Canada, that the overall level of Green House Gases will be a net drop over time. And that's with a very limited scope of operations. Scaled up and taking more ships out of bunker fuel and into cleaner fuel will necessarily increase the benefits of the operation of this project.

Further, in a timely event, there was a PSE gas line rupture in British Columbia that resulted in a number of stakeholders asking people in Tacoma and Puget Sound to do emergency conservation measures to manage the stoppage of gas distribution.

This lends itself to the thought that since we are already dependent on the gas line from BC, and that the line can be disrupted and limiting supplies to Puget Sound, that having an 8 million gallon tank locally to act as an emergency reserve is sound business and critical infrastructure.

This SEIS being limited to the life cycle GHGs related to every element (including fugitive gas emissions) where even in the worst case scenario and using figures that would not be necessarily be a direct result of the PSE LNG plant in Tacoma, we would see a decrease in the tons of atmospheric release of GHGs, is incredible. Considering that many of those actions and uses of GHG fuels would occur even without the PSE LNG plant actually lends the result to the concept that GHG net reduction as a result of the plant would be even better than projections.

I realize that this SEIS is limited in scope, and requested by groups that wanted another chance to find a way to defeat the plant. I see already in the news that even with this SEIS and solid methodology, not only are opponents trying to argue against the methodology and deny the results, but who are already trying to get another EIS ordered in the hopes of shutting down the permitting process.

I ask that the Puget Sound Clean Air Agency, while respecting the thoughts on all side of the issues regarding the plant, stick with the science and grant the permit on the basis of climate necessity.

Stephen Hagberg
Tacoma, WA

(I may add at this point, thought it's beyond the lifecycle of GHGs associated with the plant, that I do share concerns about the stability of the soil upon which the container is built upon, particularly given the seismic nature of the area, that we should proceed. Even in a complete rupture, given that the gas would be at a max of 3 psi, the danger to the area would be minimal. A lighter than air gas, there is no existential threat to shoreline, waters, habitat or resources in the area. Even given a complete rupture and the possibility of an explosion (based on methodologies of military Fuel/Air

explosives) any resultant detonation would hardly be of a catastrophic result. Would suck for the people in the immediate blast zone, but does not fit within the dire descriptions opponents put forth.

Finally, I wish to state that if opponents actually had viable options in which to complete the project in an acceptable fashion, I would be more inclined to engage them. As it is, the all/nothing, monkeywrenching, hopes of finding fellow travelers to enact their will in spite of science and need is all the more reason to grant the permit.)

Your Port of Kalama, and Cowlitz County,

Dear Puget Sound Clean Air Agency,

2031-1 3. Outside of SEIS Scope

Thank you for addressing my concern:

Please consider the effect of the process of fracking on the water in the holding ponds. The water is not purified of the chemicals that have been added before it is pumped back into the ground.

Thank you.

Please include this impact in the Final Supplemental Environmental Impact Statement.

From: Andrea Hakimian
To: Public Comment
Subject: LNG wrong for Tacoma
Date: Wednesday, October 31, 2018 5:37:36 PM

Dear Sir or Madam,

I write to strongly oppose the proposed liquified natural gas plant on the Tacoma tide flats. LNG is terrible for Tacoma and for the climate. Only a small percent of Tacoma's PSE customers will benefit from the plant, but Tacoma customers will pay ~40% of the cost of the facility - and profits go overseas to Australia. However, Tacoma will have to bear the brunt of any safety issues that arise. The port is already crowded, and in case of fire an evacuation would be extremely complex, especially since there is no nearby fire station.

LNG is a climate buster, with methane being its primary component, a known greenhouse gas 86 X worse as carbon dioxide. Fracking contaminates groundwater and leaks along pipeline infrastructure.

Do not permit this LNG plant! It does neither Tacoma nor our Earth any good.

Sincerely,
Andrea Hakimian

ATTN: Public Comment on DSEIS, PSE LNG Project
Dear Puget Sound Clean Air Agency,
I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to deny the permit because the Draft Supplemental Environmental Impact Statement does not accurately represent the true greenhouse gas emission profile of the project. I have the following specific concerns:

WHAT IS WORSE CASE SCENARIO REGARDING
PUBLIC HEALTH HAZARDS & ENVIRONMENTAL DAMAGE ?

(Check here to continue comments on the other side). ☐ ➡

In addition, a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required and adequate consultation with the Puyallup Tribe and other neighbors of the project should be conducted.

Name: MICHAEL HALL Email: MICHAELHALL1846@GMAIL.COM

Address: _____

By completing this comment card you agree to receive updates about the project.

Subject: Puget Sound Energy's LNG facility
Date: Thursday, November 15, 2018 11:33:17 AM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

PSE's LNG project increases our greenhouse gas emissions and fuels climate change - which means more wildfires and smoke for our region. The resulting air pollution makes us sick and leads to higher rates of asthma attacks, heart problems and cancer in our communities.

Sincerely,

Megan Halliburton

Subject: Comment on Tacoma LNG SEIS
Date: Tuesday, October 30, 2018 9:02:31 PM

Dear Puget Sound Clean Air Agency,

As a person of faith, I believe we are called to care for both creation and communities. My values of stewardship, justice, and responsibility have compelled me to comment on this project. The tidelands are a bad choice because of how they will behave in a serious (9.0) earthquake. A disaster will affect the people least able to survive. Thank you for conducting a supplemental environmental review of the greenhouse gas emissions for PSE's proposed LNG facility on the Tacoma Tideflats.

As a member of Earth Ministry/Washington Interfaith Power & Light, which has been working closely with scientists and policy experts to review the SEIS, I am concerned that the document does not fully analyze the climate impacts of this project.

Please address the following in the Tacoma LNG SEIS:

1. Methane's impact on climate – The SEIS uses a dated value for the 100-year Global Warming Potential (GWP) for methane from 2007 when updated values were published 2013 and then again in 2016. Using the best available science shows the plant would have higher greenhouse gas emissions. Additionally, given the short timeframe required to address climate change as recently noted by the United Nations, the SEIS should use the 20-year GWP for methane, which shows that the plant will be more than 50% dirtier over the next two decades.

2. Source of fracked gas – It is a false assumption that British Columbia would be the only gas source for this facility and this requirement is not enforceable. In addition, the SEIS relies upon self-reported pollution data on BC gas from the fossil fuel industry. It also failed to incorporate multiple, recent independent studies showing methane pollution rates as much higher than those reported by the fossil fuel industry.

3. Lack of alternative options – TOTE is already using ultra-low sulfur diesel (ULSD) and other companies are also using ULSD or scrubbers to meet emission requirements. The no action alternative assumes that LNG is required for TOTE to meet its emission requirement, when these alternatives already exist and are in use.

4. Alterations to the original proposal – Deviating from PSE's proposal, the SEIS included bunkering more than the two TOTE vessels on the Blair Waterway. The SEIS should instead provide an analysis using only secured customers.

5. Incomplete information – Use of placeholder values, incorrect units of measurement, and the stated need for more data from PSE makes the analysis incomplete and hard to follow. The draft SEIS should be thoroughly edited and released for a new full public comment period.

The Puyallup Tribe, citizens of Tacoma, and residents of the Salish Sea have a right to know the total local and global impacts of this proposal. With missing data and alterations to the project, this draft SEIS does not account for full climate impacts.

I ask that the PSCAA live into its self-proclaimed commitment to be good and wise stewards of our shared resources. Please re-start this review with complete information and additional opportunity for comment.

Thank you for caring for creation and our community.

Sincerely,
Rev. Holly Hallman

10/22/18 I object to the approval of the SEIS for the Tacoma LNG facility without further more rigorous study. I recommend the SEIS be sent back for changes in scientific methodology that addresses the errors and omissions in the current document. The SEIS is using 100yr. GWP and not the 20 year value, which is more relevant to the climate emergency. The project will have a 40yr. lifespan So why does the report project out to 100 years? Leakages are only reported by the fossil fuel industry, rather than by an objective 3rd party - So ~~there is~~ where is the objectivity? It has already been shown that PSE cannot guarantee it will only source from British Columbia. The SEIS does not use best practice when assessing the impact of slippage during transportation. Methane leaks at every point from extraction to transmission to delivery. Methane is more powerful at trapping heat than CO_2 in the atmosphere. Not addressed in SEIS. Thank you. Kathleen Roos

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

The Basics: Government is in place to provide and protect the general welfare of its people. It needs to veraciously stand by this obligation. The best way forward for all people is to think forward into the future.

The situation: LNG infrustructre investments are not going to serve us well now or in the future; climate change. The proposed project also has not been given consent to build on tribal lands.

Recommendation: We need investments in true clean energy: reneables such as wind, solar, geothermal combined with energy efficiency upgrades made accessible for your people.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Gentle persons:
The claim that burning the natural gas proposed to ship from Tacoma would result in release of less GHG than not burning it must be based on unjustifiable presumptions. It is simply firmly true that the owners of fossil fuel and those making money in handling and burning it must not make use of this fossil fuel if life including that of us humans are to survive.

I want us to survive.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

I appreciate your willingness to look at the long-term effects on climate change. The proposed plant will do more to accelerate climate change than to reduce it.

I am particularly interested in the environmental justice impacts of the plant. Perhaps I should say, "environmental injustice." The adverse impacts on local low-income and minority neighborhoods are sufficient to base a permit denial on.

Thank you for the opportunity to provide this comment.

Subject: Comment on DSEIS, PSE LNG Project
Date: Tuesday, October 9, 2018 6:18:57 PM

To whom it may concern,

I support the PSE Liquefied Natural Gas project in Tacoma.

This project is critical to the continued relevance of our ports in the Pacific Northwest. LNG is a key fuel for the shipping industry world wide and is called out as a means for the International Maritime Organization (IMO) to achieve the GHG goals it has laid out, not to mention that this is a fuel that fully complies with all ECA and fuel regulations current and upcoming in 2020.

Additionally the project will allow for PSE to avoid the future cost and emissions of building an expanded pipeline for natural gas into our region to reliably supply the growing demand from residential and business customers.

Finally as more renewable natural gas becomes available in the state, this plant will allow for the liquefaction of this renewable fuel and supply that to transportation customers in all kinds of applications. This would make the benefit of this project even larger as renewable sources come available.

This is one issue with your recommendation for the supply source of natural gas to be confined to British Columbia on the permit. If a large supply of renewable gas becomes available in other locations, it may prevent PSE from using that in their LNG plant.

Regards,
Jonathan Harris.

Get Outlook for Android

Steve: Thank you. Todd Mitchell?

[06:20:00] Sarah Smith? Carolyn Hartt?

Carolyn: First off, I'm Carolyn Hartt. And my great grandparents moved here at the turn of last century and were part of the colonization. I'm honored to stand with the Puyallup Tribe and other First Nation people whose land we've stolen. It strikes me that the realization that both of the opinions presented or both of the options presented by those in favor of the PSE plant are fossil fuel alternatives.

[06:21:00] It's a fallacy of reason. The October 8 IPCC report demands that we make radical changes. Let us not be guilty of too little too late. A methane storage facility should never be located in a populated zone because of the inherent combustibility of the vapors. Additionally, methane gas is toxic and contributes exponentially more than even CO_2 emissions to the greenhouse effect on the atmosphere. Folks are very aware of this. Leaks during normal operation conditions are inevitable. Any denial of that reality is indefensible.

Sorry, I didn't mean to make that rhyme. In the event of an earthquake or lahar, the spill and explosion would be catastrophic for the tide flats, for the port, for all of the high paid jobs that this brings, for Tacoma, for Federal Way, Milton, Puyallup, and Fife.

[06:22:08] It would be catastrophic. I live in the blast zone in South Tacoma. So, I can't imagine the aftermath of that. The continued development and investment of fossil fuels is absolutely the wrong way for our economy and our health. I'm running out of time. In conclusion, it isn't too much to ask our leaders to be courageous in the face of the fossil fuel corporations. Thank you.

Date: Sunday, November 18, 2018 1:57:35 PM

The Puget Sound Clean Air Agency holds the power to grant or deny a key permit for the Puget Sound Energy Liquefied Natural Gas project in Tacoma. Finding the initial Environmental Impact Statement lacking, you opened up a Supplemental Environmental Impact Statement process to take into account the life cycle impacts of natural gas.

Thank you for doing this.

I completely object to the placement of this facility on tribal land without their consent, and to the obvious damage such a plant would contribute to our environment.

The dangers of climate change are all around us. The acceleration of damage is obvious. If the PSCAA allows PSE to do this, it will find itself humiliated by likely subsequent events. You must understand that the plant is in the wrong place doing the wrong thing.

PSCAA
Attn: Public Comment
1904 3rd Ave
Suite 105
Seattle, WA 98101

We need new technology and innovation to improve our air quality.

I would urge the Puget Sound Air Agency (PSCAA) to complete your Supplemental EIS review of the LNG Facility and TOTE's conversion to LNG powered ships in a timely manner and consider the following information:

The maritime industry currently uses diesel to power their ships.
There is no current Federal or State air quality requirement to do more than diesel at this time.
The use of LNG as a maritime fuel results in significant emissions reductions.
LNG reduces particulate matter, sulfur dioxides (SOx) and nitrogen oxides (NOx). SOx by 100% particulate matter by 99%. NOx, by 90% and according to the PSCAA's own conservative estimate, LNG use will reduce greenhouse gases by 13.5%
Without the conversion to LNG, maritime ships will default to the use of diesel fuel which is far more polluting.
I would request that you analyze both the increased cost PSCAA created for the LNG Plant and TOTE's conversion to LNG when you required an SEIS so late in the process. Specifically, I would like you to analyze the net impact of increased Sox, Nox, particulate matter and CO2 emissions during the 18+ month delay due to the lack of timely action of PSCAA in the original Environmental Impact Statement. It is appropriate that you quantify the impacts the PSCAA actually had on air quality in the region due to your management of the original EIS.

Thank you for your consideration.

Brian Haynes

Subject: Tacoma LNG Terminal
Date: Monday, October 29, 2018 9:49:11 AM

Hello - I am writing to express my opposition to the proposed Puget Soon energy LNG Terminal at the Port of Tacoma. We don't need an export terminal in Puget Sound for British Columbia gas. Let the Canadian's figure that out for themselves. The draft SEIS for the project is not complete and contains at least 10 “placeholder” values instead of actual data. One of these is related to the Global Warming Potential (GWP) value for methane. The project itself is proposed to be located on disputed Puyallup Tribal lands and is being built without their consent. I believe that the PSCAA should complete the draft SEIS and address these and other issues relating the the project's potential impact on global climate change. In particular the analysis should assess both 20 year and 100 year impacts, especially in view of the Intergovernmental Panel on Climate Change report that establishes the need for urgent action to reduce carbon emissions in the next two decades. Then the PSCAA should re-issue the SEIS, and reset the public comment period.

Subject: LNG - We need more studies!
Date: Tuesday, November 20, 2018 4:57:12 PM

I attended the hearing at the Rialto. While I didn't come up to speak (and there were still many there to talk from the early session before anybody from the evening group spoke) I still was impressed with all of the information and passion coming from our community. I think the anti-LNG group had double the speakers which to me is an indication that people want more of an environmental scoping process. I don't understand the pro-LNG people. Why are they afraid of more study and information? If they are convinced it's going to be so great, fine. Let's find out so that everybody will know. There were just too many valid questions people had that could not be answered.

Please put me down for at least having more of a study about this. Seems like we should take more time when we are putting up a huge structure (that could be a problem) that will be here in Tacoma forever. Once we complete this, it will be ours.

By the way, I have a very close friend who actually works on LNG facilities in Fort MacMurry, Alberta. That is ground zero for fracking. When he learned about this LNG tank his comment was "Why the hell are they putting this thing so close to a city? That is not wise." I agree.

Please do more study on this. Please, for all of us.

Thanks for your time,
Bon Henderson

Date: Tuesday, October 30, 2018 7:11:17 PM

Puget Sound Clean Air Agency,

Dear PSCAA,

I am deeply concerned about the LNG project, beginning with the fact that it has been allowed to get this far in construction without having the proper permits. That in itself should be a red flag that those behind the project are not interested in the well-being of our community.

Climate change is an immediate, overwhelming danger, and using natural gas contributes to the problem, from fracking, to the possibilities of leakage and spills along the pipeline. We need to be investing our resources in clean, renewable energy, not continue to build more fossil fuel sites.

I am also angry about the fact that facility is being built against the wishes of the Puyallup tribe, which should have sovereignty in this matter.

There is nothing about this project which advances the good of our communities. It only increases the dangers. Please deny the final permit for this project and then help ensure it is shut down entirely!

Thank you,

Janet Hendrickson

Subject: Tacoma LNG SEIS Project Comment
Date: Monday, October 22, 2018 4:30:04 AM

Dear Responsible Official,

In order to keep the earth habitable for humans, we must stop building new fossil fuel infrastructure. We should have a Manhattan Project level effort to switch to renewable energy ASAP.

Puget Sound Energy and Tote Marine seem to imagine that a clean energy future can be arrived at by digging the fossil fuel hole deeper. This proposed LNG project is another step toward climate chaos at a moment when the IPCC has given us a clear warning that we must urgently move away from fossil fuels.

Fracked gas is not a lesser evil. Scientists' understanding of methane's impact on the climate continues to evolve, and at every step along the way we learn that fracking allows more methane escapement than we had previously observed and that the impact of methane on the climate, particularly in the short term, is even more serious than had been previously understood.

1843-1 12. LCA Inputs and Assumptions - Global Warming Potential Value

From: Emily Herbert
To: Public Comment
Subject: Tacoma LNG Terminal
Date: Friday, October 19, 2018 10:11:18 AM

Dear Deciders:
In view of the latest IPCC report indicating that we have very little time left to dramatically reduce the existing CO2 in our atmosphere and have not reduced it at all in the past 30 years! It is imperative that we halt all non essential mining, transport and use of fossil fuels. This project is dirty, supports the worst harm from fracking which leaks methane as well as the life cycle of what is fracked. And they did not use the best available science for the Global Warming Potential (GWP) value for methane.
GWP is a measure of potency for a greenhouse gas and it is measured against carbon dioxide (CO2). CO2 has a GWP value of 1. Methane, however has a much larger GWP value. They are using the 2007 value of 25 for the 100-year number (i.e. the value average over 100 years), whereas they should be using the 2016 value of 32. Everything else being equal, making this one modification in their models makes the LNG plant dirtier from a greenhouse gas emissions perspective than staying with the heavy fuel oil. As a specie, we face enough dirty air to destroy all humans and much of life on the planet. STOP it NOW, please.

Subject: Puget Sound Energy's LNG facility
Date: Friday, November 16, 2018 11:28:19 AM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

I'd like to concentrate on one of many concerns I have in the draft SEIS and that is the process in analyzing the GWP. The GWP number given in the report is 25 for a 100-year period. This is from the UN IPCC AR 4 report. There is now an AR5 report showing methane's GWP at 28 tons. I've seen other more current reports showing methane's GWP higher than either one of these. A 100-year analysis does not fit with the methane emissions characteristics. A more accurate analysis would be to include a 20 year study for 2 reasons: one, that methane's emissions are short lived, about 10 years and, two, the IPCC's special report on the rapid response needed to limit global warming to 1.5 C above pre-industrial levels.

From the 5th Assessment Report of the Intergovernmental Panel on Climate Change (IPCC), approved in 2009, I recently read the following statement on using the 100 yr GWP horizon:

"The GWP has become the default metric for transferring emissions of different gases to a common scale; often called 'CO2 equivalent emissions' (eg., Shine, 2009). It has usually been integrated over 20, 100 or 500 years consistent with Houghton et al. (1990). Note, however that Houghton et al. presented these time horizons as 'candidates for discussion [that] should not be considered as having any special significance'. The GWP for a time horizon of 100 years was later adopted as a metric to implement the multi-gas approach embedded in the United Nations Framework Convention on Climate Change (UNFCCC) and made operational in the 1997 Kyoto Protocol. The choice of time horizon has a strong effect on the GWP values – and thus also on the calculated contributions of CO2 equivalent emission by component, sector or nation. There is no scientific argument for selecting 100 years compared with other choices (Fuglestvedt et al., 2003; Shine, 2009). The choice of time horizon is a value judgment because it depends on the relative weight assigned to effects at different times."

Based on the above statement, it seems to me that using the 100 year horizon for methane's GWP would skew the emissions numbers because of the short lived emission characteristic in methane compared to the long lived emissions in CO2. In layman's terms, it feels like comparing apples to oranges. I have read about recent recommendation to use a dual term GWP of 20 and 100 years. A co-author on this subject I found on the internet, Michael Oppenheimer, the Albert G. Milbank Professor of Geosciences and International Affairs at Princeton University says, "Different gases have widely different lifetimes in the atmosphere after emission and affect the climate in different ways over widely different timescales. The paired approach creates a more comprehensive picture of the nature of climate change and the effects of various policies to stem its consequences." Lead author Ilissa B. Ocko from the Environment Defense Fund said in that same article, "It is imperative that both the near-and long-term climate impacts of policies be transparent to a decision-maker. We are not saying that one timescale is more important than the other, just that the decision-maker must be fully informed of climate impacts on all timescales."

In conclusion, I'm asking you to please consider using the most recent data in GWP emissions for methane and add the GWP data for a 20 year factor so that we can receive a more thorough analysis. Also, know that I support the Puyallup tribe with their stance on the subject of the LNG plant.

Thank you for this time.

Steve: Yeah, it's right here. So, Desiree Douglass? kathy Hewitt?

Kathy: Good evening. My name is Kathy Hewitt, and I'm a resident of Tacoma. I'm a grandmother to two wonderful boys, and that's the main reason I'm here. Today, I'd like to concentrate on one of the many concerns I have in the report, the process in analyzing the GWP. The GWP number used in the report is outdated. One study published less than a year ago even suggests that the GWP for methane is likely 14% more than the AR5 number. In addition, a more accurate analysis would include a 20 year study for two reasons.

[04:31:00] 1) That methane's emissions are short lived. And 2) the IPCC's special report on the rapid response needed to limit global warming. The AR5 report states, "The choice of time horizon has a strong effect on the GWP values. And thus, also on the calculated contributions of CO_2 equivalent emissions by component, sector, or nation. There is no scientific argument for selecting 100 years compared with the other choices. The choice of time horizon is a value judgment because it depends on the relative weight assigned to affects at different times."

Some scientists are supporting the concept of using both the 20 and 100 year numbers. In one article I read, Princeton University professor Michael Oppenheimer said, "Different gases have widely different lifetimes in the atmosphere after emission and affect the climate in different ways over widely different time scales."

[04:32:06] "The paired approach creates a more comprehensive picture of the nature of climate change and the affects of various policies to stem its consequences." In that same article, Alissa B. Occo of the Environmental Defense Fund said, "It is imperative that both the near and long term climate impacts of policies be transparent to a decision maker. We are not saying that one time scale is more important than the other. Just that the decision maker must be fully informed of climate impacts on all time scales."

In conclusion, please use the most recent scientific data for GWP units and apply a 20 year horizon for the GWP, so that we can receive a more thorough, accurate analysis. Thank you for your time.

I am strongly opposed to this project because it violates the Puyallup Tribes treaty rights under the 1855 Medicine Creek Treaty. Treaty rights have more authority than the right of any other governing body or agency. Why have their rights been ignored and their land and people subject to such risk? They must be included in any negotiations to move forward with this project, regardless of how difficult or inconvenient it is to accomplish.

Nov. 1, 2018.

Hello.

The current draft of the SEIS is woefully inadequate and misleading, as informed community members made clear to you at the hearing on Tuesday, October 30. Do the right thing and begin all over again with your review of the LNG Plant's impact on our air quality. No doubt, a properly conducted review, based on up to date science, will reveal that transport, containment and export of fracked gas will threaten our air quality to a devastating degree. Methane will not only dirty our air but contribute to accelerated climate change. Just at a time when the planet is reaching its tipping point in regards to human carelessness. Duh! Do your job! Protect Chief Leschi School students, the Puyallup Tribe, Fife community members, Northeast and Hilltop residents, workers at the Port and my small grandson. His little lungs cannot bear this assault and his future smells stinky and poisonous!

Janet Higbee-Robinson

Steve: Thank you. So, next is Rus Higley.

Rus: Thank you for letting me speak today during the public comment period for the SEIS, for the Puget Sound Energy Liquid Natural Gas Plant in Tacoma.

[05:24:00] My name is Rus Higley. And with my wife and two children, I live in Tacoma and work in the Puget Sound region. I am a marine biologist and teach in the sciences at several local colleges, including the nearby University of Washington Tacoma. In fact, the students in my science and sustainability class are here today listening in and being part of our future. According to Puget Sound Clean Air Agency's own strategic plan, 2014 to 2020, your agency has two goals. And I quote, "protect public health and the environment from air pollution and become the most climate friendly region in the United States."

Within that document, you discuss targeting "high impacted communities where pollution levels pose the greatest risk" and "socioeconomic disparities in air pollution". Tacoma and its aroma have been the butt of jokes in this region, in terms of air quality and pollution for half a century due to a legacy of pollution that still lingers and still significantly impacts the citizens that live in the region surrounding the Port of Tacoma.

[05:25:02] Although the pollution directly coming out of a tail pipe will significantly decrease, when switching from bunker fuel and diesel, this ignores the real cost, due to the others paying the upstream and downstream environmental costs of natural gas and results in a net loss. You must account for the full lifecycle of natural gas. If we are concerned about air quality in Tacoma, TOTE Shipping has already answered with their ability to turn off the ships and plug into shored power.

If Puget Sound Clean Air Agency is to reach its second goal of "becoming the most climate friendly region in the United States", it must not be at the cost of damaging other locations. To adequately measure this, the SEIS must include the most current research on natural gas, especially including fugitive emissions and the most recent numbers that show natural gas is likely equivalent to coal in global warming potential. Whether referring to natural gas or liquid natural gas, neither are the answer.

[05:26:00] Tacoma is not the pig, and it doesn't need anymore lipstick.

Steve: Thank you. Next up is Linda Fortune.

[05:08:00] Stephanie Hillman?

Stephanie: Thank you. My name is Stephanie Hillman. I'm a campaign rep with the Sierra Club. And we incorporate, by reference, the comments of the Puyallup Tribe and definitely strongly support their concerns. I also support the well thought out comments of those who have spoke before me, community members who oppose this project. We, the Sierra Club, will be submitting some more technical comments. But I wanted to take this chance to thank you for conducting the SEIS and for holding this hearing because I want to trust that this means you're taking the greenhouse gas emissions of fracked gas and its impacts on climate change very seriously.

With the IPCC conclusion that we have 12 short years to turn this whole fossil fuel impact around, I hope you realize that this is an opportunity for you to be a part of the solution and not a key player in bringing on the most catastrophic impacts of climate change.

[05:09:12] And you've heard from so many people here tonight that have read and analyzed the SEIS and have heard that, and I agree, that it grossly underrepresents the true impacts of fracked gas on our climate and, therefore, the true impacts of this particular LNG facility. I urge you to apply the best available science and a new assessment and see if your conscience allows you to permit a project that would so negatively impact the future forever. Thank you.

Steve: Thank you. Before I call the next speaker up, the next group of five will include Tom Pearson, Terry Velasquez, Chuck Valdez, Russ Higley, Molly Frankel, and Malcolm Russel.

Subject: Puget Sound Energy LNG Project
Date: Tuesday, October 30, 2018 9:12:31 AM

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,
Personal Note:
My son lives up the hill from the Tideflats. An LNG storage plant will be exceedingly dangerous. California positioned their LNG storage facility close to shipping but far away from commercial or residential areas near Santa Barbara. It was the recommendation by the EIS report that LNG storage Must be a great distance away from citizens. Explosions can occur. Methane gas is released during the process of cooling. Earthquakes or storms can shut off power. Even a slight warming due to loss of power can cause an explosion. How do I know of the CA EIS report recommendations? My brother's company did the EIS report twenty years ago.
LNG is not safe for our environment. LNG storage was too costly of a venture for British Columbia, why is Tacoma proposing this fool's folly?
We will fight this for my family, and for the safety of families living in the area. LNG is a short term fix; it is not the future.

First of all, I want to thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma. With our climate in grave peril, as emphatically stated in the latest IPCC report, your review of the greenhouse gas impacts of the natural gas used in this project couldn't be more important. Those scientists make clear that we cannot, and must not, allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources.

My first concern with this draft SEIS is that it's not complete. There are several sections that are missing data and so we can not accurately assess the quality of the report and understand how certain conclusions are reached. Because of that, I request that you complete this report, reissue it, and then reset the public comment period so that we have time to review the completed report thoroughly.

With that said, I am aware of several issues with the current draft report you issued on October 8th. It is my belief that if these issues are given proper attention and addressed with best available science, it will show that the marginal improvements in emissions the study claims will disappear and the project will in fact be worse for the climate than doing nothing at all.

Here are some of the issues as I understand them:

- The SEIS is not using the best available science for the Global Warming Potential (GWP) of methane. It uses the 100-year GWP of methane and not the 20-year value which is much more relevant given the urgency in addressing the climate crisis. The appropriate 20-year

GWP value to use is 96.
- This facility is projected to have a 40 year lifespan, so why does the report project out to 100 years, which is 90 years beyond the time we need to have taken decisive action?
- The SEIS claims emissions benefits from customers that Puget Sound Energy simply does not have. According to PSE and the City of Tacoma, the only maritime customer is TOTE with its two vessels which have already delayed their conversion to consume LNG. Securing new customers (there are only just over 100 LNG ships in operation out of a worldwide fleet of 90,000) as well as the additional permitting could take years and is not guaranteed.
- The SEIS says that emissions will only be reduced if the natural gas comes from Canada, because leakage rates are reportedly lower there than in the US. Shockingly, most leakage rates were self-reported by the fossil fuel industry based on models and recent measurements taken in the field have shown that leakage rates are much much worse.
- How can it be guaranteed that PSE is sourcing its gas from BC anyway? Their recent filings show they relied on gas from BC, Alberta, and the US. And with the recent pipeline explosion in BC that interrupted PSE's supply, we know it's not always available.
- When ships use any fuel, a certain percentage of it escapes without combusting through the exhaust system and into the atmosphere. This is known as slippage and the SEIS uses a lower rate than is considered best practice.

Thanks again for initiating this crucially important review of this facility and I hope that you will take best available science into consideration when revising this draft SEIS.

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma.

My experience as a fish and wildlife biologist for 32 years, followed by 10 years as a volunteer environmental educator, has convinced me that we must not allow any further fossil fuel infrastructure to be built and must rapidly transition to renewable energy sources. The current SEIS has 6 defects that must be remedied:

1. The SEIS uses the 100-year potential effect of methane, not the 20-YEAR value which is much more relevant given the half-life of methane. The appropriate 20-year value use is 96.

2. This facility is projected to have a 40 year lifespan, but as I understand it the world has only about 12 YEARS to act decisively. It is unrealistic for the report to promise reducing air pollution 100 years from now!

3. The SEIS claims emissions benefits from customers that PSE has NOT SECURED. The only maritime customer has only two vessels, which have already delayed their conversion to LNG.

4. The SEIS says that emissions will only be reduced if the natural gas comes from Canada, but recent studies have shown that LEAKAGE RATES are much worse than those given in the SEIS.

5. How can it be guaranteed that PSE is sourcing its gas from BC? Their recent filings show they also relied on gas Alberta and the US. And with the recent explosion in BC that interrupted PSE's supply, we know that this SOURCE WILL NOT ALWAYS BE AVAILABLE.

6. When ships burn fuel, some slips, without burning, into the atmosphere. The SEIS uses a LOWER SLIPPAGE RATE than is considered best practice.

I hope you will revise your assessment of these issues when redrafting this SEIS.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

I am against any form of FRACKING!! NO NO NO!!!

Steve: Next up is Alex Hofeling.

[04:55:00]

Alex: Good evening PSCAA staff and all concerned citizens within this room. My name is Alex Hofeling. I live in Gig Harbor with my family. I'm also a TOTE employee. I'd like to start with a statement we can all agree on. Environmentally, we need to do better. Status quo is no longer acceptable. And I think everybody in this room has illustrated that. As a matter of fact, the Obama led EPA created a mandate to make such improvements. This mandate were for shipping companies, such as TOTE, operating within 200 miles of the United States, to make great improvements to improve local air quality.

TOTE made the decisions and the investment to make the greatest improvement by removing most of all sulfur from our fuel. Comparing this choice against the status quo, TOTE burns diesel to power our ships today.

[04:56:00] The reality is this. We either stay with the status quo, diesel, or we can advance to something better. There is no false third choice. In this case, our something better is a fuel source that provides better local air quality and, according to the SEIS, reduced greenhouse gases based on science, not on words. And 100% were significant reductions in sulfur, significant reductions in particulate matter, and as I noted, about 14% reduction in greenhouse gases through our ships. This is getting better in increments. Or the choice is do we stay with the status quo. These are the two choices. There is no third choice.

If TOTE cannot get access to this fuel, we, in essence, all of us, in reality, accept the status quo. That's the reality. That's worse air quality in Tacoma, which is a huge point for the PSCAA.

[04:57:00] It's also worse air quality in Puget Sound and Alaska. It's also, according to the SEIS, increased greenhouse gases. We need to do better, and we can do better. If we don't accept the environmentally improving technologies, we are accepting status quo. I urge PSCAA to follow the science and follow your rule improving air quality. Thank you very much.

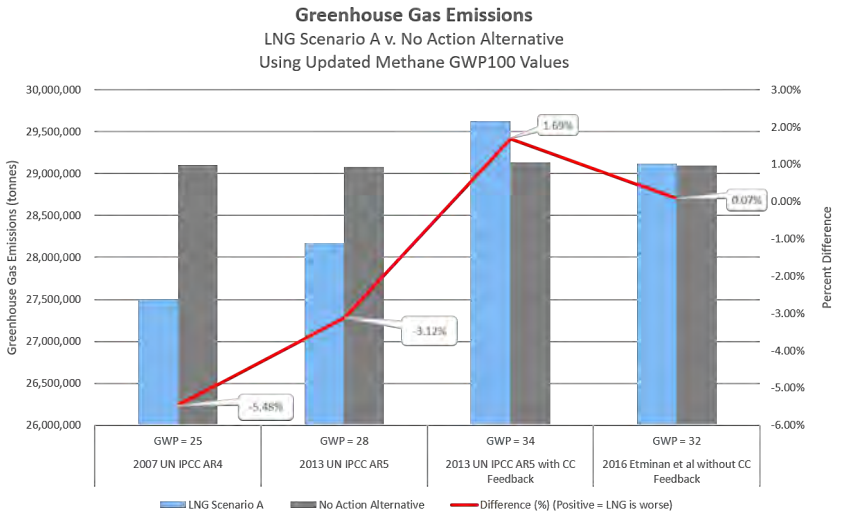
Puget Sound Clean Air agency
ATTN: Public Comment on DSEIS, PSE LNG Project
1904 3rd Ave. Suite 105
Seattle, WA 98101

I want to thank the hard-working folks at the PSCAA for their in-depth FEIS and SEIS reports they did on the Tacoma LNG plant. Now I am asking the PSCAA to supplement their SEIS with a **Global Warming Potential** of methane from reports that are more recent than the 2006 report used in the SEIS.



Methane Global Warming Potential over 100 years:
2007 UN IPCC AR4 (used by PSCAA).....25 tons CO2 equivalent
2013 UN IPCC AR5 (without climate carbon feedbacks .....28 tons CO2 equivalent
2013 UN IPCC AR5 (with climate carbon feedbacks).....34 tons CO2 equivalent
2016 study by M. EtminanG. MyhreE. J. HighwoodK. P. Shine.....32 tons CO2 equivalen**t**

I work as an engineer for a Navy contractor designing and ruggedizing circuit boards to a vast library of MIL-STD specifications and test procedures. So I have some idea the resources it takes to conduct a study and write a report of this magnitude.

When my colleagues and I have to synthesize large volumes of data, pictures, and analyses, we invariably end up building customized tools that are specific to the project. Spreadsheets with complex data-manipulation formulas, tools for retrieving large data sets, interfacing with test equipment and so forth. In reviewing the SEIS, I was keenly aware of the large amounts of data and analysis that went into the pictures, charts, paragraphs, and maps.

My point here is: the authors and contributors of the FEIS and SEIS at PSCAA have built the tools that made the reports possible. **Those tools can be used again (without re-incurring the cost of developing them from scratch). Re-run the models again, feed them the more recent Global Warming Potential values from the 2013 UN report and 2016 UN report. Then report these findings alongside the findings you're currently reporting with the 2007 GWP value.**

Your results should look something like this chart, construction of which can be found here.

Regards,
Steven Hofer

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Fracking and exporting fuel to china is not in the interest of protecting the planet and allowing our youth to have a full life on a habitable planet.

[00:31:00]

Carole: Thank you. Steve Hoffman? I'm sorry, this is Steve Hoffman@ Earthlink.net.

Steve: Yeah, that's me. My name is Steve Hoffman, and I am speaking on behalf of the Freedom Socialist Party. As my party's candidate for US senate in this year's primary, I was proud to stand with the Puyallup tribe and area activists in their fight to stop the Tacoma LNG facility. It is outrageous that a private energy firm would be allowed to build such a high risk facility so close to a population center, and without anything resembling proper consultation with the Puyallup Tribe as required by treaty and so clearly explained by the representative from the Puyallup Tribal Council today. The LNG facility poses a grave danger to the tribe's fish runs that they rely on.

[00:32:00] Tribal fish rights should mean that the government is responsible for doing whatever it takes to make sure that there are fish in the waters. Washington State has no right to put those fish and the health of Puget Sound at risk, so a fossil fuel corporation can obtain a permit. Given that the recent UN report on climate change has warned that we only have 12 years to dramatically reduce the burning of fossil fuels to avoid ecological catastrophe, now is not the time to double down on fracked gas. As other speakers have mentioned, the fracking process itself poisons water aquifers, ruins lands.
And from the production, distribution, storage, and transmission, produces high greenhouse gas emissions. Today, I urge the Puget Sound Clean Air Agency to take a stand for a health planet and a sustainable energy future.

[00:33:00] And as far as the jobs go, I think the construction of a sustainable energy infrastructure throughout the nation would provide far more jobs than the fossil fuel projects that we're discussing today. I urge you to deny the permit for the LNG facility. Thank you.

Dear Port of Kalama, and Cowlitz County,
Dear Puget Sound Clean Air Agency,

I am concerned about treaty rights of the Puyallup people and other indigenous groups. Please include the wishes of tribes in all areas which may at all be impacted by any infrastructure + emissions in your FSEIS.

thanks

Please include this impact in the Final Supplemental Environmental Impact Statement.

Dear Port of Kalama, and Cowlitz County,
Dear Puget Sound Clean Air Agency,

Just because people may not live near extration points, other living beings do. I'm very concerned about the ~~exposure~~ levels of toxic chemicals used for extration with clean water. Please study what kinds of life can live in the waters that has been used for gas extraction. This will be whats left of us if money continue to driven energy decisons.

Thanks!

Please include this impact in the Final Supplemental Environmental Impact Statement.

Name: Rachael Hagan	Email:
Address: 8003 44th AVE NE Seattle WA	Phone:

Carole: Thank you. Rachel Hogan?

Rachel: Hi, thanks for hearing me. I saw the effects of a toxic spill when I was a fisherman. I saw oil deposits from Exxon Valdez oil spill back in the late '80s spread far and hundreds of miles away from where it happened and with huge and lasting impacts to fisheries, jobs, beaches, and not the least of which was the toll it took upon the animals, the sea life, the birds, and mammals.

[02:37:07] I won't forget it. Years later, it was hard to sample herring without getting piles of lesioned fish. They have big, angry, open wounds ulcerated, dying tissue. And when you witness fish swimming in circles not because they're playing or because they're chasing prey but because their bodies are permanently bent, and they can't swim right, you quickly understand how toxicity lasts in the chain of life for generations. When I later worked in a small place poisoned by industry, I experienced just a tiny bit of the horror of how that manifests. The people who made profits from an extractive industry were long, long gone.

But the people who lived there were left with the faulty water filtration system, which produced liquid that wasn't even fit for the dump. EPA oversight meant that someone came to change the filter once in a while, sometimes with years in between.

[02:38:00] So, people had babies born with birth defects. Parents and kids struggled to think. Dogs were sick and squirting from both ends. And I could go on. Until some of you have experienced this first hand, or unless you already live in Tacoma and know what's going on, this may be some far off idea that you believe won't really affect you. But I'm here tonight to tell you it's not just some emotional version of sad and unfortunate. It's very cruel and very real. This happens over and over, until we are where we are now.

With Puget Sound posed to operate that huge tank, building it like it owns the place and belongs, like a lesion sitting there already eating away at the living earth and desiring to spread its twisted veins across our lands and into the air, accelerating climate change with methane. We need to get it off Puyallup Tribal Fishing grounds now.

[02:39:00] Saib Tabrizi says, "When poison becomes a habit, it ceases to injure, make your soul gradually acquainted with death." Off Ecology's website, the state environmental SEPA policy has some

great ideas. I'm out of time. I'm going to say there are poisons that blind you and poisons that open your eyes. Mine are open. I hope that the poisons around you don't blind you.

Dear Port of Kalama, and Cowlitz County,
Dear Puget Sound Clean Air Agency,

2130-1 3. Outside of SEIS Scope

Just because people may not live near extration points, other living beings do. I'm very concerned about the ~~exposure~~ levels of toxic chemicals used for extration with clean water. Please study what kinds of life can live in the water that has been used for gas extraction. This will be whats left of us if money continue to drives energy decisons.

Thanks!

Please include this impact in the Final Supplemental Environmental Impact Statement.

Dear Port of Kalama, and Cowlitz County,

Dear Puget Sound Clean Air Agency,

2131-1 3. Outside of SEIS Scope

I'm grossed out and shocked knowing that tailing ponds are even real. Please study the psychological state of the people who design + pay for these. The psychological profiles of those who dump the sludge, slurry + toxic waste for generations to come - for the sickness it will bring to so many now + in the future. Are they themselves sick? Are they so disconnected from love of life on this planet that they just don't care or perhaps it is a self-destructive or sociopathic profile. Please study this or have it studied.

Please include this impact in the Final Supplemental Environmental Impact Statement. Thanks!!

Dear Puget Sound Clean Air Agency,

2132-1 3. Outside of SEIS Scope

As a parent of 2 kids I'm completely confused about how fracked gas has become any sort of energy solution with the threats to our environment + health. I can't imagine a state where a family choosing to walk forestland or down a street could risk exposure to the toxic soup used to extract the gas. Carcinogens not only at the source of tailing ponds but all along the pipeline + transport routes. Please use your heart when making preparing the additional info in the FSEIS. Protect our kids! Thanks!

Please include this impact in the Final Supplemental Environmental Impact Statement.

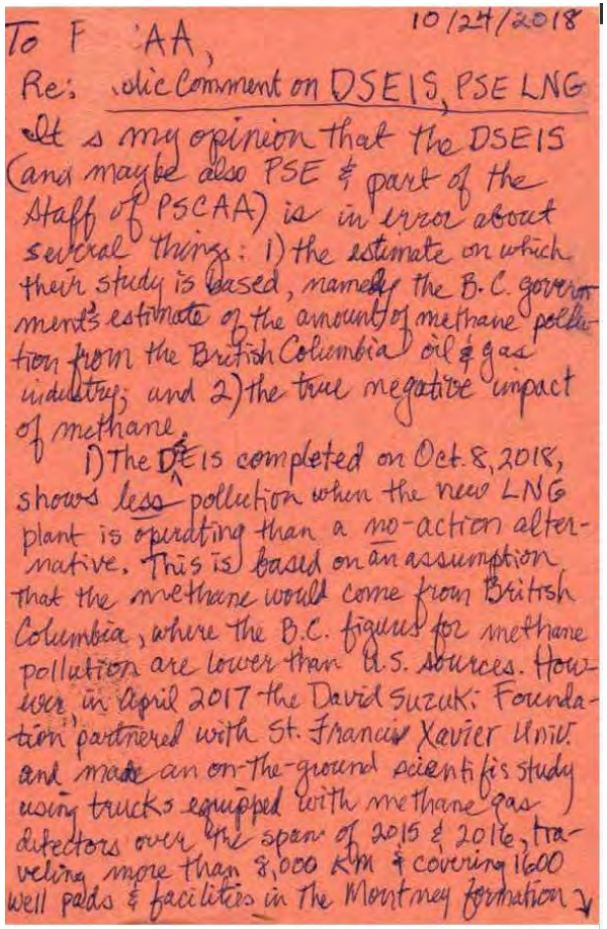
ATTN: Public Comment on DSEIS, PSE LNG Project
Dear Puget Sound Clean Air Agency,
I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to deny the permit because the Draft Supplemental Environmental Impact Statement does not accurately ~~represent the true~~ greenhouse gas emission profile of the project. I have the following specific concerns:

RECEIVED
NOV 19 2018
Puget Sound Clean Air Agency

The dangers of an LNG facility in the tideflats area of Tacoma are unacceptable. Knowing what we know about the dangers of climate change this project is a step in the wrong direction for the health of our planet.



(Check here to continue comments on the other side.)

In addition, a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required and adequate consultation with the Puyallup Tribe and other neighbors of the project should be conducted.

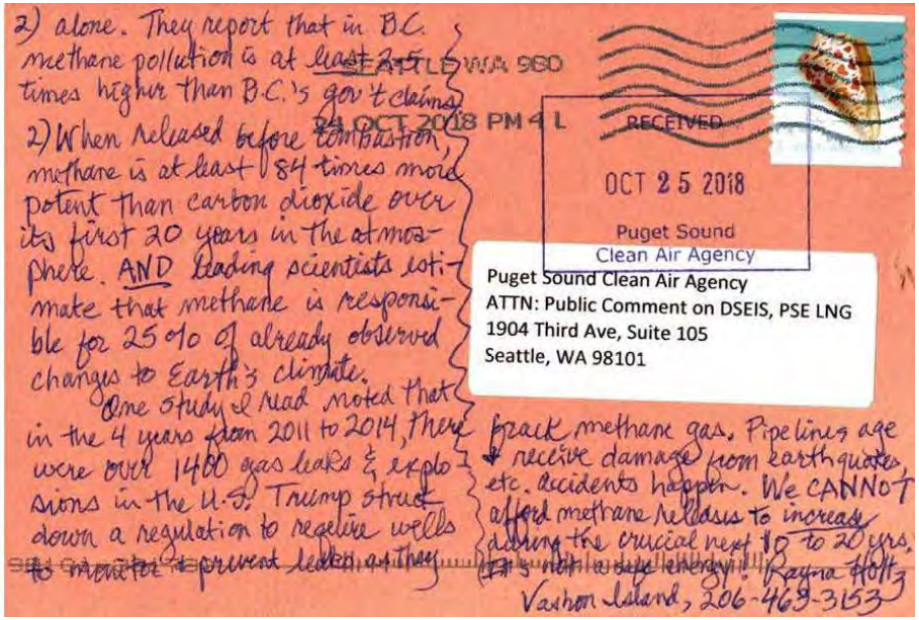
By completing this comment card you agree to receive updates about the project.

To F AA, 10/24/2018



Re: olic Comment on DSEIS, PSE LNG

It is my opinion that the DSEIS (and maybe also PSE & part of the staff of PSCAA) is in error about several things: 1) the estimate on which their study is based, namely the B.C. government's estimate of the amount of methane pollution from the British Columbia oil & gas industry; and 2) the true negative impact of methane.

1) The DEIS completed on Oct. 8, 2018, shows less pollution when the new LNG plant is operating than a no-action alternative. This is based on an assumption that the methane would come from British Columbia, where the B.C. figures for methane pollution are lower than U.S. sources. However in April 2017 the David Suzuki Foundation partnered with St. Francis Xavier Univ. and made an on-the-ground scientific study using trucks equipped with methane gas detectors over the span of 2015 & 2016, traveling more than 8,000 KM & covering 1600 well pads & facilities in the Montney formation ↓

0307-1 12. LCA Inputs and Assumptions - Global Warming Potential Value

0307-2 13. LCA Inputs and Assumptions - Natural Gas Source

2) alone. They report that in BC. methane pollution is at least 3.5 times higher than B.C.'s gov't claims.

2) When released before combustion, methane is at least 84 times more potent than carbon dioxide over its first 20 years in the atmosphere. AND leading scientists estimate that methane is responsible for 25% of already observed changes to Earth's climate.

One study I read noted that in the 4 years from 2011 to 2014, there were over 1400 gas leaks & explosions in the U.S. Trump struck down a regulation to require wells to monitor & prevent leaks, as they frack methane gas. Pipelines age & receive damage from earthquakes, etc. Accidents happen. We CANNOT afford methane releases to increase during the crucial next 10 to 20 yrs. It's not a safe energy!

City of Tacoma
Puget Sound Clean Air Agency
Hearing on SEIS for Tacoma Liquefied Natural Gas Facility
October 30, 2018

To All Who Are Concerned:

My comments on this EIS center around three issues.

The first issue is that I find the approval process fatally flawed, in that both the Final EIS and now the Supplemental EIS have failed to secure permission from the Puyallup Tribe. The 1854 Treaty of Medicine Creek recognizes their ancient rights to hunt, fish and forage in their usual and accustomed areas in the Puyallup River/Commencement Bay shorelines for thousands of years before other peoples came to build the city of Tacoma. They oppose this LNG plant.

The second issue is that methane escapes and spills and powerfully increases the greenhouse effect. The life cycle analysis is based on the understanding that the source of the natural gas will be British Columbia. But a 2017 study by the David Suzuki Foundation in partnership with St. Francis Xavier University showed that "Methane pollution from the oil and gas industry in British Columbia is now at least 2.5 times higher than stated by the B.C. government, and may be much higher." Methane is 87 times more potent than carbon dioxide in a 20-year period. Currently B.C.'s new regulations have yet to be proven effective, while the United States has no regulations or enforcement adequate to control the escape of methane into the atmosphere, and to prevent spillage all along the line from extraction to transport along pipelines, to storage or conversion at an LNG plant, and finally delivery to customers. Attempts during the Obama administration to institute regulations were cancelled by the Trump administration.

Meanwhile, the International Panel on Climate Change issued a press release on October 8, 2018, comparing likely scenarios from limiting global warming to 1.5°C versus 2°C. In the first scenario, global sea level rise would ten cm lower than in the second, and coral reefs would decline by 70-90 percent compared to 99 percent in the second. The report states that "We are already seeing the consequences of 1° of global warming through more extreme weather, rising sea levels and diminishing Arctic sea ice." It also concludes that our efforts must accelerate.

It is folly to build yet another fossil fuel plant, when what the world desperately needs are new renewable and clean energy facilities. Even if there were no methane leaks, (but there are multiple ones at every stage of the gas life cycle), burning LNG still emits quantities of CO_2 into the atmosphere, where they add to the greenhouse effect. Wind and solar do not, and there are sites aplenty in

0444-1 5. Regulatory Framework
0444-2 13. LCA Inputs and Assumptions - Natural Gas Source

0444-4 14. LCA Inputs and Assumptions - Leakage/Slippage
0444-5 3. Outside of SEIS Scope

Washington and neighboring states where both can thrive. In the face of fierce, deadly forest fires in California, Washington, and B.C. this summer, and of violent hurricanes decimating cities every year now, and some South Pacific Islanders already forced to abandon their inundated islands, and over half of the world's coral reefs dead already, we don't have time to fiddle with so-called "transition fuels." We need to make every effort to stop ALL emissions of greenhouse gases asap.

In the September 16 issue of *Seattle Times Pacific NW*, pp32-3, there's an article about the Seattle move toward green energy. The nonprofit Built Green, a program of the Master Builders Association of King and Snohomish Counties, notes that "Since 2008, the number of certified green homes in Seattle has increased, and those homes are going for higher levels of certification. " In 2014 Built Green certified 33 percent of newly permitted single-family homes, in 2017 it was 65 percent, and on August 22 this year the numbers already exceeded the entire year of 2015. Green Canopy Homes builds exclusively net-zero-energy homes. One person interviewed noted that "Millenials are far more interested (than prior generations) in purchasing products and services from organizations aligned with their values rather than just getting the best price to consume the most." There are similar movements on Vashon Island and other places.

My third issue is safety. Mount Rainier was recently listed as the second most dangerous volcano in the U.S., and the path of its mud flows during eruptions in the past has been through Puyallup into Commencement Bay. The tide flats location is also subject to sea level rise and to earthquakes. An eruption could coincide with earthquake activity and generate a tsunami as well. Geologists studied the developments at Mount Saint Helens avidly for months before the eruption, yet nobody was expecting the side to blow out of the mountain. Geologist David Johnson barely had time to shout a warning over his transmitter before he was obliterated. More and more, as our climate deteriorates, we are learning not to count on the old patterns.

At its best, the PSE LNG plant will increase global warming. But at its worst, in the current regulatory climate, and without monitoring or enforcement, it will increase it on steroids.

Sincerely,

Rayna Holtz

Rayna Holtz

0444-6 3. Outside of SEIS Scope
0444-7 3. Outside of SEIS Scope

Steve: Thank you. Carol Umbehocker? Rayna Holtz?

Rayna: Thank you for the opportunity to comment. I'll try to be brief.

[05:37:00] I submitted by printed statement. And I think I am going to just wing it because there are some things that really haven't come up, I feel. I think that we have looked too narrowly at the impact of the lifecycle of natural gas. I feel as though to look simply at how natural gas compares to oil and diesel is the wrong comparison. That we have to look at all of the issues, in the context of the health of our ecosystem and our climate. And that all three of them are no longer safe for us. That, essentially, the IPCC new estimates of how rapidly climate change is happening changes all of the basic rules of the game.

[05:38:13] It's very difficult to understand all of the issues that are involved. But for one thing, it's not just the life history of the gas, once it's fracked. It's what the contamination is that's left behind, in extracting the fuel that we need to live the way we currently live. And we know now that we can't continue to live the way we have been living. And we have to look at the contaminants that are a part of fracking and realize that those contaminants are going to be around for hundreds of years. They are contaminating the soils and the waters. And moreover, the climate change is not going to just be temporary inconvenience.

[05:39:05] It's beyond anything that we've yet experienced. And we've been experiencing once a year disasters every single year now for the past 10 years, I think. The unbelievable forest fires, the unbelievable hurricane damage, the flooding. And as a result, we're going to have to stop saying we only have two alternatives and look for an alternative that's a clean one. Thank you.

Steve: Thank you. So, I'm going to go through the list of the next names I'll call, and I'll come back to the first one on the list. Joanna Monroe, Shirley Low, Marianna B, Tara Doyle-Ennekin, Dan Riley, Joy Caddock, Zoe Shurman, John Winkler, Sarai Salgado, Twylia Westling.

Puget Sound Energy Liquid Natural Gas Plant
Comment on SEIS from Rayna Holtz

The October 2018 SEIS errs in its estimates of the harmful greenhouse gas effects of the methane Puget Sound Energy proposes to purchase and transport to its LNG site in Tacoma. I want to address three areas where the report is inaccurate and/or inadequate.

First, it is a mistake to calculate the Global Warming Potential (GWP) for a period of 100 years. Because methane is 86 times more potent than CO_2 during the first 20 years after it escapes into the atmosphere, and it then dissipates into CO_2 and water vapor (which continue to act as greenhouse gases[1]), and because it is precisely the next 20 years in which we seek to significantly reduce our greenhouse gas emissions, we need to focus our planning and preparation to avoid all possible additional contributions during this next 20 years. At current rates of emissions we are pushing global climate change past tipping points that lock us into worsening feedback loops.

Second, the EIS uses faulty estimates of how much methane escapes into the atmosphere at well sites, during transportation in pipelines, and at junctions where the gas is transferred or delivered as part of processing and use at destinations. Authors of the EIS used inadequately researched figures for the British Columbia sources they target for the majority of the methane they plan to purchase. These figures are very likely incorrect, in light of the ground-based measurements undertaken in 2015 and 2016 that found, “Methane pollution from the oil and gas industry in British Columbia is now at least 2.5 times higher than stated by the B.C. government, and may be much higher.” This research was conducted by the David Suzuki Foundation in partnership with St. Francis Xavier University[2]. Reports from their 2018 research find that 85 percent of active wells are directly venting methane daily and that B.C. methane emissions continue to be 2.5 times higher than reported.[3]

Likewise, other current climate change studies continue to corroborate the conclusion of a study conducted in 2014 by Stanford University, the Massachusetts Institute of Technology and the Department of Energy’s National Renewable Energy Laboratory, which shows that “Methane leaks negate the benefits of natural gas as a fuel for vehicles”.[4] There is not adequate monitoring of accidental emissions throughout the life cycle of methane gas, beginning with fracking sites, and including also the abandoned wells and wellfields.

The United States government currently does not adequately protect citizens from the plethora of negative impacts to water, soil, air, oceans, ecosystems, and human health from methane gas mining and emissions. We depend on our state and local agencies to examine closely the current research, and recognize that all greenhouse gas emissions need to be located, recognized, and reduced, rather than adding more sites that will continue to leak methane. (Increasing methane emissions from swamps and melting permafrost present challenges enough!)

Third, the overriding focus of the SEIS in its examination of the impacts of the proposed Tacoma LNG plant is on the idea that there is a current need for a so-called “bridge fuel”, as if the methane leaks can be dealt with gradually, because the time of reckoning with climate change is distant. That is simply wrong! The time for bridge fuels is past. Popular magazines today chronicle the damage climate change is wreaking **right now**: stories of disappearing species and ecosystems, damage done daily to people, cities, agriculture, and ecosystems because of hurricanes, wildfires, storm flooding, sea level rise, overheated streams killing spawning salmon, fisheries failing—all due to the effects of ***current*** levels of greenhouse gases. We do not have a way to prevent these catastrophes, and ***we cannot continue to set policy by placing our trust in future solutions***. We need to draw a line now. Already we have an

1319-4 cont'd 3. Outside of SEIS Scope
1319-5 3. Outside of SEIS Scope

unacceptable quantity of greenhouse gases. It makes no sense to start new extraction sites and build new infrastructure for a gas more dangerous than CO_2, -- 86 times worse at trapping heat, yet invisible to people and able to escape from fractured earth, old pipes and valves, and other place it's handled. We are releasing a malignant genie from its bottle! We would be better off leaving it deep in the earth and working with renewable clean sources of energy instead. Moreover, the negative impacts of fracked gas won't stop when we stop producing it, because it will continue to require expensive site cleanup (of toxic materials displaced during mining/fracking into aquifers and onto agricultural lands); monitoring and containment (of methane leaking into the atmosphere from the disturbed geologic beds); and treatment of associated health issues (from contaminated water, soil, and air). Every removal site, especially fracked wells, adds to the costs.

Final Thoughts

An October 8, 2018 report from the Intergovernmental Panel on Climate Change[5], coincidentally released on the same date as this SEIS, explains the results of their studies of what differences are projected in 2100 if we succeed in holding global warming to 1.5^{O} above pre-industrial levels, as opposed to 2^{o} above. "For instance, by 2100, global sea level rise would be 10cm lower with global warming of 1.5^{o}C compared with 2^{O}C. The likelihood of an Arctic Ocean free of sea ice in summer would be once per century with global warming of 1.5^{o}C, compared with at least once per decade with 2^{O}C. Coral reefs would decline by 70-90 percent with global warming of 1.5^{o}C, whereas virtually all (>99 percent) would be lost with 2^{O}C."

Jim Skea, Co-Chair of IPCC Working Group III warns that, "Limiting warming to 1.5^{o}C is possible within the laws of chemistry and physics but doing so would require unprecedented changes." Another observation is that although some of the kinds of actions that will be needed have already been started around the world, they will need to accelerate to succeed by 2030. The report lists impressive and thorough research and study statistics: 91 authors from 44 citizenships and 40 countries of residence, including 14 coordinating lead authors, 60 lead authors, and 17 review editors; an additional 133 contributing authors; over 6,000 cited references; and a total of 42,001 expert and government review comments.

I agree with Priyardarshi Shukla, Co-Chair of IPCC Working Group III, that, "This report gives policymakers and practitioners the information they need to make decisions that tackle climate change while considering local context and people's needs. ***The next few years are probably the most important in our history."***

Dear Port of Kalama, and Cowlitz County,
Dear Puget Sound Clean Air Agency,

I am very concerned about how these projects will increase greenhouse gas emissions. It seems clear that any increase in extraction, transport & usage of fracked gas will have potentially devastating effects on human health, the environment and future generations.

Please include detailed information & best current science on methane leakage & operational emission in your studies.

Please include this impact in the Final Supplemental Environmental Impact Statement.

Subject: PSE"s Tacoma LNG Facility
Date: Wednesday, November 21, 2018 4:04:08 PM

Puget Sound Clean Air Agency
1904 3rd Ave #105
Seattle, WA 98101

Puget Sound Clean Air Agency:
Please approve Puget Sound Energy's LNG facility in Tacoma. I am in support of this project and the facility because of the following reasons:
- the facility will provide positive employment contributions to the community and region;
- LNG fuel use on deep-draft ships offers a "cleaner" alternative for our local air quality (vs. use of heavy fuel oil on deep-draft ships);
- an LNG facility would provide a "localized" competitive advantage for our region because global shipping companies will be looking to obtain LNG fuel in the future. A port that cannot (would not) offer an LNG loading facility for commercial vessels may not be able to "host" port stays for deep draft ships that burn LNG as a propulsion fuel (ship owners that operate LNG-powered vessels are more-likely to enter ports that offer an LNG fueling option). Tacoma and the general region would be seen as "backwards" if LNG fuel for deep draft ships is not available in the port/region in the future;
- this facility creates an excellent addition to the regional infrastructure by providing a better "storage/holding" facility for LNG that can be utilized at "peak-use" times (the current infrastructure during "peak-use" has inherent risks to the region; the designed engineering improvements provided by utilization of the LNG facility will mitigate risk of hazards associated with the current system at "peak-use" times)
- the designed redundancies, designed safety protocols, and designed safety procedures of the facility allow for operation with absolute minimal risk to the general public and to the environment; and
- this facility will create positive, long-term economic impact for the end-users of natural gas (thousands of residential customers).

This statement is written in support of Puget Sound Energy's Tacoma LNG facility, during PSCAA's draft SEIS comment period.

Respectfully Submitted,
Russell Horton

Carole: Thank you. Doug Howell?

Doug: Hi. My name is Doug Howell. I work for Sierra Club. And 21 years ago, I was on the standing advisory committee for the Puget Sound Clean Air Agency. And Steve, I remember your work. You've always been incredibly diligent. And I am disappointed.

[02:26:00] This is not the Clean Air Agency I've always known. You've always been so diligent in your work. And this is a huge shortcoming. Two quick technical points. PM benefit here on LNG just doesn't exist anymore. The only real PM threat you've ever issued has been from the wild fires being caused by global warming. And that argument about LNG of being a benefit for PM, particulate, it's just smoke and mirrors. The second part on the technical point on BC gas is that you have to look at, over time, where that gas comes from. They're cherry picking out of BC, and their data, according to David Suzuki Foundation, is wrong anyway.

You have to take a broader look of where all gas comes from to really get a true picture of what the source is. But let's go to a more important issue. You are setting an incredible precedent here. You cannot afford to be extremely diligent, and you're not there yet. You have to go back to the drawing board. You just haven't crossed that finish line of putting something forward that has enough integrity that you've always brought to the job.

[02:27:03] One last point. Most people don't know this. We started to do an analysis of Puget Sound Energy's inventory, and we started to take a look at their upstream. It's our assertion now that Puget Sound Energy is the largest greenhouse gas polluter in Washington State. Their own inventory is 15 million tons, if you put in the upstream, it's 20 million. Reference point, Washington State is 95 million. We need upstream for that inventory. Puget is No. 1. We are enabling them to dig the hole deeper.

Not only are they the biggest polluter, but they're the most important company for stopping global warming, when we clean up electricity and electrify everything. But there's one primary principle before that. Stop digging the hole deeper. No LNG.

Bad idea- no pipeline. No natural has depot.
Not good for the planet and an environmental ‘no-no.’

0462-1 12. LCA Inputs and Assumptions - Global Warming Potential Value

Dear Puget Sound Clean Air Agency,

As a mother of two and avid outdoors person I deeply concerned about the impact the LNG will have on global warming. We have already suffered through an unbearable month in summer with unbreathable air. The LNG plant will not reduce greenhouse gas emissions based on the most current GWP which was not used in the SEIS. It is critical that the SEIS be redone using 20 year GWP data, which is the most current.

Please include this in the final supplemental environmental impact statement.

0463-1 12. LCA Inputs and Assumptions - Global Warming Potential Value

Dear Puget Sound Clean Air Agency,

Puget Sound Clean air has promised to protect citizens from air pollution. This cannot be achieved if you accept the current SEIS for the LNG. The GWP used in the current report is outdated. The SEIS needs to be redone using the most current 20 year GWP (we do not have 100 years).

Please include this in the final supplemental environmental impact statement.

Subject: Comment on Tacoma LNG SEIS
Date: Monday, October 29, 2018 2:18:37 PM

Dear Puget Sound Clean Air Agency,

As a person of faith, I believe we are called to care for both creation and communities. My values of stewardship, justice, and responsibility have compelled me to comment on this project.

Methane is an even more short-term greenhouse gas than CO2, and LNG is Methane. Leaks occur all along the drilling and transfer routes, which accelerates climate change and associated disasters.

Explosions from this plant put too many people at risk, and methane is HIGHLY explosive (Remember the Bellingham explosion?)

Incomplete data and too many alterations of this project make this SEIS a moving target and too difficult to assess accurately. Please clean it up and resubmit for public comment.

We need clean energy far more than we need more polluting methane. It's not natural and it's not a bridge fuel. It's a huge part of the greenhouse gas problem.
Thank you for conducting a supplemental environmental review of the greenhouse gas emissions for PSE's proposed LNG facility on the Tacoma Tideflats.

As a member of Earth Ministry, which has been working closely with scientists and policy experts to review the SEIS, I am concerned that the document does not fully analyze the climate impacts of this project.

Please address the following in the Tacoma LNG SEIS:

1. Methane's impact on climate – The SEIS uses a dated value for the 100-year Global Warming Potential (GWP) for methane from 2007 when updated values were published 2013 and then again in 2016. Using the best available science shows the plant would have higher greenhouse gas emissions. Additionally, given the short timeframe required to address climate change as recently noted by the United Nations, the SEIS should use the 20-year GWP for methane, which shows that the plant will be more than 50% dirtier over the next two decades.

2. Source of fracked gas – It is a false assumption that British Columbia would be the only gas source for this facility and this requirement is not enforceable. In addition, the SEIS relies upon self-reported pollution data on BC gas from the fossil fuel industry. It also failed to incorporate multiple, recent independent studies showing methane pollution rates as much higher than those reported by the fossil fuel industry.

3. Lack of alternative options – TOTE is already using ultra-low sulfur diesel (ULSD) and other companies are also using ULSD or scrubbers to meet emission requirements. The no action alternative assumes that LNG is required for TOTE to meet its emission requirement, when these alternatives already exist and are in use.

4. Alterations to the original proposal – Deviating from PSE's proposal, the SEIS included bunkering more than the two TOTE vessels on the Blair Waterway. The SEIS should instead provide an analysis using only secured customers.

5. Incomplete information – Use of placeholder values, incorrect units of measurement, and the stated need for more data from PSE makes the analysis incomplete and hard to follow. The draft SEIS should be thoroughly edited and released for a new full public comment period.

The Puyallup Tribe, citizens of Tacoma, and residents of the Salish Sea have a right to know the total local and global impacts of this proposal. With missing data and alterations to the project, this draft SEIS does not account for full climate impacts.

I ask that the PSCAA live into its self-proclaimed commitment to be good and wise stewards of our shared resources. Please re-start this review with complete information and additional opportunity for comment.

Thank you for caring for creation and our community.

Sincerely,
Ms. Rhonda Hunter

Subject: Puget Sound Energy - Tacoma Liquefied Natural Gas Project
Date: Monday, October 29, 2018 11:00:14 AM

As a long-time resident, an environmental scientist (Masters of Science in Geology) and a local business person I feel very strongly about keeping our waterways and shorelines clean and safe, our air healthy, and our public services properly funded. It is from this background that I express my support for the Puget Sound Clean Air Agency (PSCAA) to finalize the draft SEIS it presented on October 8, 2018 and to issue the permit(s) that Puget Sound Energy (PSE) has requested for its liquefied natural gas (LNG) facility at the Port of Tacoma. I appreciate projects that will lead to increased tax revenues to help our local schools and public safety departments.

The LNG facility will improve our marine environment by providing a cleaner fuel alternative. LNG reduces the risk of fuel spills over water thereby preventing damage our waterways. It will also help reduce greenhouse gas emissions and virtually eliminate visible particulate emissions produced by ships. This is a very favorable outcome for the citizens of Tacoma and the entire South Sound region, namely better air quality with accompanying reduction in health risks.

I strongly support the region's efforts to create a healthy business climate for local companies who choose to do business in Tacoma. Tacoma is a working industrial marine port-based community, and both TOTE and PSE are respected, long-time area businesses here. We all benefit from both the family wage jobs they provide within the Port, and the fact that both are committed to using the best available environmental technology to remain competitive in the world economy is a boon to our entire community.

I am confident in the conclusion of the draft SEIS that the project will result in a decrease in GHGs. I look forward to publication of a Final SEIS that confirms the draft's conclusions about LNG fuel benefits. I urge you to move forward and approve the PSCAA permit(s) for Tacoma LNG. This project will provide great benefits to the citizens of Tacoma, Pierce County, and the South Sound region for years to come.

Mike Hutchinson
Tacoma Resident

Subject: Supplemental EIS Tacoma LNG plant
Date: Friday, November 2, 2018 1:47:35 PM

Dear Puget Sound Clean Air Agency,

Thank you for assessing greenhouse gas emissions for the proposed Tacoma LNG plant. I support the position of the Puyallup Tribe in requesting a SEIS with more complete and accurate information.

Having been a UW faculty member in the Departments of Medicine and Pharmacology and having raised a child with asthma, I am very aware of and concerned about the health impacts of adding to our fossil fuel infrastructure.

Any increase in demand for fracked gas will negatively impact British Columbia communities by increasing air and water pollution that exacerbates asthma and heart disease, contributes to premature births and affects the brain and nervous system.

Locally, in Tacoma, there are also risks. The proposed plant will be a complex facility in a busy maritime port, and the risk of explosions and leaks will be borne predominantly by the Puyallup tribe and other local communities. This is not just a hypothetical risk. In 2014, two 14 million-gallon tanks exploded at the Williams Companies LNG facility in Plymouth, Washington.

The estimates of methane leaks from fracking are likely very conservative. Reports cited in the SEIS use industry-reported information. Recent studies suggest that wells and pipelines in B.C. may leak as much as 6 times more than previously reported.

In addition, the modeling of global warming potential for methane emissions uses a 100-year timeframe, but methane's impact is most important over a 20-year timeframe. The SEIS should rely the most recent Intergovernmental Panel on Climate Change analysis, which assesses methane as 86 times more potent than Carbon Dioxide over a 20-year timeframe.

Climate change is already impacting our health in the Puget Sound region. We see the health impacts of extreme heat events and air pollution exacerbated by climate change. Expanding

our fossil fuel infrastructure will prolong our reliance on these polluting fuels.

I ask that you revise this draft Supplemental EIS using the latest science and accurate accounting of lifecycle greenhouse gas emissions.

Sincerely,

Rejean Idzerda, PhD

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Dear Puget Sound Clean Air Agency,

A fourth generation citizen of the Pacific Northwest and Puget Sound, I'm writing with real concerns about the propose liquid natural gas project in Tacoma. No, no, no, no, and NO. The SEIS uses bad science and presents misleading information. Please don't mess with the Tacoma tidelands or tribal lands. If you truly care about clean air, then honor the values you include on your website -- and show us what it means to be good and wise stewards of our natural resources right now and for the future.

Did I mention how unhappy we were when the PSE gasoline blew up in our Greenwood, Seattle neighborhood? THANK GOD nobody was hurt. Unfortunately, PSE did blow up one of our favorite businesses, so you'll understand why, like many locals, I don't have much faith in PSE's goodwill or concern about gas leaks, climate change, plants, animals, clean air, or people's lives.

I urge you to take another closer look at the proposed facility, and this time take the best available science into consideration. There is no way for the Agency to uphold its commitments unless you deny the air permit for this facility. You harm us all.

Subject: Puget Sound Energy's LNG facility
Date: Monday, November 19, 2018 11:20:41 AM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

Fracked gas is not clean. Apart from all the toxic liquids injected into the ground, natural gas itself produces CO2 when burned, and leakages release methane too.

All fossil fuels are harmful, please do everything you can to reduce your use of oil, gas and coal ASAP, and do not invest any more time or money into expanding their use!

Sincerely,

Ian James

Subject: NO fracked gas in Tacoma
Date: Thursday, November 15, 2018 4:35:23 PM

Fracked gas LNG project in Tacoma is unacceptable! It would increase our greenhouse gas emissions and further fuel climate change that is on the verge of no return - which means more extreme climate events and wildfires that will only worsen if we continue to pursue fracking (which is a detriment in and of itself) and the gas that comes of it. Our fire seasons have already intensified, causing death, destruction of homes, forests, and wildlife habitat which we keep witnessing across the globe and especially on the US coasts and devastating wildfires in California. Outrageous and as I said, unacceptable. The increased air pollution makes citizens sick and leads to higher rates of asthma attacks, heart problems amongst many other health issues.

Your proposed Liquefied Natural Gas (LNG) refinery, storage and distribution facility in the Tideflats area of Tacoma is inappropriate and unsuitable and frankly intolerable. It is sited on Puyallup Tribal lands and is being built WITHOUT their consent. There are many concerns about the project ranging from taxpayer and ratepayer subsidization, safety issues, and environmental impact.

My words are few, but my objections are many.

Here are other reasons we cannot move forward with this proposal:

These are just some of the shortcomings developed by a coalition of groups including Advocates for a Cleaner Tacoma (ACT), Sierra Club, 350 Seattle, Washington Physicians for Social Responsibility (WPSR) and 350 Tacoma.

- The Draft SEIS is Incomplete – The current version of the draft SEIS does not contain all the information we, the public, need to fully assess the accuracy of this study and the predicted impact of the LNG facility. There are at least 10 places in the study that have “placeholder” values instead of actual data. We request that the PSCAA complete the draft SEIS, re-issue it, and then reset the public comment period so that we may better formulate our questions about this project.
- SEIS is Using Outdated Methane Global Warming Potential Value – They did not use the best available science for the Global Warming Potential (GWP) value for methane. GWP is a measure of potency for a greenhouse gas and it is measured against carbon dioxide (CO2). CO2 has a GWP value of 1. Methane, however has a much larger GWP value. They are using the 2007

1598-4 cont'd 12. LCA Inputs and Assumptions - Global Warming Potential Value
1598-5 12. LCA Inputs and Assumptions - Global Warming Potential Value
1598-6 14. LCA Inputs and Assumptions - Leakage/Slippage
1598-7 13. LCA Inputs and Assumptions - Natural Gas Source
1598-8 6. Purpose and Need
1598-9 14. LCA Inputs and Assumptions - Leakage/Slippage

value of 25 for the 100-year number (i.e. the value average over 100 years), whereas they should be using the 2016 value of 32. Everything else being equal, making this one modification in their models makes the LNG plant dirtier from a greenhouse gas emissions perspective than staying with the heavy fuel oil.

Report	20-year GWP	100-year GWP
2007 IPCC AR4	72	25
2013 IPCC AR5	86	28
2016 Scientific Study (authors include lead from 2013 study)	96	32

- Analysis is based on 100-year, not 20-year, global warming potential (GWP) values – They base all of their analysis on the 100-year GWP of methane, whereas, given the IPCC report that was released on Monday indicating that we must change our energy fuel mix in the next 12 years or face dire consequences in 22 years, they should be using the 20-year numbers, as that is the timeframe where action is needed. Using the most recent 20-year value of 96 makes the LNG plant 150% dirtier than the current capability.
- Questionable claims that B.C. fracked gas is as clean as they claim – They indicate that the fracked gas from B.C. has a much smaller leakage rate. However they fail to incorporate 2017 and 2018 analyses showing that a large percentage of the fracked gas wells are underreporting their methane leakages.
- What assurances do we have that all of the fracked gas would come from BC? They claim that all of the natural gas will be coming to the plant from British Columbia. However, just as we saw on Wednesday with the natural gas pipeline explosion in BC, they were able to use natural gas from North Dakota. The methane leak estimates from North Dakota are noticeably higher than those reported from B.C. We have no guarantees that the gas used would come from BC. Of note, per their 2017 10K filing with the Securities and Exchange Commision (SEC), in 2017 they obtained gas from British Columbia (54.8%), Alberta (19.1%) and the United States (26.1%).
- Analysis assumes credit for extra maritime customers that currently do not exist – The analysis appears to assume that Puget LNG (the for-profit arm of this venture that will be selling the LNG to maritime customers) already has additional maritime customers, and so is claiming greenhouse gas emissions reduction credit for them. They have no such customers and so cannot legitimately claim such credit.
- Questionable Methane Slippage Rates for TOTE Vessels – It appears that they are using smaller methane slippage rates (the amount of unburned methane that will escape into the atmosphere through the exhaust system) for the TOTE maritime vessels that will be burning the LNG. In fact, even in PSE's own

greenhouse gas life cycle analysis that they completed and is provided as part of this report, their external peer reviewer questioned PSE's assumption on their methane slippage rate indicating that they should be using the higher rate as that is considered best practice.

- Analysis does not incorporate diesel emissions for transporting sand/water to the fracked wells – Fracking requires large consumption of water and sand for its operations, however GHG emissions from these diesel trucks were not included in the analysis

Thank you for reading my concerns and considering these reason why this proposal is dangerous. I trust you will show Washingtonians you possess integrity, show your honor and call off all plans for this project anywhere.

Ms. Jarvis

Subject: Tacoma LNG SEIS Project Comment
Date: Tuesday, October 23, 2018 10:34:05 AM

Dear Responsible Official,

Recent gov.bc ads and speeches extol our good fortune of having 'clean' LNG and 'clean' hydroelectric to use or sell: "...it will be great for air around the world to use 100 per cent 'clean' energy to displace coal." But with every energy system, in its extraction, transportation, and final use, there is always some amount of greenhouse gas or heat released.

'Clean' energy is best defined as an energy system which emits insignificant amounts of chemical, particulate, radiation, or carbon pollution after mitigation and remediation. By this definition solar, wind, geothermal, wave and tidal, nuclear, and run-of-the-river hydro are relatively clean (Barnard, CleanTechnica Aug2016)
Fossil fuel generation is never clean no matter how much mitigation and remediation is performed in any part of the system. So when one reads or hears "clean gas" or "clean LNG" this is not correct. There will always be some level of leakage of gas in the upstream, LNG plant, or downstream segments. And even if the LNG is produced partly by electricity from major hydro dams, which themselves are not the cleanest, LNG is a subcomponent of the total 'fracked natural gas-LNG system'.

The 'clean gas' energy as a solution to climate change is a myth. Even if it is sent to other countries, it will be used as a substitute for coal and oil, and delay the true solution developing actual low GHG emitting renewable energies.

John K. Jeglum

Sincerely,
John Jeglum

0614-1 12. LCA Inputs and Assumptions - Global Warming Potential Value

Dear Port of Kalama, and Cowlitz County,
Dear Puget Sound Clean Air Agency,

I am very concerned about this project's impact on Global Warming because Methane is a greenhouse gas 86 times more powerful than Carbon Dioxide. The EPA is using an out-of-date estimate for Methane's impact on global warming. So the next Environmental Impact statement needs to take the most current science into account when conducting the impact statement on the environment

Please include this impact in the Final Supplemental Environmental Impact Statement.

Subject: comment in regard to LNG facility
Date: Monday, November 5, 2018 5:43:42 PM

Dear PSCAA,

Honestly, I don't have a lot to add to the already thorough and detailed public commentary in opposition to the LNG facility in Tacoma. I am a very active Sierra Club member in our local Tatoosh Group, and focus most of my efforts on park stewardship, environmental restoration, and supporting environmentally-minded local candidates for office. Thus, I admit that I am not an expert on this LNG issue. However, I do understand the big picture, how the LNG facility affects our future, and how this permit would enable its undesirable consequences.

Climate change is the challenge of our time. The science continues to reveal that the situation is more dire than we have previously imagined. By denying this LNG permit, we are essentially saying "NO" to more fossil fuel infrastructure that will only make it more difficult to reduce greenhouse gas emissions over the coming years. The extraction, transportation, and processing of LNG provides multiple opportunities for methane to leak into our atmosphere and compound our global warming problem. Methane is over 80 times as potent as carbon dioxide as a greenhouse gas. We are already seeing unusual amounts of methane emerging from the northern tundra as long-frozen permafrost melts away. We are already losing the battle, so let's not compound the problem with even more methane pollution!

Finally, I speak as a father of a 5-year-old. My daughter and her peers will inherit whatever environment we choose to give them. If encouraging LNG production is likely to increase methane emissions and therefore exacerbate climate change, we ought to stop it in its tracks. I urge the PSCAA to deny this permit. Thank you for your time and consideration,

Brett M. Johnson
Executive Committee Member
Sierra Club Tatoosh Group of Pierce County

1587-1 19. LCA Inputs and Assumptions - End Use

From: Christian Johnson
To: Public Comment
Subject: LNG SEIS public comment
Date: Friday, October 26, 2018 12:51:13 PM

Dear PSCAA,

As a Tacoma resident and PSE customer and ratepayer, I am against the LNG facility. I am not willing to pay extra in my bill every month to cover the cost of that tank.

Will the SEIS cover transport such as trains and trucks? I-5 is one of the busiest freeways in the U.S. Tacoma has several oil trains running through it everyday and PSE wants to use the railways for LNG? What if there is an accident? Who will be responsible for the costs? PSE won't because they are an LLC and will just pick up and leave us in the rubble.

The LNG is dangerous and corrupt. There is a lot of information that is being kept from the public.

-Christian Johnson

1646-1 17. LCA Inputs and Assumptions - Peak Shaving

From: Christian Johnson
To: Public Comment
Subject: Public comment on fracked gas facility
Date: Sunday, October 28, 2018 6:31:15 PM

Dear PSCAA,

The peak shaving purpose does not add up. The peak shaving is only for 10 years and after that it goes to for-profit corporations. We all know that PSE will export this gas to questionable foreign countries like China and Russia.

A revised complete SEIS should be provided and a new full public comment period should be provided. The city should not have been the lead SEPA agency- it was a conflict of interest since 2 council members wrote a letter approving of the LNG project.

-Christian Johnson

Carole: Thank you. Steward Zimmerman? Dr. Lisa Johnson?

Lisa: Good afternoon. My name is Dr. Lisa Johnson. I'm a family physician and a long term Physician for Social Responsibility member. I've also lived on Puget Sound for about 40 years. I'd like to speak regarding the health of all of our members of our community. First, I thank you for your decision to assess the lifecycle greenhouse gas emissions for this Tacoma LNG project.

[01:56:05] We, at PSR, support the position of the Puyallup Tribe in encouraging a supplemental EIS with more complete and more accurate information. First, we're concerned about the effects of methane emissions on the environment. We've talked about the IPCC report and the impact of methane over a 20 year cycle, instead of 100 year cycle and know that methane's effects are 86 times more potent than carbon dioxide over the 20 year period. And the SEIS should use that model for its analysis. We're also concerned about methane leaks from fracking in British Columbia.

Recent studies have shown that wells and pipelines in BC may leak as much as six times more than has been previously reported.

[01:57:02] And that is also not included in the EIS. As health professionals, we're also concerned about an increase in fracked gas demand, which could worsen the health of our Canadian neighbors. That is, effects of air pollution that exacerbate asthma, heart disease, chronic pulmonary disease and premature births. I also want to say that flammable emissions from LNG bunkering could pose a significant risk of explosion in the busy port with lives and infrastructure in the balance. In summary, with this in mind, we ask that you revise this draft SEIS using the latest science and accurate accounting of lifecycle greenhouse gas emissions. Thank you.

djohnson-deal@tdn.com

[03:24:04] So, next speaker would be Deborah Hill. Kyle Jolibois?

Kyle: Good evening. My name is Kyle Jolibois. I was born in St. Joe's Hospital, Hilltop. Lifetime resident. And I thought this was about air. And all we've been talking about is 17 jobs that this may incur.

[03:25:00] I live in the blast zone. I live on Broadway, two blocks away, four blocks down. I can see this monster in my backyard. And it's supposed to be not completed yet because it doesn't have your permit. But this thing is huge. I can see it with the naked eye 2.2 miles from my house. And every day, as I leave my house, I look at the port, and I can see West Rock and all the fumes they pollute our skies with. And you want to put in LNG that the report is incomplete. Let me ask you this, sir. Would you be sitting there if you ever done anything incomplete? No, you wouldn't. Nothing gets done that's incomplete.

[03:26:03] And all we're asking for is a complete report. You guys are rushing this, and I don't know why. This is going to devastate Tacoma. The reports are that the port is going to be under water in 30 years. Then what? I think this is a huge mistake for Tacoma. I just think you would take some more consideration in what you're doing because it's going to affect a lot of people. Thank you.

Dear Puget Sound Clean Air Agency,
I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to deny the permit because the Draft Supplemental Environmental Impact Statement does not accurately represent the true greenhouse gas emission profile of the project. I have the following specific concerns:

During consideration of this plan the IPCC released their latest report proving that the time to put an end to new fossil fuel infrastructure is well behind us! You could not make a more irresponsible decision than to approve a terminal in Tacoma.

_____(Check here to continue comments on the other side).

In addition, a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required and adequate consultation with the Puyallup Tribe and other neighbors of the project should be conducted.

Subject: Puget Sound Energy's LNG facility
Date: Thursday, November 15, 2018 8:13:19 AM

Dear Puget Sound Clean Air Agency,

Thank you for opening up this review process and for your careful consideration of all the impacts of Puget Sound Energy's proposed LNG facility. I'm writing to express my opposition to the project and express significant concern.

I oppose this for several reasons, including the fact that climate change means we cannot allow new fossil fuel infrastructure. Period!
And I oppose on the grounds of environmental justice- this disproportionately affects disadvantaged communities by adversely impacting air quality.
Let's move away from air pollution, greenhouse gas emissions, and toward green energy sources including solar and wind.

Sincerely,

Jenny Jones

Carole: Thank you. Steve Gilbert? Kevin Jones?

Kevin: Hello, and thank you for the opportunity to speak today. I want to introduce myself as a person who has had 35 years of engineering program management experience, including risk management.

[01:09:02] I am not paid to be here. I'm retired and received no compensation for my testimony today. I want to thank you for performing a supplemental environmental impact statement. I was very concerned regarding the upstream gas emissions comment from the city of Tacoma, which, basically, said those are too remote to the project site and the city of Tacoma to be part of the EIS. Of course, we know those emissions go into the one climate that we have. My concern of what I've heard today is a reliance on the reliability and accuracy of the supplemental environmental impact statement. I think you've heard a few reasons why that is to be not trusted.

I, myself, have looked at some numbers and believe that it is some fiction in what you have seen and, therefore, what we're trying to base our analysis on. The notion of gas as a bridge fuel I think is now a known myth, due to the higher than reported gas leaks. And I have a couple of references I'll bring up.

[01:10:00] So, I'm concerned that the supplemental environmental impact statement makes unreasonable assumptions about these emissions. Historically, upstream gas emissions are higher than reported. In 2016, *The Economist*, which is not a liberal newspaper, noted that gas leaks in America are underestimated by about 30%. The Atmospheric Chemistry and Physics Group recently reported that gas leaks in British Columbia are underreported by 43%.

If this assessment is applied to the upstream gas emissions in the supplemental environmental impact statement, we find the greenhouse gas emission savings from the proposed action drops from 40,000 tons of reduced emissions to only 6,440 tons for Scenario A. If you base a permit approval on a net greenhouse gas reduction of less than one percent that is not good engineering practice, and it would never pass muster in an engineering class.

[01:11:00] I'm also concerned about the fugitive emissions from British Columbia. The concern about whether or not the source is reliable over the life expectancy of this facility. Some people have characterized we need the facility to mitigate the disruptions due to pipeline explosions. I would claim that pipeline explosions is a threat to the basis upon which the proposal is made because you

1172-1 13. LCA Inputs and Assumptions - Natural Gas Source
1172-2 14. LCA Inputs and Assumptions - Leakage/Slippage
1172-3 5. Regulatory Framework

need a supply, in order to make the system work. So, I view that this project does not have an acceptable risk posture regarding greenhouse gas emissions.

When other system level factors are considered like the outdated global warming potential values and using 100 year versus 20 year values, the supplemental EIS conclusions are just not credible. Based on these factual errors in the SEIS, you must reject this permit. Thank you for your time.

Tacoma LNG Facility Testimony – Puget Sound Clean Air Agency

My name is Kevin Jones. I am a PSE ratepayer. I have 35 years of engineering project planning, implementation and risk management experience working for The Boeing Company. Now retired, I have not been paid to testify and will receive no financial benefit due to your final permit decision. I oppose issuing the permit to PSE for the Tacoma LNG facility.

Thank you for performing a Supplemental Environmental Impact Statement (SEIS) for the Tacoma LNG Facility. I was quite concerned when upstream gas emissions were dismissed by the City of Tacoma as "too remote to the project site and the City of Tacoma to be part of the EIS". Of course, these emissions pour into the only climate we have.

Unfortunately, the SEIS conclusion is based on upstream gas emissions which are not credible. Gas as a bridge fuel is now a known myth due to much higher than reported upstream methane leaks. The SEIS makes erroneous and unreasonable assumptions about these upstream gas emissions. Historically, upstream gas emissions are higher than reported. In 2016 The Economist noted that upstream gas leaks in the United States are underestimated by about 30%. The Atmospheric Chemistry and Physics group recently reported that gas leaks in British Columbia are under-reported by 43%. If this assessment is applied to the upstream gas emissions in the SEIS we find the stated greenhouse gas emission reduction of the proposed scenario A action falls from 40,000 tons to 6440 tons.

Basing permit approval on a net greenhouse gas emission reduction of less than 1% would not pass muster in a high school level engineering class. Further, a permit issued for the LNG facility, based on this erroneous SEIS, will result in a fossil fuel facility investment that locks us into an approach that provides no proven environmental benefits over a multi-decade time period during which time true environmental solutions to maritime shipping pollution could emerge.

In addition to the unreliable British Columbia fugitive gas emission data, the SEIS also assumes a reliable British Columbia delivery network over the entire life span of the facility. The October 9 pipeline explosion, which PSE euphemistically calls an "unexpected rupture", adds significant doubt to this reliability. You heard testimony that the LNG facility can mitigate the risk of a pipeline explosion. In fact, pipeline explosions create significant risk to achieving the important (though specious) SEIS caveat that all the source gas must come from British Columbia.

The SEIS, when corrected to use reasonable upstream gas emission leak levels, indicates an unacceptable risk regarding greenhouse gas emission reductions. The conclusion that the proposed action reduces greenhouse gas emissions is based on SEIS fiction. When other system level factors are considered, like the outdated global warming potential values and using 100-year versus 20-year values, the SEIS conclusions are not credible.

Based on these factual errors in the SEIS, you must reject this permit.

Puget Sound Clean Air Agency,

Dear Puget Sound Clean Air Agency,

First of all, I want to thank you for opening up this review process on the Puget Sound Energy Liquefied Natural Gas project being built in Tacoma.

That said, I want the LNG project to end immediately. We must take action if we want to have a livable planet in the future.

Natural Gas has less carbon content than other fossil fuels but its production is just as dangerous. Gas seeps out of the wellheads and gets released during transportation, and in its unburned state it is much more threatening to us than the products of burning coal or oil. Natural Gas in the air is 86 times more potent in creating the Greenhouse Effect than carbon dioxide over a 20--year span. The LNG project in Tacoma will be complicit in releasing natural gas into the air and will create climate chaos just as much as the other forms of fossil fuels.

Please deny this project any permits that are still pending. Thank you.

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

Dear Puget Sound Clean Air Agency,

We must switch our dependence on fossil fuels to renewable sources of energy. While I appreciate the SEIS process I believe the conclusions are flawed.

The SEIS is not using the best available science for the Global Warming Potential (GWP) of methane. It uses the 100-year GWP of methane and not the 20-year value which is much more relevant given the urgency in addressing the climate crisis. The appropriate 20-year GWP value to use is 96.

This facility is projected to have a 40 year lifespan, so why does the report project out to 100 years, which is 90 years beyond the time we need to have taken decisive action?

The SEIS claims emissions benefits from customers that Puget Sound Energy simply does not have. According to PSE and the City of Tacoma, the only maritime customer is TOTE with its two vessels which have already delayed their conversion to consume LNG.
Securing new customers (there are only just over 100 LNG ships in operation out of a worldwide fleet of 90,000) as well as the additional permitting could take years and is not guaranteed.

The SEIS says that emissions will only be reduced if the natural gas comes from Canada, because leakage rates are reportedly lower there than in the US. Shockingly, most leakage rates were self-reported by the fossil fuel industry based on models and recent measurements taken in the field have shown that leakage rates are much much worse.

How can it be guaranteed that PSE is sourcing its gas from BC anyway? Their recent filings show they relied on gas from BC, Alberta, and the US. And with the recent pipeline explosion in BC that interrupted PSE's supply, we know it's not always available.

When ships use any fuel, a certain percentage of it escapes without combusting through the exhaust system and into the atmosphere. This is known as slippage and the SEIS uses a lower rate than is considered best practice.

With these points in mind I wonder how the SEIS can conclude that there will be less greenhouse gas produced than if the project does not go forward? I hope that you will take

best available science into consideration when revising this draft SEIS.

Sincerely,
Erika Kane

Comment:

Dear EFSC Chair Beyeler, and Council Members Dowlin, Grail, Jenkins, Senn, Billings, and Roppe

The Draft of the Supplemental Environmental Impact Statement, Washington state created to evaluate this project is obviously flawed and motivated by money. Was it written by the fox who protects the hen house? Plus the Native tribes (whose lands the proposed project is located) object to the project. The fact Washington State is going forward is another case of white people bossing around native peoples for their economic benefit. Also please read the landmark report by the UN Intergovernmental Panel on Climate Change (IPCC) . We need to stop carbon emissions NOW. Tell me would you continue to smoke knowing you had cancer? Probably NOT. So let's not frack. It is reckless and crazy.

ATTN: Public Comment on DSEIS, PSE LNG Project
Dear Puget Sound Clean Air Agency,
I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to deny the permit because the Draft Supplemental Environmental Impact Statement does not accurately represent the true greenhouse gas emission profile of the project. I have the following specific concerns:

SEIS is using outdated methane global warming potential value. They are using 2007 instead of 2016 values. 2016 value is now 32 which makes LNG plant emissions higher.

(Check here to continue comments on the other side).

In addition, a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required and adequate consultation with the Puyallup Tribe and other neighbors of the project should be conducted.

Dear Puget Sound Clean Air Agency,
I strongly oppose the Puget Sound Energy Liquefied Natural Gas Project and urge you to deny the permit because the Draft Supplemental Environmental Impact Statement does not accurately represent the true greenhouse gas emission profile of the project. I have the following specific concerns:

The production, processing, storage, transmission and distribution of fracked gas leaks massive amounts of methane into the atmosphere. When accounting for methane leaks, fracked gas has climate impacts similar to coal.

(Check here to continue comments on the other side).

In addition, a Supplemental Environmental Impact Statement addressing health and safety aspects of the project should be required and adequate consultation with the Puyallup Tribe and other neighbors of the project should be conducted.
